EXECUTIVE SUMMARY

This human health risk assessment (HHRA) was completed by Stantec Consulting Ltd. (Stantec) on behalf of LNG Canada Development Inc. (LNG Canada). The purpose of this risk assessment is to comply with the provincial and federal conditions required to support the Environmental Assessment for the LNG Canada Export Terminal Project (the Project), located in Kitimat, British Columbia (BC).

LNG Canada is undertaking the construction and operation of a natural gas liquefaction facility and marine terminal for the export of liquefied natural gas (LNG) in the District of Kitimat. The construction of the marine terminal requires the dredging of approximately 3.5 million cubic metres of sediment from the Certified Dredge Area (CDA) to a depth of at least 14 metres (m) below sea level.

Dredging activities disturb marine sediments which are known to contain chemicals of potential concern (COPC). These COPCs include polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCB), polychlorinated dibenzo-para-dioxins and polychlorinated dibenzofurans (PCDD/F), cadmium, copper, and zinc. Dredging could influence COPC exposures to benthic marine life such as crabs and groundfish; and affect the local quality of marine foods that people harvest and consume.

In August 2015, a HHRA was conducted as part of the Application for an Environmental Assessment (Application) for the Project. The 2015 HHRA included the prediction that dredging would have no significant effect or a marginal reduction to the concentration of COPCs in marine foods. This prediction meant that there would be no significant Project-related influence on the quality of marine foods, and no significant Project-related change in health risk to people consuming these marine foods.

The provincial and federal conditions issued by the BC Environmental Assessment Office and the Impact Assessment Agency of Canada (IAAC; formerly the Canadian Environmental Assessment Agency), respectively, required LNG Canada to confirm these predictions by establishing a marine food sampling program that would be implemented before and after dredging. Data from the marine food sampling program would be used to quantify the change in marine food quality and the subsequent change in health risk to people consuming these foods. This HHRA presents the data collected from the marine food sampling program and characterizes the 2018 pre-dredge, 2019 post-dredge, and 2020 post-dredge health risk to marine food harvesters.

Since there is no harvesting or consumption of marine foods from Kitimat Harbour due to several overlapping harvesting bans and the general perception among the public that the area is contaminated, the health risk described in this HHRA is hypothetical and based on the over-conservative assumption that the public, members of the Haisla Nation, and other Indigenous groups harvest their entire allotment of marine food from Kitimat Harbour year-round.

Specimens of Dungeness crab and English sole were collected during August and September of 2018 (pre-dredge), August and September 2019 (post-dredge), and August 2020 (post-dredge) at three study areas. The Kitimat Harbour study area is the main area of interest for this HHRA. Kitamaat Village and Kildala Arm are reference sites used to distinguish the effects of dredging from background and regional effects. From these specimens, tissue samples of crab meat, crab hepatopancreas, and sole meat were dissected and analyzed for concentrations of PAH, PCB, PCDD/F, cadmium, copper, and zinc. The laboratory results were used to characterize the health risk to people consuming these foods. The health risk from exposure to non-carcinogens was assessed for PCB, PCDD/F, cadmium, copper, and zinc.

Overall, the measured concentration of COPCs in marine foods from Kitimat Harbour either showed a decrease or no statistically significant change from the 2018 pre-dredge to 2019/2020 post-dredge periods. These results confirm the predictions of the 2015 HHRA that dredging would have no significant effect or a marginal reduction on the concentration of COPCs in marine foods.

The Haisla Nation also expressed interest in the overall quality of marine foods in Kitimat Arm and Kildala Arm. The results of this study show that if a person harvested their entire allotment of marine foods from the Kitimat Harbour, Kitamaat Village, or Kildala Arm study area, there would be a unacceptable health risk from COPC

exposure at all three locations. However, the degree of health risk between each location is similar, meaning that marine foods from Kitimat Harbour did not contain a particularly higher COPC concentration relative to the Kitamaat Village and Kildala Arm reference sites. The results suggests that the concentrations of COPC in marine foods are likely representative of regional background levels. Specifically, the concentration of cadmium, copper, and zinc in marine foods may be naturally occurring in the region encompassing all study areas. Concentrations of PCDD/F may be representative of background levels in the region encompassing all study areas, resulting from atmospheric and hydrospheric transport and deposition. Only PAH and PCB concentrations suggest a potential local anthropogenic source.

The health risk from exposure to carcinogens was assessed for PAH. The results show a statistically significant decrease in the incremental lifetime cancer risk (ILCR) for people exposed to PAH through their consumption of crab meat, crab hepatopancreas and sole meat harvested from Kitimat Harbour from the 2018 pre-dredge to 2020 post-dredge period. Overall, this suggests a net positive effect, where marine foods contained lower PAH concentrations for the 2020 post-dredge period, resulting in a lower health risk to marine food consumers in Kitimat Harbour.

ABBREVIATIONS

BC	British Columbia
CCME	Canadian Council of Ministers of the Environment
CDA	Certified Dredge Area
COPC	chemicals of potential concern
EDI	estimated daily intake
HHRA	human health risk assessment
HQ	hazard quotient

GLOSSARY

Term	Definition
Application	Application for an Environmental Assessment
Chemical of Potential Concern	chemicals that are identified as being present at concentrations that may be of potential human health risk
Estimated Daily Intake	the estimated daily amount of a chemical that a person is exposed to from their consumption of marine foods
Hazard Quotient	The ratio between the estimated daily intake of a chemical and the toxicological reference value, defining the health risk for that chemical. In British Columbia, a hazard quotient threshold of 1.0 is applied. However, Health Canada has requested the threshold hazard quotient applied in this risk assessment to be 0.2 to account for background exposure of COPCs from other exposure routes (i.e., drinking water, inhalation, dermal contact).
Human Health Risk Assessment	a process that evaluates the potential human health risks associated with predicted exposures to chemicals in the environment
Incremental Lifetime Cancer Risk	the increase in lifetime cancer risk associated with lifetime exposure to a carcinogenic chemical
Quality	The term "quality" is used in this report to describe the measurable concentration of chemicals in a media such as tissue or sediment. Sediment quality and marine food quality specifically refers to the concentration of contaminants that are measurable.
The Project	the LNG Canada Export Terminal Project
Toxic Equivalence	A means of evaluating the toxicity of a chemical mixture containing chemically similar compounds with similar biological effects. The toxicity of the chemical mixture is converted to a concentration of a single chemical with an equivalent toxic potential.
Toxicity	the ability of a chemical to cause biological harm
Toxicological Reference Value	The daily-average exposure limit for a chemical below which there is negligible human health risks. This is sometimes referred to as the "*tolerable daily intake*".

1. INTRODUCTION

1.1. Overview

LNG Canada Development Inc. (LNG Canada) is undertaking the construction and operation of a natural gas liquefaction facility and marine terminal for the export of liquefied natural gas (LNG) in the District of Kitimat (Figure 1-1). The Project will initially include two LNG processing units, or "trains", each with a processing capacity of 7 million tonnes per annum of natural gas. The Project also includes the option to add two more trains for a maximum operating capacity of 28 million tonnes per annum. The LNG would be loaded onto Q-Flex LNG carriers for export to overseas markets in Asia.

The construction of the marine terminal requires the dredging of approximately 1.7 million cubic metres of sediment from the Certified Dredge Area (CDA) to a depth of at least 14 metres (m) below sea level. Surface sediment in the CDA (0 to 2.5 metre) contains chemicals of potential concern (COPC) at concentrations greater than environmental quality guidelines. These COPCs include polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCB), polychlorinated dibenzo-para-dioxins and polychlorinated dibenzofurans (PCDD/F), cadmium, copper, and zinc. Dredging of these sediments during the construction of the marine terminal could influence COPC exposures to benthic marine life such as crabs and groundfish, and affect the local quality of marine foods that people harvest and consume.

In August 2015, a human health risk assessment (HHRA) was conducted as part of the Environmental Assessment (Application) (LNG Canada 2015). The 2015 HHRA characterized the existing health risk to people who harvested and consumed Dungeness crab and English sole within 500 metres of the CDA. The health risk was based upon people's dietary exposure to COPCs from the consumption of Dungeness crab meat, crab hepatopancreas, and English sole meat. The 2015 HHRA and supporting technical memoranda included the prediction that dredging within the CDA would not increase COPC concentrations in marine foods but may result in a marginal reduction to the concentration of PAH, PCB, PCDD/F, cadmium, copper, and zinc in these foods. Based on this prediction, it was concluded that there would be no significant Project-related influence on the quality of marine foods, and therefore, no significant Project-related change in health risk to people consuming marine foods near the CDA.

The provincial and federal conditions issued by the BC Environmental Assessment Office and the IAAC, respectively, required LNG Canada to confirm the prediction by establishing a marine food sampling program that would be implemented before and after dredging. Tissue samples from

Dungeness crab and English sole would be submitted for chemical analysis, and the results for each year would be compared to determine whether there are any statistically significant changes in marine food quality.

This HHRA was completed by Stantec Consulting Ltd. (Stantec) on behalf of LNG Canada. The purpose of this HHRA is to comply with the provincial and federal conditions required to support the Environmental Assessment for the LNG Canada Export Terminal Project (the Project) located in Kitimat, British Columbia (BC).

The primary objective of this HHRA is to address the provincial and federal conditions which require confirmation of the conclusions of the 2015 HHRA by comparing the quality of marine foods in the 2018 pre-dredge period with the 2019 and 2020 post-dredge periods, and characterizing the subsequent change in health risk to people.

The secondary objective of this HHRA is to characterize the overall health risk among the three study areas for people consuming marine foods in the region, based on their ingestion exposure to COPCs.

1.2. Study Background

During the development of the Application for the Project, inquiries were made by the Haisla Nation, regulators, and other stakeholders regarding the potential effect that dredging may have on the quality of marine foods. Laboratory analysis of sediment cores taken from the CDA indicated that the upper 2.5 metre layer of sediment contained PAH, PCDD/F, cadmium, copper, and zinc at concentrations that were greater than environmental quality guidelines for the protection of aquatic life and human health. These chemicals originate from a combination of nearby industrial activity and naturally occurring inputs to the environment.

During the review process for the environmental assessment, stakeholders raised a concern that dredging the upper 2.5 metre layer of sediment could create a sediment plume and increase the exposure and uptake of these chemicals into nearby marine life. Consequently, it was presumed by stakeholders that people who harvest and consume these marine foods (e.g., crabs, fish, shellfish) would have a higher exposure to these chemicals, and therefore, a higher degree of health risk.

In response to these inquiries, LNG Canada conducted a HHRA in 2015, which characterized the existing quality of marine foods and existing health risk to people who may harvest and consume these foods near the CDA. The study included the collection of Dungeness crab, and English sole for chemical analysis of PAH, PCDD/F, cadmium, copper, and zinc concentrations. Crab meat, crab hepatopancreas and sole fillets were dissected out and submitted for analysis. Specimens were collected within 500 metres of the edge of the CDA. The 500 metre limit was established in consultation with the Haisla Nation and regulators.

The 2015 HHRA characterized the existing health risk associated with exposure to PCDD/F, cadmium, copper, and zinc, based upon the conservative assumption that people harvest their entire allotment of marine foods from within 500 metres of the CDA. However, potential human health risks associated with exposure to PAH in these foods could not be adequately assessed because the method detection limits of the procedures used to measure PAH concentrations were too high to provide meaningful results for use.

The 2015 HHRA also included the prediction that dredging would not increase the COPC concentrations in marine foods but may result in a marginal reduction to the concentration of COPCs in marine foods. This prediction was based on several lines of rationale:

1. The highest COPC concentrations in the sediment were found on the surface layer, meaning that marine life in the study area was already exposed to sediments (via direct contact, filter feeding, and sediment particle ingestion) containing the highest COPC concentrations.
2. The Project is not a source of PAH, PCDD/F, cadmium, copper, or zinc, meaning that the Project has no potential to increase COPC concentrations in the sediment.
3. Dredging would permanently remove the surface sediment layer that contains COPCs, exposing deeper sediment layers that are clean. Furthermore, as dredging of the deeper sediment layers progressed, the plume of clean sediment would settle on the ocean floor and cover contaminated sediments in areas outside of the CDA. This means that after dredging, marine life that re-settles near the CDA would primarily be exposed to cleaner sediment.
4. The overall area that is affected by dredging (i.e., 500 metre radius of the CDA) is small relative to the home range of many species of marine life. For example, Dungeness crabs commonly migrate up to 10 miles (16 kilometres) during their lifetime (California Department of Fish and Wildlife). This means that mobile species of marine life would likely spend a small proportion of their lifetime within 500 metres of the CDA, and the overall COPC exposure from this area would be negligible over their lifetime.
5. Studies conducted over the last two decades, led by Dr. Curtis Eickhoff and Dr. Mark Yunker, have demonstrated that the dominant contaminants in Kitimat Harbour are PAH. However, these PAH have a very low bioavailability because they are chemically bound to pitch coke particles, as summarized in the 2015 HHRA and associated technical memoranda (LNG Canada 2015). The physical disturbance of sediment during dredging is unlikely to alter the chemical properties of PAH that are bound to pitch coke particles. This means that the bioavailability of PAH in the existing environment is low, and would remain low during dredging.

This prediction meant that there would be no statistically significant increase in COPC concentrations in marine foods after dredging, and no significant Project-related change in health risk to people consuming these marine foods. These findings were submitted as part of the Application for the Project in August 2015.

Following the review of the Application for the Project, the BC Environmental Assessment Office and the IAAC issued a set of conditions that LNG Canada was required to meet as part of its Application. The federal conditions established by the IAAC are in APPENDIX 1. The federal conditions applicable to this HHRA are as follows (verbatim):

6.3 The Proponent shall implement measures related to marine water quality and sediment water quality, including:

- 6.3.1 prior to the commencement of dredging, establishing a shellfish and groundfish tissue baseline and using it to complete a human health risk assessment for the consumption of fish.
- 6.3.6 developing and implementing a post-dredging follow-up program, in consultation with Aboriginal groups, to confirm the human health risk assessment predictions, including additional sampling of the shellfish and groundfish tissue to confirm the assessment predictions regarding the bioavailability and bioaccumulation of contaminants in fish consumed by humans. The Proponent shall communicate the results of the follow-up program to Aboriginal groups.

The provincial conditions established by the BC Environmental Assessment Office are in APPENDIX 2. The provincial conditions applicable to this HHRA are as follows (verbatim):

- Condition 6 Bullet 6: The results of shellfish and groundfish tissue sampling to form a baseline to the satisfaction of the BC Environmental Assessment Office, including the completion of an associated human health risk assessment.
- Condition 6 Bullet 7: A post-dredging follow-up program to confirm the human health risk assessment predictions, including potential additional tissue sampling to confirm the assessment of predictions regarding the bioavailability and bioaccumulation of toxins in marine organisms consumed by humans.

To address potential effects of dredging on the quality of marine foods, LNG Canada is required to confirm the predictions of the 2015 HHRA and establish a new marine food quality baseline prior to dredging with a follow-up sampling program after dredging. This HHRA report is designed to meet those provincial and federal conditions.

The study design of the 2015 HHRA is applied to this risk assessment. However, during the program design and consultation with the Haisla Nation and regulators, several critical adjustments were made to the study design as follows:

1. PCB was added as a COPC. Although PCB was not above sediment quality guidelines in the CDA, it was detected above guidelines approximately 700 metres away in the dredge

pocket for the Rio Tinto Terminal A Extension Project. To address concerns of PCB migration due to dredging at the Rio Tinto dredge pocket, LNG Canada agreed to include PCB as a COPC into the study.

2. PAH, PCB, and PCDD/F will be analyzed in tissues using high-resolution mass-spectrometry (HRMS), applying accredited analytical methods by the US Environmental Protection Agency (US EPA Method 1668A and 1613) and California Environmental Protection Agency (Cal EPA Method 429). HRMS has a lower detection limit relative to gas chromatography—mass spectroscopy. For PAH, the detection limit is a sample detection limit (i.e., the detection limit varies with each sample) of approximately 1 part per billion (ppb). For PCB and PCDD/F, the sample detection limit is approximately 1 part per trillion (ppt). This adjustment was made to lower the detection limits in line with food-grade analysis so that a non-detectable outcome would likely indicate that the health risk is negligible.
3. Two reference sites were added to the study design, which are not affected by dredging in the CDA. The first reference site is approximately 2 kilometres southeast of the CDA and includes the waters within 500 metres of the Kitamaat Village shoreline. This reference site was selected by the Haisla Nation because they are interested in the quality of marine food near their reserve, and the extent of potential contamination from human activities in the region. The second reference site is Kildala Arm, located approximately 30 kilometres southeast of the CDA. This reference site was selected by the Haisla Nation because it is an important harvesting location, and they are interested in the quality of marine foods in an area that they consider to be pristine. The addition of these reference sites may also distinguish the degree of anthropogenic contaminants from naturally occurring background contaminant levels in marine foods.

1.3. Scope and Objective of the Human Health Risk Assessment

The scope of this HHRA is driven by the Project's federal and provincial conditions for an Environmental Assessment Certificate. The scope only includes the assessment of human health related to the harvest and consumption of marine foods within the CDA. The primary objective of this HHRA is to satisfy the federal and provincial conditions described in Section 1.2.

Based upon these conditions, the objectives of this HHRA include: the collection of shellfish (Dungeness crab) and groundfish (English sole) tissue before and after dredging and applying the laboratory results to characterize the change in health risk from the pre-dredge to post-dredge periods, and the confirmation of predictions regarding health risk, and bioavailability and bioaccumulation of chemicals as described in the 2015 HHRA (LNG Canada 2015).

This HHRA applies Health Canada's guidance on conducting HHRAs (Health Canada 2010a, 2010b). The calculation methods and assumptions (e.g., human receptor characteristics, food ingestion rates) used to quantify human health risks are the same as the 2015 HHRA to maintain consistency when comparing the results between pre-dredge and post-dredge periods.

1.4. Study Timeline

The development of the marine food quality program took place between 2015 and 2018, and included consultation with the Haisla Nation, Health Canada, and the BC Ministry of Health. Field collection of marine foods began in 2018. At present, the following program milestones have been completed:

Field Collection

- **August 2018** – Pre-dredge marine food collection period.
- **August 2019** – First post-dredge marine food collection period.
- **August 2020** – Second post-dredge marine food collection period.

Dredging Activities

- **September 1, 2018 to February 15, 2019** – First dredging season completed.
- **September 1, 2019 to February 15, 2020** – Second dredging season completed.
- **September 1, 2020 to February 15, 2021** – Third dredging season completed.

Reporting

- **July 2019** – Summary report for the pre-dredge marine food collection period.
- **March 2020** – Human health risk assessment report comparing the pre-dredge and first post-dredge period.

- **April 2021** – Human health risk assessment report comparing the pre-dredge collection period to the first and second post-dredge collection period.

As of February 15th, 2021, the majority of the dredging activities as defined for the construction phase of the Project were complete.

2. SITE CHARACTERIZATION

The site characterization provides a description of the study areas and the factors that may influence marine food quality and health risk to seafood consumers. This includes a description of existing and past industrial activities near Kitimat Harbour, marine harvesting bans in the region, and harvesting activities reported by the Haisla Nation and other Indigenous groups.

2.1. Historical Activities near Kitimat Harbour

2.1.1. Industrial Activities

The waters of Kitimat Harbour and its surrounding lands are zoned for industrial use. The marine environment in Kitimat Harbour has been influenced by industrial and municipal activities for over 60 years. Four major point sources of waste discharge have operated near Kitimat Harbour (Figure 2-1). These include the waste discharge outfall from:

1. Rio Tinto, BC Works (operational)
2. Kitimat municipal sewage treatment plant (operational)
3. Ocelot Industries Ltd. (operational)
4. Eurocan Pulp and Paper Mill (decommissioned in 2010)

Rio Tinto, BC Works is an aluminum smelter that was the primary source of PAH in the marine environment in Kitimat Harbour and has been operational since the 1950s. The PAH from the aluminum smelter originate from the use of pitch coke as raw material for the anodes in aluminum smelting. Pitch coke is a carbon-rich porous solid produced from the distillation of coal tar. Coal tar is heated until the volatile organics evaporate out, and the remaining solid is pitch coke. Studies on pitch coke in the Kitimat Harbour indicate that PAH in pitch coke is integrated into the carbon matrix, resulting in these PAH having a relatively low bioavailability relative to PAH from other sources such as forest fires or fuel combustion exhaust (Johnson et al 2015, Yunker et al 2011, Paine et al. 1996).

In 2015 and 2016, Rio Tinto, BC Works upgraded its facilities by replacing its original Soderberg smelting potlines with modern AP40 technology smelting potlines. The AP40 smelting potlines reduce electricity consumption rates per unit of product and reduce the production rate and release rates of PAH by up to 97% because the pitch coke anodes are replaced by carbon anodes (Rio Tinto 2014). The remaining 3% of PAH produced from smelter operations are emissions from fuel combustion as part of the standard operation of equipment and vehicles.

V:\1231\active\EM\123110458\gis\figures\disciplines\human_health\Human Health Risk Assessment on the Effects of Dredging on Marine Country Foods\123110458-Fig_2_1_Historical_Activities_and_Harvesting_Bans_near_Kitimat_Harbour.mxd

The Kitimat municipal sewage treatment plant and Ocelot Industries Ltd. are minor contributors of COPCs in the marine environment, and primarily discharge organic carbon from sewage waste, oil, grease, and methanol (BC ENV 1987).

The Eurocan pulp and paper mill was decommissioned in 2010, but the waste treatment pond is still operational. Although PCDD/F concentrations in the sediment of the CDA were found to be greater than sediment quality guidelines for the protection of aquatic life, the source of these PCDD/F has not been confirmed. The production of PCDD/F is typically associated with older pulp and paper mills that use chlorinated paper bleaching processes. However, the Eurocan pulp and paper mill did not use chlorine in its bleaching process and PCDD/F were almost completely absent from discharges from this pulp mill (Yunker and Cretney 1996). Existing PCDD/F in the marine environment near Kitimat may originate from historical wood preservation operations near Kitimat Harbour where the use of pentachlorophenol preservatives provided a chlorine source for the generation of PCDD/F. Discharges from the Kitimat municipal sewage treatment plant and the Eurocan pulp and paper mill enter the lower Kitimat River and contribute to some COPCs in the marine environment of Kitimat Harbour.

2.1.2. Marine Harvesting Bans

Kitimat Harbour and its surrounding waters are subject to several spatially and temporally overlapping seafood harvesting bans. These harvesting bans are illustrated in Figure 2-1 including:

- Permanent harvesting ban on all species of bivalves within a 300 metre radius of industrial, municipal, and sewage treatment plant outfall discharges (DFO 2013a)
- Permanent harvesting ban on all species of bivalves within 125 metre radius of any marine, ferry wharf or floating living accommodation facility (DFO 2013a)
- Permanent sanitary closure on all shellfish harvesting in Fisheries and Oceans Canada Management Area 6-1 (DFO 2013a)
- Permanent shellfish harvesting ban due to the potential for domoic acid marine biotoxin contamination in clams, mussels, scallops, oysters, cockles, whelks, and crab hepatopancreas (DFO 2013a)
- Permanent shellfish harvesting ban due to the potential for paralytic shellfish poisoning affecting clams, mussels, whelks, moon-shells and dogwinkles, oysters, whole scallops, and the hepatopancreas of crabs and lobsters (DFO 2013a)

It is illegal to harvest, and unsafe to consume, these species of seafood from closure areas at any time of the year (DFO 2013b). Shellfish harvesting bans do not apply to fish.

