Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Surface Water: Water Quality.	Demobilization of grout batch mixing plant (after cap pour).	Possible equipment decontamination (washout) may affect water quality on site.	Proper design, inspection and management procedures of washout pit.	Sampling prior to dewatering will ensure negligible effects to water quality.	No adverse residual effects.
Surface Water: Water Quality.	Demolition of above grade structures.	Demolition affects water quality due to potential runoff.	Dust suppression, runoff diversion and standard construction procedures will reduce effect on water quality.	Effects on surface water quality are temporary, minor and localized, and not expected to affect overall surface water quality.	No adverse residual effects.
Surface Water: Water Quality.	Sizing of material.	Outdoor cutting steel and crushing masonry may affect water quality due to potential run-off.	Dust suppression, runoff diversion and standard construction procedures will reduce effect on water quality.	Effects on surface water quality are temporary, minor and localized, and not expected to affect overall surface water quality.	No adverse residual effects.
Surface Water: Water Quality.	Set up laydown area and perform clearance surveys.	Run-off from material stored outdoors may affect water quality.	Utilizing paved areas for laydown will reduce infiltration, as well as runoff diversion will reduce the effect on surface water quality.	Effects on surface water quality are temporary, minor and localized, and not expected to affect overall surface water quality.	No adverse residual effects.
Surface Water: Site Drainage.	Concrete cap installation.	Concrete cap installation will impede water infiltration, thus affecting site drainage.	Sediment and erosion controls.	The concrete cap covers the footprint of the current building; thus, the concrete cap may have a minor, but unmeasurable effect on site drainage.	No adverse residual effects.
Surface Water: Site Drainage.	Engineered cover.	Grading and installing layers of earth will affect site drainage and alter soil run off, affecting site drainage	Sediment and erosion controls.	The engineered cover may have a minor effect on site drainage.	No adverse residual effects.
Surface Water: Site Drainage and Water Quality.	Site demobilization.	Possible equipment decontamination via washout, if required, may affect water quality on site. Site remediation may alter site drainage.	Proper design, inspection and management procedures of washout pit.	No measurable effect is expected from equipment decontamination. Site remediation may increase local soil infiltration, having a positive effect on site drainage.	No adverse residual effects.

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Institutional Controls and Post-Institutional Controls					
Surface Water: Water Quality (radiological).	Facility performance during the postclosure period.	Groundwater will flow into the eventually degraded grouted structure. Contaminated groundwater will flow out and eventually into the Ottawa River.	In-design mitigations to isolate and contain the inventory in order to reduce the potential of groundwater contamination.	Groundwater will flow into the eventually degraded grouted structure. Contaminants will reach surface water, river sediment and shoreline sediment.	Effects of radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.
Surface Water: Water Quality (non-radiological).	Facility performance during the postclosure period.	Groundwater will flow into the eventually degraded grouted structure. Contaminated groundwater will flow out and eventually into the Ottawa River.	In-design mitigations to isolate and contain the inventory in order to reduce the potential of groundwater contamination.	Groundwater will flow into the eventually degraded grouted structure. Contaminants will reach surface water, river sediment and shoreline sediment.	Effects of non-radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.

9.3.4 Assessment of Residual Effects

Since the surface water environment is a pathway to other environmental components (e.g., aquatic, terrestrial environments and human health), any potential adverse residual effects identified are further assessed within those environmental components (see Sections 9.4.4, 9.6.4, 9.8.4, 9.9.4 and 9.10.2.4).

9.3.5 Monitoring and Follow-up

The surface water (i.e., site drainage, water quality) environment represents a pathway for transfer of an effect to VCs in other environmental components. As discussed in Section 9.1.2.3, a proposed follow-up monitoring program was developed to support the EA Follow-up Program. Specifically, the effluent and environmental monitoring aspects are relevant for the surface water environment. please note that this section discusses only those monitoring considerations specific to the surface water environment, specifically, monitoring details (e.g., parameters, locations/effluent streams, frequency).

Environmental monitoring of the Ottawa River

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

9.3.5.1 Effluent Monitoring

Each potential effluent stream during the Decommissioning Execution and Institutional Controls phases was evaluated in the proposed follow-up monitoring program to determine the need for monitoring following the systematic informed planning process. Monitoring details for those waterborne effluent streams requiring monitoring are summarized for the Decommissioning Execution and Institutional Controls phases in Table 9.3-6and Table 9.3-7 below.

Evaluation criteria for liquid effluent, and actions taken to address exceedances were developed and are presented in the proposed follow-up monitoring program. The generic actions to address exceedances are presented in Section 9.1.2.3 above.

Decommissioning Execution

Table 9.3-6 Waterborne Effluent Monitoring during the Decommissioning Execution Phase

Effluent Stream	Monitoring Required (Y/N)	Parameters to be Monitored	Monitoring Frequency[1]
Water collection points throughout the facility	Y	Radionuclides	Prior to every batch shipment to CRL
		Metals	Prior to every batch shipment to CRL
		Toxic chemicals	Prior to every batch shipment to CRL
		Volume	Per batch
Subsurface drainage	Y	Monitored as part of the proposed follow-up environmental (Section 12.3.2) and groundwater (Section 12.3.3) monitoring	
Surface water drainage	Y	Monitored as part of the proposed follow-up environmental (Section 12.3.2) monitoring	
Washout pit	Y	Radionuclides	Prior to every batch shipment to CRL
		Water Clarity	Prior to every batch shipment to CRL
		pH	Prior to every batch shipment to CRL
		Volume	Per batch

Notes:

1 - Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each effluent stream are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Institutional Controls

Any waterborne releases during the Institutional Controls phase will be monitored as part of environmental monitoring, discussed below (as well as groundwater monitoring in Section 9.5.5).

9.3.5.2 Environmental Monitoring

This section provides a concise summary of the proposed follow-up environmental monitoring in the surface water environment.

Evaluation criteria for the surface water environment, and actions taken to address exceedances were developed and are presented in the proposed follow-up monitoring program. The generic actions to address exceedances are presented in Section 9.1.2.3 above.

Decommissioning Execution

Following the systematic informed planning process, monitoring details were developed for the Decommissioning Execution phase. These monitoring details are summarized in Table 9.3-7 below.

Table 9.3-7 Proposed Surface Water Environmental Monitoring During the Decommissioning Execution Phase

Subcomponent	Sampling Locations	Parameters to be Monitored	Monitoring Frequency[1]
Erosion	Visual inspection of site drainage and erosion will be undertaken as part of CNL's Routine Inspections Procedure (CNL 2018a)		
On-site Surface Water Quality	• Ottawa River shoreline, downgradient of effluent points	• Radionuclides	Monthly
Ottawa River Water Quality	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	• Radionuclides • pH • Water Clarity • Metals	Quarterly
Sediment Quality (*if triggered by tier 2 surface water or groundwater exceedances*)	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	Parameters dependent upon exceedances in other environmental media.	Annually

Notes:

N/A – not applicable
1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.

Institutional Controls

Following the systematic informed planning process, monitoring details were developed for the Decommissioning Execution phase. These monitoring details are summarized in Table 9.3-8 below.

Table 9.3-8 Surface Water Environmental Monitoring During the Institutional Controls Phase

Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
On-site surface water quality	• Ottawa River shoreline, downgradient of effluent points	• Radionuclides	Monthly
Site drainage	Visual inspection of site drainage and erosion will be undertaken as part of CNL's *Surveillance Plan* (Taylor 2019)		
Ottawa River Water Quality	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	• Radionuclides (alpha and beta emitters) • pH • Metals *If triggered* • Radionuclides (gamma emitters)	Quarterly
Sediment Quality *(if triggered by tier 2 surface water or groundwater exceedances, or a potential seismic event scenario)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	(*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annual, if triggered

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

9.3.6 Conclusion

As shown in Table 9.3-5, no adverse residual effects were identified for the surface water environment.

It is important to note that the surface water environment is also a pathway that carries Project emissions to receptors (both human and non-human). While some contaminants (e.g., mercury) can be assessed by comparing their water concentrations against benchmarks, the potential effects of others (e.g., most radionuclides) must be evaluated through the effect of the medium on receptors. The potential effects of Project contaminants on receptors are not necessarily limited to only water pathways (e.g., ingestion); rather, all relevant pathways that can affect a receptor are cumulatively considered.

Project emissions are not expected to have adverse effects on the surface environment because their estimated concentrations in water were found not to have adverse health effects on human receptors (see Sections 9.8.4 and 9.10.2.4) and not to cause undue risk for relevant biota (see Sections 9.4.4 and 9.6.4).

The assessment of potential effects to the surface water environment (Section 9.3.3) took into consideration the concerns expressed by Indigenous Nations, communities, and organizations during engagement activities (Section 9.3.1.1).

Monitoring activities, such as inspection of site drainage properties and analyzing discharges for parameters of concern, will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects.

9.4 Aquatic Environment

9.4.1 Assessment Boundaries

9.4.1.1 Spatial Boundaries

Similar to the aquatic environment baseline characterization in Section 8.4 above, the Site and Local Study Areas for this assessment are consistent with the general spatial boundaries outlined in Section 5.2.1.1. The Regional Study Area for the aquatic environment is consistent with the surface water environment Regional Study Area outlined in Figure 8.3-1 above.

9.4.1.2 Temporal Boundaries

The temporal boundaries for this assessment are the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS.

9.4.2 Selection of VCs

As outlined in Section 5.2.4, VCs for the aquatic environment were selected to encompass the potential effects of the project on the aquatic environment as well as other environmental components such as surface water that act as a pathway to the aquatic environment. VCs were selected to represent a variety

of ecological roles within the aquatic environment. VCs for the aquatic environment and the rationale for their selection are listed in Table 9.4-1.

Table 9.4-1 VC Selection for the Aquatic Environment

Environmental Component	Sub-Category		VC	Effects Assessed		Rationale
				Habitat	Exposure	
Aquatic Environment	Aquatic Invertebrates		Benthic invertebrates		x	Macroinvertebrates occupy the sediment and are an important food source for benthivorous fish species. They are used to evaluate overall ecosystem health.
	Aquatic Vegetation		Aquatic vegetation (e.g., cranberries)		x	Represents a fundamental element of ecosystem health and function.
	Fish	Small	Emerald shiner		x	Numerically important pelagic forage species.
		Large	White sucker		x	Abundant benthivorous, bottom dwelling fish, an important component of that community with available data.
		Large	Lake sturgeon		x	THR (COSEWIC), END (SARO) Benthivorous, bottom-dwelling fish. Lake sturgeon has been subject to fishery exploitation in the past, before population declines. It is the largest, longest-living freshwater fish in Ontario. In the stretch of the Ottawa River that includes NPD, the lake sturgeon is more abundant than elsewhere in the river.

9.4.2.1 Indigenous Engagement Feedback – Key Interests and Concerns related to Aquatic Environment VCs

This section describes how the input from Indigenous engagement activities influenced the selection of VCs in the aquatic environment assessment. Table 9.4-2 summarizes the key interests and concerns raised by Indigenous peoples related to VCs for the evaluation of potential effects to the aquatic environment (based on Table 6.3-1 above), and demonstrates how the interest or concern has been addressed in the present assessment.

Table 9.4-2 Summary of Interests and Concerns Raised During Indigenous Engagement Activities that Influenced the Scope of the Aquatic Environment Assessment

Interest or Concern	How the Interest Was Included in the Assessment
Effects to the aquatic environment	Potential effects of the project on the aquatic environment are assessed using the aquatic plant and animal VCs selected in the EIS (Section 9.4.3). Based on feedback received during Indigenous engagement, CNL confirmed that fish species of Indigenous importance were captured in the assessment, specifically in the EcoRA calculations (Section 6.3). In response to feedback from Indigenous Nations, communities and organizations, CNL also added new VCs that live and/or feed in the aquatic environment: moose, otter and mink. In addition, the aquatic environment is protected by the mitigation measures employed in the other environmental components, e.g., surface water environment, atmospheric environment and geological and hydrogeological environment (Section 9.4.3.2).
Fish and spawning habitat	No physical disturbances to spawning habitat are expected from the NPD Closure project, because the project does not involve any in-water or near-water work such as infilling, construction or blasting (Sections 9.4.3).
Fishing areas	Fishing does not currently occur on the NPD property. The EIS assesses potential effects of the project on fishing as a resource activity practiced by Indigenous peoples in nearby areas (Section 9.9.3).
Impacts on riparian ecosystems	Protection of riparian ecosystems is discussed in the EIS as part of the assessment of potential contaminant exposure effects on the surface water environment and aquatic plant and animal VCs (Sections 9.4.3 and 9.6.3). Based on feedback received during Indigenous engagement, CNL also added new VCs that live and/or feed in the aquatic environment: moose, otter and mink. The project is not expected to have any physical impacts on the current riparian habitat on the NPD site, because no project activities will occur near the shoreline (Section 9.4.3).
Bioaccumulation of contaminants in fish species	Bioaccumulation of contaminants in fish species was taken into account in the assessment of potential exposure risk to fish and fish-eating animal VCs (Sections 9.4.3 and 9.6.3). The EcoRA TSD calculations used conservative assumptions to estimate contaminant concentrations in fish tissue, and to model contaminant transport through the food chain. In addition, to address any concerns related to fish concentrations, the EA Follow-Up Program includes monitoring of contaminants in fish tissue if any surface water exceedances are identified, during the Decommissioning Execution and Institutional Control phases (Section 12.3.2).
Fishing rights	Indigenous peoples' rights to fish are assessed in the EIS using the fishing activities VC under the traditional land and resource use environmental component (Section 9.9.3), and by assessing the effects of the project on fish and fish habitat (Section 9.4.3).

Interest or Concern	How the Interest Was Included in the Assessment
Specific aquatic species identified as important by Indigenous Nations, communities and organizations during engagement activities: trout (lake trout, speckled trout, brook trout) northern pike/jackfish, pickerel/walleye, sauger, muskellunge, cranberries, bass (smallmouth bass), walleye, sturgeon, bait fish, burbot, catfish, chub, lake sturgeon, lake whitefish, mud pout/brown bullhead, sucker, sunfish, yellow perch, and cranberries (see terrestrial environment for semi-aquatic VCs)	Potential effects to all of these species are assessed in the EIS and EcoRA, where they were already included as VCs and/or represented by an EcoRA receptor (e.g., benthic fish, pelagic fish, aquatic vegetation). See Tables 6.3-2 through 6.3-5 for mapping of these species to EcoRA receptors.

Notes:

The table above provides a summary of the concerns expressed by multiple Indigenous Nations, communities and organizations. See Table 6.3-1 for a more detailed listing of key interests and concerns from each Indigenous Nation, community and organization.