2.1.3. Traditional Use and Local Harvesting

Members of the Gitga'at First Nation, Gitxaala Nation, Haisla Nation, Kitselas First Nation, Kitsumkalum First Nation, Lax Kw'alaams First Nation, Metlakatla First Nation, and Métis Nation British Columbia are known to harvest traditional marine foods from Douglas Channel and Kitimat Arm. The only traditional territory that overlaps the CDA is that of the Haisla Nation. Reports from the Haisla Nation were used to evaluate the general level of harvesting in the region.

Haisla Nation members harvest marine foods in areas including the Moore Creek and Anderson Creek watersheds, the Lower Kitimat River to Minette Bay area, and along Kitimat Arm (Haisla Nation 2013; Powell 2013). Haisla Nation members catch salmon in the Kitimat River from the river mouth (and approach areas) to roughly 40 kilometres (km) upstream, including steelhead, chinook (spring), sockeye, pink, chum, and coho. Other species harvested by Haisla Nation members in Kitimat Arm include crabs, prawns, shrimp, sea cucumbers, herring, halibut and other ground-fish, cod, and bivalves (primarily cockles and butter clams).

Industrial development and the resulting pollution have severely affected harvesting locations used by Haisla Nation members in the Kitimat River estuary and in the waters and coastline immediately to the west of the Kitimat River mouth (including the Kitimat Harbour area). Haisla Nation members currently do not collect shellfish or crab in the CDA, nor in the marine waters north of Kitamaat Village due to real or perceived chemical contamination (Powell 2013) and most local residents (presumably including Haisla Nation members) avoid fishing near Kitimat Harbour over the same concerns (Hummel and Langagger 2013, pers. comm.). Pollution from the Eurocan pulp and paper mill was suspected to have reduced local stocks of butter clams and cockles, forcing Haisla Nation members to travel as far as Clio Bay to harvest shellfish (Powell 2013). Field observations conducted during the course of field work for this HHRA noted that soft-shelled clams of the Mya genus were the most abundant along Hospital Beach, with no observed clams along the shoreline of Kitamaat Village due to poor bivalve habitat that was predominantly gravel and cobble material.

Eulachon fishing has not taken place in the Kitimat River area since 1971 because of contamination due to effluent from the Eurocan pulp and paper mill (Gordon et al.; Powell 2013). With the loss of the Kitimat River eulachon fishery, Haisla Nation members now travel long distances to fish for eulachon in the Kemano River, a smaller system with a reduced eulachon fishery (Gordon et al.).

The Eurocan Taint Management Committee was formed in 1995 to address the effects of pollution on species harvested by the Haisla Nation (in particular, eulachon). The committee included representatives from the BC provincial government, the District of Kitimat, Environment Canada, the Haisla Nation, and the Eurocan pulp and paper mill. The Test Development Committee (a subcommittee of the Eurocan Taint Management Committee) was created to develop a method for determining if treatment of the mill effluent was sufficient to reduce tainting of the eulachon (BC Environmental Appeal Board 1999). The Eurocan pulp and paper mill closed in 2010, removing this source of pollution in the Kitimat River estuary, but operations to treat water from the Eurocan site continue; and treated water is released into the marine environment.

3. PROBLEM FORMULATION

The objective of the problem formulation stage is to develop an overall understanding of how people may come into contact with contaminants at a site so that exposures and the potential health risks can be evaluated. The problem formulation is comprised of three main components: identifying the relevant COPCs (screening) that could affect human health risk; identifying human receptors within the assessment area; and, identifying the plausible exposure pathways through which human receptors could be exposed to COPCs.

These three components of the problem formulation stage are integrated to develop a conceptual site model, which is the foundation of a risk assessment. The conceptual site model identifies the plausible exposure pathways where human receptors could be exposed to COPCs.

3.1. Study Areas

There are three study areas included in this HHRA, shown in Figure 3-1. Their purpose and rationale for selection are as follows:

1. **Kitimat Harbour** - The Kitimat Harbour study area is the primary location of interest, and includes all marine waters within a 500 metre distance of the CDA. The marine environment in this area has been affected by historical activities described in Section 2.1. The 500 metre radius from the CDA was established as the study area to be consistent with the 2015 HHRA (LNG Canada 2015).
2. **Kitamaat Village** - The Kitamaat Village study area is a reference site approximately 2 km southeast of Kitimat Harbour. It includes the waters within 1 km west of the Village shoreline. The waters near the two marinas at the north and south ends of Kitamaat Village are excluded because they may be ongoing sources of fuel-based contaminants from boats. The Kitamaat Village study area is not expected to be affected by dredging activities; but it may have been affected by historical industrial activities in Kitimat Harbour and the Kitimat Arm in general. This reference site was selected by the Haisla Nation to investigate the current quality of marine food in the area.
3. **Kildala Arm** - The Kildala Arm study area is approximately 30 km southeast of Kitimat Harbour by boat. It includes the waters at the eastern tip of Kildala Arm. This study area is unaffected by industrial activities in the region. This reference site was also selected by the Haisla Nation because it is an important location for harvesting marine foods. It is also used for harvesting by residents of Kitimat, tourists, and fishing charters.

3.2. Certified Dredge Area

The CDA is within the Kitimat Harbour study area. During the construction phase, dredging of approximately 1.7 million cubic metres of sediment in the CDA will deepen the basin to a depth of 14 metres below sea level to accommodate LNG carriers and other support vessels.

During the development of the environmental assessment for the Project, sediments in the CDA were determined to contain concentrations of organic contaminants and some metals that were higher than the Canadian Council of Ministers of the Environment (CCME) sediment quality guideline for the protection of aquatic life and BC Contaminated Sites Regulations standards for soil quality for industrial land use. The surface 2.5 metre sediment layer contained the highest contaminant concentrations that once dredged and handled as soil, were greater than the industrial land use standards, and therefore, characterized as IL+ (i.e., above industrial land use standards). Sediments dredged from depths deeper than 2.5 metre had concentrations of contaminants that were below the industrial land use soil standards, and characterized as IL-.

Sediments characterized as IL+ for disposal purposes were dredged and disposed of off site in accordance with regulatory requirements. Sediments characterized as IL- for disposal purposes were dredged and disposed of in the Project on-site Dredgeate Disposal Site. Sediments characterized as acceptable for disposal at sea were disposed of at sea to the west of Kitamaat Village. The disposal at sea site was established through consultation with the Haisla Nation, and it is their preferred disposal at sea location.

Dredging of the IL+ sediment layer may re-distribute organic and metal contaminants in the marine environment. The concern is that disturbing the IL+ sediment layer through dredging could change how marine life is exposed to these chemicals, and potentially result in higher contaminant concentrations in marine foods that people consume.

3.3. Chemical of Potential Concern Screening

The COPCs that are assessed in this HHRA were established as part of the 2015 HHRA (LNG Canada 2015) and related consultation during program development. The screening of COPCs was based upon the maximum detected concentration of PAH, PCB, PCDD/F, and metals in sediment samples from the CDA, which were compared to the following environmental quality guidelines:

- CCME soil quality guidelines for residential use for the protection of human health
- CCME sediment quality guidelines for the protection of aquatic life

Based on this screening method, PAH, PCDD/F, cadmium, copper, and zinc were identified as COPCs. PCB was not screened as a COPC, but it was detected above environmental quality guidelines approximately 700 metres away in the dredge pocket for the Rio Tinto Terminal A Extension Project. LNG Canada agreed to include PCB as a COPC for this study to address concerns that dredging in the Rio Tinto dredge pocket could affect the quality of marine food in the Kitimat Harbour study area.

Table 3-1 presents the range of chemical concentrations that were detected among the sediment samples collected as part of the 2015 baseline studies for the Environmental Assessment.

Table 3-1 2015 Marine Sediment Quality in the Certified Dredge Area

Chemical	Concentration in Surficial Sediment (0.3 m - 2.5 m)	Concentration in Deep Sediment (2.5 m - 14.3 m)	CCME Soil Quality Guidelines (Residential Use) for the Protection of Human Health	CCME Sediment Quality Guidelines for the Protection of Aquatic Life (Interim Guideline)
PAH (mg/kg)[A]	< 0.05–163.4	1.37–5.86	20	0.0888
PCB (mg/kg)	< 0.03	<0.03	1.3	21.5
PCDD/F (ng TEQ/kg)	0.01–5.89	Not Analyzed	4	0.85
Cadmium (mg/kg)	< 0.05–1.62	< 0.05–0.205	10	0.7
Copper (mg/kg)	11.2–176	14.1–42.1	63	18.7
Zinc (mg/kg)	27.2–391	29.3–62.6	250	124

NOTE:

[A] Based on benzo(a)pyrene toxic equivalents

3.4. Human Receptor Identification

Human receptors may include members of the Gitga'at First Nation, Gitxaala Nation, Haisla Nation, Kitselas First Nation, Kitsumkalum First Nation, Lax Kw'alaams First Nation, Metlakatla First Nation, Métis Nation British Columbia and the general public in Kitimat or Kitamaat Village who may consume marine foods harvested from the study area. Kitamaat Village is the nearest Indigenous community to the project site. The life stages that are considered include toddlers (1 to less than 5 years) and adults (20 to less than 80 years). Toddlers are assessed because they have a higher rate of food consumption per unit body weight relative to adults. This means that the exposure dose of a COPC through the diet is greater for toddlers than adults, providing a more conservative estimate of health risk. Adults are assessed because they represent a lifetime of exposure with a higher rate of food consumption. Therefore, the adult lifestage is used to assess potential cancer risk from exposure to carcinogenic COPCs such as PAH. Infants less than 1 year old typically have a liquid diet consisting of mother's milk or formula, and are therefore not considered in this assessment. Children (5 to 12 years old) and teenagers (13 to 19 years old) are not considered in this assessment because they have a lower rate of food consumption per unit body weight relative to toddlers, and would therefore provide a less conservative estimate of health risk.

Other human receptors include recreational users, tourists, and seasonal residents. The consumption rates of locally harvested marine foods for these receptors are lower than permanent residents due to the temporary nature of their residency. Therefore, evaluating the health risk to members of the local Indigenous groups and permanent residents is protective of recreational users, tourists, and seasonal residents.

3.5. Conceptual Site Model

The conceptual site model is the core component of the HHRA, which describes the means by which human receptors can be exposed to COPCs in the environment. When a plausible and relevant exposure pathway is identified, it is defined as "operable" and is evaluated in greater detail in the HHRA. Pathways that are not plausible or not relevant to the Project are defined as "inoperable" and are not evaluated further.

The scope of this assessment includes the conceptual site model illustrating the operable pathway by which human receptors could be exposed to COPCs from their diet of marine foods (Figure 3-2). These COPCs primarily originate from effluent generated by current and historical industrial activities in the marine environment of Kitimat Harbour. Marine wildlife may take up these COPCs through direct contact or ingestion of water and sediment, or from its food. Human receptors may take up these COPCs indirectly from their consumption of marine foods harvested from Kitimat Harbour.

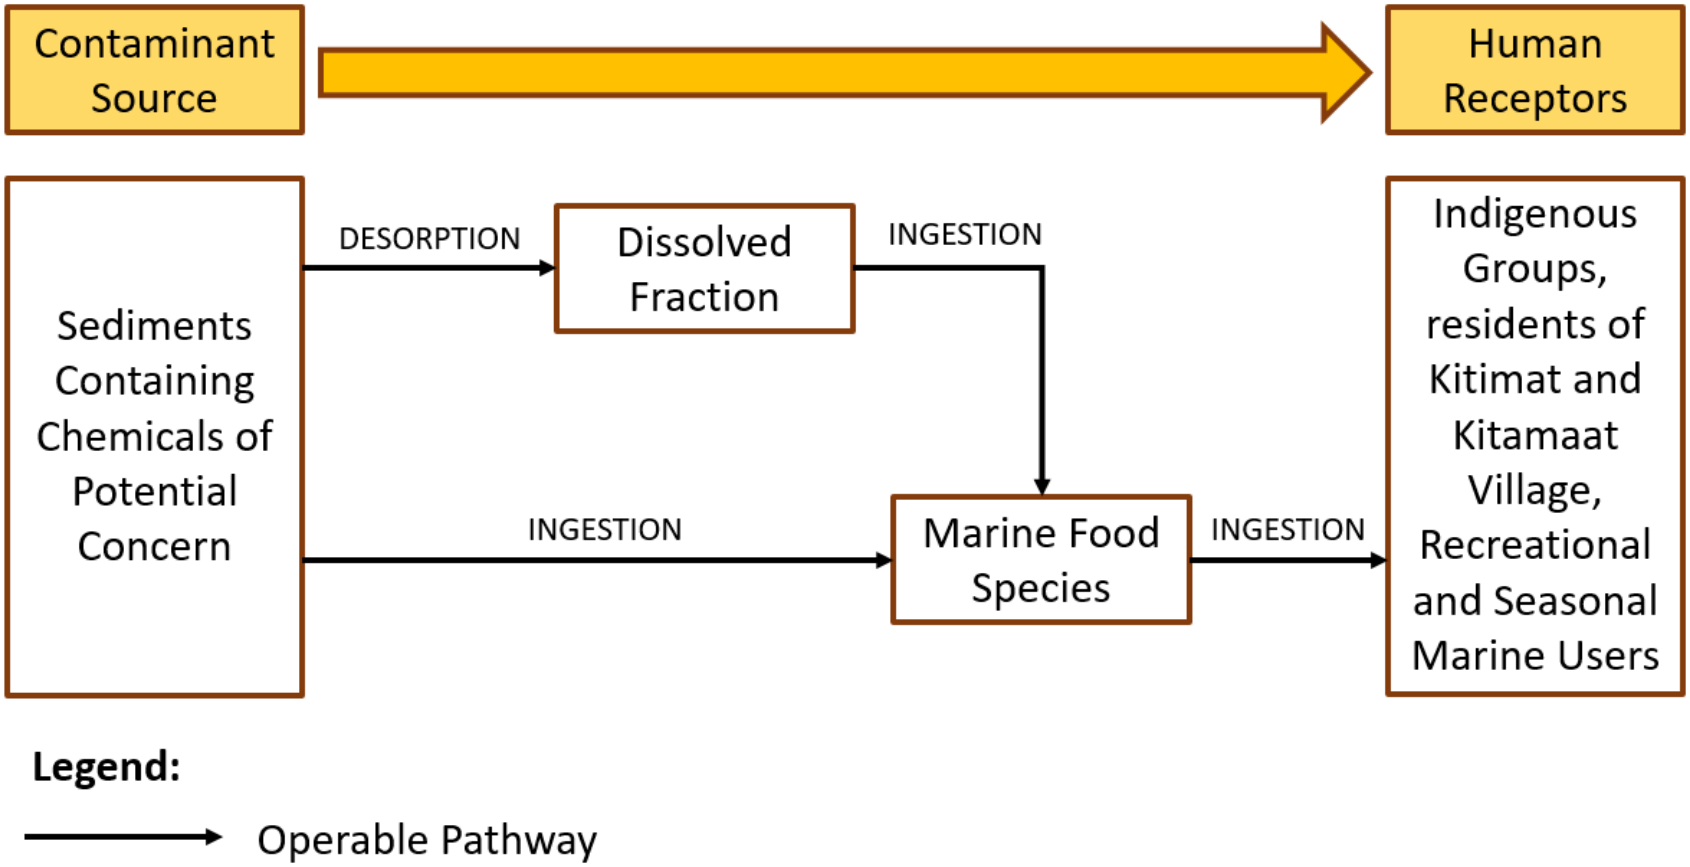

Figure 3-2 Conceptual Site Model

4. TOXICITY ASSESSMENT

4.1. Introduction

The toxicity assessment identifies the toxicological reference value (TRV) for each COPC. The TRVs used in this assessment apply to oral ingestion exposures only.

For non-carcinogenic health effects, the TRVs represent threshold doses. An oral dose that is less than the threshold dose represents a negligible health risk. In general, the body can manage low doses of non-carcinogenic COPCs through metabolism or excretion so that the COPC concentration does not reach a level in the body that could cause an adverse effect.

For carcinogenic health effects, the TRVs apply to non-threshold effects. Theoretically, there is no safe dose for a carcinogenic COPC because any degree of exposure carries a risk. Cancer risk from exposure to carcinogenic COPCs is cumulative over a lifetime, recognizing that for many carcinogens, there is a latency period between exposure and effect. The TRV for carcinogenic COPCs represents the incremental increase in cancer risk per unit of exposure.

4.2. Methods

The TRVs applied in this assessment are cited from Health Canada's risk assessment guidance documents (Health Canada 2010c). TRVs are provided for toddler and adult life stages when applicable for some non-carcinogenic COPCs. TRVs for carcinogenic COPCs do not apply life stages, because the carcinogenic risk assumes a lifetime of exposure.

Chemical groups such as PAH, PCB, and PCDD/F may contain tens or hundreds of substances with different molecular structures. Each substance within that group is referred to as a congener. The congeners within a chemical group often share similar molecular structures, physiochemical properties and adverse health effects, but they can vary considerably in toxic potency. To reduce the complexity of assessing every congener independently, a toxic equivalence factor (TEF) is applied to adjust for the toxic potency. The concentration of the congener is multiplied with its TEF, and the product is represented as a toxic equivalence (TEQ) to the most toxic congener in that chemical group.

For example, the PAH chemical group contains hundreds of congeners. Among these, eight congeners are carcinogenic with benzo(a)pyrene having the highest toxicity with a TEF of 1.0. Benzo(b/j)fluoranthene has a TEF of 0.1, meaning its carcinogenic potency is 10% of benzo(a)pyrene. Table 4-1 shows a sample calculation of a PAH mixture, where the total concentration of carcinogenic PAH is 9.27 ppb, but with the toxic equivalence of 0.37 ppb TEQ of benzo(a)pyrene.

Table 4-1 Sample Conversion of PAH Mixture to Toxic Equivalence

Polycyclic Aromatic Hydrocarbon	Measured Concentration (ppb)	Toxic Equivalence Factor (TEF)	Toxic Equivalence (ppb TEQ)
Benzo(a)pyrene	0.03	1	0.03
Benzo(b/j)fluoranthene	0.03	0.1	0.003
Benzo(a)anthracene	0.05	0.1	0.005
Chrysene	7.0	0.01	0.07
Benzo(k)fluoranthene	0.01	0.1	0.001
Indeno(1,2,3-cd)pyrene	2.0	0.1	0.2
Dibenz(a,h)anthracene	0.06	1	0.06
Benzo(g,h,i)perylene	0.09	0.01	0.0009
Total Concentration	**9.27**		**0.37**

The TEQ conversion method was developed by the United States Environmental Protection Agency, and it is recognized by Canadian and international environmental regulatory agencies. Table 4-2 lists the TEFs that are applied to PCDD/F, PCB, and PAH (CCME 2010, WHO 2005).

Table 4-2 Toxic Equivalency Factors for PCDD/F, PCB, and PAH

PCDD/F	TEF	PCB	TEF	PAH	TEF
2,3,7,8-Tetra CDD	1.0	33'44'-TetraCB	0.0001	Benzo(a)pyrene	1.0
1,2,3,7,8-Penta CDD	1.0	344'5-TetraCB	0.0003	Benzo(b/j)fluoranthene	0.1
1,2,3,4,7,8-Hexa CDD	0.1	233'44'-PentaCB	0.00003	Benzo(a)anthracene	0.1
1,2,3,6,7,8-Hexa CDD	0.1	2344'5-PentaCB	0.00003	Chrysene	0.01
1,2,3,7,8,9-Hexa CDD	0.1	23'44'5-PentaCB	0.00003	Benzo(k)fluoranthene	0.1

Octa CDD	0.0003	33'44'5-PentaCB	0.1	Dibenz(a,h)anthracene	1.0
2,3,7,8-Tetra CDF	0.1	HexaCB	0.00003	Benzo(g,h,i)perylene	0.01
1,2,3,7,8-Penta CDF	0.03	23'44'55'-HexaCB	0.00003		
2,3,4,7,8-Penta CDF	0.3	33'44'55'-HexaCB	0.03		
1,2,3,4,7,8-Hexa CDF	0.1	233'44'55'-HeptaCB	0.00003		
1,2,3,6,7,8-Hexa CDF	0.1				
2,3,4,6,7,8-Hexa CDF	0.1				
1,2,3,7,8,9-Hexa CDF	0.1				
1,2,3,4,6,7,8-Hepta CDF	0.01				
1,2,3,4,7,8,9-Hepta CDF	0.01				
Octa CDF	0.0003				

4.3. Toxicological Reference Values

4.3.1. Polycyclic Aromatic Hydrocarbons (PAH)

PAH belong to a class of over 100 congeners that are characterized by a molecular structure containing multiple aromatic rings. They are produced through the incomplete combustion of organic compounds such as coal, crude oil, gasoline, wood, and garbage. Natural sources of PAH in the environment include volcanic eruptions and fires.

Among the over 100 PAH congeners, eight are carcinogenic with varying degrees of carcinogenic potency. These include: benzo(a)pyrene, benzo(b/j)fluoranthene, benzo(a)anthracene, benzo(k)fluoranthene, benzo(g,h,i)perylene, dibenz(a,h)anthracene, indeno(1,2,3-cd)pyrene, and chrysene.

Among the carcinogenic PAH, benzo(a)pyrene has the highest carcinogenic potency (i.e., TEF = 1.0). A TEF is applied to the other carcinogenic PAH congeners that allows for a PAH mixture to be represented as a TEQ of benzo(a)pyrene. The carcinogenic TRV cited from Health Canada is 2.3 $(mg/kg\text{-}bw\text{-}d)^{-1}$ for benzo(a)pyrene (Health Canada 2010c).

4.3.2. Dioxins and Furans (PCDD/F)

PCDD/F are persistent organic pollutants in the environment that are produced through combustion of organic compounds in the presence of chloride. Natural sources of dioxins include volcanic eruptions and forest fires, while anthropogenic sources of dioxins include incineration, metal smelting and refining, and chemical manufacturing. There are 75 congeners of polychlorinated dibenzo-p-dioxins (PCDD), seven of which are considered toxic. There are also 135 congeners of polychlorinated dibenzofurans (PCDF), ten of which are considered toxic. The most toxic congener is 2,3,7,8-TCDD and it has a TEF of 1.0. The remaining PCDD/F congeners that are toxic have a TEF that is less than 1.0, as shown in Table 4-2.

Health effects from exposure to PCDD/F include skin disorders (i.e., chloracne), impairment of function to the liver, immune system, and endocrine system, and developmental effects to the nervous system (Health Canada 2005).