9.4.3 Identification of Residual Effects

9.4.3.1 Project-Environment Interactions

As shown in Table 5.2-1, potential effects to the aquatic environment may occur as a result of interactions during the Decommissioning Execution, Institutional Controls and Post-Institutional Controls phases, in particular:

- Installation and operation of the grout batch mixing plant;
- Drawing water from the Ottawa River via dry hydrant;
- Removal of above grade structures;
- Facility performance during the Institutional Controls phase; and
- Facility performance during the Post-Institutional Controls phase.

Interactions in other environmental components (e.g., surface water and geological and hydrogeological environments) have the potential to affect aquatic biota and habitats. This is illustrated in Table 9.4-3 below.

None of the activities of the project are expected to affect fish habitat; there will be no infilling, construction or blasting in the river, and no activities near the wetlands. Releases are considered in the assessment of effects on biota in this section and in the EcoRA TSD.

Table 9.4-3 Project-Environment Interactions in the Aquatic Environment

Phase		Project Works and Activities	Potential Interaction	Habitat	Exposure
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**			
	1.2	Assign storage area for raw materials, ship in sand. Likely east side of licensed area.	Run-off from the stockpiles could result in deposition of suspended solids to the river, potentially affecting aquatic habitat.	x	
	1.4	Draw water from the Ottawa River through the existing dry hydrant	Drawing water from the Ottawa River may affect aquatic biota and habitat	x	
	1.10	Wash out cement truck sluice and pumper truck and slip pipes. (Daily)	Contamination may affect aquatic biota that could enter the washout pit prior to sampling and dewatering.	x	x
	1.11	Sample and dewater the cleaning pit. Emplace sediments into voids in condenser pit.	Washout pit dewatering[7] could result in deposition of suspended solids to the river, potentially affecting aquatic habitat.	x	
	3	**Removal of Above Grade Structure**			
	3.1	Conventional heavy equipment knockdown of reactor hall.	Demolition may contaminate the Ottawa River via runoff and affect aquatic biota.	x	x
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Material sizing may contaminate the Ottawa River via runoff and affect aquatic biota.	x	x
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	Runoff from material stored outdoors could result in deposition of suspended solids to the river, potentially affecting aquatic habitat.	x	
	3.10	Demolish block walls and inside walls around control room and change rooms.	Demolition may contaminate the Ottawa River via runoff and affect aquatic habitat and biota.	x	x
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Demolition may contaminate the Ottawa River via runoff and affect aquatic habitat and biota.	x	x
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Demolition may contaminate the Ottawa River via runoff and affect aquatic habitat and biota.	x	x
	4	**Install Concrete Cap and Engineered Cover**			
	4.2	Engineered Cover (ship in materials, layer and shape mound, install geotextile layer, grade property, install remaining earth layers and seed).	Installation of the engineered cover may increase soil runoff, affecting aquatic habitat and biota.	x	
	5	**Final Site Restoration**			
	5.2	Demobilize Site (remove temporary facilities, decontaminate equipment, remove power upgrades, poles and lines, return transformers).	Washout pit releases could affect aquatic habitat and biota.	x	
C*	**6**	**Long-Term Care and Maintenance**			
	6.8	Facility performance during the Institutional Controls phase	Groundwater will start to enter and eventually resaturate the grouted structure and come into contact with contamination. Dissolved contaminants may reach the Ottawa River.		x
PIC**	**7**	**Post-Institutional Controls**			
	7.1	Facility performance during the Post-Institutional Controls phase	Groundwater in the resaturated and eventually degraded structure will become contaminated. Contaminated and groundwater will flow out and eventually into the Ottawa River.		x

Notes: *IC: Institutional Controls **PIC: Post-Institutional Controls

[7] Handled as a non-routine discharge following approved CNL Environmental Protection processes (Matasich 2021)

9.4.3.2 Proposed Mitigation Measures

The dry hydrant may be used to draw water from the Ottawa River for project activities. The dry hydrant was installed with measures to minimize the impact to the aquatic environment. For example, the strainer was designed for the protection of fish following DFO guidelines with wire mesh over the strainer and a riprap pad under the intake to reduce attractant habitat. The design of the dry hydrant is consistent with DFO guidance on end-of-pipe fish protection screens for small water intakes in freshwater (DFO 2020).

For other project activities, since other environmental components (i.e., surface water environment, atmospheric environment, geological and hydrogeological environment) act as pathways to affect the aquatic environment, mitigations within these components (e.g. in-design mitigation measures, dust suppression, runoff diversion, washout pit design and management etc.) will also reduce potential effects to the aquatic environment.

9.4.3.3 Effects After Mitigation

Decommissioning Execution

Habitat-Related Effects

None of the activities of the project are expected to affect fish habitat because the dry hydrant was installed with measures to minimize impact to the aquatic environment. There will be no infilling or construction in the river, and no activities near the wetlands. Therefore, no effects to aquatic habitat are expected in the Site, Local or Regional Study Areas during the Decommissioning Execution phase.

Any potential releases of suspended solids to the Ottawa River will be mitigated through dust suppression and runoff diversion mitigation measures, as well as sampling prior to washout pit dewatering. As discussed in Section 9.3.3.3, these mitigation measures will ensure negligible effects to surface water quality.

Exposure-Related Effects

In the EcoRA TSD, all radiological and chemical COPCs were screened out of the assessment for the Decommissioning Execution phase. Therefore, no potential exposure-related effects to aquatic biota are expected in the Site, Local or Regional Study Areas during the Decommissioning Execution phase.

For details on the screening process, see the EcoRA TSD or Section 9.1.1.1 above.

Institutional Controls and Post-Institutional Controls

Habitat-Related Effects

No potential habitat-related effects are expected in the aquatic environment in the Site, Local or Regional Study Areas during the postclosure period (Institutional Controls and Post-Institutional Controls phases).

Exposure-Related Effects

During the postclosure period, the grouted structure will degrade, and groundwater will flow into the facility. Contaminants will dissolve into the groundwater, which will continue to flow and release contaminants to the Ottawa River. As shown in the Alkaline Plume Supplementary Document to the PostSA TSD, the alkaline plume flowing from the grouted structure is expected to be sufficiently diluted and of relatively small volume, and are not expected to result in contamination to the aquatic environment.

The EcoRA TSD assesses radiological and non-radiological exposure of aquatic biota to this contamination. The results of the EcoRA are conservatively assumed to apply to the Site, Local and Regional Study Areas, and are briefly summarized as follows:

Radiological

In the EcoRA TSD, 9 radiological contaminants were screened in for all scenarios, as well as an additional 11 radionuclides that were screened in for only specific scenarios. For the Normal Evolution Scenario (NES), the results of EcoRA showed no adverse residual effects on aquatic biota. Sensitivity analysis cases shown in the EcoRA account for uncertainties in parameter values such as sorption (i.e., NES SA – Sorption) and inventory (i.e., NES SA – Radioactive Inventory) among others. No adverse residual effects on aquatic biota were identified for any of the sensitivity cases. The EcoRA TSD also assesses Disruptive Event scenarios (i.e., human intrusion and extreme degradation of engineered structures) and Defence in Depth scenarios (i.e., role of waste form, role of existing facility, role of grout). For these scenarios, approximately 30 radionuclides were screened in. No adverse residual effects were identified for aquatic biota under any of these scenarios. For details on the screening process, see the EcoRA TSD or Section 9.1.1 of this EIS. Therefore, no adverse residual effects to aquatic biota are anticipated from exposure to radiation during the postclosure period (Institutional Controls and Post-Institutional Controls phases).

The EcoRA TSD also studies “What If” scenarios (e.g., mass excavation, river level fall). “What If” scenarios make deliberately extreme assumptions so as to understand the limits of safety performance and are not compared with any criteria because they are extremely unlikely, and in some cases implausible.

Non-radiological

In the EcoRA TSD, no non-radiological contaminants were screened in for the normal evolution scenario for the postclosure period. Similarly, no non-radiological contaminants were screened in for any of the sensitivity cases, disruptive scenarios and defence-in-depth scenario. For details on the screening process, see the EcoRA TSD or Section 9.1.1 of this EIS. Therefore, no adverse residual effects from non-radiological exposure were identified for aquatic biota in the postclosure period (Institutional Controls and Post-Institutional Controls phases).

The EcoRA TSD also studies “What If” scenarios (e.g., mass excavation, river level fall). “What If” scenarios make deliberately extreme assumptions so as to understand the limits of safety performance and are not compared with any criteria because they are extremely unlikely, and in some cases implausible.

9.4.3.4 Prediction Confidence and Uncertainty

Section 6 of the EcoRA TSD outlines the uncertainties associated with the assessment of risk to aquatic biota. Most of these uncertainties are addressed through the use of conservative assumptions (e.g., 100% absorption of intake of a COPC from diet).

REGDOC-2.9.1 on Environmental Principles, Assessments and Protection Measures (CNSC 2020a) provides guidance on characterizing the effects of the project on aquatic flora and fauna, including a full accounting of effects on species of natural conservation status and their habitat. As per REGDOC-2.9.1 (Appendix C.3), the aquatic environment effects assessment was based on predictions from the EcoRA TSD, and covered effects such as the following (from REGDOC-2.9.1):

- effects on habitat;
- effects on aquatic species, including rare or sensitive species; and
- contaminant exposures through environmental and food chain transport.

None of the physical activities of the project are expected to affect fish habitat: there will be no blasting, infilling or construction in the river, and no activities near the wetlands. Neither thermal effects nor impingement and entrainment effects are assessed, as this is not relevant to the project.

REGDOC-2.9.1 (Appendix C.3) requires a clear description of how any predicted effects compare to the expected reference condition for unexposed biota on a biological population basis, taking natural variation into account. Predictions of effects should include sufficient detail to allow follow-up verification.

Uncertainty in animal behaviour is addressed in the EcoRA through the assumption that biota are present in the Site Study Area year-round, which is likely to overestimate the magnitude of exposure for mobile biota (i.e., lake sturgeon, white sucker, emerald shiner).

The calculations in the EcoRA are based on maximum concentrations. However, the duration of any effects is unknown. It has been assumed that any effects are long-term.

9.4.3.5 Residual Effects

Table 9.4-4 summarizes the effects assessment above and presents the residual effects that were identified for the aquatic environment. The residual effects in Table 9.4-4 are grouped by effect rather than by individual interaction as listed in Table 9.4-3.

Table 9.4-4 Summary of Residual Effects in the Aquatic Environment

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution						
Aquatic Environment	Dewatering the washout pit.	Benthic invertebrates Aquatic vegetation Emerald shiner White sucker Lake sturgeon	Equipment washout and dewatering may affect aquatic biota.	Proper design, inspection and management procedures of washout pit. Dewatering releases will be handled as a non-routine discharge following approved CNL Environmental Protection processes (Matasich 2021)	No effects are predicted.	No adverse residual effects.
Aquatic Environment	Draw water from the Ottawa River through the existing dry hydrant	Benthic invertebrates Aquatic vegetation Emerald shiner White sucker Lake sturgeon	Drawing water from the Ottawa River may affect aquatic biota and habitat	The dry hydrant was installed with measures to minimize the impact to the aquatic environment, in consultation with the DFO. Design and use of the dry hydrant will be consistent with DFO guidance (DFO 2020)	No effects are predicted.	No adverse residual effects.
Aquatic Environment	Demolition of above grade structures.	Benthic invertebrates Aquatic vegetation Emerald shiner White sucker Lake sturgeon	Demolition may affect aquatic biota via potential runoff.	Dust suppression, runoff diversion and standard construction procedures will reduce effects.	No effects are predicted.	No adverse residual effects.
Aquatic Environment	Sizing of material.	Benthic invertebrates Aquatic vegetation Emerald shiner White sucker Lake sturgeon	Outdoor cutting steel and crushing masonry may affect aquatic biota via potential run-off.	Dust suppression, runoff diversion and standard construction procedures will reduce effects.	No effects are predicted.	No adverse residual effect.
Institutional Controls and Post-Institutional Controls						
Aquatic Biota (radiological)	Facility performance during the	All aquatic VCs	Groundwater will flow into the eventually degraded structure. Contaminated groundwater may flow out	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination and	Radionuclides are expected to be within	No adverse residual effects.

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
	postclosure period.		and eventually into the Ottawa River. This may be transferred to biota	effects in the terrestrial environment.	acceptance criteria.	
Aquatic Biota (non-radiological)	Facility performance during the postclosure period.	All aquatic VCs	Groundwater will flow into the eventually degraded structure. Contaminated groundwater may flow out and eventually into the Ottawa River. This may be transferred to biota.	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects in the terrestrial environment.	Chemical contaminants are expected to be below benchmarks.	No adverse residual effects
Aquatic Environment: Engineering Degradation (non-radiological)	Instantaneous degradation of the concrete and grout, altering the hydraulic properties and decreasing contaminant transport times.	Benthic invertebrates Aquatic vegetation Emerald shiner White sucker Lake sturgeon	Lead in groundwater reaching the Ottawa River is predicted to contaminate surface water and sediment and may affect aquatic biota.	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects in the aquatic environment.	No undue effects are predicted	No adverse residual effect.
Aquatic Environment: Surface Erosion (radiological)	Flooding of sufficient magnitude has the potential to expose contaminated rock to the surface environment.	Benthic invertebrates Aquatic vegetation Emerald shiner White sucker Lake sturgeon	Exposure to contaminated rock may affect aquatic biota.	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects in the aquatic environment.	No undue effects are predicted	No adverse residual effect.

9.4.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on the aquatic environment have been predicted.

9.4.5 Monitoring and Follow-up

The VCs in the aquatic environment are benthic invertebrates, aquatic vegetation, emerald shiner, white sucker and lake sturgeon. The follow-up and monitoring work undertaken by CNL in other environmental components (i.e., the surface water and geological and hydrogeological environments) is directly related to confirming the EIS findings related to aquatic environment VCs. As discussed in Section 9.1.2.3, a proposed follow-up monitoring program was developed to support the EA Follow-up Program. Specifically, the environmental monitoring aspects are relevant for the aquatic environment. Please note that this section discusses only those monitoring considerations specific to the aquatic environment, specifically, monitoring details (e.g., parameters, locations/effluent streams, frequency).

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

9.4.5.1 Environmental Monitoring

This section provides a concise summary of the follow-up environmental monitoring in the aquatic environment.

Evaluation criteria for the aquatic environment, and actions taken to address exceedances were developed and are presented in the proposed follow-up monitoring program. The generic actions to address exceedances are presented in Section 9.1.2.3 above.

Decommissioning Execution

Following the systematic informed planning process, monitoring details for the aquatic environment were developed for the Decommissioning Execution phase. These monitoring details are summarized in Table 9.4-5 below. No effects were predicted for the aquatic environment in this EIS; the monitoring of media within the aquatic environment was only identified in the event that exceedances of evaluation criteria are measured for contaminants in surface water (tier 2) or sediment in the Ottawa River.

The need for monitoring in the aquatic environment may be triggered if monitoring of Ottawa River surface water identifies exceedances of tier 2 evaluation criteria. Aquatic environment monitoring activities may include fish tissue sampling (triggered by surface water exceedances) or benthic invertebrate community sampling (triggered by sediment exceedances).

Table 9.4-5 Aquatic Environmental Monitoring During the Decommissioning Execution Phase

Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Fish (*if triggered by tier 2 surface water exceedances)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	(*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annual, if triggered
Benthic Macroinvertebrate community (*if triggered by sediment exceedances)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	Benthic macroinvertebrate community metrics	Semi-annually

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Institutional Controls

Following the systematic informed planning process, monitoring details were developed for the Institutional Controls phase. These monitoring details are summarized in Table 9.4-6 below. No effects were predicted for the aquatic environment in this EIS; the monitoring of media within the aquatic environment was only identified in the event that exceedances of evaluation criteria are measured for contaminants in surface water (tier 2) or sediment in the Ottawa River.

The need for monitoring in the aquatic environment may be triggered if monitoring of Ottawa River surface water identifies exceedances of tier 2 evaluation criteria. Aquatic environment monitoring activities may include fish tissue sampling (triggered by surface water exceedances) or benthic invertebrate community sampling (triggered by sediment exceedances).

Table 9.4-6 Aquatic Environmental Monitoring during the Institutional Controls Phase

Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Fish *(if triggered by tier 2 surface water exceedances)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	(*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annual, if triggered
Benthic Macroinvertebrate community (*if triggered by sediment exceedances*)	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	Benthic macroinvertebrate community metrics	Semi-annually

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

9.4.6 Conclusion

As shown in Table 9.4-4, no adverse residual effects were identified for the aquatic environment.

The assessment covered the aquatic VCs of interest to Indigenous Nations, communities, and organizations, including the fish species identified during Indigenous engagement activities (see Sections 6.3, 9.4.1.1).

Monitoring activities in other environmental components (i.e., surface water, and geological and hydrological environments) are cumulatively considered and will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects related to the aquatic environment. If monitoring identifies concerns in the other environmental components, CNL will assess the implications to the aquatic environment (e.g., through discussion with CNL biologists).

9.5 Geological and Hydrogeological Environment

9.5.1 Selection of VCs

As outlined in Section 5.2.4, the geological and hydrogeological environment (i.e. soil quality, groundwater flow and quality) represents features that can be affected by the project and as such would be pathways or mechanisms for transfer of an effect to another environmental component (e.g. surface water environment, aquatic environment). In addition to pathways, specific VCs have been identified in the geological and hydrogeological environment (Table 9.5-1). The potential effects will be considered with respect to these VCs as well as VCs in other applicable environmental components.

Table 9.5-1 VC Selection for the Geological and Hydrogeological Environment

Environmental Component	Pathway or VC	Rationale
Geological and Hydrogeological Environment	Pathway to human health	The potential effects on humans associated with changes in soil and groundwater conditions (radiological and chemical releases and concentrations) as well as groundwater flow and other physical parameters will be considered in the Human Health component.
	Pathway to non-human biota health	The potential effects on non-human biota associated with changes in soil and groundwater conditions (radiological and chemical releases and concentrations) as well as groundwater flow and other physical parameters will be considered for the Aquatic and Terrestrial Environment VCs.
	Pathway to VCs in other environmental components	The potential effects on VCs in other environmental components associated with changes in soil and groundwater conditions (radiological and chemical releases and concentrations, and noise) as well as groundwater flow and other physical parameters will be considered in the applicable environmental components. These will include effects on Surface Water Environment, Aquatic Environment and Terrestrial Environment VCs.
	VC: Soil quality	Potential to affect the Geological and Hydrogeological environment, as soil quality may be affected during construction activities (e.g., release of contaminated particulate matter during removal of above-grade structure). Soil contamination may also occur during the Institutional Controls and Post-Institutional Controls phases, e.g., via surface water and irrigation.
	VC: Groundwater quality	Potential to affect the Geological and Hydrogeological environment, as groundwater will come into contact with contamination during the Institutional Controls phase (i.e., via contact with contamination) and Post- Institutional Controls phase (i.e., via contact with contaminants in the grouted structure).
	VC: Groundwater flow	Potential to affect the Geological and Hydrogeological environment during the Institutional Controls phase: groundwater flow will be affected in a localized area, as groundwater starts to enter the grouted structure.

9.5.1.1 Indigenous Engagement Feedback – Key Interests and Concerns related to Geological and Hydrogeological Environment VCs

This section describes how the input from Indigenous engagement activities influenced the scope of the geological and hydrogeological environment assessment. Table 9.5-2 summarizes the key interests and concerns raised by Indigenous peoples related to the evaluation of potential effects to the geological and hydrogeological environment (based on Table 6.3-1 above), and demonstrates how the interest or concern has been addressed in the present assessment.

Table 9.5-2 Summary of Interests and Concerns Raised During Indigenous Engagement Activities that Influenced the Scope of the Geological and Hydrogeological Environment Assessment

Interest or Concern	How the Interest Was Included in the Assessment
Need better understanding of the groundwater flow system	The existing groundwater flow around the NPD site is discussed in the EIS as part of the determination of baseline hydrogeological conditions (Section 8.5.5). In response to feedback from Indigenous Nations, communities and organizations, CNL has added a groundwater flow VC. CNL also completed additional geoscientific characterization and updated its Geosynthesis TSD to better understand the local geology and hydrogeology. These additional findings are summarized in Section 8.5.3 and 8.5.5. CNL also has a detailed, calibrated groundwater flow model (Groundwater Modelling TSD) used to define hydrogeological conditions into the future to support the PostSA TSD.
Current and future impacts to groundwater quality	The EIS considers project impacts to groundwater quality in Section 9.5.3. The EIS also assesses impacts to VCs in other environmental compartments (e.g., the aquatic environment) from changes to groundwater conditions associated with the project. The baseline groundwater quality conditions, which are summarized in Section 8.5.6, are indicative of past impacts on groundwater. CNL has added groundwater quality and soil quality VCs to the assessment, and has identified mitigation measures related to protection of groundwater and soil from contamination (Section 9.5.3.2).

Notes:

The table above provides a summary of the concerns expressed by multiple Indigenous Nations, communities and organizations. See Table 6.3-1 for a more detailed listing of key interests and concerns from each Indigenous Nation, community and organization.

9.5.2 Assessment Boundaries

9.5.2.1 Spatial Boundaries

Similar to the geological and hydrogeological baseline characterization in Section 8.5 above, the Site and Local Study Areas for this assessment are consistent with the general spatial boundaries outlined in Section 5.2.1.1. The Regional Study Area for the geological and hydrogeological environment is outlined in Figure 8.5-1, and extends five km beyond the Site Study Area.

9.5.2.2 Temporal Boundaries

The temporal boundaries for this assessment are the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS.

9.5.3 Identification of Residual Effects

9.5.3.1 Project-Environment Interactions

As shown in Table 5.2-1, potential effects to the geological and hydrogeological environment may occur as a result of interaction with activities in the Decommissioning Execution, Institutional Controls and Post-Institutional Controls phases:

- Removal of above grade structures;
- Facility performance during the Institutional Controls phase;
- Facility performance during the Post-Institutional Controls phase.

The rationale for these interactions is included in Table 9.5-3 below.

Table 9.5-3 Project-Environment Interactions in the Geological and Hydrogeological Environment

		Project Works and Activities	Rationale
Decommissioning Execution	**3**	**Removal of Above Grade Structure**	
	3.1	Conventional heavy equipment knockdown of reactor hall.	Demolition will release contaminated particulate matter which may affect soil quality.
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Sizing of material will release contaminated particulate matter which may affect soil quality.
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	Material laydown may release contaminated particulate matter which may affect soil quality.
	3.10	Demolish block walls and inside walls around control room and change rooms.	Demolition will release contaminated particulate matter which may affect soil quality.
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Demolition will release contaminated particulate matter which may affect soil quality.
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Demolition will release contaminated particulate matter which may affect soil quality.
IC*	**6.**	**Long-Term Care and Maintenance**	
	6.8	Facility performance during the Institutional Controls phase.	Groundwater will start to enter and eventually resaturate the grouted structure, which will affect groundwater flow in a localized area. Soil contamination may also occur (e.g., via the surface water environment). Groundwater will come into contact with contamination, affecting groundwater quality.
PIC**	**7**	**Post-Institutional Controls**	
	7.1	Facility performance during the Post-Institutional Controls phase.	The groundwater in the resaturated and eventually degraded structure will become contaminated. Soil contamination may also occur (e.g., via irrigation). The alkaline plume study shows essentially no alkaline plume forming for at least 100,000 years post-closure.

Notes:

*IC: Institutional Controls

**PIC: Post-Institutional Controls

As seen in the above table, soil quality and groundwater flow and quality were identified as having potential project-environment interactions as part of the geological environment. No other project-environment interactions have been identified relating to geology and geomorphology. Interrelationships with the groundwater regime are discussed as a part of the hydrogeological environment.

9.5.3.2 Proposed Mitigation Measures

The mitigation measures presented below are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required.

In addition to the in-design mitigation measures identified in Section 4.1 above, the following mitigation measures have been identified to limit and/or eliminate contamination of groundwater and soil:

- survey and remediation of localized areas of contamination in affected areas (e.g. laydown areas, staging areas) as required throughout the project;
- dust suppression and sedimentation, runoff and erosion control mitigation measures identified for the atmospheric and surface water environments in Sections 9.2.3.2 and 9.3.3.2 to minimize and localize effects to soil and groundwater quality;
- design, inspection and management of washout pits and material storage site(s);
- specific spill prevention and clean-up procedures will be prepared by CNL prior to commencement of construction, in accordance with CNL's Management and Monitoring of Emissions procedure (Lambert 2022) to minimize the risk of accidental spills. CNL's Waste Management procedures (Riopel 2020) will be followed for any removal and disposition of contaminated material;
- storage of only material expected to be clean in laydown areas; and
- reduction in the probability of accidental spills that will affect surface water quality through adherence to spill management practices including: health and safety procedures, chemical storage in approved containers, secondary spill containment for harmful substances, spill containment measures and training of personnel in spill containment procedures.

9.5.3.3 Effects After Mitigation

Decommissioning Execution

Site and Local Study Area

In the Decommissioning Execution phase, there are potential effects to soil quality from the release of contaminated particulate during demolition and material sizing. As discussed in Section 8 of the DecomSA TSD, mitigation measures (identified above) will trap and remediate effects to soil quality, and as such, only localized and negligible effects on soil quality are expected. Effects to groundwater flow may occur from the engineered cover; however, these effects are expected to be localized to the area surrounding the concrete cap and engineered cover. No effects are expected on groundwater quality during the Decommissioning Execution phase.

Regional Study Area

Any potential effects within the Site and Local Study Areas are localized. Therefore, no effects are expected to extend into the Regional Study Area during the Decommissioning Execution phase.

Institutional Controls and Post-Institutional Controls

Any potential changes to groundwater flow are expected to occur during resaturation. Any effects on groundwater flow will be temporary and localized to the area surrounding the NPDDF.

The PostSA TSD also considers impacts on soil quality in the Institutional Controls and Post-Institutional Controls phases (e.g., via irrigation of soil used for growing crops).

As discussed in the PostSA TSD, during the Institutional Controls phase, the facility will gradually resaturate, and dissolved contaminants will start leaching out into the surrounding groundwater. Contaminant concentrations in the groundwater surrounding the NPDDF are expected to be much lower than within it. The alkaline plume study shows essentially no alkaline plume forming for at least 100,000 years post-closure.

The project's potential effects on the geological and hydrogeological environment, resulting from changes to groundwater quality, are assessed with respect to VCs in other environmental components (see Sections 9.4.3, 9.6.3, 9.8.3, 9.9.3 and 9.10.3).

Radiological

During the Institutional Controls phase, the concentrations in the surrounding groundwater are dominated by tritium, peaking at around 3,000 Bq/L. By 100 y, concentrations are around 10 Bq/L. For perspective, the current drinking water guideline for tritium is 7,000 Bq/L (Health Canada 2017). This value has also been adopted by Province of Quebec as drinking water criteria for tritium (Quebec Regulation; Chapter Q-2, r. 40). Therefore, the estimated groundwater concentrations are less than the criterion.

The maximum concentrations for the radionuclides with the highest concentrations in groundwater during the assessment timeframe are calculated in the PostSA TSD. These concentrations are presented in Table 9.5-4.

Table 9.5-4 Radionuclides with the Five Highest Concentrations in Groundwater^ (Bq/L)

Time (y)	H3	C14	Ca41	Cl36	Ni59	Total
100	$1x10^{1}$	$5x10^{-2}$	$2x10^{-7}$	$6x10^{-2}$	$<1\ x10^{-10}$	$1x10^{1}$
300	$2x10^{-4}$	$5x10^{-1}$	$8x10^{-6}$	$4x10^{-2}$	$<1\ x10^{-10}$	$5x10^{-1}$
1000	$<1\ x10^{-10}$	$2x10^{0}$	$2x10^{-4}$	$6x10^{-2}$	$<1\ x10^{-10}$	$2x10^{0}$
3000	$<1\ x10^{-10}$	$1x10^{0}$	$2x10^{-1}$	$2x10^{-1}$	$6x10^{-7}$	$2x10^{0}$
10000	$<1\ x10^{-10}$	$1x10^{-1}$	$6x10^{-1}$	$2x10^{-1}$	$4x10^{-4}$	$9x10^{-1}$
30000	$<1\ x10^{-10}$	$3x10^{-3}$	$1x10^{-1}$	$1x10^{-1}$	$1x10^{-2}$	$2x10^{-1}$
50000	$<1\ x10^{-10}$	$3x10^{-4}$	$1x10^{-2}$	$7x10^{-2}$	$4x10^{-2}$	$1x10^{-1}$
Maximum (Bq l-1)	$3x10^{3*}$	$6x10^{0}$	$6x10^{-1}$	$3x10^{-1}$	$4x10^{-2}$	$3x10^{3}$
Time of peak (y)	7	1300	10,000	6,500	50,000	7

Notes:

^ All concentrations relate to the bedrock groundwater. * The early peak is a result of the rapid diffusion of tritium from NPDDF external walls into groundwater at the beginning of the assessment timeframe.

The maximum concentrations in groundwater are below the WHO drinking water guidance (WHO 2022) for tritium and carbon-14 (the other radionuclides have no corresponding guidance levels). All radionuclides are included in dose calculations to estimate effects to human and non-human biota health in Sections 9.4, 9.6, 9.8, and 9.10.2.