The non-carcinogenic TRV for PCDD/F is 2.3 pg TEQ/kg bw-day based on Health Canada's tolerable daily intake of 2,3,7,8-TCDD equivalents (Health Canada 2010c). Health Canada has concluded that epidemiological evidence is inadequate to designate PCDD/F as carcinogenic.

4.3.3. Polychlorinated Biphenyls (PCB)

PCB are persistent organic pollutants in the environment with no naturally occurring sources. They are produced primarily for use as coolants, insulating fluids, and hydraulic fluids in electrical equipment, transformers, and capacitors because of its low flammability, low vapor pressure, and low dielectric constant. Due to their toxic effects to people, Canada banned the manufacture, import, and sale of PCB in 1977, and banned the release of PCB into the environment in 1985. Similar bans were applied around the same time by developed nations across the globe. However, PCB are still used today in electrical equipment pre-dating the ban, and in some developing countries that did not take part in the ban.

PCB have been detected throughout the world as a result of atmospheric and hydrospheric transport. While the ocean represents the main sink of PCB due to its large volume and dissolving capacity, PCB that volatilize into the air can transport and deposit into pristine environments with no local PCB sources.

PCB include a group of 209 congeners in which one to ten chlorine atoms can replace hydrogen atoms. Toxic effects among the dioxin-like PCB congeners are similar to those of dioxins and furans, but with varying toxic potencies. Health Canada recommends that the assessment of dioxin-like PCB should apply TEFs to convert a PCB mixture to an equivalent concentration of 2,3,7,8-TCDD, and the risk associated with PCDD/F and PCB combined in a risk assessment. Therefore, the TRV for dioxin-like PCB is 2.3 pg TEQ/kg bw-day based on Health Canada's tolerable daily intake of 2,3,7,8-TCDD equivalents (Health Canada 2010c). Health Canada has concluded that epidemiological evidence is inadequate to designate PCB as carcinogenic.

4.3.4. Cadmium

Cadmium is a toxic metal that has various industrial and commercial applications such as paints and nickel-cadmium rechargeable batteries. There are no known significant deposits of cadmium. The only cadmium mineral of importance is greenockite (i.e., cadmium sulfide), which is almost always associated with the zinc mineral, sphalerite (i.e., zinc sulfide). Therefore, cadmium is typically produced as a by-product of zinc mining, smelting, and refining. Cadmium tends to concentrate in organs such as the kidney and liver where metal metabolism and excretion takes place in animals.

The target organs for adverse effects from cadmium are the bones and kidneys. Chronic effects of long-term oral exposure to low doses of cadmium include fragile bones, and kidney damage, specifically the renal cortex. The acute effects of short-term oral exposure to high levels can lead to stomach irritation, including vomiting and diarrhea (ATSDR 2008).

The TRV for cadmium is based on Health Canada's oral tolerable daily intake 0.001 mg/kg bw-day (Health Canada 2010c). Health Canada and the United States Environmental Protection Agency has concluded that there is insufficient evidence to establish a carcinogenic effect from oral exposures to cadmium (Health Canada 2010c, US EPA IRIS 1987).

4.3.5. Copper

Copper is a ubiquitous metal in modern life that is used in pipes, wires, cookware, coin currency, and most types of products with electronic components. Copper is an essential trace element that is vital to all life. It is a component of various proteins and enzymes, and it is required for proper function of some metabolic processes. The adult recommended daily intake for copper to maintain health is 0.9 milligrams per day (approximately 0.012 mg/kg-bw day), with an upper limit of 10 milligrams per day (approximately 0.13 mg/kg-bw day). At doses above the upper limit, high copper exposure may result in hepatotoxicity and gastrointestinal effects.

The TRV for copper is based on Health Canada's tolerable daily intake of 0.091 mg/kg bw-day for toddlers and 0.141 mg/kg bw-day for adults 20 years and older (Health Canada 2010c). These values are based on human nutrition studies of vitamin supplements, recognizing that copper is an essential trace element in human metabolism that can be toxic at excessive doses. There is no carcinogenic TRV for copper as there is little evidence indicating that copper is causally associated with the development of cancer in humans.

4.3.6. Zinc

The TRV for zinc is based on the United States Environmental Protection Agency oral reference dose of 0.48 mg/kg bw-day for toddlers and 0.57 mg/kg bw-day for adults 20 years and older, which is based on human clinical studies (Health Canada 2010c).

Zinc is an essential element that is required for proper enzymatic function and metabolic processes in almost all forms of life. In humans, zinc plays a role in enzyme function, metabolism, immunity, and homeostasis. Health Canada's recommended dietary intake for zinc to maintain health is estimated at 3 to 7 mg/day for children under 12 years old, and 8 to 9 mg/day for adults (i.e., up to 0.11 mg/kg-bw day).

The acute effects of short-term exposure to large quantities include stomach cramps, nausea, and vomiting (ATSDR 2005). The chronic effects of long-term exposure to small quantities of zinc can cause anemia and a decrease in beneficial cholesterol in the body. Copper and zinc uptake are competing mechanisms in the human body and high chronic exposures to zinc may lead to poor copper utilization and copper deficiency by decreasing the activity of the erythrocyte copper and zinc superoxide dismutase enzyme. Epidemiological studies completed on humans and animals have not shown a relationship between zinc and cancer development.

4.3.7. Summary of Toxicological Reference Values

Table 4-3 provides a summary of the TRVs applicable to this risk assessment.

Table 4-3 Toxicological Reference Value Summary

Chemical of Potential Concern	Non-carcinogenic TRV (mg/kg bw-day)	Carcinogenic TRV $(mg/kg\text{-}day)^{-1}$
PAH (as Benzo(a)pyrene)	Not applicable	2.3
PCDD/F (as 2,3,7,8-TCDD)	2.3×10^{-9}	Not applicable
PCB (as 2,3,7,8-TCDD)	2.3×10^{-9}	Not applicable
Cadmium	0.001	Not applicable
Copper (Adult)	0.141	Not applicable
Copper (Toddler)	0.091	Not applicable
Zinc (Adult)	0.57	Not applicable
Zinc (Toddler)	0.48	Not applicable

5. EXPOSURE ASSESSMENT

5.1. Introduction

The exposure assessment provides the human receptor characteristics (body weight, food ingestion rates) used to evaluate the dose of COPCs that human receptors are exposed to from their ingestion of marine foods. Human receptor characteristics are used to quantify the estimated daily intake (EDI) of a COPC.

5.2. Methods

Health Canada provides guidance on the methods for calculating the EDI based on the concentration of a COPC in food and human receptor characteristics (Health Canada 2010a).

The following equation was used to calculate EDI:

$$EDI_{COPC} = \frac{IR_{food} \times C_{food} \times F}{BW}$$

Where:

- EDI_{COPC} = estimated daily intake of a COPC from marine food (mg/kg body weight-day)
- IR_{food} = Ingestion rate for a specific marine food (kg/day)
- C_{food} = COPC concentration in a specific marine food (mg/kg), presented in Table 5-2
- F = Consumption frequency; assumed to be every day for the entire year or 1 (unitless)
- BW = Body weight (kg)

5.2.1. Human Receptor Characteristics

Human receptor characteristics used to calculate the EDI include body weight (kg), ingestion rate (kg/day), and consumption frequency (number of days consuming per year) of the selected marine foods. Table 5-1 presents the human receptor characteristics for toddlers (1 to less than 5 years old) and adults (20 to less than 80 years old) based on human receptor characteristics described in Richardson (1997) and Richardson and Stantec (2013).

Indigenous use of locally harvested marine foods in coastal communities is usually greater than the general public. Indigenous ingestion rates for crab and sole are based on reported values from Richardson (1997) for Indigenous male and female consumers of fish and shellfish, which excluded study participants that reported no consumption of fish and shellfish. These ingestion rates are intended to represent marine foods harvested in all areas of Kitimat Arm. The ingestion rate of marine foods harvested near Kitimat Harbour is not available due to the perceptions of contamination in the area and general avoidance of harvesting described in Section 2.1.3. It is reasonable to assume that there is no active harvesting of marine foods in the Kitimat Harbour study area defined by a 500-m radius around the CDA since there is no public access to Kitimat Harbour. Warning signs are posted at beach sites (i.e., Hospital Beach) and marinas (i.e., MK Marina in Kitamaat Village) indicating that shellfish and crab harvesting is prohibited year-round. People who are not aware of the historical industrial activity in Kitimat Harbour are still expected to avoid harvesting near Kitimat Harbour due to the signage. It is unlikely that Indigenous marine food harvesters, tourists, and fishing charters would intentionally approach visible industrial facilities near Kitimat Harbour for the purpose of fishing and crabbing. Harvesting near Kitimat Harbour was observed to be infrequent, and the Haisla Nation have actively said that they do not harvest from this area of Kitimat Harbour due to their perception that the area is contaminated.

Although it does not appear that people actively harvest marine foods near Kitimat Harbour, risk assessments typically make conservative assumptions to protect human health. Therefore, it was assumed that people harvest marine foods from Kitimat Harbour.

The adult daily ingestion rate of 0.02 kg/day for crab hepatopancreas assumes that one crab is consumed every day. The average hepatopancreas weight from the sampled crabs was 0.02 kilograms (kg). The toddler consumption of hepatopancreas was 43% of the adult consumption based on guidance from Richardson (1997).

Table 5-1 Human Receptors Characteristics

NOTES:

[a] Richardson and Stantec (2013)

[b] Richardson (1997)

5.3. Marine Country Food Quality

Specimens of Dungeness crab and English sole were collected from Kitimat Harbour, Kitamaat Village, and Kildala Arm each year corresponding to the following collection periods:

- August 2018 – Pre-dredge
- August 2019 – Post-dredge 1
- August 2020 – Post-dredge 2

Dungeness crab and English sole were shipped in chilled coolers to Bureau Veritas Laboratories for dissection and chemistry analysis. Stantec trained Bureau Veritas Laboratories staff on the methods to dissect crab leg meat, crab hepatopancreas, and English sole meat. The step-by-step dissection protocol is provided in APPENDIX 3.

For each collection period, 15 tissue samples for each tissue type at each study area were collected and analyzed for PAH, PCB, PCDD/F, cadmium, copper, and zinc. Organic COPCs were analyzed using HRMS, which can detect concentrations down to approximately 1 ppb for PAH, and approximately 1 ppt for PCB and PCDD/F.

A 2-step process was applied to analyzing and reporting the laboratory results. The first step was to determine whether the COPC was detectable or essentially non-detectable. For chemical groups such as PAH, PCB, and PCDD/F, when more than 70% of the individual congeners are reported as below the detection limit, the concentration is reported as essentially non-detectable. The criteria of 70% non-detects is set based on professional judgment, and to limit the effect of a scenario where a concentration is reported that reflects a detection limit rather than measured concentrations.

The second step was to calculate the 95% upper confidence limit on the mean (95% UCLM) concentration of all COPCs in all tissues, based on a sample number of 15. The 95% UCLM represents a reasonable upper bound limit on the true mean concentration. The 95% UCLM was calculated using ProUCL 5.1; a statistical program developed by the United States Environmental Protection Agency. The 95% UCLM estimate provides a statistical interpretation of the uncertainties inherent in the underlying data and thus, provides a reasonable upper bound on potential exposures and associated human health risks.

The 95% UCLM concentration of COPC is presented in Table 5-2 for crab meat, crab hepatopancreas, and sole meat for all years and all study areas. If the 95% UCLM concentration is "essentially non-detectable", where 70% or more of the results are below the detection limit, this is indicated with "ND". However, the 95% UCLM concentration is still calculated under the

assumption that the COPC is present in the tissues at the detection limit. This means that the values listed beside "ND" are highly influenced by the detection limit.

A two-tailed t-test statistical analysis was conducted on the laboratory results between the 2018 and 2019 collection year, and the 2018 and 2020 collection year in Kitimat Harbour. This analysis was conducted to determine whether the COPC concentrations in seafood showed a statistically significant increase or decrease from the 2018 pre-dredge period to the post-dredge periods.

The COPC concentrations are also shown graphically on Figure 5-1 to Figure 5-6. In these figures, the upper row of graphs shows the COPC concentration using the same scale to illustrate the relative differences in concentration between tissue type. If there is a large difference in COPC concentration between tissue types that result in poor resolution at low concentrations, the lower row of graphs applies a higher resolution concentration scale.

5.4. Change in Marine Country Food Quality in Kitimat Harbour

This section summarizes the changes in marine food quality in Kitimat Harbour from the 2018 pre-dredge period to the 2019 and 2020 post-dredge periods. The purpose of describing statistically significant changes in marine food quality is to satisfy the primary objective of this HHRA, which is to confirm the provincial and federal conditions listed in Section 1.2. These conditions require LNG Canada to confirm the 2015 Human Health Risk Assessment predictions on the bioavailability and bioaccumulation of COPCs in marine foods.

Changes in marine food quality are focused on the Kitimat Harbour study area. If a statistically significant change is noted in the marine food quality in Kitimat Harbour, the results from the reference sites are also examined to distinguish between Project-related changes that are observed only in Kitimat Harbour, and regional changes that are also observed near Kitamaat Village and/or Kildala Arm.

5.4.1. Polycyclic Aromatic Hydrocarbons (PAH)

PAH concentrations in marine food are shown in Table 5-2 and in Figure 5-1. Figure 5-1 illustrates that PAH concentrations were generally in the range of <1 to 4 ppb-TEQ in all three tissues. Although PAHs are organic contaminants that tend to accumulate in fatty tissues such as the hepatopancreas, it does not appear to bioaccumulate in the hepatopancreas relative to the crab and sole meat. The absence of biomagnification of PAH in the hepatopancreas may be due to PAH metabolism in the organ.

When examining only the results in Kitimat Harbour, the results do not show that PAH bioaccumulates or biomagnifies in marine foods relative to the reference sites. The PAH concentration in marine foods from Kitimat Harbour is similar to those from the reference sites. This is despite the very high PAH concentrations of up to 163 mg/kg in the sediment within the CDA, where the CCME guideline for the protection of aquatic life is 0.0888 mg/kg. PAH concentrations in Kitimat Harbour marine foods would be several orders of magnitude higher than the reference sites, if these PAHs were bioavailable. The results lend support to studies conducted in the 1990's that pitch-coke based PAH in Kitimat Harbour have a very low bioavailability. The results from Kitimat Harbour also show a statistically significant decrease in PAH was observed in crab meat, hepatopancreas and sole meat for one or both post-dredge periods. These results suggest that PAH concentrations in the marine foods from Kitimat Harbour are currently lower than the pre-dredge period.

When comparing the results from Kitimat Harbour with the reference sites, the PAH concentrations in marine food from all three study areas were very similar. For example, PAH concentrations in

marine foods from Kildala Arm was similar in range to those in Kitimat Harbour. This observation was not expected, given that the sediments in Kitimat Harbour are known to contain higher levels of PAH compared with Kildala Arm.

These results strongly suggest that the PAH concentrations in marine food are representative of regional conditions that affect all three study areas, and the high PAH concentration in the sediments of Kitimat Harbour do not result in a higher bioaccumulation or biomagnification in marine foods due to low bioavailability.

5.4.2. Polychlorinated Biphenyls (PCB)

PCB concentrations in marine food are shown in Table 5-2 and in Figure 5-2. Figure 5-2 illustrates that the 95% UCLM concentrations for PCB were generally in the range of <1 ppb TEQ for crab meat and sole meat, and between 1 to 3 ppb TEQ in crab hepatopancreas.

PCB concentrations in crab meat showed a statistically significant decrease from 2018 to 2019, but there was no change between the 2018 and 2020 results. In sole meat, there was no change from 2018 to 2019, but a statistically significant decrease was observed from 2018 to 2020. PCB concentrations in crab hepatopancreas showed no change throughout the study. Overall, PCB concentrations in marine food from Kitimat Harbour showed either a statistically significant decrease, or no change.

When comparing between Kitimat Harbour and the reference sites, PCB concentrations in crab meat and sole meat were approximately in the same range of less than 1 ppb TEQ. Only the crab hepatopancreas from Kitimat Harbour showed notably higher PCB concentrations relative to the reference sites.

5.4.3. Dioxins and Furans (PCDD/F)

PCDD/F concentrations in marine food are shown in Table 5-3 and in Figure 5-3. Overall, PCDD/F was essentially non-detectable in crab meat and sole meat in all three study areas for all collection periods, with an approximate sample detection limit of <0.2 to <0.5 ppt TEQ. The crab hepatopancreas was the only tissue that consistently showed measurable concentrations of PCDD/F, with concentrations of approximately 1 ppt TEQ for all three sampling periods. There was no significant change in PCDD/F concentrations in crab hepatopancreas from the pre-dredge to post-dredge period.

This data strongly suggests that the observed PCDD/F concentrations in marine foods for this study are background levels that are present in the region encompassing all three study areas, rather than effects from local human activity.

5.4.4. Cadmium

Cadmium concentrations in marine food are shown in Table 5-2 and in Figure 5-4. Figure 5-4 (upper graphs) illustrates that cadmium concentrations were highest in the hepatopancreas organ at approximately 1 ppm, and near the detection limit of 0.0013 ppm for crab meat and sole meat. Although the cadmium concentration in sole meat was near the detection limit, a statistically significant increase was observed in the 2020 samples. This was primarily due to most of the tissue samples being below the detection limit for cadmium (<0.0013 mg/kg), resulting in a very low sample variability. As a result, any tissue sample that contains a slightly higher concentration may result in a finding of significance because it falls outside of the sample variability. Although there is a statistically significant increase, the overall concentration of cadmium in sole meat is still near the detection limit as illustrated in the upper row of graphs in Figure 5-4, and this cadmium in sole meat constitutes a small fraction of the overall cadmium content in marine foods.

When compared to the reference sites, marine foods in Kitimat Harbour contain a similar cadmium content to that of Kitamaat Village and Kildala Arm. For example, marine foods from Kildala Arm had similar cadmium concentrations to that of Kitimat Harbour. This may suggest that the observed cadmium concentrations in marine foods for this study could be naturally occurring levels, rather than effects from human activity.

5.4.5. Copper

Copper concentrations in marine food are shown in Table 5-2 and in Figure 5-5. Figure 5-5 (upper graphs) illustrates that copper concentrations were highest in the hepatopancreas organ, and substantially lower in crab meat and sole meat.

For crab hepatopancreas and sole meat, the change in copper concentrations from the 2018 pre-dredge period to the 2019 and 2020 post-dredge period was not significantly different. Copper in crab meat decreased in both post-dredge periods.

When compared to the reference sites, marine foods from Kitimat Harbour tended to have lower copper concentrations than Kitamaat Village and Kildala Arm. In particular, marine foods from Kildala Arm had the highest copper concentrations. This may suggest that the observed copper concentrations in marine foods for this study could be naturally occurring levels, rather than effects from human activity.

5.4.6. Zinc

Zinc concentrations in marine food are shown in Table 5-2 and in Figure 5-6. Figure 5-6 illustrates that zinc concentrations were highest in crab meat, followed by crab hepatopancreas, and sole meat.

For all three types of marine food, the change in zinc concentrations from the 2018 pre-dredge period to the 2019 and 2020 post-dredge period was not significantly different. Zinc concentrations in the tissues appeared to be consistent throughout the study, regardless of the location that the sample came from. For example, the 95% UCLM zinc concentration in crab meat was consistently in the range of 30 to 40 ppm at in all study areas. Similar patterns were observed in crab hepatopancreas and sole meat.

These results suggest that zinc levels did not change in marine foods from dredging activities. This may suggest that the observed zinc concentrations in marine foods for this study could be naturally occurring levels, rather than effects from human activity.

5.4.7. Summary of Changes in Marine Country Food Quality in Kitimat Harbour

The changes in marine food quality in Kitimat Harbour are summarized in Table 5-3. Overall, the measured concentration of COPCs in marine foods either showed a decrease or no statistically significant change. These results confirm the predictions of the 2015 HHRA that dredging would have no significant effect or a marginal reduction to the concentration of COPCs in marine foods

Cadmium was the only exception, where pre-dredge concentrations in sole meat were mostly below the detection limit. During the 2020 post-dredge period, several sole samples had detectable cadmium concentrations. However, the cadmium concentration in sole meat was generally near the detection limit of 0.0013 mg/kg, and negligible compared to crab hepatopancreas, which normally contained approximately 300 times higher cadmium concentrations.

When the COPC concentrations in marine foods in Kitimat Harbour are compared to the reference sites, PCDD/F, cadmium, copper, and zinc appear to be naturally occurring background levels in the region encompassing all study areas. Only PAH and PCB results suggest a potential anthropogenic source.

Table 5-3 Summary of Changes in Marine Food Quality in Kitimat Harbour

Chemical of Potential Concern	Change in COPC Concentration from Pre-dredge to Post-dredge		
	Crab Meat	Hepatopancreas	Sole Meat
PAH	Decrease or No change	Decrease or No change	Decrease
PCB	Decrease or No change	No change	Decrease or No change
PCDD/F	No change	No change	No change
Cadmium	No change	No change	Increase or No change
Copper	Decrease	No change	No change
Zinc	No change	No change	No change

5.5. Estimated Daily Intake of COPCs

The EDIs for each marine food and each COPC are presented for toddlers and adults of the general public and Indigenous populations. The results for Kitimat Harbour are indicated on the tables as pre-dredge (2018), post-dredge (2019), and post-dredge (2020) results. Results for Kitamaat Village and Kildala Arm are listed based upon the years, since those locations are not influenced by dredging activities. A sample calculation for an Indigenous adult consuming marine foods is available in APPENDIX 4. For this assessment, it was assumed that 100% of the marine foods are harvested from the study areas and that 100% of the COPCs ingested are bioavailable and absorbed into the body. Cells that are shaded indicate that the EDI is based on essentially undetectable concentrations.

For PAH, the EDI was calculated for Indigenous and non-Indigenous adults only because the EDI is used in the calculation of cancer risk over a lifetime exposure (i.e., 80 years).

6. RISK CHARACTERIZATION

The risk characterization stage provides a quantitative measure of risk to human receptors from the consumption of marine foods containing COPCs. Non-carcinogenic health risks for PCB, PCDD/F, cadmium, copper and zinc are quantified by evaluating the hazard quotient (HQ) associated with these COPCs. Carcinogenic health risks for PAH are quantified by evaluating the incremental lifetime cancer risk (ILCR) over a lifetime of exposure through consuming locally harvested marine foods.

The risk characterization focuses on the following, to meet the secondary objective of this HHRA:

1. The overall risk from COPC exposure for people harvesting and consuming seafood from Kitimat Harbour. This will indicate whether the seafood from Kitimat Harbour represents a significant risk to seafood consumers.
2. The overall risk from COPC exposure for people harvesting and consuming seafood from the region encompassing Kitimat Harbour and the Kitamaat Village and Kildala Arm reference sites. This will indicate whether there is a substantial difference in risk between the study areas or not.