The maximum concentrations of radionuclides in the soils overlying the NPDDF are presented in Table 9.5-5 below. All radionuclides are included in dose calculations to estimate effects to human and non-human biota health in Sections 9.4, 9.6, 9.8, and 9.10.2.

Table 9.5-5 Contaminants Present at the Highest Concentration in NPDDF Soil

Time (y)	Radionuclides (Bq/kg)					
	H3	Ni59	C14	Ca41	Cl36	Total
100	$2x10^{2}$	$3 x10^{-8}$	$9 x10^{0}$	$5 x10^{-2}$	$9 x10^{-1}$	$2 x10^{2}$
300	$2x10^{-3}$	$3 x10^{-7}$	$1 x10^{1}$	$4 x10^{-1}$	$9 x10^{-1}$	$1 x10^{1}$
1000	$<1x10^{-10}$	$4 x10^{-6}$	$1 x10^{1}$	$3 x10^{0}$	$9 x10^{-1}$	$2 x10^{1}$
3000	$<1x10^{-10}$	$1 x10^{-4}$	$2 x10^{1}$	$8 x10^{0}$	$8 x10^{-1}$	$3 x10^{1}$
10000	$<1x10^{-10}$	$3 x10^{-2}$	$2 x10^{1}$	$9 x10^{0}$	$2 x10^{-0}$	$3 x10^{1}$
30000	$<1x10^{-10}$	$8 x10^{-1}$	$2 x10^{0}$	$9 x10^{-1}$	$1 x10^{-0}$	$7 x10^{0}$
50000	$<1x10^{-10}$	$5 x10^{0}$	$3 x10^{-1}$	$1 x10^{-1}$	$1 x10^{-0}$	$8 x10^{0}$
Maximum	$1 x10^{4}$	$5 x10^{0}$	$2 x10^{1}$	$1 x10^{1}$	$2 x10^{-0}$	$1 x10^{4}$
Time of max. (y)	10	50,000	6,000	6,500	12,000	10

Non-radiological

The PostSA TSD results show that the highest lead concentration in groundwater is $4x10^{-7}$ mg/L and occurs in the overburden at 12,000 years after closure. The highest concentration in the bedrock is $3x10^{-7}$ mg/L at 90,000 years after closure. The MOE generic Site Condition Standards (2011) for lead in groundwater are:

- 0.1 mg/L, the generic site condition standards for shallow soils in a potable ground water condition;
- 0.02 mg/L, the generic site condition standards for shallow soils in a non-potable ground water condition;
- 0.01 mg/L, the generic site condition standards for use within 30 m of a water body in a potable groundwater condition; and
- 0.02 mg/L, the generic site condition standards for use within 30 m of a water body in a non-potable groundwater condition.

The calculated concentrations of lead in groundwater are far lower than these criteria.

During the assessment timeframe, the highest concentration of lead in soil is 0.9 mg/kg in the cap at 12,000 years after closure. Slightly lower concentrations are also found in the garden soil (0.04 mg/kg). All concentrations are much lower than the MOE soil standard of 45 mg/kg for lead.

No other non-radioactive contaminants reach the environment in any considerable concentration. Additionally, the alkaline plume study shows essentially no alkaline plume forming for at least 100,000 years post-closure. The PostSA TSD provides more details on non-radiological concentrations in the groundwater which are used to estimate effects to human and non-human biota health in Sections 9.4, 9.6, 9.8, and 9.10.2.

9.5.3.4 Prediction Confidence and Uncertainty

Although the project has been described in Titterington (2016), Johnson (2022a) and various other studies, there are some minor uncertainties with respect to some aspects of the project details. These uncertainties, and their implications on the assessment of effects, are outlined below.

Since the location of certain aspects of the project (e.g., the laydown area) have not been finalized, there is some uncertainty with the potential for these activities to affect soil and groundwater quality and groundwater flow. The exact locations of the grout batch mixing plant, staging areas, raw material storage areas, on-site trucking routes have could influence the potential for soil and groundwater contamination. The sediment and erosion controls, consistent with Morin (2018), discussed under mitigation measures above, would reduce this uncertainty.

Mitigation measures will ensure that runoff and sediment will be properly contained/managed to localize any potential effects, and remediation will ensure that effects do not extend past the Decommissioning Execution phase.

REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures* (CNSC 2020a, Appendix C.4) states the requirement for a description of any predicted changes to the environment due to: modifications to the geology and geomorphology of the site; removal of bedrock and/or consolidated deposits; or disturbance of soils or sediments. Since the project does not involve the removal of bedrock or deposits, and does not involve any new disturbance of soil, this is not considered relevant. Changes to the shoreline are discussed in this EIS in Section 9.11 (Accidents and Malfunctions), and sediment transport is addressed in Section 9.4 of this EIS (Aquatic Environment).

9.5.3.5 Residual Effects

Table 9.5-6 summarizes the effects assessment above and presents the residual effects that were identified for the geological and hydrogeological environment and are carried forward for assessment in the appropriate environmental components. The residual effects in Table 9.5-6 are grouped by effect rather than by individual interaction as listed in Table 9.5-3.

Table 9.5-6 Summary of Residual Effects in the Geological and Hydrogeological Environment

Environmental Component/ VC	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution					
Geological and Hydrogeological Environment: Groundwater Flow	Washout pit construction and operation.	Washout pit will create an impermeable area on the site, affecting groundwater flow and direction.	Proper design, inspection and management of washout pits	Effects are expected to be localized.	No adverse residual effects.
Geological and Hydrogeological Environment: Soil Quality.	Demolition.	Demolition will release contaminated particulate matter which may affect soil quality.	Dust suppression methods (e.g. misting) and runoff control will trap dust and other potential contaminants produced from demolition, thereby limiting contamination of the surrounding soil. Soil remediation during final site restoration, if necessary.	Effects on soil quality are negligible, localized and temporary.	No adverse residual effects.
Geological and Hydrogeological Environment: Soil Quality.	Sizing of material.	Sizing of material will release contaminated particulate matter which may affect soil quality.	Dust suppression methods (e.g. misting) will trap dust and other potential contaminants produced from crushing of masonry and cutting beams, thereby limiting contamination of the surrounding soil. Cutting will also be done in a controlled manner. Soil remediation during final site restoration, if necessary.	Effects on soil quality are negligible, localized and temporary.	No adverse residual effects.
Geological and Hydrogeological Environment: Soil Quality.	Material laydown and clearance surveys.	Material laydown may release contaminated particulate matter which may affect soil quality.	Dust suppression methods (e.g. misting) and runoff control will trap dust and other potential contaminants. Only material that is expected to be clean will be brought to the clearance survey lay down area, therefore further minimizing the potential for contamination. Soil remediation during final site restoration, if necessary.	Effects on soil quality are negligible, localized and temporary.	No adverse residual effects.

Environmental Component/ VC	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Institutional Controls and Post-Institutional Controls					
Geological and Hydrogeological Environment: Groundwater Quality (radiological).	Facility performance during the postclosure period.	Groundwater will flow into the eventually degraded structure and become contaminated.	In-design mitigation measures to isolate and contain the inventory in order to reduce the potential of groundwater contamination.	Contaminated groundwater has the potential to transfer effects to humans and biota in other environmental compartments. Effects on groundwater quality, as evaluated through dose assessment for humans and biota, are negligible.	Potential adverse residual effects on groundwater quality, as evaluated through dose assessment for humans and biota (Sections 9.4, 9.6 and 9.8) are negligible.
Geological and Hydrogeological Environment: Groundwater Quality (non-radiological).	Facility performance during the postclosure period.	Groundwater will flow into the eventually degraded structure and become contaminated.	In-design mitigation measures to isolate and contain the inventory in order to reduce the potential of groundwater contamination.	Contaminated groundwater has the potential to transfer effects to humans and biota in other environmental compartments. Effects on groundwater quality, as evaluated through assessment for humans and biota, are negligible.	Potential adverse residual effects on groundwater quality, as evaluated through assessment for humans and biota (Sections 9.4, 9.6 and 9.8) are negligible.

9.5.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on the geological and hydrogeological environment have been predicted, based on the assessment of the VCs selected for this environmental component.

Since the geological and hydrogeological environment is also a pathway to other environmental components (e.g., surface water, aquatic and terrestrial environments, human health), the potential adverse residual effects are further assessed within those environmental components (see Sections 9.3.4, 9.4.4, 9.6.4, 9.8.4, 9.9.4 and 9.10.3).

9.5.5 Monitoring and Follow-up

The VCs for the geological and hydrogeological environment are soil quality, groundwater flow and groundwater quality. This environmental component also represents a pathway for transfer of an effect to VCs in other environmental components (i.e., surface water, aquatic, and terrestrial environments). As discussed in Section 9.1.2.3, a proposed follow-up monitoring program was developed to support the EA Follow-up Program. Specifically, the environmental and groundwater monitoring aspects are relevant for the geological and hydrogeological environment. Please note that this section discusses only those monitoring considerations specific to the geological and hydrogeological environment, specifically, monitoring details (e.g., parameters, locations, frequency).

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

9.5.5.1 Groundwater Monitoring

Following the systematic informed planning process, monitoring well locations (both existing and new) required to support the groundwater monitoring were selected.

Evaluation criteria for groundwater flow and direction, and actions taken to address exceedances were developed. The generic actions to address exceedances are presented in Section 9.1.2.3 above.

9.5.5.1.1 Flow and Direction

Decommissioning Execution

Following the systematic informed planning process, monitoring details were developed for the Decommissioning Execution phase. These monitoring details are summarized in Table 9.5-7 below.

Table 9.5-7 Groundwater Monitoring during the Decommissioning Execution Phase

Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Reference Wells (upgradient of the facility); Existing Wells and/or Proposed New Wells (downgradient of the facility)	Groundwater Level	*Groundwater Flow and Direction* 4 campaigns (quarterly for 1 year), following completion of the Decommissioning Execution phase

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Groundwater flow and direction are obtained indirectly: groundwater levels in wells are measured and this data (along with additional parameters) are used to calculate groundwater flow velocity and estimate the direction of groundwater flow.

Institutional Controls

Monitoring during resaturation of the facility is not straightforward. In the overburden sands and fill, a greater amount of water is flowing past the facility than through its low permeability walls, and therefore resaturation is expected to have little impact on water levels outside of the facility. Within the bedrock, there is a possibility of measuring small head changes over the first phases of resaturation; however, the required location of the measurements is not practical. Based on the resaturation model, these water levels must be measured within 5 m of the facility, within bedrock but also within the footprint of the facility. After approximately 10 years, the difference in water levels at all locations is 0.5 m or less, and after 20 years, the difference is approximately 0.1 m or less. Large changes in water levels only reflect early resaturation, and not complete saturation (85 years in the base case). As well, while these small changes are easily observed in the resaturation model that considers steady-state climactic conditions, small differences in water levels will likely be very difficult if not impossible to discern amongst seasonal fluctuations in water levels. Therefore, monitoring close to the facility, and comparing to predicted levels, is not considered to be practical. Instead, as mentioned earlier, measured groundwater levels from wells in the vicinity of the facility will be obtained and used to calculate flow and direction, which will be compared to baseline levels at these locations. When finalized, the EA Follow-up Program will reflect the most up-to-date resaturation modelling. The expectation is that resaturation will be complete within the next several decades.

Monitoring of groundwater flow and direction during the Institutional Controls Phase is summarized in Table 9.5-8.

Table 9.5-8 Monitoring Groundwater Flow and Direction During the Institutional Controls Phase

Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Reference Wells (upgradient of the facility); Existing Wells and/or Proposed New Wells (downgradient of the facility)	Groundwater Level	*Groundwater Levels (Obj. #3):* During resaturation: semi-annually After resaturation: to be determined in future using the periodic review process.

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

9.5.5.1.2 Groundwater Quality

Decommissioning Execution

Following the systematic informed planning process, monitoring details were developed for the Decommissioning Execution phase. These monitoring details are summarized in Table 9.5-9 below.

Table 9.5-9 Monitoring Groundwater Quality During the Decommissioning Execution Phase

Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Reference Wells (upgradient of the facility); Existing Wells and/or Proposed New Wells (downgradient of the facility)	Wellhead Parameters	semi-annually and, 1 one-time campaign at the completion of DE
	Radionuclides	
	Anions	
	Alkalinity	
	Major Cations	
	Metals	
	Petroleum Components (F1 - F4)	

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Institutional Controls

CNL will also conduct routine groundwater analyses for parameters of concern (radiological and non-radiological), to verify that potential effluent emissions are below the applicable guidelines. Following the systematic informed planning process, monitoring details for groundwater quality were developed for the Institutional Controls phase. These monitoring details are summarized in Table 9.5-10 below.

Table 9.5-10 Monitoring Groundwater Quality During the Institutional Controls Phase

Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Reference Wells (upgradient of the facility); Existing Wells and/or Proposed New Wells (downgradient of the facility)	Wellhead Parameters	1st year: Quarterly 2nd year to completion of resaturation: Semi-annual After resaturation: 1 one-time campaign at the completion of resaturation *Resaturation Monitoring[2]:* *(Tritium, Gross Beta/Gamma, pH, and Alkalinity)* 1st year: Quarterly 2nd year to completion of resaturation: Semi-annual After Resaturation: 1st year: Periodic (Quarterly) for 1 year After resaturation: 2nd year and beyond: Periodic (semi-annually).
	Radionuclides	
	Anions	
	Alkalinity	
	Major Cations	
	Metals	
	Petroleum Components (F1 - F4)	

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.
2- When finalized, the EA Follow-up Program will reflect the most up to date resaturation modelling. The expectation is that resaturation will be complete within the next several decades.

9.5.5.2 Environmental Monitoring

This section provides a concise summary of the proposed follow-up environmental monitoring in the geological and hydrogeological environment.

Evaluation criteria for the geological and hydrogeological environment, and actions taken to address exceedances were developed and are presented in the proposed follow-up monitoring program. The generic actions to address exceedances are presented in Section 9.1.2.3 above.

Decommissioning Execution

Following the systematic informed planning process, monitoring details were developed for the Decommissioning Execution phase. These monitoring details are summarized in Table 9.5-11 below.

Monitoring in the geological environment may be triggered, for example soil sampling may be triggered by groundwater monitoring results or monitoring wet and dry deposition may be triggered by exceedances in atmospheric contaminants.

Table 9.5-11 Geological Environmental Monitoring in the Decommissioning Execution Phase

Environmental Subcomponent	Sampling Locations	Parameters to be Monitored	Monitoring Frequency[1]
Wet and Dry Deposition *(if triggered by atmospheric exceedances)*	• Site boundary • Sensitive receptors within the Regional Study Area.	*(if triggered)* parameters dependent upon exceedances in other environmental media.	Continuous
Soil quality *(if triggered by groundwater exceedances)*	• Established monitoring points within the Site Study Area	• Radionuclides *(if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Institutional Controls

Following the systematic informed planning process, monitoring details were developed for the Institutional Controls phase. These monitoring details are summarized in Table 9.5-12 below.