6.1. Estimating Non-Carcinogenic Risk (Threshold Effects)

Non-carcinogenic health risk is evaluated from the calculation of the HQ. The HQ is the ratio between the EDI and the TRV for a COPC. The HQ is calculated using the following formula:

$$HQ_{COPC}\ (unitless) = \frac{EDI_{COPC}}{TRV_{COPC}}$$

Where:

- HQ_{COPC} = Hazard quotient for a COPC
- EDI_{COPC} = Estimated daily intake of a COPC from consuming marine food (mg/kg bw-day); from Section 5.3.
- TRV_{COPC} = Toxicological reference value of a COPC (mg/kg bw-day); from Section 4.3.

Provincial regulatory agencies across Canada apply different HQ thresholds when assessing health risk. For this assessment, a threshold HQ of 0.2 is applied because there are other sources of COPCs for which this assessment does not account for. For example, exposure to PCB, PCDD/F,

and metals may come from dermal contact with soil and water, drinking water, or ingestion of other foods that are not considered in this assessment (e.g., purchased foods, other types of country foods). A threshold HQ of 0.2 may be interpreted such that a single exposure pathway for a COPC should not exceed 20% of the applicable tolerable daily intake, and other exposure pathways that are not considered in this assessment account for the remaining 80% of exposure.

6.1.1. PCB

Table 6-1 presents the PCB HQs for toddlers and adults from their consumption exposure of marine foods.

To evaluate the change in health risk to marine food consumers in Kitimat Harbour, the pre-dredge and post-dredge HQs for PCB were compared. The HQs for PCB were above the benchmark of 0.2 for all human receptors in the pre-dredge and post-dredge periods. This indicates that there was an unacceptable health risk from PCB exposure in marine foods during the pre-dredge period, and there continues to be an unacceptable health risk in the post-dredge period. However, the post-dredge period showed either a significant decrease or no change in the health risk, depending on the type of marine food being considered. It may be unsafe to consume marine foods from Kitimat Harbour at the consumption rates applied in this study.

When the HQs from the three study areas are considered, the health risk from PCB exposure in marine foods was similar for all areas. For example, the HQ for toddlers consuming crab meat from Kitimat Harbour in 2018 was 0.80, compared to 0.89 from Kildala Arm. The health risk benchmark of 0.2 was exceeded in all study areas for all sampling years for some or all human receptors. A similar degree of health risk from PCB in marine foods exists in all study areas, and it is not exclusive to the industrialized region of Kitimat Harbour.

PCBs are produced through certain types of industrial activity and there are no naturally occurring sources of this substance. Since there are no current or historical industrial activities in Kildala Arm, it would be reasonable to assume that marine foods in this study area would have undetectable PCB concentrations. The PCBs detected in marine foods in Kildala Arm may be the result of long distance atmospheric or hydrospheric transport and deposition. Given that similar concentrations of PCB have been measured in marine foods in all three study areas, they are likely representative of background levels found throughout the Kitimat Arm and Kildala Arm region, and not COPCs associated with industrial activities in Kitimat Harbour.

6.1.2. PCDD/F

Table 6-2 presents the PCDD/F HQs for toddlers and adults from their consumption exposure of marine foods.

Overall, the health risk from PCDD/F in crab meat and sole meat is inconclusive because the HQs are above the health risk benchmark of 0.2, but the HQ is based upon essentially non-detectable concentrations as indicated by the shaded cells in Table 6-2.

Only the HQs for crab hepatopancreas are based on detectable concentrations. In Kitimat Harbour, the PCDD/F HQs were greater than 0.2 for toddlers but not for adults. There was no substantial change in the PCDD/F HQs between the pre-dredge and post-dredge collection periods.

When the PCDD/F HQs in Kitimat Harbour are compared to those of Kitamaat Village and Kildala Arm, the range in HQs are similar. The similar PCDD/F concentrations in marine food, as illustrated

in Figure 5-3, suggest that the observed PCDD/F concentrations in the three study areas are background levels for the region. Marine foods from Kitimat Harbour present no greater PCDD/F health risk to consumers to marine foods from Kitamaat Village or Kildala Arm.

Hazard quotients greater than 0.2 are in **bold underline**.

6.1.3. Cadmium

Error! Not a valid bookmark self-reference. presents the cadmium HQs for toddlers and adults from their consumption exposure of marine foods.

Overall, the health risk from cadmium in crab meat and sole meat is below the HQ benchmark of 0.2 for all collection periods and all study areas. The consumption of crab meat and sole meat does not contribute a substantial amount of cadmium risk.

The cadmium HQ was greater than the health risk benchmark of 0.2 for crab hepatopancreas in all three study areas. Crab hepatopancreas from Kitamaat Village showed the highest cadmium HQ, followed by Kitimat Harbour and Kildala Arm. Given that the cadmium HQ in the Kildala Arm reference site is already above the health risk benchmark, and higher in Kitimat Harbour and Kitamaat Village, limited consumption of the crab hepatopancreas from any of these locations is advised.

6.1.4. Copper

Error! Not a valid bookmark self-reference. presents the copper HQs for toddlers and adults from their consumption exposure of marine foods.

Overall, sole meat from the three study areas did not contribute a substantial amount of copper risk. The health risk benchmark of 0.2 for copper was exceeded only from crab meat and crab hepatopancreas for toddlers. Interestingly, the highest copper HQ was observed for crab hepatopancreas from Kildala Arm, followed by Kitamaat Village and Kitimat Harbour. It is not clear why copper concentrations in crab hepatopancreas are highest at the reference sites, and lowest in Kitimat Harbour. There was also no significant change in the copper HQ in Kitimat Harbour between the pre-dredge and post-dredge periods.

Given that the copper HQs for toddlers in all study areas are already above the health risk benchmark, limited consumption of the crab hepatopancreas for toddlers is advised.

6.1.5. Zinc

Error! Not a valid bookmark self-reference. presents the zinc HQs for toddlers and adults from their consumption exposure of marine foods.

There was no significant change in the zinc HQ in Kitimat Harbour between the pre-dredge and post-dredge periods. The zinc HQs for marine foods are also similar throughout this study in all study areas. This strongly suggests that the observed zinc concentrations in marine foods represent naturally occurring background levels, and not indicative of nearby contamination from human activities.

Overall, sole meat and crab hepatopancreas the three study areas did not contribute a substantial degree of zinc risk to toddlers and adults. The health risk benchmark of 0.2 for zinc was exceeded only from toddlers consuming crab meat. This result suggests that crab meat consumption should be limited for toddlers to limit the health risk from exposure to zinc, and applies to crab meat from all study areas.

Hazard quotients greater than 0.2 are in **bold underline**.

6.2. Estimating Carcinogenic Risk (Non-Threshold Effects)

The change in lifetime cancer risk is expressed as the ILCR and represents the potential overall increase in cancer risk that is associated with exposure carcinogenic compounds, including PAH (as a TEQ of benzo(a)pyrene). The ILCR is calculated using the following formula:

$$ILCR = (Estimated\ Lifetime\ Daily\ COPC\ Exposure) \times (TRV)$$

Where:

- ILCR = Incremental lifetime cancer risk (unitless)
- Estimated Lifetime Daily COPC Exposure (mg/kg bw-day) = the estimated daily exposure to a carcinogenic COPC over a lifetime (80 years)
- TRV = the carcinogenic toxicological reference value for a COPC (mg/kg bw-day)$^{-1}$

Regulatory agencies in BC and Health Canada have set ILCR of 0.00001 as the cancer risk acceptability benchmark; or an ILCR of 1 in 100,000 people (i.e., 10^{-5}) (Health Canada 2010a).

6.2.1. PAH

Table 6-6 presents the ILCRs for human exposures to PAH for each type of marine food and the total ILCR assuming a person consumes all three foods at the cited consumption rates every day of the year over a lifetime (80 years).

Table 6-6 Incremental Lifetime Cancer Risk from PAH

Crab Hepatopancreas	5.35E-07	2.83E-07	4.61E-07	2.83E-07	2.22E-07	2.93E-07	5.71E-07	1.26E-07	5.88E-07
Sole Meat	**2.68E-05**	4.57E-06	2.95E-06	3.69E-06	1.30E-06	2.00E-06	7.64E-06	8.05E-07	5.14E-06
Total ILCR	**3.53E-05**	7.69E-06	4.04E-06	**2.26E-05**	6.85E-06	4.74E-06	**1.00E-05**	5.95E-06	**1.25E-05**

NOTE:
Shaded cells denotes value based on essentially non-detectable concentration.
ILCR greater than 0.00001 is indicated in **bold underline**.

In Kitimat Harbour, the ILCR for adults and Indigenous adults harvesting and consuming all three types of marine foods is above the benchmark of 10^{-5} under the 2018 pre-dredge period. This means that people who harvest and consume all three types of marine foods daily at the cited consumption rates would have an unacceptable degree of cancer risk from their exposure to PAH. In the subsequent 2019 and 2020 post-dredge periods, the total ILCR decreases to below the ILCR benchmark, indicating that there is no unacceptable cancer risk from consuming these foods. The total ILCR is reduced by approximately 88% from the 2018 pre-dredge to 2020 post-dredge period. This result suggests that dredging may have reduced the PAH content in marine foods in Kitimat Harbour, and subsequently reduced the cancer risk to marine food consumers from their exposure to PAH.

A similar outcome was shown in Kitamaat Village, where the total ILCR in 2018 was above the cancer risk benchmark of 10^{-5}. The total ILCR in 2020 shows a 78% reduction, and is below the cancer risk benchmark. However, these results for Kitamaat Village are largely based on essentially non-detectable lab results.

In Kildala Arm, the total ILCR is shown to increase numerically from 2018 to 2020. However, these results are based largely upon essentially non-detectable concentrations. It should be noted that summing the ILCR for multiple marine foods may also result in an over-estimation of the cancer risk, especially if the ILCR is based on concentrations that are essentially non-detectable.

7. CONCLUSIONS

7.1. Summary of Changes in Marine Country Food Quality in Kitimat Harbour

The changes in marine food quality in Kitimat Harbour are summarized below. Overall, the measured concentration of COPCs in marine foods either showed a decrease or no statistically significant change. The exception was for cadmium in sole meat which showed a statistically significant increase in the 2020 post-dredge period, but the concentration was still near the detection limit.

These results confirm the predictions of the 2015 HHRA that dredging would have no significant effect or a marginal reduction to the concentration of COPCs in marine foods.

Table 7-1 Summary of Changes in Marine Food Quality in Kitimat Harbour

Chemical of Potential Concern	Change in COPC Concentration from Pre-dredge to Post-dredge		
	Crab Meat	Hepatopancreas	Sole Meat
PAH	Decrease	No change	Decrease
PCB	Decrease or No change	No change	Decrease or No change
PCDD/F	Decrease	No change	No change
Cadmium	No change	No change	No change
Copper	No change	No change	No change
Zinc	No change	No change	No change

7.2. Natural vs Anthropogenic COPCs

The COPCs in this HHRA were identified as chemicals in the CDA sediment that were greater than the CCME sediment quality guidelines for the protection of aquatic life. This method was applied because there are no scientifically accepted screening criteria for chemicals in food.

The CCME sediment quality guidelines protect aquatic life from direct exposure to chemicals in the sediment. The derivation of these guidelines does not consider chemical uptake and retention into its tissues. This means that a chemical that is above the CCME sediment quality guideline does not reflect the chemical concentration in the tissues of marine life. For this reason, the HHRA is needed to confirm whether these chemicals present a potential human health risk.

When sediment samples from the CDA were compared to the CCME sediment quality guidelines for the protection of aquatic life, PAH, PCB, PCDD/F, cadmium, copper, and zinc were above the guidelines and considered COPCs. It was originally assumed that marine foods from Kitimat

Harbour would contain greater concentrations of these COPCs compared with marine foods from Kitamaat Village and Kildala Arm. However, based on the laboratory results, most of the identified COPCs are present at similar concentration ranges within the tissues analyzed, in all three study areas. This suggests that for metals, they are naturally occurring concentrations. For PCDD/F, they may be background levels resulting from regional or global atmospheric and hydrospheric dispersion and deposition of persistent chemicals, rather than local contamination.

For example, in Table 5-2 and Figure 5-3, PCDD/F concentrations in the crab hepatopancreas were similar in range for all three study areas and essentially non-detectable in crab meat and sole meat. The high concentration of PCDD/F originally measured in the sediments within the CDA of Kitimat Harbour have not resulted in a notable increase in PCDD/F concentrations in marine food. Similar observations were made of cadmium (Figure 5-4), copper (Figure 5-5), and zinc (Figure 5-6). Only PAH in sole meat and PCB concentrations in crab hepatopancreas and sole meat from Kitimat Harbour were notably higher than those from Kitamaat Village and Kildala Arm. Although the results are not definitive that PAH and PCB concentrations are particularly higher in marine foods from Kitimat Harbour.

Based on these observations, PCDD/F, cadmium, copper, and zinc in marine foods appear to be naturally occurring or background levels in the region, where similar concentrations in marine food are found in all study areas. PCDD/F, cadmium, copper, and zinc may have been screened into the HHRA based on sediment concentration comparisons to the CCME sediment quality guideline, but the tissue data suggests that these are not contaminants in marine foods. Only PAH and PCB results suggest a potential anthropogenic source.

7.3. Summary of Risk to Marine Food Consumers, 2020

Based upon the HQs for people consuming marine foods from Kitimat Harbour, there is an unacceptable health risk for at least one or more COPCs for all types of marine foods and all human receptors that is not unique to the Project CDA. In the context of marine food quality in the region, a similar degree of risk was observed in all three study areas. This is consistent with the laboratory results showing that PCDD/F, cadmium, copper, and zinc concentrations in marine foods are similar in all study areas.

People who may harvest and consume their entire allotment of marine foods near the Kitimat Harbour CDA will experience similar degrees of health risk from exposure to COPCs compared to people who harvest and consume their entire allotment of marine foods from Kitamaat Village and Kildala Arm. However, it is unlikely that people harvest and consume a substantial proportion of marine foods from Kitimat Harbour due to the five overlapping marine food harvesting bans encompassing this area, and due to the likelihood that people would choose to harvest marine

foods away from an industrial site when other locations are available. Regardless of the location that a person is harvesting their marine foods in either Kitimat Arm or Kildala Arm, adjusting one's consumption rate of these marine foods is advised to limit one's risk.

8. UNCERTAINTY ANALYSIS

8.1. Introduction

The assessment of human health risk involves multiple steps in the risk assessment framework. Uncertainties that are inherent to these steps will influence the final assessment of human health risk. There may be uncertainties associated with data gaps, COPC screening methods, estimation of exposures and ingestion rates, or laboratory analytical methods. Where uncertainties exist, a conservative approach was taken to overestimate the potential risk when feasible. This section describes the uncertainties that were identified and their influence on the assessment of human health risk.

8.2. Screening of Chemicals of Potential Concern

In a HHRA, the process of screening chemicals to select COPCs typically applies environmental quality guidelines that are protective of human health. However, there are no provincial or federal guidelines applicable to seafood quality that are protective of human health.

In the absence of environmental quality guidelines applicable to seafood quality, guidelines applicable to marine sediment and terrestrial soil were applied as a surrogate. The CCME soil quality guidelines for the protection of human health (residential use) were applied as a surrogate guideline when screening for COPCs.

The BC Ministry of Health also requested the additional screening against the CCME sediment quality guidelines for the protection of aquatic life. Sediment quality guidelines for the protection of aquatic life are based on adverse effects to marine life from direct exposure to chemicals in the sediment. These guidelines do not provide any information on chemical bioavailability or whether the chemicals in the sediment are absorbed and retained in the tissues of marine life and passed on to marine foods consumers.

This step reduces the uncertainty in the HHRA because it introduces a benchmark for chemicals to be screened against, when no such benchmark would exist otherwise.

8.3. Detection Limits for PAH, PCB, and PCDD/F

The 2015 HHRA had applied gas chromatography—mass spectroscopy analysis for PAH in marine foods. This type of analysis has a relatively low resolution, and it was not capable of measuring the trace concentrations of PAH in marine foods. Since a non-detectable outcome was also possible for PCB and PCDD/F, all organic COPCs in this study were analyzed using accredited forms of analysis using HRMS. HRMS is a high-resolution analytical method, which is capable of measuring down to approximately 1 ppb for PAH, and 1 ppt for PCB and PCDD/F. However, the laboratory results summarized in Table 5-2 and APPENDIX 5 (for 2018 pre-dredge samples), APPENDIX 6 (for 2019 post-dredge samples), and APPENDIX 7 (for 2020 post-dredge samples) indicate that some results for PAH, PCB, and PCDD/F were still below the detection limit.

Stantec consulted with analytical chemistry experts at Bureau Veritas Laboratories in Burnaby, BC regarding the possibility of further lowering the detection limits. However, the sample detection limits applicable to this study are the lowest achievable using accredited analytical methods. Chemical analytical experts at Bureau Veritas Laboratories indicated that it was possible to lower the detection limits further using non-accredited analytical methods, citing this as common practice among published research that uses university chemistry laboratories for analysis. However, using a non-accredited analytical method could introduce further uncertainty and inconsistency with the analytical methods. Stantec chose to apply the accredited analytical method rather than introduce further uncertainty by using an unaccredited method of analysis.

In instances where a COPC was found to be lower than the detection limit, it was assumed that the COPC was present at the detection limit. The 95% UCLM concentration of COPCs was calculated by applying this assumption, when applicable. However, if more than 70% of the test results were below the detection limit, the sample group was flagged as "essentially non-detectable". This allows for the interpretation of the health risk based on the presumption that COPCs are present at the detection limit, while also recognizing that the results were essentially non-detectable in most tissue samples.

Experts at Bureau Veritas Laboratories also noted that tissue samples with essentially non-detectable concentrations (i.e., with 70% or more congeners below the detection limit) may be artificially high when reported as a TEQ due to the summation of non-detects from the individual congeners. For example, if a tissue sample contains non-detectable (less than 1 ppt) PCDD/F concentrations for all 17 congeners, the reported concentration would be higher than 1 ppt TEQ because the toxic equivalence is summed for the 17 congeners. This means that concentrations of PAH, PCB, and PCDD/F that are essentially non-detectable are overestimated and conservative. The degree of overestimation varies per sample.

8.4. Assumed vs Actual Marine Food Ingestion Rates

The estimated ingestion rates for marine foods from Richardson (1997) are for the average Canadian and Indigenous population. These ingestion rates may reflect a person's actual ingestion of seafood; but they do not reflect the harvesting and consumption of marine foods within the Kitimat Harbour study area.

Section 2.1.2 (Marine Harvesting Bans) and Section 2.1.3 (Traditional Use and Local Harvesting) indicate that local Indigenous groups and the general public in Kitimat perceive the marine waters near Kitimat Harbour to be contaminated from industrial activity. Furthermore, the area affected by dredging is under multiple overlapping shellfish harvesting bans that are applicable to crabs and shellfish year-round. Currently, local people do not harvest marine foods near Kitimat Harbour because there are other readily accessible areas that are perceived to be clean (i.e., south of Kitamaat Village). There are also numerous large vessels, barges, and equipment that would present a safety risk to the public approaching Kitimat Harbour to harvest marine foods during construction.

During the course of this study, aesthetic differences were observed in Dungeness crab from Kitimat Harbour to those collected from Kitamaat Village and Kildala Arm. During crab dissections, the hemocoel (i.e., the main body cavity) of crabs from Kitimat Harbour was observed to contain hemolymph containing black sediment. Crabs from Kitamaat Village and Kildala Arm contained hemolymph that was clear. Dungeness crabs from Kitimat Harbour also had a distinct odour, comparable to the smell of ash. These observations, when made by people who harvest marine foods near Kitimat Harbour, are likely to perpetuate the perception that the seafood in the area is contaminated. In personal communications with members of the Haisla Nation, they noted a disagreeable taste associated with Dungeness crabs near Kitimat Harbour as a reason they no longer harvest from the area. Consequently, although the data suggests similar degrees of health risk among the three study areas based on the tissue chemistry, members of the Haisla Nation and the public are likely to continue to avoid harvesting near Kitimat Harbour due to notable changes in marine food quality as it relates to visual aesthetics, odour, and taste.

Therefore, this HHRA conservatively overestimates the actual consumption of marine foods harvested from the Kitimat Harbour study area.

8.5. Health Risk Associated with Multiple COPC Exposure

The current understanding of the toxicity of certain compounds is based primarily on toxicity studies performed in laboratory animals exposed to a single toxic agent. However, the human population is exposed to complex mixtures of chemicals at lower concentrations than those routinely examined in animal toxicity studies; and, the effects of any interactions (e.g., synergistic effects) between these substances on their overall toxicity is virtually unknown. As a result, guidelines for the protection of human health are almost exclusively based on exposure to single substances.

Substances in a mixture may interact in five general ways to elicit a biological response:

- Non-interacting: when substances have no effect in combination with each other, the toxicity of the mixture is the same as the toxicity of the most toxic substance in the mixture
- Additive: when substances have similar targets and modes of action, but do not interact, the hazard for exposure to the mixture is simply the sum of hazards for the individual substances
- Potentiation: when a non-toxic substance enhances the toxicity of another
- Synergistic: when there is a positive interaction among the substances such that the response is greater than would be expected if the substances acted independently
- Antagonistic: when there is a negative interaction among the substances such that the response is less than would be expected if the substances acted independently

There is no clear guidance on how to evaluate the interaction amongst substances in a mixture and their potential effects to human health risk. There are exceptions for chemicals such as PCDD/F, PCB and PAH where variants of a chemical group have the same mode of action and toxic endpoint, but at different levels of potency. In such cases, regulatory agencies provide guidance in the form of toxic equivalency factors, which are converted into a toxic equivalency or TEQ based on the toxic equivalency factors that are accepted by the scientific community. This method was applied when evaluating the concentration of PAH, PCB, and PCDD/F in marine foods samples.

8.6. Definition of Health and Perceived Health

The HHRA is a science-based approach recommended by Health Canada to evaluate human health risk. The risk assessor recognizes that the definition of health extends beyond physical health that is assessed in this report.

The risk assessor recognizes that traditional harvesting and use of country foods is deeply integrated with the perception of social, nutritional, cultural, and spiritual health. The practice of hunting, fishing, and gathering country foods and sharing them with other members of the community are social practices that bring individuals and families together. In this way, country foods represent an important factor in health and well-being that cannot be assessed scientifically in the same manner as the HHRA.

8.7. Toxicological Reference Values

The toxicity information for which TRVs and cancer slope factors are derived from typically include human epidemiological and nutritional studies and animal dose-response studies. For example, the TRVs for copper and zinc are based on nutritional studies because these metals are essential elements that are required for enzyme function and metabolism but become toxic at high doses. TRVs for PAH, PCB, PCDD/F and cadmium are based on animal dose-response studies or accidental human poisoning cases, since these substances have no important role in biological processes and are associated with only adverse biological effects.

Uncertainty factors are typically denominators of 10, 100 or 1,000 which are applied to the no observable adverse effects level (i.e., the highest exposure concentration where no chronic health effects were measured) to determine the TRV. Therefore, TRVs have a large margin of conservatism incorporated into their derivation to reduce the risk of underestimating a COPC's risk potential.

Decision Statement
Issued under Section 54 of the *Canadian Environmental Assessment Act, 2012*

to
LNG Canada Development Inc.
c/o Russell Morrison, Senior Environmental Planner

595 Burrard Street, PO Box 49162
Vancouver, British Columbia
V7X 1J1

for the
LNG Canada Export Terminal Project

Description of the Designated Project

LNG Canada Development Inc. is proposing the construction and operation of a natural gas liquefaction facility and marine terminal for the export of liquefied natural gas (LNG) in the District of Kitimat, British Columbia. The Designated Project would convert natural gas to LNG, approximately 26 million tonnes per annum, for export to global markets. The Designated Project is expected to have a life of at least 25 years.

Conduct of the environmental assessment

The Canadian Environmental Assessment Agency (the Agency) commenced an environmental assessment of the Designated Project under the *Canadian Environmental Assessment Act, 2012* (CEAA 2012) on May 21, 2013 and, on that same date, the Minister of the Environment, under the authority of section 32 of CEAA 2012, granted the substitution of the environmental assessment process set out in British Columbia's *Environmental Assessment Act* for the CEAA 2012 process.

British Columbia's Environmental Assessment Office (the EAO) conducted an environmental assessment of the Designated Project in accordance with the substitution conditions set out in subsection 34(1) of CEAA 2012, including those additional conditions set by the Minister of the Environment, and in consideration of the Memorandum of Understanding on Substitution of Environmental Assessments (2013) entered into by the Agency and the EAO. The EAO submitted its report to the Agency on May 6, 2015.

Decision on environmental effects referred to in subsection 5(1) of CEAA 2012

In accordance with paragraph 52(1)(a) of CEAA 2012, after considering the report of the EAO on the Designated Project and the implementation of mitigation measures that I consider appropriate, I

determined that the Designated Project is likely to cause significant adverse environmental effects referred to in subsection 5(1) of CEAA 2012.

In accordance with subsection 52(2) of CEAA 2012, I referred to the Governor in Council the matter of whether those significant adverse environmental effects were justified in the circumstances.

In accordance with paragraph 52(4)(a) of CEAA 2012, the Governor in Council decided that the significant adverse environmental effects that the Designated Project is likely to cause are justified in the circumstances.

In accordance with subsection 53(1) of CEAA 2012, I have established the conditions below in relation to the environmental effects referred to in subsection 5(1) of CEAA 2012, with which LNG Canada Development Inc. must comply.

Decision on environmental effects referred to in subsection 5(2) of CEAA 2012

The carrying out of the Designated Project may require the following federal authorities to exercise a power or perform a duty or function conferred on them under an Act of Parliament other than CEAA 2012:

- The Minister of Fisheries and Oceans may issue an authorization under paragraph 35(2)(b) of the *Fisheries Act*;
- The Minister of the Environment may issue a permit for disposal at sea under subsection 127(1) of the *Canadian Environmental Protection Act*, *1999*; and
- The Minister of Transport may approve works in and about navigable waters under subsection 6(1) of the *Navigation Protection Act*.

In accordance with paragraph 52(1)(b) of CEAA 2012, after considering the report of the EAO on the Designated Project and the implementation of mitigation measures that I consider appropriate, I determined that the Designated Project is not likely to cause significant adverse environmental effects referred to in subsection 5(2) of CEAA 2012.

In accordance with subsection 53(2) of CEAA 2012, I have established the conditions below in relation to the environmental effects referred to in subsection 5(2) of CEAA 2012, with which LNG Canada Development Inc. must comply.

1 Definitions

1.1 *Aboriginal groups* – Haisla Nation, Gitga'at First Nation, Kitselas, Kitsumkalum, Gitxaala Nation, Lax Kw'alaams, Metlakatla, and Métis Nation British Columbia.

1.2 *Agency* – Canadian Environmental Assessment Agency.

1.3 *Construction* – the phase of the Designated Project during which physical activities in connection with site preparation, building or installation of any component of the Designated Project are undertaken by the Proponent prior to operation.

1.4 *Days* – calendar days.

1.5 *Decommissioning* – the phase of the Designated Project where the Proponent has permanently ceased commercial production and has commenced actions to remove from service any component of the Designated Project, and continues these actions until site restoration activities are complete.

1.6 *Designated Project* – the LNG Canada Export Terminal Project as described in the Certified Project Description in Schedule A of the Environmental Assessment Certificate issued by the Government of British Columbia (Canadian Environmental Assessment Registry Reference Number 80038).

1.7 *Ecologically important wetlands* – wetlands and estuarine wetland communities that are red-listed or blue-listed by the British Columbia Conservation Data Centre.

1.8 *Environment Canada* – the Department of the Environment as established under subsection 2(1) of the *Department of the Environment Act*.

1.9 *Fish* – as defined in subsection 2(1) of the *Fisheries Act*, includes (a) parts of fish; (b) shellfish, crustaceans, marine animals and any parts of shellfish, crustaceans or marine animals; and (c) the eggs, sperm, spawn, larvae, spat and juvenile stages of fish, shellfish, crustaceans and marine animals.

1.10 *Fish habitat* – as defined in subsection 2(1) of the *Fisheries Act*, means spawning grounds and any other areas, including nursery, rearing, food supply and migration areas, on which fish depend directly or indirectly in order to carry out their life processes.

1.11 *Fisheries and Oceans Canada* – the Department of Fisheries and Oceans as established under subsection 2(1) of the *Department of Fisheries and Oceans Act*.

1.12 *Follow-up program* – as defined in subsection 2(1) of the *Canadian Environmental Assessment Act, 2012*, means a program for (a) verifying the accuracy of the environmental assessment of a designated project; and (b) determining the effectiveness of any mitigation measures.

1.13 *Initial dilution zone* – the area adjacent to an effluent outfall where the effluent is deposited and mixes with water in the receiving environment.

1.14 *Liquefied Natural Gas (LNG)* – a fluid in a liquid state that is composed predominately of methane and that may contain minor quantities of ethane, propane, nitrogen or other components found in natural gas.

1.15 *Migratory bird* – as defined in subsection 2(1) of the *Migratory Birds Convention Act, 1994*, means a migratory bird referred to in the Convention, and includes the sperm, eggs, embryos, tissue cultures and parts of the bird.

1.16 *Mitigation measures* – as defined in subsection 2(1) of the *Canadian Environmental Assessment Act, 2012*, means measures for the elimination, reduction or control of the adverse environmental effects of a designated project, and includes restitution for any damage to the environment caused by those effects through replacement, restoration, compensation or any other means.

1.17 *Navigation impacts* – include impacts on water depths and water widths that affect the passage of a vessel, including a vessel used by Aboriginal people in the context of their current use of lands and resources for traditional purposes.

1.18 *Operation* – the phase of the Designated Project during which the commercial production takes place.

1.19 *Progressive reclamation* – a planned approach carried out concurrently with Designated Project activities aimed at progressively returning any physically disturbed areas to a state as close to the baseline as possible, as soon after the disturbance as practical.

1.20 *Project footprint* – the land area physically disturbed by activities related to the construction, operation, decommissioning or abandonment of the Designated Project.

1.21 *Proponent* – LNG Canada Development Inc. or any other party, and their successors or assigns, that assume ownership, care, control or management of the Designated Project.

1.22 *Qualified individual* – someone who, through education, experience and knowledge relevant to a particular matter, may be relied on to provide advice within his or her area of expertise.

1.23 *Reporting year* – April 1 of a calendar year through March 31 of the subsequent calendar year.

1.24 *Species at risk* – as defined in subsection 2(1) of the *Species at Risk Act*, means an extirpated, endangered or threatened species or a species of special concern.

1.25 *Transport Canada* – the Department of Transport as established under subsection 3(1) of the *Department of Transport Act*.

1.26 *Wetland* – land saturated with water long enough to promote formation of water altered soils, growth of water-tolerant vegetation and various kinds of biological activity that is adapted to the wet environment and separated into five classes: fen, bog, marsh, swamp and shallow open water wetlands (includes open water areas less than two metres deep with wetland characteristics).

1.27 *Wetland functions* – include the natural processes and derivation of benefits and values associated with wetland ecosystems, fish and wildlife habitat, organic carbon storage, water supply and purification (e.g. groundwater recharge, flood control, maintenance of flow regimes, shoreline erosion buffering), and soil and water conservation, as well as traditional use, tourism, heritage, recreational, educational, scientific, and aesthetic opportunities.

Conditions

These conditions are established for the sole purpose of the Decision Statement issued under the *Canadian Environmental Assessment Act, 2012*. They do not relieve the Proponent from any obligation to comply with other legislative or other legal requirements by the federal, provincial or local governments. Nothing in this Decision Statement shall be construed as reducing, increasing, or otherwise affecting what may be required to comply with all applicable legislative or other legal requirements.

2 General conditions

2.1 The Proponent shall, throughout all phases of the Designated Project, ensure that its actions in meeting the conditions set out in this Decision Statement are informed by the best available information and knowledge, are based on validated methods and models, are undertaken by qualified individuals, and have applied the best available economically and technologically feasible strategies.

2.2 The Proponent shall, where consultation is a requirement of a condition set out in this Decision Statement:

2.2.1 provide written notice of the opportunity for the party or parties to present their views on the subject of the consultation;

2.2.2 provide sufficient information and a reasonable period of time to permit the party or parties to prepare their views;

2.2.3 provide a full and impartial consideration of any views presented; and

2.2.4 advise the party or parties that have provided comments on how the views and information received have been considered.

2.3 The Proponent shall, where consultation with Aboriginal groups is a requirement of a condition set out in this Decision Statement, and prior to the initiation of consultation, communicate with each Aboriginal group on the most appropriate manner in which to satisfy the consultation requirements referred to in condition 2.2.

2.4 The Proponent shall, where a follow-up program is a requirement of a condition set out in this Decision Statement:

2.4.1 undertake monitoring and analysis to verify the accuracy of the environmental assessment as it pertains to the condition and/or to determine the effectiveness of any mitigation measure(s);

2.4.2 where the results of the monitoring and analysis indicate issues with respect to the accuracy of the environmental assessment or the effectiveness of any mitigation measures that may lead to adverse environmental effects, identify the means by which it will determine whether additional mitigation measures are required, including the need for consultation with other parties in reaching that determination; and

2.4.3 implement additional mitigation measures, as appropriate.

2.5 The Proponent shall, from the reporting year where construction starts, submit to the Agency an annual report, including an executive summary of the annual report in both official languages. The annual report is to be submitted by the Proponent no later than June 30 following the reporting year. The Proponent shall document in the report:

2.5.1 implementation activities undertaken in the reporting year for each of the conditions;

2.5.2 how it has considered and incorporated the factors set out in condition 2.1 in the implementation of the conditions set out in this Decision Statement;

2.5.3 for conditions set out in this Decision Statement for which consultation is a requirement, how it has considered any views and information received during or as a result of the consultation;

2.5.4 the results of the follow-up program requirements identified in conditions 3.14 , 4.2.4, 4.5, 5.3, 6.3.6 and 7.2; and

2.5.5 any additional mitigation measures implemented or proposed to be implemented, as determined under condition 2.4.

2.6 The Proponent shall publish on the Internet, or any similar medium, the annual report, the executive summary referred to in condition 2.5, the Wetland Compensation Plan referred to in condition 4.3, the plan to offset the loss of fish and fish habitat referred to in condition 3.11, the Archaeological and Heritage Resources Management Plan referred to in condition 8.1, the Decommissioning Plan referred to in condition 9.1, and the implementation schedule referred to in condition 11, following submission of these documents to the parties referenced in the respective conditions. The Proponent shall keep these documents publicly available for twenty-five years following the end of operation or until the end of decommissioning of the Designated Project, whichever comes first.

2.7 The Proponent shall notify the Agency in writing no later than 60 days after the day on which there is a transfer of ownership, care, control or management of the Designated Project in whole or in part.

2.8 In the event that there is a transfer of ownership, care, control or management of the Designated Project from LNG Canada Development Inc. to another party, that party becomes the Proponent of the Designated Project and is bound by the conditions found in this Decision Statement.

3 Fish and fish habitat

3.1 The Proponent shall implement erosion control measures and sediment control measures during all phases of the Designated Project.

3.2 The Proponent shall revegetate disturbed riparian areas, using native vegetation, as soon as practicable after construction.

3.3 The Proponent shall isolate construction activities from adjacent freshwater fish habitat.

3.4 The Proponent shall salvage and relocate fish during in-water work requiring isolation of freshwater fish habitat.

3.5 The Proponent shall design the water intake for the Designated Project to avoid or reduce injury to and mortality of fish, including the risk of entrainment of eulachon larvae. The Proponent shall install the water intake that is so designed and shall monitor the operation of that intake to determine whether or not injury to and mortality of fish is avoided or reduced. Based on the monitoring results, the Proponent shall, as appropriate, modify the water intake or implement other measures to avoid or reduce injury to and mortality of fish.

3.6 The Proponent shall apply low-noise methods or sound dampening technologies to reduce adverse effects to fish from exposure to underwater noise during pile installation.

3.7 The Proponent shall, prior to the start of in-water construction activities; establish the location and timing of sensitive life stages and habitat occupancy for fish (including marine mammals) in consultation with Fisheries and Oceans Canada and Aboriginal groups; advise the Agency of that information; and shall conduct in-water construction activities during the timing windows of least risk to those life stages and habitat occupancy, unless otherwise authorized by Fisheries and Oceans Canada.

3.8 When conducting in-water construction activities outside the timing windows of least risk referred to in condition 3.7, the Proponent shall implement additional mitigation measures following consultation with Fisheries and Oceans Canada, including sediment containment when dredging and using sediment disposal methods and equipment that will limit re-suspension of sediments.

3.9 To avoid detrimental behavioural change in or injury to marine mammals, the Proponent shall establish and maintain a marine mammal exclusion zone for all construction activities where underwater noise levels are anticipated to exceed 160 decibels at a reference pressure of one micropascal. In doing so, the Proponent shall:

3.9.1 identify the construction activities that generate underwater noise levels greater than 160 decibels and the periods of time when those activities will occur;

3.9.2 establish the boundary of the exclusion zone for each construction activity at the distance from the activity that the underwater noise level reaches 160 decibels;

3.9.3 employ a marine mammal observer and specify the role of that person in observing and reporting marine mammals in the exclusion zone during construction activities identified in condition 3.9.1;

3.9.4 specify the circumstances in which construction activities identified in condition 3.9.1 must stop or not start if a marine mammal is sighted in the exclusion zone by the observer referred to in condition 3.9.3 and not re-start until the marine mammal has moved out of the exclusion zone; and

3.9.5 specify mitigation measures, such as sound dampening technology and soft-start procedures to reduce construction noise levels in the exclusion zone.

3.10 LNG carriers associated with the Designated Project shall respect speed profiles applicable to the operation of the Designated Project, subject to navigational safety, to prevent or reduce the risks of collisions between LNG carriers and marine mammals and shall report any collision with marine mammals to Fisheries and Oceans Canada, and notify Aboriginal groups.

3.11 The Proponent shall mitigate impacts to fish and fish habitat and, in consultation with Fisheries and Oceans Canada, develop and implement a plan to offset the loss of fish and fish habitat associated with the carrying out of the Designated Project.

3.12 For any fish habitat offsets area proposed in any offsetting plan under condition 3.11, and prior to submitting the offsetting plan to Fisheries and Oceans Canada, the Proponent shall determine whether there are adverse effects:

3.12.1 on migratory birds and their habitats;

3.12.2 on terrestrial species, including amphibians and reptiles, and their habitats;

3.12.3 on species at risk and their habitat;

3.12.4 on the current use of lands and resources for traditional purposes by Aboriginal peoples;

3.12.5 on navigation; and

3.12.6 from potential sources of contamination including polycyclic aromatic hydrocarbons, dioxins, furans, copper and zinc on the receiving environment.

3.13 The Proponent shall, if there are adverse effects on any of the elements of condition 3.12, avoid or lessen those adverse effects.

3.14 In consultation with Fisheries and Oceans Canada and Aboriginal groups, the Proponent shall develop and implement a follow-up program to verify the accuracy of the environmental assessment and to determine the effectiveness of mitigation measures identified under conditions 3.1 to 3.11 and 3.13.

3.15 The Proponent shall participate in regional initiatives relating to cumulative effects monitoring and the management of marine shipping, should there be any such initiatives during the construction and operation phases of the Designated Project.

4 Wetlands

4.1 The Proponent shall mitigate the adverse environmental effects of the Designated Project on wetland functions that support migratory birds, species at risk or the current use of lands and resources for traditional purposes by Aboriginal people. The Proponent shall give preference to avoiding the loss of wetlands over minimizing the adverse effects on wetlands and for managing the effects on wetlands over compensating for lost or adversely affected wetlands.

4.2 To avoid loss of wetlands or to manage adverse effects on wetlands impacted by the Designated Project footprint and adverse effects on wetland function on and for those wetlands adjacent to the Designated Project footprint, the Proponent shall:

4.2.1 delineate clearing boundaries prior to the commencement of construction and respect those boundaries during construction;

4.2.2 maintain, where practicable, tidal flow and wildlife passage in the LNG loading line corridor between the LNG processing and storage site and the marine terminal;

4.2.3 manage surface water and avoid erosion or sedimentation to maintain hydrology of adjacent wetlands and protect water quality; and

4.2.4 conduct follow-up monitoring prior to and during construction to detect potential unanticipated loss of wetland functions and implement adjustments to mitigate loss of those wetland functions.

4.3 For effects on ecologically important wetlands that cannot be avoided or minimized, mitigation measures shall be set out in a Wetland Compensation Plan that shall be prepared by the Proponent in consultation with Aboriginal groups. The mitigation measures to be set out in the Wetland Compensation Plan shall include:

4.3.1 implementing a 2:1 ratio of compensation area to the loss of ecologically important wetland area;

4.3.2 identifying sites to compensate for the lost wetlands referred to in 4.3.1, that are as close to Kitimat as possible and that reflect similar wetland types and functions to those that are lost;

4.3.3 a preference for wetland restoration over enhancement, and wetland enhancement over creation; and

4.3.4 whenever possible, using traditional plants in the enhancement or creation of the compensation sites referred to in 4.3.2 and providing access to those sites to Aboriginal people for the purposes of gathering traditional use plants.

4.4 The Proponent shall implement the wetland compensation plan within five years of the date of the start of construction.

4.5 The Proponent shall implement a follow-up program to verify that the compensation wetland sites are fulfilling the functions of the wetlands they are replacing and shall implement corrective actions in respect of the compensation wetlands if the latter do not fulfill those functions. The follow-up program shall include monitoring of the compensatory wetland sites to verify that lost habitat is being restored at or on those sites, in year one, and in years three, five, and ten following the enhancement or creation of the compensating wetlands.

5 Migratory birds

5.1 The Proponent shall carry out all phases of the Designated Project in a manner that protects and avoids harming, killing or disturbing migratory birds or destroying or taking their nests or eggs. In this regard, the Proponent shall take into account Environment Canada's *Avoidance Guidelines*. The Proponent's actions in applying the *Avoidance Guidelines* shall be in compliance with the *Migratory Birds Convention Act, 1994* and with the *Species at Risk Act*.

5.2 The Proponent shall:

5.2.1 restrict flaring of vented emissions to the minimum required for maintenance activities or to manage emergencies;

5.2.2 minimize flaring during night time and during periods of bird vulnerability; and

5.2.3 adjust operational lighting to avoid attracting migratory birds.

5.3 The Proponent shall develop and implement a follow-up program to determine the effectiveness of the mitigation measures used to avoid harm to migratory birds, their eggs and nests during all phases of the Designated Project.

5.4 The Proponent shall avoid or lessen, and monitor effects on the habitat of the Marbled Murrelet (*Brachyramphus marmoratus*), a species that appears on Schedule 1 of the *Species at Risk Act*. The Proponent shall compensate for the loss of habitat of the Marbled Murrelet as a result of the Designated Project, taking into account Environment Canada's *Operational Framework for Use of Conservation Allowances*.

6 Human health

6.1 The Proponent shall incorporate noise and air emission reduction measures in the design of the Designated Project, and implement noise and air emission reduction measures during all phases of the Designated Project to avoid or reduce potential effects on human health, including:

6.1.1 complying with the *Waste Discharge Regulation* under British Columbia's *Environmental Management Act* for operational air emissions;

6.1.2 applying best management practices and guidance for construction noise from the British Columbia Oil and Gas Commission's *Noise Control Best Practices Guidelines*; and

6.1.3 complying with the operational noise requirement of the British Columbia Oil and Gas Commission's *Liquefied Natural Gas Facility Regulation*.

6.2 The Proponent shall develop and implement a mechanism for receiving noise complaints, in consultation with Aboriginal groups and other parties who may be adversely affected by the noise caused by the Designated Project and during all phases of the Designated Project, and respond in a timely manner to any noise complaint received.

6.3 The Proponent shall implement measures related to marine water quality and sediment quality , including:

6.3.1 prior to the commencement of dredging, establishing a shellfish and groundfish tissue baseline and using it to complete a human health risk assessment for the consumption of fish;

6.3.2 conducting an assessment of the risks and potential duration of any exceedances of Canadian Council of Ministers of the Environment's *Water Quality and Interim Sediment Quality Guidelines*, and British Columbia's *Water Quality Guidelines* and *Working Sediment Quality Guidelines* that could occur during dredging and other in-water construction activities, and identify mitigation measures to avoid such exceedances;

6.3.3 implementing mitigation measures to minimize sediment dispersion during in-water construction activities, including isolation methods;

6.3.4 conducting onsite sediment and water quality monitoring in relation to the re-suspension and bioavailability of polycyclic aromatic hydrocarbons, dioxins and furans during in-water construction activities;

6.3.5 communicating any exceedances of the Canadian Council of Ministers of the Environment's *Water Quality and Interim Sediment Quality Guidelines*, and British Columbia's *Water Quality Guidelines* and *Working Sediment Quality Guidelines* to regulatory authorities in accordance with legislative requirements and to Aboriginal groups, and implementing mitigation measures identified in condition 6.3.2 to remedy those exceedances or to reduce associated risks to human health; and

6.3.6 developing and implementing a post-dredging follow-up program, in consultation with Aboriginal groups, to confirm the human health risk assessment predictions, including additional sampling of the shellfish and groundfish tissue to confirm the assessment predictions regarding the bioavailability and bioaccumulation of contaminants in fish consumed by humans. The Proponent shall communicate the results of the follow-up program to Aboriginal groups.

6.4 The Proponent shall, during operation, treat any effluent discharge from the facility marine outfall pipe to meet subsection 36(3) of the *Fisheries Act* and British Columbia's *Water Quality Guidelines* for the protection of marine life measured at the edge of the initial dilution zone.