Table 9.5-12 Geological Environmental Monitoring in the Institutional Controls Phase

Environmental Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Soil quality *(if triggered by groundwater exceedances)*	• Soil monitoring will be co-located with groundwater exceedances. • Established monitoring points within the Site Study Area.	• Radionuclides *(if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually
Soil vapour quality *(if triggered by groundwater exceedances)*	• Soil vapour monitoring will be co-located with groundwater exceedances. • Established monitoring points within the Site Study Area.	*(if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually
Topography	Inspection of slope stability and changes in topography in the disposal facility footprint will be undertaken as part of CNL's *Surveillance Plan* (Taylor 2019)		

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

9.5.6 Conclusion

As shown in Table 9.5-6, no adverse residual effects were identified for the geological and hydrogeological environment.

It is important to note that the geological and hydrogeological environment is also a pathway that carries Project emissions to receptors (both human and non-human). While some contaminants (e.g., mercury)

can be assessed by comparing their concentrations in media (e.g., groundwater) against benchmarks, the potential effects of others (e.g., most radionuclides) must be evaluated through the effect of the medium on receptors. The potential effects of Project contaminants on receptors are not necessarily limited to only groundwater pathways (e.g., ingestion); rather, all relevant pathways that can affect a receptor are cumulatively considered.

Project emissions are not expected to have adverse effects on the geological and hydrogeological environment because their estimated concentrations in soil and groundwater were found not to have adverse health effects on human receptors (see Sections 9.8.4 and 9.10.2.4) and not to cause undue risk for relevant biota (see Sections 9.4.4 and 9.6.4).

The assessment of potential effects took into consideration the concerns expressed by Indigenous Nations, communities, and organizations during engagement activities (Section 9.5.1.1).

Monitoring activities such as the measurement of groundwater quality, flow and direction will verify the accuracy of the EA predictions.

9.6 Terrestrial Environment

9.6.1 Selection of VCs

As outlined in Section 5.2.4, VCs for the terrestrial environment were selected to encompass the potential effects of the project to the terrestrial component as well as other environmental components (e.g., atmospheric environment, geological environment) that act as a pathway to transfer potential effects to the terrestrial environment. VCs were selected to represent a variety of ecological roles within the terrestrial environment. All species are assessed for exposure-related effects. Species that are likely to be found in the Site Study Area are selected for assessment of habitat-related effects. The VCs for the terrestrial environment, with rationale for their selection, are listed in Table 9.6-1.

Table 9.6-1 VCs for the Terrestrial Environment

Environmental Component	Sub-Category	VC	Effects Assessed		Rationale
			Habitat	Exposure	
Terrestrial Environment	Terrestrial Invertebrates	Soil invertebrates		x	Soil-dwelling invertebrates (e.g. earthworm). Exposure from soil.
		Monarch butterfly	x	x	END (*SARA* status) – Monarchs are migrants and are sensitive to habitat fragmentation and disturbance. Found in the Site Study Area.
	Terrestrial Vegetation	Red maple		x	Upland/wetland deciduous tree common in the Local Study Area.
	Berries	Berries (e.g., blueberries, raspberries, serviceberries, chokeberries)			Identified through Indigenous engagement

Environmental Component	Sub-Category		VC	Effects Assessed		Rationale
				Habitat	Exposure	
Terrestrial Environment	Fungi		Mushrooms		x	Identified through Indigenous engagement
	Birds	Small-medium, aerial	Chimney swift	x	x	THR (*SARA* status) - migratory insectivorous bird. There is a chimney swift super roost in the ventilation stack in the Site Study Area which is in close proximity to site activities and may be affected.
		Large, aerial	Bald eagle	x	x	Large raptor. Cultural and ecological significance. Previously, a nest was identified in the Local Study Area but is no longer present, the tree was blown down in a storm in 2021.
		Medium, ground-dwelling	Ruffed grouse		x	Ground-dwelling non-migratory omnivorous bird. Present in the Local Study Area.
		Medium, semi-aquatic	Mallard		x	The Ottawa River is in the heart of the Atlantic Flyway, and is an important stopover for migrating waterfowl such as the mallard. Likely present in the Regional Study Area.
		Large, semi-aquatic	Great blue heron		x	Large wading piscivorous bird. Great blue herons are sensitive to human disturbance. Present in the Regional Study Area. Great blue herons often return to their nesting colonies for many consecutive years, and are sensitive to habitat destruction or disturbance.

Environmental Component	Sub-Category		VC	Effects Assessed		Rationale
				Habitat	Exposure	
Terrestrial Environment	Mammals	Small, insectivorous	**Little brown myotis** Eastern small-footed myotis Northern myotis Tri-colored bat	x	x	Bat species known to be present in the Site Study Area. All are listed as END under *SARA* except for eastern small-footed myotis. While each listed species is a VC, the little brown myotis (in bold) is used as a surrogate for the others.
		Small, herbivorous	Meadow vole	x	x	Soil-dwelling, small herbivore. Burrowing is an important exposure pathway.
		Small, omnivorous	Short-tailed shrew		x	Abundant, mostly-carnivorous small mammal. Burrowing is an important exposure pathway.
		Small, carnivorous	American mink		x	Small carnivorous mammal with both terrestrial and aquatic prey. Identified through Indigenous engagement
			Northern river otter		x	Small carnivorous mammal feeding primarily on fish. Identified through Indigenous engagement.
			Short-tailed weasel		x	Carnivorous small mammal No habitat impact is expected. Identified through Indigenous engagement
		Medium, omnivorous	Red Fox		x	Omnivorous, medium-sized mammal. No habitat impact is expected. Identified through Indigenous engagement
		Large, omnivorous	Black bear		x	Large terrestrial omnivore Cultural importance and public interest.
		Large, carnivorous	Eastern wolf		x	THR (*SARA* status) large terrestrial carnivore. Likely present in the Regional Study Area.

Environmental Component	Sub-Category		VC	Effects Assessed		Rationale
				Habitat	Exposure	
		Large, semi-aquatic, herbivorous	Moose		x	Identified through Indigenous engagement.
		Small-Medium, semi-aquatic	Muskrat		x	Aquatic piscivore/herbivore. Likely present in the Regional Study Area.
	Reptiles and Amphibians	Reptile	Blanding's turtle		x	Sighting near the Local Study Area. END (*SARA* status) Travels great distances over land.
			Eastern milksnake	x	x	SC (*SARA* status) snake present in the Site Study Area.
		Amphibian	Green frog		x	The green frog is abundant and is present in wetlands in the Local Study Area.

9.6.1.1 Indigenous Engagement Feedback – Key Interests and Concerns related to Terrestrial Environment VCs

This section describes how the input from Indigenous engagement activities influenced the selection of VCs in the terrestrial environment assessment. Table 9.6-2 summarizes the key interests and concerns raised by Indigenous peoples related to VCs for the evaluation of potential effects to the terrestrial environment (based on Table 6.3-1 above), and demonstrates how the interest or concern has been addressed in the present assessment.

Table 9.6-2 Summary of Interests and Concerns Raised During Indigenous Engagement Activities that Influenced the Scope of the Terrestrial Environment Assessment

Interest or Concern	How the Interest Was Included in the Assessment
Loss of connection to, and use of lands and water	The EIS discusses concerns about potential loss of connection to land and water, and loss of land and water use, as part of the assessment of effects on traditional land and resource use (Section 9.9.5). Changes to land and water use are discussed in the EIS as part of the expected outcomes of renaturalization during and after the Institutional Controls phase (Section 9.9.3). CNL's Public Information Program enhances engagement with Indigenous peoples and address any potential feelings of loss of connection to and use of lands and water (Section 9.9.5).
Impact on terrestrial and wetland areas from project operations (e.g., grout batch mixing plant and staging areas)	CNL has identified a preferred location for the grout batch mixing plant and associated operations (Section 4.3.1.2). The EIS addresses the potential impacts of these activities to terrestrial and wetland areas by discussing habitat and exposure-related effects of the project to VCs in the terrestrial environment as well as the surface water environmental components, including wetlands (Sections 8.6, 9.2, 9.3, 9.6). The VCs assessed include terrestrial and semi-aquatic VCs. CNL added monarch butterflies, moose, mink and otter to the assessment as a result of feedback received during Indigenous engagement.

Interest or Concern	How the Interest Was Included in the Assessment
Impacts to Species at Risk, in particular the protection of chimney swifts and monarch butterflies	The EIS assesses several SAR that have been observed, or are potentially present at the site, including: monarch butterfly; little brown myotis; chimney swift; eastern wolf; Blanding's turtle; and eastern milksnake (Section 5.2.4, 9.6.1). CNL added the monarch butterfly VC as a result of feedback from Indigenous Nations, communities and organizations. In the EcoRA TSD, additional protective measures were applied in the assessment of potential exposure effects to the SAR species, such as adding an extra safety factor to the radiological benchmarks for SAR species, and selecting chemical benchmarks protective at the individual level (EcoRA TSD Section 4). CNL has developed a number of mitigation measures to ensure the protection of biota, including SARs. Some of the planned measures are specific to the protection of SARs: chimney swifts, monarch butterflies, bats, migratory birds, amphibians and reptiles (Section 9.6.3.2). Specific to the chimney swift: The EIS assesses potential exposure- and habitat-related effects to the chimney swift (Section 9.6.3.3). CNL has undertaken numerous studies specific to chimney swifts to address potential impacts from decommissioning activities, identify mitigation measures, and monitoring for effectiveness of mitigation measures (Chimney Swift Studies TSD). Mitigation measures specifically for minimizing effects on chimney swifts include restrictions on: the timing of work activities (i.e., daylight only); the seasonal scheduling of stack-related work activities (i.e., to avoid roosting season; May 1 to September 1); distance from the stack for work activities; noise, vibration and lighting levels (Section 9.6.3.2). Specific to the monarch butterfly: The EIS assesses potential habitat- and exposure-related effects from the project to monarch butterfly (Section 9.6.3.3). Mitigation measures for the protection of monarch butterflies, such as sweeping of work areas and avoiding vegetation removal during periods of monarch presence, are outlined in Sections 9.6.3.2 and 9.6.3.3. In addition, during site restoration, the cleared area will be reseeded with milkweed (Section 9.6.3.3).
Protection of habitat: - migratory birds - plants - wildlife	CNL acknowledges that habitat protection has been expressed as an area of interest for Indigenous Nations, communities and organizations, and it has an Environmental Protection Procedure on Management of Land and Habitat (Hawkins 2024). Although the NPD Closure project does not involve destruction or removal of migratory bird habitat, the EIS does include specific mitigation measures for the protection of migratory birds and their habitat, including avoiding tree clearing (if required) during the breeding bird season, and ground nest surveys (Section 9.6.3.2). The EIS also specifically discusses migratory bird habitat of the chimney swift and bald eagle. Previously, a bald eagle's nest had been identified on the NPD site but it is no longer present, the tree was blown down in a storm in 2021 (see Section 8.6.4.2, 9.6.3.3). Protection of terrestrial habitat (i.e., for plants and wildlife) is discussed in the EIS as part of the assessment of physical disturbance and noise effects (Section 9.6.3). It is noted that NPD Closure project activities are expected to remain within the Site

Interest or Concern	How the Interest Was Included in the Assessment
	Study Area, which consists primarily of areas previously disturbed by human activity and contains various cultural vegetation communities. Other than the removal of milkweed (a temporary effect discussed earlier), no removal or destruction of wildlife areas is expected. This area provides very little suitable habitat to support resident terrestrial species (Section 8.6.1). Therefore, the EIS discusses habitat-related effects on species that are likely to be found in the Site Study Area. The EIS assesses effects from physical disturbance, wildlife habitat fragmentation, noise, and roadkill (Sections 9.6.3.1, 9.6.3.3). The EIS proposes mitigation measures for the protection of terrestrial vegetation and wildlife habitat in the Site Study Area (Section 9.6.3.2).
Reducing animal road mortality of sensitive species	Effects to sensitive species from road mortality are assessed in the EIS using the Blanding's turtle and eastern milksnake VCs. The EIS assesses the potential for direct loss of wildlife on the NPD site as roadkill from on-site transportation as well from vehicles travelling to and from the site (Section 9.6.3.3). Mitigation measures have been developed to minimize direct loss of wildlife from on-site transportation as well as vehicle travel entering the site; these include fencing, signage, training, surveys and sweeps (Section 9.6.3.2). CNL notes that to date, no eastern milksnakes or Blanding's turtles have been seen on the road at NPD.
Specific terrestrial and semi-aquatic species identified as important by Indigenous Nations, communities and organizations during engagement activities: moose, white-tailed deer, beaver, marten, mink, otter, rabbit/hare, muskrat, fox, elk, black bear, bald eagle, waterfowl/ducks, grouse, berries (blueberries, raspberries, serviceberries, chokecherries), partridge, goose, turkey, wintergreen, chaga, fiddleheads, cedar, oak, ash, yellow birch, badger, coyote, fisher, raccoon, squirrel, weasel, eastern/Algonquin wolf, barn swallow, turtle, pine, poplar, spruce, tamarack, willow, cattails, dandelions, juniper bush, Labrador tea, wiken, prickly ash, red willow, gzibimkshk (scouring rush), magajim mashkiai (sweet fern), wild leek or onion	CNL added moose, fox, river otter, mink, short-tailed weasel, berries, and mushrooms as new VCs specifically in response to Indigenous feedback. The remainder of the identified species were already included as VCs and/or represented by an EcoRA receptor. Potential effects to all of these species are assessed in the EIS and EcoRA TSD. See Tables 6.3-2 through 6.3-5 for mapping of these species to EcoRA receptors. In the EIS, some of these VCs are also assessed under existing traditional land and resource use VCs: Trapping, Hunting, Fishing and Gathering (Section 9.9).

Notes:

The table above provides a summary of the concerns expressed by multiple Indigenous Nations, communities and organizations. See Table 6.3-1 for a more detailed listing of key interests and concerns from each Indigenous Nation, community and organization.

9.6.2 Assessment Boundaries

9.6.2.1 Spatial Boundaries

Similar to the terrestrial environment baseline characterization in Section 8.6 above, the Site and Local Study Areas for this assessment are consistent with the general spatial boundaries outlined in Section 5.2.1.1. The Regional Study Area for the terrestrial environment is outlined in Figure 8.6-1.

9.6.2.2 Temporal Boundaries

The temporal boundaries for this assessment are consistent with the standard temporal boundaries outlined in Section 5.2.1.2.