7 Current use of lands and resources for traditional purposes

7.1 The Proponent shall develop and implement, in consultation with Aboriginal groups, a communication protocol for all phases of the Designated Project. The communication protocol shall include procedures and practices for sharing information and facilitating communication between the Proponent and the Aboriginal groups and other local marine users on the following:

7.1.1 location and timing of Designated Project-related construction activities;

7.1.2 location and timing of traditional activities by Aboriginal groups;

7.1.3 safety procedures, such as navigation aids and updated navigational charts;

7.1.4 location of areas where navigation is restricted for safety reasons;

7.1.5 operational speed requirements under the *Canada Shipping Act, 2001* or its regulations, and general schedules of the operation of LNG carriers associated with the Designated Project; and

7.1.6 ways in which to provide feedback to the Proponent on adverse effects related to navigation experienced by Aboriginal groups and other local marine users.

7.2 The Proponent shall develop and implement, in consultation with Aboriginal groups, a follow-up program to verify the accuracy of the predictions made during the environmental assessment in relation to the effects of the wake generated by the Designated Project on the current use of lands and resources for traditional purposes by Aboriginal groups. The follow-up program shall include:

7.2.1 monitoring during the first two years of operation of the degree of wake generation by Designated Project-related vessels and of any adverse effects on harvesters caused by vessel wake attributable to Designated Project-related vessels at key harvest sites and during key harvest periods identified in consultation with Aboriginal groups; and

7.2.2 providing the results of the follow-up program and any corrective actions taken to Aboriginal groups.

7.3 The Proponent shall provide Aboriginal groups with the implementation schedule, updates or revisions to the implementation schedule pursuant to condition 11 at the same time these documents are provided to the Agency.

8 Physical and cultural heritage and structure, site or thing of historical, archaeological, paleontological or architectural significance

8.1 The Proponent shall, in consultation with Aboriginal groups and local historical societies, develop and implement an Archaeological and Heritage Resources Management Plan for the Designated Project prior to construction. The Archaeological and Heritage Resources Management Plan shall take into account British Columbia's *Handbook for the Identification and Recording of Culturally Modified Trees*. The Archaeological and Heritage Resources Management Plan shall include:

8.1.1 a description of structures, sites or things of historical, archaeological, paleontological or architectural significance (including Culturally Modified Trees) that may be encountered by the Proponent during construction;

8.1.2 procedures and practices for on-site monitoring of construction activities that may affect a structure, site or thing of historical, archaeological, paleontological or architectural significance (including Culturally Modified Trees) and for the identification and removal of these resources; and

8.1.3 a Chance Find Protocol if a previously unidentified structure, site or thing of historical, archaeological, paleontological or architectural significance (including Culturally Modified Trees) is discovered by the Proponent or brought to the attention of the Proponent by an Aboriginal group or another party during construction.

9 Decommissioning

9.1 The Proponent shall develop and submit to the Agency a Decommissioning Plan at least one year prior to the end of operation, consistent with any statutory or regulatory requirements in effect at that time. The Decommissioning Plan shall include a description of:

9.1.1 any consultation undertaken during the development of the Decommissioning Plan, including any issues raised by Aboriginal groups and other parties and how they were resolved by the Proponent;

9.1.2 the components of the Designated Project that will be decommissioned by the Proponent;

9.1.3 the desired end-state objectives of the areas that will be decommissioned by the Proponent and those that will not be decommissioned;

9.1.4 the components of the environment that may be adversely affected by decommissioning activities or by components of the Designated Project that continue in their state at the end of operation;

9.1.5 how the Proponent will monitor and mitigate adverse environmental effects from decommissioning activities;

9.1.6 how the Proponent will conduct in-water and land-based decommissioning activities (including the location, the scheduling and sequencing of activities);

9.1.7 a strategy for progressive reclamation, if appropriate; and

9.1.8 an approach to consulting Aboriginal groups and federal and provincial authorities throughout the decommissioning phase.

9.2 The Proponent shall from the reporting year in which decommissioning begins until the end of decommissioning, submit to the Agency a written report no later than June 30 of the following reporting year. The written report shall include a description of:

9.2.1 the decommissioning activities that took place during the reporting year;

9.2.2 any adverse environmental effects identified by the proponent with respect to those decommissioning activities;

9.2.3 a description of the mitigation measures that were implemented by the Proponent to mitigate or reduce those adverse effects, and

9.2.4 consultation activities.

10 Accidents or Malfunctions

10.1 The Proponent shall take all reasonable measures to prevent accidents and malfunctions that may result in adverse environmental effects and shall implement the emergency response procedures and contingencies developed in relation to the Designated Project.

10.2 In the event of an accident or malfunction with the potential to cause adverse environmental effects, the Proponent shall:

10.2.1 notify relevant federal and provincial authorities, including the Agency of the occurrence as soon as possible;

10.2.2 implement measures to minimize any adverse environmental effects associated with the occurrence as soon as possible;

10.2.3 submit a written report to the Agency as soon as possible in the circumstances, but at the latest 30 days after the day on which the accident or malfunction took place. The written report must include:

10.2.3.1 the measures that were taken to mitigate the effects of the occurrence;

10.2.3.2 a description of any residual environmental effects, and any additional measures required to address residual environmental effects; and

10.2.3.3 if an emergency response plan was implemented, details concerning its implementation.

10.2.4 as soon as possible, but no later than 90 days after the day on which the accident or malfunction took place, submit a written report to the Agency on the changes made to avoid a subsequent occurrence of the accident or malfunction.

10.3 The Proponent shall prepare and implement a communication strategy in consultation with Aboriginal groups that shall include:

10.3.1 the types of accident or malfunction requiring a notification to the respective Aboriginal groups;

10.3.2 the manner by which Aboriginal groups shall be notified of an accident or malfunction and of any opportunities to assist in the response; and

10.3.3 points of contact for the Proponent and for the respective Aboriginal groups.

11 Implementation schedule

11.1 The Proponent shall submit an implementation schedule for conditions contained in this Decision Statement to the Agency, or anyone designated pursuant to section 89 of the *Canadian Environmental Assessment Act, 2012*, at least 30 days prior to construction. The implementation schedule shall indicate the commencement and completion dates for each activity relating to conditions set out in this Decision Statement.

11.2 The Proponent shall submit an update to this implementation schedule in writing to the Agency, or anyone designated pursuant to section 89 of the *Canadian Environmental Assessment Act, 2012*, every two years on or before June 30, until completion of the activities.

11.3 The Proponent shall provide the Agency, or anyone designated pursuant to section 89 of the *Canadian Environmental Assessment Act, 2012*, with a revised implementation schedule if any change occurs from the initial schedule or any subsequent updates. The Proponent shall provide the revised implementation schedule at least 30 days prior to the implementation of the change.

12 Record keeping

12.1 The Proponent shall maintain a written record, or a record in an electronic format compatible with that used by the Agency, and retain and make available that record to the Agency, or anyone designated pursuant to section 89 of the *Canadian Environmental Assessment Act, 2012*, at a facility close to the Designated Project (local facility). The record shall include information related to the implementation of the conditions set out in this Decision Statement, and the results of all monitoring, including:

12.1.1 the place, date and time of any sampling, as well as techniques, methods or procedures used;

12.1.2 the dates and the analyses that were performed;

12.1.3 the analytical techniques, methods or procedures used in the analyses;

12.1.4 the names of the persons who collected and analyzed each sample and documentation of any professional certifications relevant to the work performed that they might possess; and

12.1.5 the results of the analyses.

12.2 The Proponent shall retain and make available upon demand to the Agency, or anyone designated pursuant to section 89 of the *Canadian Environmental Assessment Act, 2012*, the information contained in condition 12.1 at a facility close to the Designated Project (or at a location within Canada and agreed upon by the Agency, should the local facility no longer be maintained). The information shall be retained and made available throughout construction and operation, and for twenty-five years following the end of operation or until the end of decommissioning of the Designated Project, whichever comes first.

Issuance

This Decision Statement is issued on June 17, 2015, at Ottawa, Ontario by:

<Original signed by>

_____

The Honourable Leona Aglukkaq
Minister of the Environment

APPENDIX 2. PROVINCIAL CONDITIONS FOR THE LNG CANADA EXPORT TERMINAL PROJECT

LNG CANADA EXPORT TERMINAL PROJECT

(PROJECT)

SCHEDULE B

TABLE OF CONDITIONS
FOR
AN ENVIRONMENTAL ASSESSMENT CERTIFICATE

DEFINITIONS

Aboriginal Groups	Haisla Nation, Gitga'at First Nation, Kitselas First Nation, Kistumkalum First Nation, Gitxaała Nation, Lax Kw'alaams Band, and Metlakatla First Nation.
Application	The Application for an Environmental Assessment Certificate submitted by LNG Canada Development Inc. on November 7, 2014.
Certified Dredge Area	As shown on Figure 2 of the Certified Project Description.
Certified Project Area	As shown on Figure 1 of the Certified Project Description.
Construction	The phase of the Project during which physical activities in connection with site preparation, building or installation of any component of the Project occurs. For purposes of these conditions, Construction does not include any investigative use or testing conducted prior to commencement of site clearing.
Commissioning	The period within the Construction phase of the Project when LNG processing units are brought into operation and tested for safe and reliable operation.
Mitigation Table	Table 1 in the memo titled *Summary of Mitigation Measures* submitted by LNG Canada Development Inc. on May 5, 2015.
Operations	The phase of the Project commencing on the date on which at least one train of the Project has completed commissioning and has commenced commercial production of liquefying natural gas.
Qualified Professional	An applied scientist or technologist specializing in an applied science or technology applicable to the duty or function, including, if applicable and without limiting this, archaeology, agrology, biology, chemistry, forestry, engineering, geology or hydrogeology, relevant to the field of practice set out in the condition; and who is registered with the appropriate professional organization, is acting under that organization's code of ethics and is subject to disciplinary action by that organization.

ACRONYMS

BC	British Columbia
CAS	Climate Action Secretariat (part of Ministry of Environment)
CCME	Canadian Council of Ministers of the Environment
CPD	Certified Project Description
CSCD	Ministry of Community, Sport and Cultural Development
DFO	Fisheries and Oceans Canada
DOK	District of Kitimat
EA	Environmental Assessment
EAC	Environmental Assessment Certificate
EAO	Environmental Assessment Office
EC	Environment Canada
EMP	Environmental Management Plan
FLNR	Ministry of Forests, Lands and Natural Resource Operations
MNGD	Ministry of Natural Gas Development
MOE	Ministry of Environment
MOH	Ministry of Health
MOTI	Ministry of Transportation and Infrastructure
OGC	Oil and Gas Commission
TC	Transport Canada

TABLE OF CONDITIONS

No.	Condition
1	**Air Quality** The Holder must develop, in consultation with MOE, MOH and OGC, and implement, an air quality management plan which specifies mitigation measures to reduce air emissions during Construction, and sets out the means by which the mitigation measures in the Mitigation Table under the heading "air quality" (section 5.2) related to Construction will be implemented. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO, MOE, MOH, OGC, and Aboriginal Groups no less than 30 days prior to the Holder's planned date to commence Construction. The Holder must implement the final plan to the satisfaction of EAO. Prior to commencing Operations, the Holder must develop an air quality management and monitoring plan, in consultation with MOE, MOH, and OGC, which must: • Set out the means by which the mitigation measures in the Mitigation Table under the heading "air quality" (section 5.2) related to Operations will be implemented; • Specify the measures to monitor air emissions impacts to air, soil, water, and/or vegetation; • Include the results of sufficient baseline data to support monitoring; • Establish the approach for the regular reporting of air emissions and the effects from air emissions, including reporting to appropriate government agencies, Aboriginal Groups and the public; and • Specify an adaptive management plan to address the effects related to air quality, including the effects of air quality on soil, water and vegetation, if those effects are not mitigated to the extent identified in the Application or if unexpected effects occur. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO, MOE, MOH, OGC, and Aboriginal Groups no less than 30 days prior to the Holder's planned date to commence Commissioning. The Holder must implement the final plan to the satisfaction of EAO. If the Province establishes a regional air quality and deposition monitoring program for the airshed in which the Project is located, the Holder must participate in the program to the satisfaction of MOE, OGC and EAO.
2	**Acoustics** The Holder must develop, in consultation with OGC and the DOK, a noise management plan for construction that sets out the means by which the mitigation measures related to Construction in the Mitigation Table under the heading "acoustic environment" (section 5.4) will be implemented. The Holder must demonstrate reasonable efforts to engage with

	Haisla Nation in developing and sharing information regarding implementation of the plan. The Holder must provide the final plan to EAO, OGC, DOK and Haisla Nation no less than 30 days prior to the Holder's planned date to commence Construction. The Holder must implement the plan to the satisfaction of EAO. During Operations the Holder must be designed to comply with the OGC *Noise Control Best Practices Guidelines* (2009).
3	**Greenhouse Gases** The Holder must develop a greenhouse gas emissions management plan in consultation with MNGD and CAS that sets out the means by which the greenhouse gas management mitigation measures related to Operations in the Mitigation Table under the heading "GHG management" (section 5.3) will be implemented. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must provide the final plan to EAO, MNGD, CAS and Aboriginal Groups no less than 30 days prior to the Holder's planned date to commence Commissioning. The Holder must implement the plan to the satisfaction of EAO.
4	**Fish and Fish Habitat** The Holder must develop, in consultation with DFO and OGC, a fish management and monitoring plan that must: • Describe measures to avoid or mitigate impacts to fish and fish habitat; • Identify reduced risk work windows, and the work that will occur within these windows; • Identify any work that will occur outside of the reduced risk work windows, and measures to mitigate impacts to fish and fish habitat; • Specify measures to salvage and relocate fish where instream works will isolate freshwater fish habitat; and • Describe how the Kitimat River eulachon population are considered in the development of mitigation measures, including any Fish Habitat Offsetting Plan submitted to DFO; and • Specify an adaptive management plan to address the effects on fish and fish habitat, if those effects are not mitigated to the extent identified in the Application, or if unexpected effects occur. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regardingimplementation of the plan. The Holder must provide the final plan to EAO, DFO, OGC and Haisla Nation no less than 30 days prior to the Holder's planned date to commence Construction. The Holder must implement the plan to the satisfaction of EAO.

5	**Marine Mammals** The Holder must develop, in consultation with DFO and OGC, a marine mammal management and monitoring plan applicable during Construction that must: • Identify the geographic areas where, and periods of time when, Construction could cause injury to marine mammals; • Identify the geographic areas where, and periods of time when, Construction could cause behavioural change to marine mammals; • Identify the time periods when elevated marine mammal occupancy is anticipated within the areas of potential injury to marine mammals or areas of potential behavioural change; • Specify the role of a Qualified Professional in observing and reporting marine mammals in the areas of potential injury to marine mammals during Construction; • Specify the construction activities (e.g. blasting, pile driving) which must stop or not start if a marine mammal is sighted in the areas of potential injury to marine mammals, and not re-start until the marine mammal has moved out of the relevant area; and • Specify mitigation measures for construction noise that will prevent or reduce behavioural change or injury to marine mammals. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Construction in the marine environment. The Holder must not commence construction in the marine environment until the plan is approved by EAO. Once approved, the Holder must also provide the final plan to DFO, OGC, and Aboriginal Groups. The Holder must implement the plan to the satisfaction of EAO. The Holder must develop, in consultation with DFO, TC, and the Pacific Pilotage Authority, a marine mammal management and monitoring plan for Operations that must: • Identify the geographic areas where, and periods of time when, Operations could cause behavioural change or injury to marine mammals; • Specify the speed profiles to prevent or reduce the risks of collisions between the Holder's LNG carriers and marine mammals and to prevent or reduce risk of marine mammal behavioural change caused by noise from the Holder's LNG carriers; • Specify the terms of a study during Operations to improve understanding of the behavioural disturbance or injury to marine mammals from shipping related to the Project; and • Specify an adaptive management plan to address the effects on marine mammals, if those effects are not mitigated to the extent identified in the Application or if unexpected effects occur. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Operations. The Holder must not commence Operations until the plan is approved by EAO. Once approved, the Holder must also provide the final plan to DFO, TC and Aboriginal Groups. The Holder must implement the plan to the satisfaction of EAO.

	As requested by EAO, the Holder must participate in provincial or federal government initiative(s) that seek to manage or monitor the cumulative effects of shipping on marine mammals in areas overlapping the Certified Marine Route or Certified Pilot Boarding Area, as shown on Figure 3 of the Certified Project Description.
6	**Marine Water Quality and Contaminants** The Holder must develop a marine water quality management and monitoring plan for Construction for the Certified Dredge Area. The plan must be developed in consultation with MOE, MOH, DFO and OGC. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding the implementation of the plan. A Qualified Professional must develop the plan and supervise the implementation of the plan. The plan must include: • Mitigation measures to minimize sediment dispersion, including, but not limited to, isolation methods; • Measures to monitor onsite sediment and water quality, particularly in relation to the re-suspension and bioavailability of polycyclic aromatic hydrocarbons, polychlorinated dibenzo-p-dioxins and furans; • An approach to communicate any exceedances of CCME *Water Quality and Interim Sediment Quality Guidelines*, and BC *Water Quality Guidelines* and *Working Sediment Quality Guidelines* to the appropriate regulatory authorities, and to remedy or reduce risks of those exceedances to human health; • An assessment of the risk for, and potential duration of, any exceedances of CCME *Water Quality and Interim Sediment Quality Guidelines*, and BC *Water Quality Guidelines* and *Working Sediment Quality Guidelines for British Columbia* during dredging activity and following Construction, and identification of mitigation to address such exceedances; • An adaptive management plan to address the effects on water quality predicted, if those effects are not mitigated to the extent identified in the Application, or if unexpected effects occur; • The results of shellfish and groundfish tissue sampling to form a baseline, to the satisfaction of EAO, including the completion of an associated human health risk assessment; and • A post-dredging follow-up program to confirm the human health risk assessment predictions, including potential additional tissue sampling to confirm the assessment of predictions regarding the bioavailability and bioaccumulation of toxins in marine organisms consumed by humans. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Construction in the marine environment. The Holder must not commence Construction in the marine environment until the plan is approved by EAO. Once approved, the Holder must also provide the final plan to MOE, MOH, DFO, OGC, and Haisla Nation. The Holder must implement the plan to the satisfaction of EAO. The Holder must, in consultation with MOE, DFO and OGC, develop a marine water quality monitoring plan for Operations to ensure that any effluent discharge from the

	facility marine outfall meets BC *Water Quality Guidelines* for the protection of marine life. The plan that must: • Establish the initial dilution zone from the discharge point of the outfall pipe; and • Specify a monitoring program to confirm adherence to the BC *Water Quality Guidelines* for the protection of marine life. The Holder must demonstrate reasonable efforts to engage Haisla Nation in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Operations. The Holder must not commence Operations until the plan is approved by EAO. Once approved, the Holder must also provide the final plan to MOE, DFO, OGC, and Haisla Nation. The Holder must implement the plan to the satisfaction of EAO.
7	**Vegetation and Visual Quality** The Holder must conduct an assessment to determine feasibility of implementing wind firming techniques prior to site clearing. The assessment must be conducted by a Qualified Professional. Should the Qualified Professional determine that wind firming techniques are feasible, they must be implemented to the satisfaction of EAO. The Holder must maintain a mature vegetation buffer of at least 30 metres between the Kitimat River and the Certified Project Area shown on Figure 1 of the CPD, where such a buffer currently exists, unless both of the following apply: removal or alteration of the buffer is required for safety or regulatory reasons, and the removal or alteration is authorized by OGC.
8	**Vegetation – red and blue listed plants** The Holder must develop, in consultation with FLNR and OGC, a vegetation management and monitoring plan for Construction. The plan must be based on the results of the habitat assessment surveys for red- and blue-listed plants and communities within the Certified Project Area and must: • Specify the mitigation measures to avoid or minimize impacts to red- and blue-listed plants and communities; • Specify the pre-construction salvage and translocation program for red- and blue-listed plants; and • Include a contingency plan to mitigate effects to red- and blue-listed plants and communities if there are plants or communities discovered in addition to those identified in the habitat assessment surveys. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Construction. The Holder must not commence Construction until the plan is approved by EAO. Once approved, the Holder must also provide the final plan to FLNR, OGC, and Haisla Nation. The Holder must implement the plan to the

	satisfaction of EAO.
9	**Invasive Plant Management** The Holder must develop, in consultation with FLNR and OGC, an invasive plant management plan that describes measures to prevent, monitor and control the establishment and spread of invasive plant species in the Certified Project Area during Construction and Operations. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding the implementation of the plan. The Holder must provide the plan to EAO, FLNR, OGC, and Haisla Nation no less than 30 days prior to the Holder's planned date to commence Construction. The Holder must implement the plan to the satisfaction of EAO.
10	**Wetland Compensation** The Holder must develop, in consultation with EC and FLNR, a wetland compensation plan that is consistent with the *Federal Policy on Wetland Conservation* and compensates any permanent loss of wetland function for red-listed or blue-listed wetlands and estuarine wetland communities. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding implementation of the plan. The Holder must provide the final plan to EAO, EC, FLNR, and Haisla Nation no less than 30 days prior to the Holder's planned date to commence Construction. The Holder must implement the plan to the satisfaction of EAO.
11	**Surface Water Management** The Holder must develop, in consultation with FLNR, DFO and OGC, a surface water quality management plan to mitigate potential adverse effects of Project activities on water quality and aquatic habitat during Construction. The plan must: • Describe how stormwater will be collected, treated, tested, and discharged, as well as any monitoring activities; and • Describe how surface water runoff around the facility will be managed to avoid potential contamination, as well as any monitoring activities. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding the implementing of the plan. The Holder must provide the plan to EAO, FLNR, DFO, OGC, and Haisla Nation no less than 30 days prior to the Holder's planned date to commence Construction. The Holder must implement the plan to the satisfaction of EAO. The Holder must develop, in consultation with FLNR, DFO and OGC, a surface water quality management plan to mitigate potential adverse effects of Project activities on water quality and aquatic habitat during Operations. The plan must:

	• Describe how stormwater will be collected, treated, tested, and discharged, as well as any monitoring activities; and • Describe how surface water runoff around the facility will be managed to avoid potential contamination, as well as any monitoring activities. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding the implementing of the plan. The Holder must provide the plan to EAO, FLNR, DFO, OGC, and Haisla Nation no less than 30 days prior to the Holder's planned date to commence Operations. The Holder must implement the plan to the satisfaction of EAO.
12	**Wildlife – general** The Holder must develop a wildlife management plan for Construction in consultation with EC, FLNR and OGC that must: • Set out the means by which the wildlife mitigation measures related to Construction in the Mitigation Table under the heading "wildlife resources" (section 5.6) will be implemented; • Include results of completed marbled murrelet presence and habitat surveys, plans for additional presence surveys, and specify mitigation to avoid or reduce adverse effects of the Project on marbled murrelets and marbled murrelet habitat. Surveys must be completed prior to site clearing activity; • Include site assessment survey plans for bat species within the Certified Project Area and specify mitigation to avoid or reduce adverse effects of the Project on bat habitat, if the surveys indicate the presence of bat habitat. Surveys must be completed prior to site clearing activity; • Include a plan to manage human-wildlife conflict to avoid or reduce direct wildlife mortality; • Specify the mitigation that will be implemented for wildlife habitat features that are encountered within the Certified Project Area; • Specify the consideration of migratory bird timing windows when scheduling planned flaring events, where feasible from a technical and safety perspective, to minimise the risk of mortality and injury to birds during Construction and Commissioning; • Set out a monitoring and follow-up program with respect to impacts to wildlife within the Certified Project Area during Construction. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Construction. The Holder must not commence Construction until the plan is approved by EAO. Once approved, the Holder must also provide the plan to EC, FLNR, OGC, and Haisla Nation. The Holder must implement the plan to the satisfaction of EAO. Marbled murrelet and bat survey results must be provided to EC and FLNR prior to site clearing. The Holder must develop a wildlife management plan for Operations in consultation with