9.6.3 Identification of Residual Effects

9.6.3.1 Project-Environment Interactions

As shown in Table 5.2-1, potential effects to the terrestrial environment may occur as a result of interaction with activities in the Decommissioning Execution phase and the Post-Institutional Controls phase, in particular:

- Installation and operation of the grout batch mixing plant;
- Grouting the below grade structure;
- Removal the above grade structure;
- Final site restoration;
- Facility performance during the Institutional Controls phase; and
- Facility performance during the Post-Institutional Controls phase.

The rationale for these interactions is included in Table 9.6-3 below.

Table 9.6-3 Project-Environment Interactions in the Terrestrial Environment

Phase		Project Works and Activities	Potential Interaction	Habitat	Exposure
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**			
		Generation of garbage, particularly food wastes.	Generation of food or other wastes by workers on site may attract wildlife (i.e. bears to the site).		
	1.1	Designate footprint, create access, temporary fencing (east side of main building).	Despite being in a previously disturbed area, all activities related to establishing the project footprint (fencing) are expected to result in dust and emissions, and affect and displace wildlife.	x	x
	1.2	Assign storage area for raw materials, ship in sand. Likely east side of licensed area.	Despite being in a previously disturbed area, storage of raw materials will create dust, physical effects (noise, vibration, encroachment) and emissions, affecting vegetation and wildlife.	x	x
Decommissioning Execution	**1.3**	Set up mixing stations, hook up electrical power or diesel power.	Despite being in a previously disturbed area, all activities related to establishing the project footprint (i.e. Setting up mixing stations, power supply) are expected to affect wildlife habitat.	x	
	1.4	Truck in necessary water supply or source water directly from river.	Transportation of water is expected to create dust, physical effects (noise, vibration, encroachment) and emissions. On-site transportation may result in road mortality.	x	x
	1.6	Construct washout pit. Lined excavation with water transfer. Likely near grout batch mixing station.	Despite being in a previously disturbed area, excavation of the washout pit is expected to create dust, physical effects (noise, vibration, encroachment) and emissions, affecting vegetation and wildlife. The washout pit may attract wildlife.	x	x
	1.7	Level area for pumper.	Despite being in a previously disturbed area, levelling the ground is expected to create dust, physical effects (noise, vibration, encroachment) and emissions, affecting vegetation and wildlife.	x	x
	1.9a	Truck grout to pumping station (20 trips per day).	On-site transportation is expected to create dust, physical effects (noise, vibration, encroachment) and emissions. On-site transportation may result in road mortality.	x	x

Phase		Project Works and Activities	Potential Interaction	Habitat	Exposure
Decommissioning Execution	**2**	**Grouting of Below Grade Structure**			
	2.3	Grout Fill Nuclear Area.	Displacement of air containing tritium, lead and asbestos may result in exposure effects to non-human biota. Transportation of grout is expected to create dust, physical effects (noise, vibration, encroachment) and emissions. Grouting base of stack and creating penetrations at base of stack for drainage and ventilation may affect chimney swifts. On-site transportation may result in road mortality.	x	x
	3	**Removal of Above Grade Structure**			
	3.1	Conventional heavy equipment knockdown of reactor hall.	Demolition will release noise, dust, radioactivity and other potential contaminants.	x	x
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Material sizing will result in physical effects (noise, vibration, encroachment), dust, radioactivity and other potential contaminants.	x	X
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	Off-site material transport may affect off-site traffic. On-site material transportation will create dust, physical effects (noise, vibration, encroachment).	x	x
	3.4	Steel and rubble emplaced in condenser room.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x
	3.5	Grout first level of demolition material in condenser room.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x
	3.6	Steel and rubble emplaced in condenser room.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x
	3.7	Grout second level of demolition material in condenser room.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x
	3.8	Steel and rubble in condenser room.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x
	3.9	Grout third level of demolition material in condenser room.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x

Phase		Project Works and Activities	Potential Interaction	Habitat	Exposure
Decommissioning Execution	**3.10**	Demolish block walls and inside walls around control room and change rooms.	Demolition will create physical effects (noise, vibration, encroachment), dust, radioactivity and other potential contaminants.	x	x
	3.11	Collapse ceilings of furnace room and adjacent rooms.	Demolition will release create physical effects (noise, vibration, encroachment), dust, radioactivity and other potential contaminants.	x	x
	3.12	Emplace block wall rubble in furnace room or condenser room.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Air displacement from below grade structure will release radioactivity and other potential contaminants.		x
	3.15	Grout furnace room and adjacent areas to ground level.	Air displacement from below grade structure will release dust, radioactivity and other potential contaminants.		x
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Demolition will create physical effects (noise, vibration, encroachment), dust, radioactivity and other potential contaminants.	x	x
Decommissioning Executive	**5**	**Final Site Restoration**			
	5.1	Site Restoration (install fencing, install monitoring wells if required, remediate areas affected by previous operations or decommissioning, washout pit, complete closure surveys, etc.).	These activities will create physical effects (noise, vibration, encroachment), dust and emissions. Remediating areas affected by previous operations or decommissioning is expected to reverse some of the habitat-related effects of the decommissioning. On-site transportation may result in road mortality.	x	x
	5.2	Demobilize Site (Remove temporary facilities, decontaminate equipment, remove power upgrades, poles and lines, return transformers).	Demobilizing the site will result in dust and reverse some of the habitat-related effects of the decommissioning. On-site transportation may result in road mortality.	x	x

Phase		Project Works and Activities	Potential Interaction	Habitat	Exposure
IC*	**6**	**Long-term Care and Maintenance**			
	6.6	Renaturalization of the Site Study Area.	Renaturalization of a portion of the Site Study Area may increase habitat.	X	
	6.7	Facility performance during the Institutional Controls phase	Groundwater will start to enter and eventually resaturate the grouted structure. Contaminated groundwater will flow out and may eventually reach the Ottawa River. This Will be transferred to soil through irrigation, and biota through drinking water.		x
PIC**	**7**	**Postclosure**			
	7.1	Facility performance during the Post-Institutional Controls phase	Groundwater in the resaturated and eventually degraded structure will become contaminated. Contaminated groundwater will flow out and may eventually reach the Ottawa River. This Will be transferred to soil through irrigation, and biota through drinking water.		x
		Renaturalization	Renaturalization in the Site Study Area may increase habitat.	x	

Notes:

* - IC: Institutional Controls phase

** - PIC: Post-Institutional Controls phase.

9.6.3.2 Proposed Mitigation Measures

The mitigation measures presented below are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required.

In addition to the in-design mitigation measures identified in Section 4.1 above, the following mitigation measures have been identified to ensure the protection of the terrestrial environment:

- dust and noise suppression measures as described in Section 9.2.3.2;
- delineation of work areas, limiting project activities to within previously disturbed areas to reduce direct loss of wildlife on-site resulting from the project;
- posted speed limits in the Site Study Area, as well as the access road to reduce roadkill on-site;
- heavy equipment entering the site will be inspected to ensure they are free of dirt clogs coming from outside of the site, to prevent the spread of invasive species via seeds (Hawkins 2024);

- localized surface scarifying with a track machine to break up soil-compacted areas during final site restoration where necessary; these areas will then be top-dressed as required and replanted with native vegetation or allowed to revegetate naturally, subsoil tilled and cultivated (as needed);
- disposal of garbage on-site, particularly food waste, in proper containers to deter wildlife;
- completion of visual inspection to ensure that no bat roosts are present in the facility prior to commencement of below-grade grouting. If a roost is found, then through consultation with CNL's biologist, mitigation measures such as the installation of artificial bat houses and planning work outside of the maternity roosting period will be implemented;
- sweep work areas for the presence of SARs (e.g., eastern milksnakes, nests, bats, roosts, barn swallows, monarch butterflies) prior to work being undertaken, particularly from August to October when juvenile milksnakes are known to enter buildings (Morin and Carr 2015). Employee training will ensure that if a milksnake is encountered, the situation will be properly handled to ensure compliance with *SARA* requirements;
- removal of milkweed will occur only during a period of time when the host plant is not known to be occupied by any life stages of the species; removal will occur between October 01 and April 30;
- no removal of milkweed outside of the Site Study Area;
- vegetation removal by way of mowing or brushing of nectaring plants along the side of the roads and rights-of-way will be avoided during the period of time the monarch is present in the area (May 01 to September 30); and
- during final site restoration, the 1.2-hectare area cleared for the grout batch mixing plant will be seeded with milkweed.

In addition, CNL has identified mitigation measures specifically for the protection of migratory birds in the Site Study Area (chimney swift specific mitigation is discussed below). The project activities are expected to remain within previously disturbed areas, and no tree clearing is planned. However if needed, any tree clearing will follow CNL's Environmental Evaluation process. In order to protect nesting migratory birds, in accordance with the *Migratory Birds Convention Act*, the site preparation activities will avoid tree clearing during the breeding bird season (April 8 - August 28), wherever possible. If such activities cannot be scheduled outside the prime nesting season, deterrents for nesting will be implemented and a nest survey must be conducted beforehand (i.e., within 2 days) to ensure there are no active nests in the areas of activity. It is also possible that migratory birds (e.g., ground nesting birds) could be present in the Site Study Area during site preparation activities. Therefore, nest surveys will be conducted prior to establishing the project footprint if set up of various components (e.g., grout batch mixing plant) commences during the breeding bird season (Morin and Carr 2015).

If a migratory bird nest is discovered in the Site Study Area during project execution, ECCC guidelines on establishing buffer zones and setback distances (https://www.canada.ca/en/environment-climate-change/services/avoiding-harm-migratory-birds/reduce-risk-migratory-birds.html#toc5) will be implemented to reduce risk to migratory birds.

As identified in the guidelines, any nest found during the nesting period should be protected with a buffer zone until the young have permanently left the vicinity of the nest. A buffer zone is determined by a setback distance which varies according to; the degree of tolerance of the species to disturbance, previous exposure of birds to disturbance, level of disturbance, and landscape context.

If a nest is found during project execution, an assessment of the activity will be conducted to assess the level of disturbance and an appropriate buffer will be established in accordance with ECCC guidelines. Please note that only the Canada warbler and the eastern wood-pewee have been detected on the site. Special attention will be given to those species if some level of vegetation removal is to be conducted during the migratory bird breeding season.

Following recommendations by ECCC – CWS (Canadian Wildlife Service), the NPD Closure Project developed a plan to exclude bats from accessing the facility (specifically the crawl space under the mechanical wing) in an effort to minimize the impact of the activity on bats using the NPDWF during the summer months as a roosting area and during the winter months as an overwintering site. In 2021, CNL completed work to seal the crawl space under a permit (SARA-OR-21-0588) issued by ECCC. This work involved the installation of a one-way door was successful at evicting the bat from the crawl space and preventing re-entry. This was confirmed through weekly inspections (visual and photographic searches and audio recordings) following the exclusion work. These activities are documented in a letter from CNL to ECCC (CNL 2021c). The success of the exclusion work was also confirmed via crawl space inspections (completed in winter 2021/22) and exit surveys (completed during the summers of 2021 and 2022), and no bats were seen or detected. Therefore, the crawl space has not been accessible to bats since 2021, and is no longer consider habitat or residence.

Through the permitting process, any mitigation measures that are identified will be implemented through the project.

As discussed in Section 8.5, CNL undertook investigation of the viability of ventilation stack removal. It was decided that ventilation stack retention will mitigate the risk of abandonment of the ventilation stack by the chimney swifts. In addition to ventilation stack retention, proposed mitigation measures during the chimney swift roosting season (May 1 to September 1) were identified in the Chimney Swift TSD, and are listed below:

- limitation of decommissioning activities to between 7 am and 7 pm (i.e., daylight hours when the swifts are not in the ventilation stack) where possible;
- modifications to the stack will be performed when chimney swifts are not present in the stack;
- given that the ventilation stack is 46 m (150 feet) in height and the chimney swift roost in the top portion of the stack, coupled with the low flow within the stack, it is considered reasonable to assume that dust will not reach the upper portion of the stack and impact critical roost habitat. For this reason, dust suppression measures in addition to those described in Section 9.2.3.2 are not warranted; and,
- restriction of Decommissioning Execution activities near the roost (within 5 m) as much as possible. Placement of infrastructure (e.g., grout batch mixing plant) should be avoided within 5 m. Further,

as a precaution, any reduction in Decommissioning Execution activities between 5-90 m of the roost would be beneficial.

The following mitigation measures (identified in the Chimney Swift TSD) are to be undertaken when chimney swifts are suspected in the ventilation stack (e.g., at night, during inclement weather from May 1 to September 1 etc.):

- noise performance should be considered in the selection of mechanical equipment and vehicles;
- bearing in mind a minimum placement of 5m from the ventilation stack, mobile plants (e.g., compressors, generators) and other noisy apparatuses such as concrete batching should be located as far as possible from the ventilation stack. These devices should be oriented to direct noise emissions away from the ventilation stack as far as possible, and onsite structures and terrain will be used to screen the ventilation stack and provide noise suppression wherever practicable;
- dramatic and sudden disturbances should only ever be undertaken between 7 am and 7 pm;
- the noise level of audible warning devices should be kept to the minimum necessary for employee health and safety;
- major demolition activities should be undertaken following a planned schedule;
- major demolition procedures should be developed to keep noise and vibration to a minimum without compromising demolition requirements;
- if significant vibration impacts cannot be avoided, consider relocating sources so that there is no direct line of sight between the source and ventilation stack;
- orient all external lighting fixtures so that the top of the ventilation stack is not illuminated;
- insofar as is practical, keep dust from demolition to a minimum (see dust suppression methods in Section 9.2.3.2);
- activities that will create substantial vibration and noise should only be undertaken between 7 am and 7 pm, and it is also recommended that a ‘soft-start’ approach be undertaken. This requires that each time the activity is initiated after a period of inactivity (>24 hours), the disturbance (noise and vibration) levels will be gradually increased over a 30-minute period to allow swifts at least an opportunity to acclimate. Noise and vibration should be minimized without compromising demolition requirements; and,
- in order to minimize the impact to chimney swifts during grouting of the base of the stack and creating penetrations at base of stack for drainage and ventilation, this work will avoid the chimney swift roosting season (May 1 to September 1).

As per the Ontario Ministry of Natural Resources and Forestry, Best Management Practices for Mitigating the Effects of Road on Amphibians and Reptiles (https://arc-solutions.org/wp-content/uploads/2017/02/mnrf_herp_road-mitigation_bmp_2016.pdf), CNL will be implementing mitigation measures to influence driver behaviour:

- Staff and contractors will receive a SAR Awareness training session offered by CNL to increase their knowledge about the potential species at risk present at NPD, how to identify them, what do

to if detected and how to report it to Environmental Protection. A species at risk identification field guide will be available on the job site at all time, and frequent inspection for wildlife presence will be conducted by the environmental personnel in the field.

- The low speed limit of 50 km/h or 20 km/h on NPD property will be enforced for all staff and contractors.
- Daily road mortality survey will be conducted (only on days when activities occur), during the herpetofauna active season (April 15 to Sept 30th).
- If any road mortality is detected (i.e., one individual) for the Eastern Milksnake, CNL will evaluate if exclusion fencing of the area would be an appropriate mitigation measure. Due to the temporary nature of the NPD Closure Project, temporary fencing will be considered such as silt fences.
- Two signs have been installed on each end of the NPD road to remind employees and contractors of the potential presence of herpetofauna, namely snakes, on the road.

9.6.3.3 Effects After Mitigation

In this section, habitat-related and exposure-related effects are discussed for each phase of the project.

The EcoRA TSD assessed exposure effects for all radiological and chemical COPCs identified in the EIS. The results of the EcoRA TSD have a large safety margin, given the conservative assumptions that were used, such as:

- It was assumed that terrestrial biota would spend all of their time on-site, consuming all of their food and water from the site, regardless of migratory patterns or home ranges; and
- Maximum contaminant concentrations at the most sensitive receptor locations were used.

Decommissioning Execution

Site Study Area

Habitat-Related Effects

Because of previously disturbed nature, there is limited potential for loss of habitat for animals potentially found in the Site Study Area associated with Decommissioning Execution activities. The loss of habitat is temporary and minor, displacing wildlife to cultural communities unaffected by project activities, or the surrounding forests. The project is not expected to introduce any physical barriers to wildlife. The following terrestrial VCs in the Site Study Area may have the potential to be affected by loss of habitat: monarch butterfly, eastern milksnake, meadow vole, little brown myotis.

As discussed in Section 8.6, the ventilation stack in the Site Study Area is used as a roost by chimney swifts. The potential effects of Decommissioning Execution activities on chimney swifts are assessed in the Chimney Swift TSD. Activities are not expected to physically alter the roost's habitat quality. However, due to the proximity of the ventilation stack to Decommissioning Execution activities, there is potential for disturbance of the roost through loud noise (acute and/or chronic), vibration (from demolition or machinery) and encroachment (i.e., activities being carried out too close to the ventilation stack, regardless of noise or vibration produced). These effects are most likely to occur when Decommissioning Execution activities overlap with the chimney swifts being present in the roost. Chimney swifts spend the day foraging, and they usually only roost at night or during inclement weather (i.e., rain and/or low temperature). Chimney swifts are often roosting in the ventilation stack during the day in May due to cold temperatures. Therefore, the only Decommissioning Execution activities that pose a greater risk of directly disturbing roosting chimney swifts are those that occur at night (which would only be during an abnormal situation) or on poor weather days (when Decommissioning Execution activities are ongoing). Although no effects on the chimney swift are expected, the chimney swift roost will be monitored regularly throughout decommissioning to ensure they are not disturbed. Details of this monitoring is discussed in Section 9.6.5.

The noise generated by the proposed project would likely be audible to wildlife in the immediate vicinity of the project activities. Although the proposed project is located in a largely rural area that is habitat for both large and small mammals including common rodents, deer, bears, foxes, etc. as well as avian species, its proximity to Highway 17 means that wildlife in the project area may be accustomed to elevated noise levels. In addition, even in cases where the noise is elevated above background noise conditions, it should be noted that such noise will be localized and temporary in nature.

Ground-dwelling VCs such as the eastern milksnake and meadow vole are likely to be temporarily displaced by Decommissioning Execution activities and operations. Eastern milksnakes are habitat generalists and have been recorded in both open and forested habitats (COSEWIC 2014). Therefore, the Site Study Area is not considered to comprise important habitat for milksnakes. It is possible that incidental mortality will arise as a result of project operations and activities. Proper delineation of the work area will deter wildlife from entering the Site Study Area. Training employees to identify and properly handle milksnakes, and conducting regular site sweeps in work areas will help to ensure that milksnakes will be recognized and removed from the Site Study Area to prevent incidental mortality. No residual habitat effects are expected on the eastern milksnake.

The monarch butterfly is known to be present in the Site Study Area. An area of approximately 1.2 hectare currently containing milkweed will have to be cleared for this project in the area where the grout batch mixing plant will be located (see Figure 4.3-1) in order to prevent impacts to monarch butterflies during the operation of the grout batch mixing plant. The milkweed is present on an area where asphalt remains from previous operations of the site. The milkweed to be removed represents approximately 30% of the milkweed observed in disturbed areas and along roadways on the NPD site (Figure 8.6-2). Milkweed is present elsewhere at NPD in smaller areas as well as along Highway 17. Although monarch butterfly larvae feed solely on milkweed plants, monarchs also rely heavily on a variety of wildflowers as a nectar source. These nectar sources are vital to monarch survival and are particularly important during the fall migration.

No net habitat-related effects are expected, as CNL will conduct site sweeps, and removal of the milkweed will occur only during a period of time when the host plant is not known to be occupied by any life stages of the species (between October 01 and April 30). Milkweed will not be removed outside of the Site Study Area. The removal of the milkweed won't have a direct impact on monarch individuals due to the timing of the removal. In addition, since milkweed is present elsewhere at or around the NPD site, the temporary removal of milkweed from the one hectare is not likely to have an impact on the reproductive success of the monarch individuals at NPD. Nectaring sites are available throughout the NPD site and will be maintained for the duration of the NPD Closure Project. To do this, vegetation removal by way of mowing or brushing of nectaring plants along the side of the roads and rights-of-way will be avoided during the period of time the monarch is present in the area (May 01 to September 30). During site restoration, the 1.2-hectare area will be seeded with milkweed. Surveys will be conducted for a period of 3 years and information on milkweed establishment and monarch larvae and chrysalis occupancy will be monitored.

Meadow voles are likely present in the Site Study Area, and throughout suitable habitat in the surrounding area. Any potential population decline as a result of habitat loss in the Site Study Area is temporary and not expected to affect the local population. No residual habitat effects are expected on the meadow vole.

No effects are expected on migratory bird habitat in the Site Study Area.

There is potential for direct loss of wildlife from project activities, particularly as roadkill from vehicle operation on-site. Posted speed limits and the small amount of on-site vehicle use will limit the potential for roadkill. Furthermore, during the Decommissioning Execution phase, animals are likely to avoid these areas due to their frequent disturbance and availability of surrounding vegetation communities. Proper delineation of the work area will reduce wildlife entering the site.

Following final site restoration and demobilization, land outside the licensed area will begin to renaturalize, which is expected to have a positive effect on the biodiversity of terrestrial biota.

Overall, no reduction in wildlife productivity is expected.

Exposure-Related Effects

In the Site Study Area, all radiological and chemical COPCs were screened out of the assessment for the Decommissioning Execution phase in the EcoRA TSD, and therefore were not assessed further (i.e., for effects on terrestrial biota). Thus, it is predicted that no adverse residual exposure-related effects will be observed for terrestrial biota during the Decommissioning Execution phase. This includes moose and berries which were added to the EcoRA TSD assessment as ecological receptors to reflect VCs identified through Indigenous engagement.

For details on the screening process, see the EcoRA TSD or Section 9.1.1.1 above.

Local Study Area

Habitat-Related Effects

No habitat effects on terrestrial VCs in the Local Study Area are expected. Note that the Bald Eagle's nest is no longer present, the tree blew down in a storm in 2021.

Decommissioning Execution activities will also result in an increase in noise and dust for surrounding undisturbed communities in the Local Study Area. These effects are expected to be temporary, minor and localized as discussed in Section 9.2.3.3.

There is potential for direct loss of wildlife as roadkill from vehicle operation to and from the site in the Local Study Area. This is expected to be a temporary, occasional and minor effect.

Exposure-Related Effects

In the Local Study Area, all COPCs were screened out of the assessment for the Decommissioning Execution phase in the EcoRA TSD, and therefore were not assessed further (i.e., for effects on terrestrial biota). Thus, it is predicted that Decommissioning Execution activities have a low potential to affect terrestrial vegetation and wildlife. This includes moose and berries which were added to the EcoRA TSD assessment as ecological receptors to reflect VCs identified through Indigenous engagement.

Regional Study Area

Habitat-Related Effects

No habitat-related effects are expected in the Regional Study Area during the Decommissioning Execution phase.

There is potential for direct loss of wildlife as roadkill from vehicle operation to and from the site in the Regional Study Area. This is expected to be a temporary, occasional and minor effect.

Exposure-Related Effects

In the Regional Study Area, all COPCs were screened out of the assessment in the EcoRA TSD, and therefore were not assessed further (i.e., for effects on terrestrial biota). Thus, it is predicted that Decommissioning Execution activities have a low potential to affect terrestrial vegetation and wildlife. This

includes moose and berries which were added to the EcoRA TSD assessment as ecological receptors to reflect VCs identified through Indigenous engagement.

Institutional Controls and Post-Institutional Controls

Habitat-Related Effects

No adverse habitat-related effects are expected during the Institutional Controls and Post-Institutional Controls phases in the Site, Local or Regional Study Areas.

Renaturalization of the Site Study Area over time may increase habitat for wildlife and would be beneficial for both vegetation and wildlife communities.

Exposure-Related Effects

During the postclosure period (i.e., Institutional Controls and Post-Institutional Controls phases), the grouted structure will degrade, and groundwater will flow into the facility. Soluble contaminants will dissolve into the groundwater, which will continue to flow and release contaminants to the Ottawa River. This will affect terrestrial wildlife and biota through drinking the water, consumption of aquatic biota and plants and swimming. The alkaline plume flowing from the grouted structure is expected to be sufficiently diluted and of relatively small volume, and is not expected to result in contamination to the terrestrial environment.

The PostSA TSD examines several potential scenarios for the postclosure period as a way to capture and quantify uncertainties in the future conditions at the site (for detail on these scenarios, the reader is directed to the PostSA TSD). The PostSA TSD details the results of the assessment of radiological and non-radiological contamination of the terrestrial environment (among other environments) for these scenarios. The PostSA scenarios were assessed for potential effects on terrestrial biota in the EcoRA TSD, including moose and berries which were added to the EcoRA TSD assessment as ecological receptors to reflect VCs identified through Indigenous engagement. The results of this assessment are summarized below.

Radiological

In the EcoRA TSD, approximately 30 radiological contaminants were screened in for the normal evolution scenario as well as several additional scenarios. For the Normal Evolution Scenario (NES), the results of EcoRA showed no adverse residual effects on terrestrial biota. Sensitivity analysis cases shown in the EcoRA account for uncertainties in parameter values such as sorption (i.e., NES SA – Sorption) and inventory (i.e., NES SA – Radioactive Inventory) among others. No adverse residual effects on terrestrial biota were identified for any of the sensitivity cases. The EcoRA TSD also assesses Disruptive Event scenarios (i.e., human intrusion and extreme degradation of engineered structures) and Defence in Depth scenarios (i.e., role of waste form, role of existing facility, role of grout). For these scenarios, approximately 30 radionuclides were screened in. No adverse residual effects were identified for terrestrial biota under any of these scenarios. For details on the screening process, see the EcoRA TSD or Section 9.1.1 of this EIS. Therefore, no adverse residual effect to terrestrial biota are anticipated from exposure to radiation during the postclosure period (Institutional Controls and Post-Institutional Controls phases).

The EcoRA TSD also studies “What If” scenarios (e.g., mass excavation, river level fall). “What If” scenarios make deliberately extreme assumptions so as to understand the limits of safety performance and are not compared with any criteria because they are extremely unlikely, and in some cases implausible.

Non-radiological

In the EcoRA TSD, no non-radiological contaminants were screened in for the normal evolution scenario for the postclosure period. Similarly, no non-radiological contaminants were screened in for any of the sensitivity cases, disruptive scenarios and defence-in-depth scenario. For details on the screening process, see the EcoRA TSD or Section 9.1.1 of this EIS. Therefore, no adverse residual effects from non-radiological exposure were identified for terrestrial biota in the postclosure period (Institutional Controls and Post-Institutional Controls phases).

The EcoRA TSD also studies “What If” scenarios (e.g., mass excavation, river level fall). “What If” scenarios make deliberately extreme assumptions so as to understand the limits of safety performance and are not compared with any criteria because they are extremely unlikely, and in some cases implausible.

9.6.3.4 Prediction Confidence and Uncertainty

Although the project has been described in Titterington (2016), Johnson (2022a) and various other studies, there are some minor uncertainties with respect to some aspects of the project details. These uncertainties, and their implications on the assessment of effects, are outlined below.

The exact locations of the grout batch mixing plant, staging areas, raw material storage areas, on-site trucking routes have not yet been finalized. Since the location of certain aspects of the project (e.g., the laydown area) have not been finalized, there is some uncertainty in the assessment effects on the terrestrial environment. The entire Site Study Area has been identified as the project footprint, which is conservative as the delineated work area is expected to be smaller. As discussed above, CNL does not intend to extend the project footprint outside of already disturbed areas.

In addition, the schedule has not been finalized. The uncertainty of timing certain activities may change the potential effects of noise, dust and other disturbances. This uncertainty is mitigated by restricting the timing of certain activities, as well as dust and noise mitigation outlines in Section 9.2.3.2.

The locations of pits for raw material acquisition are unknown and will depend on the contractor selected for the grout batch mixing plant and grouting activities. The uncertainty with respect to distance travelled off-site may affect the potential roadkill in the Regional Study Area.

The chimney swifts’ diet consists entirely of terrestrial insects, which are represented by soil invertebrates (earthworm) in the model due to a lack of available TFs for insects. This is a conservative assumption, as it provides a direct pathway to soil contamination.

Uncertainty in animal behaviour is addressed in the EcoRA through the assumption that biota are present in the Site Study Area year-round, which is likely to overestimate the magnitude of exposure for mobile

biota (e.g., migrating birds, such as chimney swift, and hibernating animals, such as little brown myotis and black bear).

The monarch butterfly was not fully assessed due to a lack of available data on the effects of the lead. However, the exposure to lead through its diet of vegetation is considered to be negligible, as terrestrial vegetation does not exceed benchmarks in any scenarios.

REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures* provides guidance on characterizing the effects on the project on terrestrial flora and fauna, including a full accounting of effects on species of elevated conservation status and their habitat. As per REGDOC-2.9.1 (CNSC 2020a, Appendix C.5), the terrestrial environment effects assessment was based on predictions from the EcoRA TSD, and covered effects such as the following (from REGDOC-2.9.1):

- effects on terrestrial habitat and loss of habitat for relevant species;
- disturbance of feeding, nesting or breeding habitats;
- direct and indirect wildlife mortality (e.g., roadkill);
- disruption of daily or seasonal wildlife movements such as migration or home ranges;
- contaminant exposures through environmental and food chain transport.

Some effects were assessed quantitatively in Section 9.6.3.3 above, such as physical barriers to wildlife; noise and vibration; reduction in wildlife productivity and effects on biodiversity.