	EC, FLNR and OGC that must: • Set out the means by which the wildlife mitigation measures related to Operations in the Mitigation Table under the heading “wildlife resources” (section 5.6) will be implemented; • Identify mitigation measures, including migratory bird timing windows, to reduce the risk of mortality and injury to birds during planned flaring events during Operations, as feasible from a technical and safety perspective; • Include a plan to manage human-wildlife conflict to avoid or reduce direct wildlife mortality; • Identify mitigation measures to allow for wildlife passage through the estuary and continued tidal flows; and • Set out a monitoring and follow-up program with respect to impacts to wildlife the Certified Project Area during Operations. The Holder must demonstrate reasonable efforts to engage with Haisla Nation in developing and sharing information regarding the implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder’s planned date to commence Operations. The Holder must not commence Operations until the plan is approved by EAO. Once approved, the Holder must also provide the plan to EC, FLNR, OGC, and Haisla Nation. The Holder must implement the plan to the satisfaction of EAO.
13	**Local Economic Opportunities** The Holder must design and deliver programs to support local and Aboriginal employment and contracting opportunities, skills training and education. At the time of submitting compliance reports required by this EAC’s clause 1, the Holder must report to EAO on the implementation of these programs. The programs must be implemented during Construction and Operations.
14	**Community Services and Infrastructure** The Holder must develop a plan to adaptively manage potential socio-economic effects on services and infrastructure delivered by provincial agencies and local governments. The scope of the plan is for effects that are directly attributable to the Project, and related to the temporary Construction workforce. The plan must include the mitigation measures in the Mitigation Table under the headings “infrastructure and services” (section 7.2) and “community health and wellbeing” (section 7.5). The Holder must develop the plan in consultation with CSCD and based on CSCD guidance materials. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups, local governments, provincial government infrastructure and service providers in developing the plan. The plan must include specific actions to address the following: • Communication with potentially affected Aboriginal Groups, local governments, provincial government infrastructure and service providers regarding Project

	activities and actions related to the implementation of mitigation measures; • An approach for monitoring and reporting on the effectiveness of the mitigation measures set out in the plan; • An adaptive management approach, which includes the development of additional and/or alternative mitigation measures to address the Project's effects on community infrastructure and services, if those effects are not mitigated to the extent identified in the Application, or if unexpected effects occur; and • Engagement with potentially affected Aboriginal Groups, local governments and provincial government infrastructure and service providers on the adaptive management activities. The Holder must provide the plan to EAO and CSCD no less than 60 days prior to the Holder's planned date to commence Construction. The Holder must not commence Construction until the plan has been approved by EAO. Once approved, the Holder must also provide the final plan to CSCD, local governments, provincial government infrastructure and service providers, and Aboriginal Groups. The Holder is required to implement the plan, in consultation with CSCD, and to the satisfaction of EAO, until two years after the completion of Construction, or as otherwise directed by EAO. As requested by EAO, the Holder must participate in multi-stakeholder initiatives undertaken by the Province with regards to managing cumulative effects to community infrastructure and services. For the purposes of this condition, "Construction" does not include site clearing or preparation.
15	**Health and Medical Services** The Holder must develop a health and medical services plan, in consultation with Northern Health and in accordance with Northern Health's *Health and Medical Services Plan: Best Management Guide for Industrial Camps*. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan.The health and medical services plan must: • Describe the Project site and infrastructure that may impact health outcomes and the spread of disease; • Specify the health care services that will be provided for the workforce residing in the workforce accommodation centre; • Establish disease / infection prevention and outbreak protocols, including preparation, response and management protocols; • Outline programs for health promotion, disease prevention and on-site wellness; and • Establish a process for coordinating the management of urgent care and medical escalations with local service providers. The Holder must provide the final plan to EAO and Northern Health no less than 30 days prior to the Holder's planned date to commence Construction. The Holder must implement the plan to the satisfaction of EAO.

	For the purposes of this condition, “Construction” does not include site clearing or preparation.
16	**Transportation** The Holder must develop, in consultation with MOTI and the DOK, a traffic impact assessment and traffic management plan. The traffic impact assessment must be developed in accordance with MOTI’s *Planning and Designing Access to Developments* manual (2009). The traffic impact assessment must include: • A traffic safety analysis; and • An analysis of the Project’s effects on vehicular traffic and infrastructure and proposed mitigation measures, including at Haisla Nation bridge and in relation to increased airport and rail traffic. The traffic management plan must be developed in accordance with MOTI’s *Traffic Management Guidelines for Work on Roadways*. The traffic management plan must: • Identify measures to mitigate the impacts of Project-related transportation on the safety and efficiency of other users of the transportation network; and • Include measures for traffic control, public communications, incident management and response, and plan implementation. The Holder must provide the traffic impact assessment and traffic management plan to EAO, MOTI, and DOK prior to there being 500 persons housed in the workforce accommodation centre. The Holder must implement the plan to the satisfaction of EAO.
17	**Marine Transportation** The Holder must develop, in consultation with TC and DFO, a marine activities plan for Construction with the objective of mitigating and monitoring impacts to marine users. The plan must: • Set out the means by which the marine transportation measures related to Construction in the Mitigation Table under the heading “marine transportation & use” (section 7.4) will be implemented; • Identify Construction activities, including any fish habitat offset plans, that have the potential to interfere with marine navigation; • Identify existing and traditional navigational routes, fishing areas, habitat areas, harvesting areas, commercial shipping use, recreational and tourism use, Aboriginal Groups’ use, and any associated timing windows; • Specify actions to inform affected stakeholders and Aboriginal Groups of potential interference with marine navigation as a result of Construction activities; • Specify actions to coordinate activities with other marine users, particularly with other industrial activities related to dredging or disposal at sea; • Specify mitigation to reduce disruption of marine navigation as a result of Construction activities; and • Specify activities to monitor the effects of the Holder’s shipping activities on marine users during Construction.

	The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Construction in the marine environment. The Holder must not commence Construction in the marine environment until the plan is approved by EAO. Once approved, the Holder must also provide the final plan to TC, DFO and Aboriginal Groups. The Holder must implement the plan to the satisfaction of EAO. The Holder must develop, in consultation with TC and DFO, a marine activities plan for Operations with the objective of mitigating and monitoring impacts to marine users. The plan must: • Set out the means by which the marine transportation measures related to Operations in the Mitigation Table under the heading "marine transportation & use" (section 7.4) will be implemented; • Identify Operations activities, including any fish habitat offset plans, that have the potential to interfere with marine navigation; • Identify existing and traditional navigational routes, fishing areas, habitat areas, harvesting areas, commercial shipping use, recreational and tourism use, Aboriginal Groups' use, and any associated timing windows; • A complaint resolution process for loss or damage to commercial traps, nets and other fishing equipment, and anchors and other vessel-related gear due to interactions with the Holder's LNG carriers; • Specify actions to inform affected stakeholders and Aboriginal Groups of potential interference with marine navigation as a result of Operations activities; • Specify activities to monitor the effects of the Holder's shipping activities to marine users during Operations; • Demonstrate the holder's participation in industry- or government-led efforts to monitor the cumulative effects of shipping activities during Operations; • Specify actions to inform the public, marine user groups, and Aboriginal Groups about the results of the Technical Review Process of Marine Terminal Systems and Transshipment Sites (TERMPOL) process respecting the Project; • Specify actions to coordinate activities with other marine users, particularly with other shippers; and • Specify mitigation to reduce disruption of marine navigation as a result of Operations activities. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Operations. The Holder must not commence Operations until the plan is approved by EAO. Once approved, the Holder must also provide the final plan to TC, DFO and Aboriginal Groups. The Holder must implement the plan to the satisfaction of EAO.
18	**Marine Transportation – wake** The Holder must develop, in consultation with TC, a wake verification plan for Operations.

	The plan must: • Identify focus areas, at shorelines and in the ocean, and periods for monitoring wake; • Describe the methodology for the selection of the focus areas and periods, including how marine users and Aboriginal Groups inform their identification and selection; • Specify a methodology for monitoring the wake of the Holder's LNG carriers, within the marine environment and at shorelines, to determine the accuracy of the results of the environmental assessment, particularly in relation to potential safety hazards to marine and shoreline users; • Include the results of baseline data to support monitoring; • Specify a process for reporting the results of the wake verification plan; • Include options for reporting, recording and responding to wake interactions between the Holder's LNG carriers and marine and shoreline users; and • Specify an adaptive management plan to address the effects of wake on marine and shoreline users if the results of the wake verification plan indicate greater wake effects than predicted in the environmental assessment, or if unexpected effects occur. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups in developing and sharing information regarding implementation of the plan. The Holder must demonstrate reasonable efforts to engage Aboriginal Groups and TC in the development of the approach to gathering baseline data, and its implementation. The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to commence Operations. The Holder must not commence Operations until the plan is approved by EAO. Once approved, the Holder must provide the plan to TC and Aboriginal Groups. The Holder must implement the plan to the satisfaction of EAO.
19	**Human Health – Workforce Accommodation Centre** Prior to developing a workforce air quality health plan the Holder must, in consultation with MOH, MOE and WorkSafe BC, complete a human health risk assessment regarding the potential effects of air quality on workers residing at the workforce accommodation centre, to the satisfaction of EAO. The assessment must consider all criteria air contaminants assessed in the Holder's Application for an EAC. The Holder must develop, in consultation with MOE, MOH, and OGC, a workforce air quality health plan that must: • Include the results of baseline data and the human health risk assessment to support monitoring; • Identify mitigation measures to reduce the risks posed by air emissions to the health of residents of the workforce accommodation centre to an acceptable level; • Include measures to monitor and report on the effectiveness of the mitigation set out in the plan; and • Provide an adaptive management plan, which includes the development of additional and/or alternative mitigation measures to address the effects of air quality on the health of residents of the workforce accommodation centre, as required.

	The Holder must provide the plan to EAO no less than 60 days prior to the Holder's planned date to establish the workforce accommodation centre. The Holder must not establish the workforce accommodation centre until the plan is approved by EAO. Once approved, the Holder must provide the final plan to MOE and MOH. The Holder must implement the plan to the satisfaction of EAO.
20	**Environmental Management Plans** The Holder must develop, to the satisfaction of EAO, a construction environmental management plan and an operations environmental management plan in accordance with section 12 of the Application. The Holder must demonstrate reasonable efforts to engage with Aboriginal Groups in developing and implementation of the plans. The Holder must provide the construction environmental management plan to EAO and Aboriginal Groups no less than 60 days prior to the Holder's planned date to commence Construction. The Holder must implement the plan to the satisfaction of EAO. The Holder must provide the operations environmental management plan to EAO and Aboriginal Groups no less than 60 days prior to the Holder's planned date to commence Operations. The Holder must implement the plan to the satisfaction of EAO.
21	**Environmental Monitor** Prior to commencing Construction, the Holder must retain the services of a Qualified Professional as an environmental monitor throughout the Construction phase of the Project with demonstrated experience and knowledge of environmental monitoring for construction projects in BC. The Holder must give the Environmental Monitor the authority to stop Project work that does not comply with: a. the terms and conditions of the EAC; b. the mitigation measures described in the plans required by the EAC; or c. any approvals, authorizations, or other regulatory requirements applicable to the Project or the Holder. The Environmental Monitor must be retained by the Holder throughout Construction. The Holder must notify EAO of any non-compliance with the EAC within 72 hours. The Holder must ensure that the Environmental Monitor prepares monthly reports on the Holder's compliance with (a), (b) and (c) above. These reports must be retained by the Holder through the Construction phase of the Project and for five years after commencing Operations. The reports must be provided to EAO and OGC upon request.
22	**Aboriginal and Public Consultation** The Holder must continue to implement the EAO-approved LNG Canada Aboriginal Consultation Plan (dated August 2013) and the EAO-approved LNG Canada Public Consultation Plan (dated August 2013) for all phases of the Project. The implementation of these plans must include information sharing and discussion of site-specific mitigation measures, including the development and implementation of social and environmental plans (including compensation plans) developed to meet regulatory requirements of the

	Project. The Holder must provide an Aboriginal consultation report and a public consultation report to EAO: • Two years after the commencement of Construction; and • One year after the commencement of Operations. The Holder must share the Aboriginal consultation report with Aboriginal Groups for review and comment prior to providing it to EAO.
23	**Cultural Awareness** The Holder must demonstrate reasonable efforts to engage with interested Aboriginal Groups to develop a cultural awareness program for employees prior to the commencement of Construction. At the time of submitting compliance reports required by the EAC's clause 1, the Holder must report to EAO on the program and its implementation. The Holder must implement the program to the satisfaction of EAO.
24	**Aboriginal Monitoring** The Holder must, through discussion with Aboriginal Groups, seek to provide opportunities for members of Aboriginal Groups to participate in monitoring activities identified in the plans in this Table of Conditions that are occurring within their asserted traditional territory. In the Aboriginal consultation reports required by Condition #21 to EAO, the Holder must include information regarding the opportunities provided and the participation of members of Aboriginal Groups in monitoring activities.

APPENDIX 3. LABORATORY DISSECTION AND ANALYSIS PROTOCOL

APPENDIX 3 - ANIMAL DISSECTION PROTOCOL

1.0 ANIMAL DISSECTION

1.1 OBJECTIVE

The objective when conducting animal dissections is to extract the recommended tissue quantity from the specimens to conduct a high-resolution chemical analysis, with a sample number of 15 for each tissue type and each study area. This section provides a step-by-step description for dissecting Dungeness crab (for leg meat and hepatopancreas) and English sole (for filet meat) with photographs of the various steps. The following dissection procedures are based on the experience acquired during the pre-dredge baseline sampling, dissection and analysis period in August and September 2018.

1.2 DISSECTION TOOLS

Proper dissection tools are essential for optimizing tissue yield and reducing contamination during the dissection process. The following dissection tools were used to dissect Dungeness crab and English sole as shown in Figure 1. Their use will be referenced in the following sections.

1. Heavy duty scissors
2. Scalpel
3. Precision scissors (with sharp tip)
4. Safety scissors (with round tip)
5. Spatula (with round and flat ends)
6. Cleaver
7. Round-headed tweezers (with grooved tip)
8. Plastic tweezers (with grooved tip)
9. Scrub brush
10. Dissection board
11. Filtered seawater or extra seawater from field

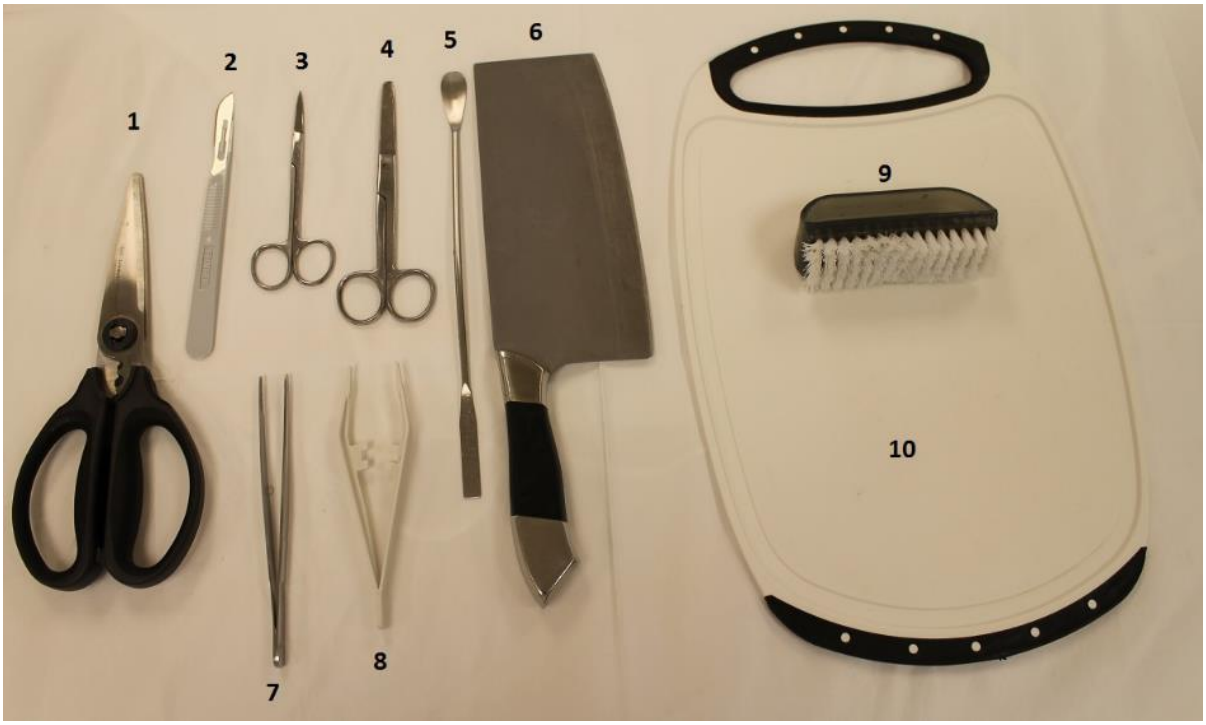

Figure 1 Dissection Tools

1.3 DISSECTION OF DUNGENESS CRABS

The dissection of Dungeness crab is labour intensive, and it requires approximately 30 to 45 minutes to extract the hepatopancreas and leg meat from a single crab. Among the 45 crabs collected from each study area, the hepatopancreas and leg meat will be dissected and retained from 15. For the remaining 30 crabs, only the hepatopancreas will be dissected and retained.

For the 15 crabs that undergo a complete dissection, it is highly recommended to store these crabs at 4°C for at least 24-36 hours before dissection. For example, Dungeness crabs collected in the field on Monday should be dissected on Wednesday. The storage time allows for the crabs to perish, and for the muscle fibres to detach from the inside of the carapace. Once the muscle fibres detach from the carapace, the leg meat can be removed from the shell as a single piece.

If dissection takes place within 36 hours from collection in the field, the muscle fibres may still be adhered to the inside of the carapace. A spatula will be required to scrape the inside of the carapace of every leg to detach the muscle fibres. This can increase the dissection time per crab to 60 minutes, and it reduces the total yield of leg meat by approximately 10% to 25% because it is difficult to access some of the leg meat with a spatula. The 36 hour storage period is not required for the 30 crabs that are dissected only for their hepatopancreas.

Dissection time and tissue recovery can be optimized by using tools that are well-suited for the task. The recommended dissection tools are: heavy-duty scissors, precision scissors, spatula, cleaver, round-head tweezers, plastic tweezers, scrub brush, and dissection board. Pre-weighed 200 mL glass jars with screw-top lids are recommended for placing tissues in prior to homogenization.

Each step of the dissection process is described in Table 1. Photos for key steps are provided after Table 1.

Table 1 Dungeness Crab Dissection Instructions

Step	Instructions
1	Remove a Dungeness crab from its zip-lock bags. If the crab has sediment adhered to its shell, clean the exterior using a scrub brush and rinse it off with seawater. Place the crab upside-down on the dissection board (Figure 2). Use a sharp tool to lift the abdominal plate and twist it off.
2	Using a cleaver, pierce the carapace down the center-line of the crab (Figure 3). The objective is to penetrate the carapace only. Do not cut through the crab beyond the carapace.
3	With each hand, hold onto the four legs on each half of the crab. Use a wringing motion to twist and detach the two halves of the crab legs from the main shell. The two halves of the crab will detach from the main shell, exposing hepatopancreas in the main shell along with other organs (Figure 4).
4	When dissecting out the hepatopancreas, it is critically important to extract as much tissue as possible from every crab. To extract the hepatopancreas, use a pair of round-headed tweezers to pull clusters of the organ out of the main shell. The hepatopancreas at the center of the main shell is integrated with other internal organs such as the gonads which are white in colour (Figure 5). It is possible to remove only the hepatopancreas, while leaving these other organs intact (Figure 6). Some hepatopancreas may also be adhered onto the detached legs (Figure 7). Place the hepatopancreas pieces in a pre-weighed glass jar.
5	The hepatopancreas organ also radiates towards the front and side portions of the main shell (Figure 8). A thin clear membrane must be peeled away to expose the hepatopancreas along the sides of the shell. Using round-headed tweezers, extract the hepatopancreas along the sides of the main shell and place it in the pre-weighed glass jar (Figure 9).
6	Once all the hepatopancreas has been extracted, weigh the jar (lid included) and record the weight of the hepatopancreas. Store the hepatopancreas at -20 °C. The colour of the hepatopancreas should also be recorded. Currently, the observed hepatopancreas colours include yellow, orange, green, grey, and black (Figure 10). Based on the appearance of the hepatopancreas, the order of these colours may also be a general indicator on the health of the organ (i.e., yellow and orange = healthy, well-defined organ structure; grey, green, or black = unhealthy, degraded or undefined organ structure). A minimum of 15 grams of hepatopancreas must be extracted from each crab to yield sufficient tissue for analysis. If a crab yields less than 15 grams of hepatopancreas, there may be insufficient tissue for analysis. In this case, another hepatopancreas sample that weighs 30 grams or more (i.e., double the minimum tissue weight) can be used for two types of analysis.
7	To extract the leg meat, first separate all 8 legs (Figure 11). Using heavy-duty scissors, cut the carapace of the legs and claws along its length (Figure 12). If the crab was collected from the field within 36 hours, a spatula will be needed to scrape the inside of the carapace to detach the muscle fibres. If the crab was collected from the field more than 36 hours ago, large segments of the leg meat can be pulled out using tweezers, without the need to scrape the carapace. Remove any bits of the carapace or crab cartilage from the meat. Place the leg meat in a pre-weighed jar. Repeat this process for all 8 legs or until 50 grams of leg meat is collected.
8	Record the mass of the leg meat and store the sample at -20 °C until the sample is ready for analysis. A minimum of 50 grams must be extracted from 15 individual crabs. The average crab yields approximately 150 to 200 grams of leg meat (or 25% of the total body weight).

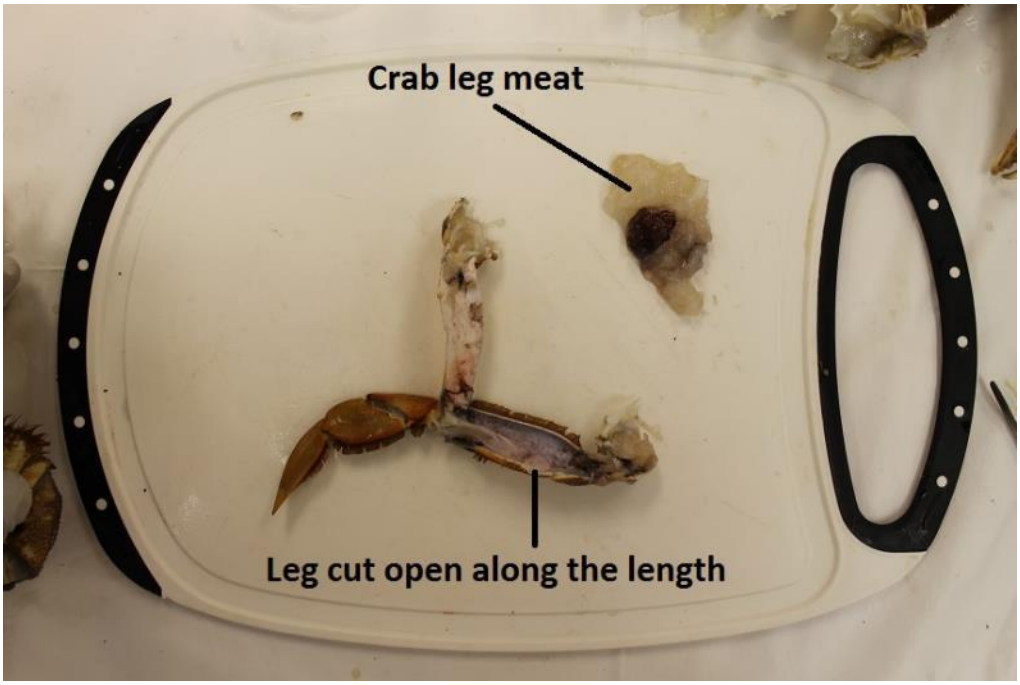

Figure 12 Crab Leg Cut Open Along Length with Meat Extracted

1.4 DISSECTION OF ENGLISH SOLE

The dissection of sole requires approximately 20 minutes to extract the meat (excluding skin and bones). Tissue recovery for a sole dissection can be optimized through dissection experience, and by using tools that are well-suited for the task. The recommended dissection tools are: heavy-duty scissors, scalpel, safety scissors, spatula, and a dissection board.

Each step of the dissection process is described in Table 2. Photos for key steps are provided after Table 2.

Table 2 Sole Dissection Instructions

Step	Instructions
1	Remove a sole from its Ziplock bag and place it on the dissection board. Use paper towels to wipe the mucous layer off both sides of the sole. Removing the mucous layer will make the dissection process easier. Lay the sole with the lighter side up (Figure 13).
2	Use a pair of heavy-duty scissors and cut through the head and along the roof of the body cavity. The dorsal and ventral spines must also be cut off (Figure 14). Discard the head and spines.
3	To extract the meat, take a scalpel and insert it into the tail from the ventral to dorsal side. The scalpel should be resting just beneath the skin, with the meat and spine under the scalpel (Figure 15).
4	Use the scalpel to cut through to the end of the tail, creating a flap of skin (Figure 16).
5	Using the flat end of the spatula, press down hard on the exposed portion of the spine to hold the sole in place. Use the other hand to grasp the flap of skin, and pull it towards the head, peeling the entire skin off the sole (Figure 17). If performed properly, the skin can be peeled off while leaving the meat attached to the body. If performed incorrectly, the skin, meat, and some bones may detach from the main body. Use the spatula to scrape of any meat adhered to the skin and place it in a pre-weighed glass jar.
11	Using the curved end of the spatula, gently press into the upper half of the meat starting from one end of the spine. Run the spatula along the length of the spine, and the meat will detach as a single filet without bones (Figure 18). Repeat this process with the lower half of the filet (Figure 19).
12	Flip the sole onto its other side. Start from Step #8 and repeat the process of removing the skin and fileting the meat on the other side. Once completed, the meat from the sole will be completely extracted, leaving only the 2 halves of the skin, and the skeleton (Figure 20). Weigh and record the weight of the meat and store it at -20 °C.

1.5 ASSIGNING TISSUE SAMPLES FOR LABORATORY ANALYSIS

Once all the animal dissections have been completed, create a table with an inventory showing the tissue weights for each container of crab hepatopancreas, crab meat, and sole meat.

If the permitted quota of crabs and sole were collected at each study area, there will be sufficient tissue to conduct all of the laboratory analyses. However, if the permitted quota is not met, or there is a low tissue yield for some specimens during the dissection process, there may be insufficient tissue to conduct the full range of laboratory analysis. In this situation, it may be necessary to adjust the tissue allocations in order to meet the sample number of 15 and meet the minimum tissue volume required for the analysis.

The following sections describe methods to resolve issues when there is insufficient tissue for analysis.

1.5.1 Crab Hepatopancreas

In each study area, the permitted quota for Dungeness crab is 45. The 45 hepatopancreas samples are divided into three groups of 15. Each group will be analyzed for one of the following sets of analysis:

- PAH, total metals, moisture content, lipid content (minimum of 15 grams required)
- PCB, moisture content, lipid content (minimum of 15 grams required)
- PCDD/F, moisture content, lipid content (minimum of 15 grams required)

In general, 10 grams of tissue is required for each organics analysis, while 5 grams are required for moisture and lipid content analysis. Total metals can be analyzed with a 0.2 gram sample. The minimum tissue volume per hepatopancreas is 15 grams. If possible, 30 grams or more of hepatopancreas should be extracted to provide archive material that can be stored at -20 °C in the event of laboratory re-works.

If fewer than 45 Dungeness crabs are collected from a study area, or if a crab yields less than 15 grams of hepatopancreas tissue, there would not be enough hepatopancreas tissue for the full range of analysis. However, if the weight of a hepatopancreas sample exceeds 30 grams, a single hepatopancreas can be used to analyze for two organic groups instead of one. For example, if there are only 40 Dungeness crabs collected from a study area, at least 5 of the hepatopancreas samples must weigh more than 30 grams to supplement the remaining analyses. An example of the assigned analyses for hepatopancreases larger than 30 grams is as follows:

- PAH, PCB, total metals, moisture content, lipid content (30 grams required)
- PCDD/F, moisture content, lipid content (15 grams required)

1.5.2 Dungeness Crab Meat

There are no anticipated issues for meeting the minimum tissue requirements of 50 grams for Dungeness crab meat. 100 grams of crab meat is the recommended amount to provide archive material that can be stored at -20 °C in the event of laboratory re-works. Among the 45 Dungeness crabs collected in each study area, 15 will undergo a full dissection that includes the leg meat. If any of these dissections yield less than 50 grams of leg meat, there would still be 30 crabs remaining to meet the tissue requirement. The 50 grams of crab meat will be submitted for PAH, PCB, PCDD/F, total metals, moisture content, and lipid content analysis.

1.5.3 English Sole Meat

In each study area, the permitted quota for sole is 45. However, sole in the Kitimat Arm are small, and ranged from 50 to 300 grams during the 2018 pre-dredge baseline collection. An adult English sole is documented in literature to reach up to 1.5 kg, but such large sole were not observed during the 2018 pre-dredge baseline collection.

Due to their small size, a single sole can not yield the recommended 100 grams of tissue, given that approximately 25-30% of the body weight is meat. Therefore, sole meat must be composited from multiple sole to achieve either the minimum tissue weight of 50 grams, or the recommended tissue weight of 100 grams. The meat from two English sole is typically sufficient to yield the minimum tissue weight of 50 grams.

1.6 SUMMARY

Table 3 summarizes the resulting tissue yields for each study area. For example, the collection of 45 Dungeness crabs is permitted in each study area. These 45 crabs must yield at least 45 individual hepatopancreas organs with a tissue weight ranging from 15 to 30 grams. The 45 hepatopancreas organs will be split into 3 groups of fifteen, and each group will be submitted for one organics analysis among PAH, PCB, or PCDD/F. Individual meat samples for crab and sole can be submitted for PAH, PCB, PCDD/F and metal analysis, because there is sufficient tissue available.

Any extra hepatopancreas or meat samples will be stored at -20 °C and remain viable for analysis for at least 1 year.

Table 3 Summary of Tissue Dissection Objectives

Animal	Permitted Quota	Tissue	Sample Number	Minimum Tissue Weight	Recommended Tissue Weight	Laboratory Analysis
Dungeness Crab	45	Hepatopancreas	15	15 grams	30 grams	PAH, metals, moisture, lipids
		Hepatopancreas	15	15 grams	30 grams	PCB, moisture, lipids
		Hepatopancreas	15	15 grams	30 grams	PCDD/F, moisture, lipids
		Meat	15	50 grams	100 grams	PAH, PCB, PCDD/F, metals, moisture, lipids
English Sole	45	Meat*	15	50 grams	100 grams	PAH, PCB, PCDD/F, metals, moisture, lipids
NOTE: * Denotes that the meat sample may be a composite from multiple animals						

APPENDIX 4. SAMPLE CALCULATIONS

Sample Calculation of the Estimated Daily Intake (EDI) for an Aboriginal Adult's Exposure to Copper and PAH in Kitimat Harbour

Receptor Characteristics	
Age range:	Aboriginal Adult (20 - 80 years old)
Body weight (BW):	76.5 kg-bw
Crab ingestion rate (IR_{CRAB}):	0.223 kg/day
Hepatopancreas ingestion rate (IR_{HEP}):	0.02 kg/day
Sole ingestion rate (IR_{SOLE}):	0.223 kg/day

Formula to calculate Estimated Daily Intake as shown in Section 5.2 of the HHRA.

$$EDI_{COPC} = \frac{IR_{FOOD} \times C_{FOOD} \times F}{BW}$$

EDI_{COPC} = Estimated daily intake of COPC from a specific food (mg/kg-bw-day)

IR_{FOOD} = Ingestion rate for a specific food (kg/day)

C_{FOOD} = 95% UCLM concentration of a COPC in a specific food (mg/kg)

F = Consumption frequency, assumed to be every day of the year or 1 (unitless)

BW = Body weight (kg-bw)

Marine Country Food	IR_{FOOD} (kg/day)[1]	F	C_{FOOD} (mg/kg)[2]		BW (kg)[1]	EDI_{COPC} (mg/kg-bw-day)[3]	
			Copper	PAH		Copper	PAH
Crab Meat	0.223	1	4.03	0.000094	76.5	1.17E-02	2.76E-07
Hepatopancreas	0.02	1	40.49	0.000801	76.5	1.06E-02	2.00E-07
Sole Meat	0.223	1	0.115	0.0	76.5	3.35E-04	1.28E-06

[1] Human receptor characteristics shown in Table 5-1 of the HHRA for Aboriginal adults.

[2] 95% UCLM Concentrations are the 2020 post-dredge concentrations in Kitimat Harbour as shown in Table 5-2 of the HHRA.

[3] EDI values are in Table 5-4 and Table 5-8 of the HHRA for Aboriginal adults consuming foods from Kitimat Harbour during the 2020 post-dredge period.

Sample calculation of the HQ for an Aboriginal adult's exposure to copper from consuming marine country foods during the 2020 post-dredge period in Kitimat Harbour

Formula to calculate Hazard Quotient as shown in Section 6.1 of the HHRA.

$$HQ_{COPC} = \frac{EDI_{COPC}}{TRV_{COPC}}$$

HQ_{COPC} = Hazard quotient for a specific COPC

EDI_{COPC} = Estimated daily intake of COPC from a specific food (mg/kg-bw-day)

TRV_{COPC} = Toxicological reference value for a specific COPC (mg/kg-bw-day)

Marine Country Food	EDI_{COPC} [1] (mg/kg-bw-day)	TRV_{COPC} [2]	HQ_{COPC} [3]
Crab Meat	1.17E-02	0.141	0.09
Hepatopancreas	1.06E-02	0.141	0.07
Sole Meat	3.35E-04	0.141	0.01

[1] EDI values for copper are in Table 5-8 of the HHRA.

[2] TRV values are in Table 4-3 of the HHRA.

[3] HQ values for copper are in Table 6-4 of the HHRA.

Sample calculation of the ILCR for an Aboriginal adult's exposure to PAH from consuming marine country foods during the 2020 post-dredge period in Kitimat Harbour

Formula to calculate Incremental Lifetime Cancer Risk as shown in Section 6.2 of the HHRA.

ILCR = (Estimated Lifetime Daily COPC Exposure) x (TRV)

ILCR = Incremental lifetime cancer risk (unitless)

Estimated Lifetime Daily COPC Exposure = EDI_{COPC} for PAH

TRV_{COPC} = Carcinogenic TRV for PAH = 2.3 $(mg/kg\text{-}day)^{-1}$

Marine Country Food	EDI_{COPC} [1] (mg/kg-bw-day)	TRV_{COPC} [2]	ILCR [3]
Crab Meat	2.76E-07	2.3	6.34E-07
Hepatopancreas	2.00E-07	2.3	4.61E-07
Sole Meat	1.28E-06	2.3	2.95E-06
Total ILCR			4.04E-06

[1] EDI values are in Table 5-4 of the HHRA.

[2] Carcinogenic TRV value for PAH is in Table 4-3 of the HHRA.

[3] ILCR values are in Table 6-6 of the HHRA.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless

indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing. Maxxam is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by Maxxam, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.

RDL = Reportable Detection Limit
Lab-Dup = Laboratory Initiated Duplicate
(1) Duplicate RPD for (Ba) above control limit - Non-homogenous sample - Increased variability of results
(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(3) Duplicate RPD for (Pb) above control limit - Non-homogenous sample - Increased variability of results at or near RDL

RDL = Reportable Detection Limit
Lab-Dup = Laboratory Initiated Duplicate
(1) Duplicate RPD for (Mercury) above control limit - Non-homogenous sample - Increased variability of results at or near RDL

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

RDL = Reportable Detection Limit
Lab-Dup = Laboratory Initiated Duplicate
(1) Duplicate RPD for (Mo) above control limit - (10% of analytes failure allowed).
(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

RDL = Reportable Detection Limit
Lab-Dup = Laboratory Initiated Duplicate
(1) Duplicate RPD for (Ca) above control limit - Non-homogenous sample - Increased variability of results. Re-analysis yields similar results.

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(3) Duplicate RPD for (Mn) above control limit - Non-homogenous sample - Increased variability of results. Re-analysis yields similar results.

Total (Wet Wt) Strontium (Sr)	mg/kg	2.23	2.02	0.997	1.90	5.56	0.013	9291911

RDL = Reportable Detection Limit
Lab-Dup = Laboratory Initiated Duplicate
(1) Duplicate RPD for (B) above control limit - Non-homogenous sample - Increased variability of results. Re-analysis yields similar results.

(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

STANTEC CONSULTING LTD
Client Project #: 123220082.843.203
Site Location: KITIMAT HARBOUR

			Matrix Spike		Spiked Blank		Method Blank		RPD		QC Standard	
QC Batch	Parameter	Date	% Recovery	QC Limits	% Recovery	QC Limits	Value	UNITS	Value (%)	QC Limits	% Recovery	QC Limits
9299259	Total (Wet Wt) Zirconium (Zr)	2019/01/31			110	80 - 120	<0.040	mg/kg				

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

(1) Reference Material for (Sb) exceeds acceptance criteria. 10% of analytes failure in multi-element scan is allowed.

(2) Reference Material for (Tl) exceeds acceptance criteria. 10% of analytes failure in multi-element scan is allowed.

(3) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.

(4) Reference Material for (Lead) outside acceptance criteria due to digestion limitation

(5) Blank Spike for (Ag) outside acceptance criteria (10% of analytes failure allowed).

(6) Method Blank exceeds acceptance limits for (As). Sample values for (As) are >10x the concentration of the method blank and the contamination is considered irrelevant.

(7) Method Blank exceeds acceptance limits for (K). Sample values for (K) are >10x the concentration of the method blank and the contamination is considered irrelevant.

(8) Method Blank exceeds acceptance limits for (P). Sample values for (P) are >10x the concentration of the method blank and the contamination is considered irrelevant.

(9) Method Blank exceeds acceptance limits for (Asr). Sample values for (Copper) are >10x the concentration of the method blank and the contamination is considered irrelevant.

(10) Blank Spike for (Na) outside acceptance criteria (10% of analytes failure allowed).

(11) Method Blank exceeds acceptance limits for (Cu). Sample values for (Cu) are >10x the concentration of the method blank and the contamination is considered irrelevant.

Special Instructions

- All samples on hold.
- The analyses indicated will apply after the hold is released.
- Report as wet wet concentrations
- Report the individual congeners of toxic/carcinogenic PAH, PCB, dioxins and furans
- Prioritize lowering the detection limits for PAH, PCB, and dioxins as discussed w/Barry Loescher

Unless otherwise agreed to in writing, work submitted on this Chain of Custody is subject to Maxxam's standard Terms and Conditions. Signing of this Chain of Custody document is acknowledgement and acceptance of our terms which are available for viewing at www.maxxam.ca/terms.

☐ Other

Special Instructions

- All samples on hold.
- The analyses indicated will apply after the hold is released.
- Report as wet wet concentrations
- Report the individual congeners of toxic/carcinogenic PAH, PCB, dioxins and furans
- Prioritize lowering the detection limits for PAH, PCB, and dioxins as discussed w/Barry Loescher

Unless otherwise agreed to in writing, work submitted on this Chain of Custody is subject to Maxxam's standard Terms and Conditions. Signing of this Chain of Custody document is acknowledgement and acceptance of our terms which are available for viewing at www.maxxam.ca/terms.

Special Instructions

- All samples on hold.
- The analyses indicated will apply after the hold is released.
- Report as wet wet concentrations
- Report the individual congeners of toxic/carcinogenic PAH, PCB, dioxins and furans
- Prioritize lowering the detection limits for PAH, PCB, and dioxins as discussed w/Barry Loescher

Unless otherwise agreed to in writing, work submitted on this Chain of Custody is subject to Maxxam's standard Terms and Conditions. Signing of this Chain of Custody document is acknowledgement and acceptance of our terms which are available for viewing at www.maxxam.ca/terms.

Special Instructions

- All samples on hold.
- The analyses indicated will apply after the hold is released.
- Report as wet wet concentrations
- Report the individual congeners of toxic/carcinogenic PAH, PCB, dioxins and furans
- Prioritize lowering the detection limits for PAH, PCB, and dioxins as discussed w/Barry Loescher

Unless otherwise agreed to in writing, work submitted on this Chain of Custody is subject to Maxxam's standard Terms and Conditions. Signing of this Chain of Custody document is acknowledgement and acceptance of our terms which are available for viewing at www.maxxam.ca/terms.

CERTIFICATE OF ANALYSIS – REVISED REPORT

BV LABS JOB #: B901006
Received: 2019/01/03, 09:00

Sample Matrix: Tissue
Samples Received: 308

Analyses	Quantity	Date Extracted	Date Analyzed	Laboratory Method	Reference
PCB Congeners in Tissue (1668A) (3)	11	2019/05/04	2019/05/15	BRL SOP-00408 BRL SOP-00409	EPA 1668A m
PCB Congeners in Tissue (1668A) (3)	1	2019/05/04	2019/05/22	BRL SOP-00408 BRL SOP-00409	EPA 1668A m
PCB Congeners in Tissue (1668A) (3)	2	2019/05/05	2019/05/16	BRL SOP-00408 BRL SOP-00409	EPA 1668A m
PCB Congeners in Tissue (1668A) (3)	13	2019/05/05	2019/05/17	BRL SOP-00408 BRL SOP-00409	EPA 1668A m

Remarks:

Bureau Veritas Laboratories are accredited to ISO/IEC 17025 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by BV Labs are based upon recognized Provincial, Federal or US method compendia such as CCME, MELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in BV Labs profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and BV Labs in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported; unless indicated otherwise, associated sample data are not blank corrected. Where applicable, unless otherwise noted, Measurement Uncertainty has not been accounted for when stating conformity to the referenced standard.

BV Labs liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. BV Labs has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by BV Labs, unless otherwise agreed in writing. BV Labs is not responsible for the accuracy or any data impacts, that result from the information provided by the customer or their agent.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested. When sampling is not conducted by BV Labs, results relate to the supplied samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix “m” indicates test methods incorporate validated modifications from specific reference methods to improve performance.
* RPDs calculated using raw data. The rounding of final results may result in the apparent difference.
(1) Analysis was conducted according to Bureau Veritas Laboratories' method BRL SOP-00410 and modified where applicable based on the sample matrix. This test is not Standards Council of Canada accredited for this matrix.
(2) Sample(s) analyzed using methodologies that have not been subjected to Bureau Veritas Laboratories' standard validation process for the submitted matrix and is not an Accredited method. Analysis performed with client consent, however results should be viewed with discretion
(3) Analysis was conducted according to Bureau Veritas Laboratories methods BRL SOP-00408 and BRL SOP-00409 and modified where applicable based on the sample matrix. This test is not Standards Council of Canada accredited for this matrix.

N/A = Not Applicable
(1) Internal standard recovery meets method limits.
(2) Recovery or RPD for this parameter is outside control limits. The overall quality control for this analysis meets acceptability criteria.
(3) Internal standard recovery is below method limits. Natives found are trace levels in the sample.

EDL = Estimated Detection Limit

RDL = Reportable Detection Limit

TEF = Toxic Equivalency Factor, TEQ = Toxic Equivalency Quotient,
The Total Toxic Equivalency (TEQ) value reported is the sum of Toxic Equivalent Quotients for the congeners tested.

WHO(2005): The 2005 World Health Organization, Human and Mammalian Toxic Equivalency Factors for Dioxins and Dioxin-like Compounds

QC Batch = Quality Control Batch

** CDF = Chloro Dibenzo-p-Furan

N/A = Not Applicable

* CDD = Chloro Dibenzo-p-Dioxin

(1) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.

(2) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.

RT>2 seconds - PCDD/DF analysis-Peak maxima of monitored ions exceeds 2 seconds

(1) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.

(2) RT > 3 seconds - PCDD/DF analysis - Peak detected exceeds expected retention time (from internal standard) by greater than 3 seconds.

RT>2 seconds - PCDD/DF analysis-Peak maxima of monitored ions exceeds 2 seconds

EDL = Estimated Detection Limit

RDL = Reportable Detection Limit

TEF = Toxic Equivalency Factor, TEQ = Toxic Equivalency Quotient,
The Total Toxic Equivalency (TEQ) value reported is the sum of Toxic Equivalent Quotients for the congeners tested.

WHO(2005): The 2005 World Health Organization, Human and Mammalian Toxic Equivalency Factors for Dioxins and Dioxin-like Compounds

QC Batch = Quality Control Batch

* CDD = Chloro Dibenzo-p-Dioxin

N/A = Not Applicable

** CDF = Chloro Dibenzo-p-Furan

(1) EMPC / NDR - Peak detected does not meet ratio criteria and has resulted in an elevated detection limit.