REGDOC-2.9.1 (CNSC 2020a, Appendix C.3) requires a clear description of how any predicted effects compare to the expected reference condition for unexposed biota on a biological population basis, taking natural variation into account. Predictions of effects should include sufficient detail to allow follow-up verification.

In the PostSA TSD, uncertainties in postclosure conditions (e.g. floods), key parameters (e.g. inventory of contamination) are addressed inherently by assessing several disruptive scenarios. Conservative assumptions are also used to address other uncertainties, such as sediment characteristics.

9.6.3.5 Residual Effects

Table 9.6-4 summarizes the effects assessment discussed above. As seen in Table 9.6-4, no adverse residual effects on the terrestrial environment have been identified. The residual effects in Table 9.6-4 are grouped by effect rather than by individual interaction as listed in Table 9.6-3.

Table 9.6-4 Summary of Residual Effects in the Terrestrial Environment

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution						
Terrestrial: Vegetation Communities/ Wildlife	Establishing the footprint of grout batch mixing plant and related activities (washout pit, pumper, raw material storage, earth grading).	Meadow vole Eastern milksnake Monarch Butterfly	Loss of vegetation and wildlife habitat.	All project works to take place in previously disturbed areas. Site to be restored at the end of the Decommissioning Execution phase. Site sweeps for ground nests to be conducted prior to establishing project footprint if during breeding season. Employee training and frequent inspection. Reseeding of grout batch mixing plant area with milkweed during site restoration.	Temporary loss of vegetation and wildlife habitat.	No adverse residual effects.
Terrestrial: Vegetation Communities/ Wildlife	Establishing the footprint of grout batch mixing plant and related activities (washout pit, pumper, raw material storage, earth grading).	Chimney swift Bald eagle Little brown myotis Meadow vole Eastern milksnake	Increased levels of physical effects (noise, vibration, encroachment), dust and emissions affecting surrounding undisturbed vegetation communities.	Standard construction best practices to be applied are discussed in Section 9.2.3.2 will also be effective at minimizing effects of noise, dust and emissions on vegetation and wildlife.	Temporary and localized effect. Species would generally be expected to return to the area following the Decommissioning Execution phase.	No adverse residual effects.
Terrestrial: Wildlife	Operation of vehicles on-site.	Meadow vole Eastern milksnake	Wildlife mortality via roadkill.	Wildlife exclusion fencing to be put in place around construction areas if required.	Small number of vehicles, occurrence of	No adverse residual effects.

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
				Posted (low) speed limits. Brake-for-Snake signs. Daily road mortality surveys on activity days (during active season) Employee training and site sweeps for eastern milksnake will increase awareness and proper procedures are followed.	roadkill likely infrequent.	
Terrestrial: Vegetation	Dust releases (material transport/storage, vehicle operation etc.).	Red maple Berries Chimney swift	Dust generation may result in reduced plant growth or senescence.	Dust suppression measures outlined in Section 9.2.3.2 will also be effective in minimizing the effects on vegetation.	Minor, localized and temporary effect on vegetation communities.	No adverse residual effect.
Terrestrial: Wildlife	Generation of garbage.	Black bear	Open access to food waste may attract wildlife to the Site Study Area and may result in nuisance bear problems.	Proper garbage disposal containers (i.e. sealed containers and frequent removal) and waste management practices will be utilized.	No effects are expected.	No adverse residual effect.
Terrestrial: Vegetation Communities/ Wildlife	Displacement of tritiated air from the facility during grouting and emplacement.	All terrestrial VCs	Release of radioactivity to terrestrial environment and potential exposure effects to vegetation and wildlife.	No mitigation measures identified.	No effects are expected.	No adverse residual effects.
Terrestrial: Vegetation Communities/ Wildlife	Transportation of grout and materials around the site.	All terrestrial VCs	Transportation of grout and materials around the site will create physical effects (noise, vibration,	Standard construction best practices to be applied discussing in Section 9.2.3.2 will also be effective at minimizing effects of noise,	Temporary and localized effect. Species would generally be expected to return	No adverse residual effects.

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
			encroachment), dust, and emissions.	dust and emissions on vegetation and wildlife.	to the area following the Decommissioning Execution phase.	
Terrestrial: Vegetation Communities/ Wildlife	Displacement of tritiated air from the facility during grouting and emplacement.	All terrestrial VCs	Release of radioactivity to terrestrial environment and exposure effects to vegetation and wildlife.	No mitigation measures have been identified.	No effects are expected.	No adverse residual effect.
Terrestrial: Vegetation Communities/ Wildlife	Demolition and related material sizing and storage.	All terrestrial VCs	Increased physical effects (noise, vibration, encroachment), dust, radioactivity and other potential contaminants from material to terrestrial environment.	Mitigation measures identified in Section 9.2.3.2 with respect to noise and dust effects will also be effective in minimizing the effects on wildlife and vegetation.	Temporary and localized effect from noise and dust. Species would generally be expected to return to the area following the Decommissioning Execution phase. No exposure effects are expected.	No adverse residual effects.
Terrestrial: Vegetation Communities/ Wildlife	Restoring and demobilizing the site (earth moving, material and equipment transport, remediation).	All terrestrial VCs	Physical effects (noise, vibration, encroachment), dust and emissions will be released. These activities will allow eventual renaturalization of the area.	Standard construction best practices to be applied are discussed in Section 9.2.3.2 will also be effective at minimizing effects of noise, dust and emissions on vegetation and wildlife.	Temporary, localized and minor disturbance.	No adverse residual effects.

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Terrestrial: Vegetation Communities/ Wildlife	Demobilization (equipment and material removal from site).	All terrestrial VCs	Demobilization of the site will reverse some of the habitat-related effects of the decommissioning.	No mitigation measures have been identified.	Eventual renaturalization and reclamation.	No adverse residual effects.
Institutional Controls and Post-Institutional Controls						
Terrestrial: Vegetation Communities/ Wildlife (radiological)	Facility performance during the postclosure period.	All terrestrial VCs	Groundwater will flow into the eventually degraded structure. Contaminated groundwater may flow out and eventually into the Ottawa River. This may be transferred to soil through irrigation, and biota through drinking water.	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects in the terrestrial environment.	Radionuclides are expected to be within acceptance criteria.	No adverse residual effects
Terrestrial: Wildlife (non-radiological)	Facility performance during the postclosure period.	All terrestrial VCs	Groundwater will flow into the eventually degraded structure. Contaminated groundwater may flow out and eventually into the Ottawa River. This may be transferred to soil through irrigation, and biota through drinking water	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects in the terrestrial environment.	Chemical contaminants are expected be below benchmarks.	No adverse residual effects

9.6.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on the terrestrial environment have been predicted.

9.6.5 Monitoring and Follow-up

Local youth group participating in chimney swift roost count.

The VCs in the terrestrial environment are soil invertebrates, monarch butterfly, red maple, chimney swift, bald eagle, ruffled grouse, mallard, great blue heron, little brown myotis (bats), short-tailed shrew, black bear, eastern wolf, muskrat, Blanding's turtle, eastern milksnake and green frog. Monitoring and follow-up activities within the terrestrial environment are discussed below. In addition to monitoring in the terrestrial environment, follow-up and monitoring work undertaken by CNL in other environmental components (i.e., atmospheric, surface water, and geological and hydrogeological environments and ambient radioactivity) are directly related to confirming the EIS findings related to VCs in the terrestrial environment.

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

Decommissioning Execution

Following the systematic informed planning process, monitoring details were developed for the Decommissioning Execution phase. These monitoring details are summarized in Table 9.6-5 below. Evaluation criteria for the terrestrial environment, and actions taken to address exceedances were developed and generic actions are presented in Section 9.1.2.3 above.

Additionally, monitoring and mitigation measures related to the chimney swift roost were developed separately (Chimney Swift TSD). The details of this monitoring are discussed below.

During the non-breeding season (May 1 to June 21 and July 31 to September 1):

- When >25 swifts are observed leaving the roost in the daytime during the first day of inclement weather (i.e., measurable precipitation lasting longer than 30 minutes, and ambient temperatures below 9^{o}C for more than 120 continuous minutes), and do not return within the observation period, then an examination of the associated decommissioning activities to identify the likely source of disturbance, with mitigation measures, should be taken; or,

- if >200 swifts are seen exiting the roost on day 2 or more of inclement weather and do not return within the observation period, then an examination of the associated decommissioning activities to identify the likely source of disturbance, with mitigation measures, should be taken.

During the breeding period (June 22 to July 30):

- If a marked decrease is seen, this may indicate that swifts have been disturbed by a contemporaneous activity in the decommissioning process. A marked decrease is a >50% decrease in the average of the counts from the previous 4 nights during which decommissioning activities have taken place during the day. If this marked decrease has been observed, then an examination of the associated decommissioning activities must ensue to identify the likely source of disturbance, with mitigation measures taken.

Upon the occurrence of any circumstances listed above, decommissioning activities taking place should be reviewed and additional mitigation measures should be applied (additional details provided in Section 9.6.3 of this EIS and in the Chimney Swift TSD). In order to assess the effectiveness of the mitigation measures, monitoring should be conducted to confirm their effectiveness prior to the resumption of work. Monitoring of mitigation effectiveness will use the same protocols listed above, but with a differing threshold of response. During the non-breeding period, if <10 swifts leave the roost on the first day of inclement weather during the observation period, or <50 swifts leave the roost on the second day of inclement weather during the observation period, then a positive response to mitigation measures is indicated. During the breeding period, if there is a $\geq$25% increase in the average daily counts from the previous four nights, then a positive response to mitigation measures is indicated. Figure 9.6-1 presents a flow chart outlining chimney swift monitoring, mitigation and monitoring of mitigation effectiveness.

Figure 9.6-1 Chimney Swift Monitoring Program Flow Chart

A survey for roosting bats will be conducted in the summer preceding the initiation of decommissioning activities. Visual surveys for evidence of roosting bats and roost emergence surveys will be conducted, using hand-held acoustic bat monitoring detectors (for species identification), on all four sides of the building. The objective of these surveys is to visualize and confirm bats exiting from any potential roosting locations within the building. This monitoring will be conducted in the summer – from June to July – during the expected period of highest bat activity. Monitoring will be conducted for a minimum of two nights, during suitable conditions (i.e., not on nights with rainfall events or high winds).

Pre-disturbance searches for hibernating little brown myotis will be conducted during the winter prior to the initiation of decommissioning to confirm the absence of hibernating individuals inside the below-grade floors. Starting in November of the calendar year prior to decommissioning activities, searches will be conducted for hibernating bats. A suitably trained biologist or environmental specialist will use a spotlight to search all surfaces of the walls and ceiling for individual hibernating little brown myotis. Searches for guano (to be distinguished from mouse feces) will also be conducted. If there are no bats detected within the below-grade floors of the building, it can be concluded that bats are not hibernating in the building and no further survey or exclusion effort is required.

If bats are detected, CNL will consult with ECCC on the appropriate next steps.

Table 9.6-5 Monitoring and Follow-up Activities in the Terrestrial Environment during the Decommissioning Execution Phase

Subcomponent	Sampling Locations	Parameters to be Monitored	Monitoring Frequency[1]
Chimney Swift	• NPD Site	Chimney swift roost disturbance	• During the non-breeding season (May 1-June 21 and July 31-September 1): 1-hour observation during inclement weather • During breeding season (June 22 to July 30): daily roost counts
Species at Risk	Along the main road, other transportation routes, and areas of where new activities are taking place on site.	Roadkill mortality	Daily during eastern milksnake active season (April 15 to September 30), only when decommissioning activities are occurring
		SAR disturbance	Prior to commencement of new or modified activities
	• NPDWF structure (crawlspace, voids outside of facility), as well as areas of bat emergence	Bat presence	Preceding the initiation of decommissioning activities: Visual inspections to be conducted in both summer (during high activity) and winter (during hibernation).
Wildlife	Along the main road, other transportation routes, and areas of where new activities are taking place on site.	Disturbance of locally rare species, migratory birds' nests, etc.	Prior to new activities or modifications to existing activities
Vegetation *(if triggered by tier 2 groundwater exceedances)*	• Established monitoring points within the Site Study Area	• Radionuclides *(if triggered)* Parameters dependent upon exceedances in other environmental media.	Quarterly

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change. Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Institutional Controls

Following the systematic informed planning process, monitoring details were developed for the Institutional Controls phase. These monitoring details are summarized in Table 9.6-6 below.

During the Institutional Controls phase, CNL will conduct periodic (i.e., once every five years) visual inspections of the ventilation stack as part of CNL's *Surveillance Plan* (Taylor 2019). If the integrity of the ventilation stack has been compromised (i.e., deterioration of concrete), the situation will be assessed, and appropriate repairs will be considered. Inspections will continue for the lifespan of the ventilation stack, or until the chimney swift is no longer listed as a SAR. Unique inspection will be triggered if circumstances occur that could change the integrity of the ventilation stack (i.e., a seismic event).

For three years following completion of decommissioning activities, CNL will conduct weekly evening roost counts when chimney swifts are present at the NPD site (i.e., roosting season, i.e., May 1 to September 1). After the three-year period, volunteers may be used to participate in National Roost Count Days (typically five per year). With respect to milkweed and monarch butterfly, during final site restoration, the 1.2-hectare area of the grout batch mixing plant location will be seeded with milkweed. Surveys will be conducted for a period of 3 years and information on milkweed establishment and monarch larvae and chrysalis occupancy will be monitored.

Monitoring and follow-up activities conducted in other environmental components (i.e., atmospheric, surface water and geological and hydrogeological environments and ambient radioactivity) will also confirm EIS predictions for effects to VCs in the terrestrial environment during the Institutional Controls phase. If parameters are above applicable guidelines or notable changes are observed, CNL biologist(s) will be consulted.

Evaluation criteria for the terrestrial environment, and actions taken to address exceedances were developed and generic actions are presented in Section 9.1.2.3 above.

Table 9.6-6 Monitoring and Follow-up Activities in the Terrestrial Environment during the Institutional Controls Phase

Environmental Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Chimney Swift	• NPD site	Chimney swift roost disturbance	Weekly for the first three years of institutional control
	Inspection of ventilation stack integrity will be undertaken as part of CNL's *Surveillance Plan* (Taylor 2019)		
Vegetation quality *(if triggered by tier 2 groundwater exceedances)*	• Vegetation monitoring will be co-located with groundwater exceedances. • Established monitoring points within the Site Study Area.	• Radionuclides (*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change. Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

9.6.6 Conclusion

As shown in Table 9.6-4, no adverse residual effects were identified for the terrestrial environment.

The assessment covered the terrestrial VCs of interest to Indigenous Nations, communities, and organizations, including moose, fox, otter, mink, weasel, berries, and mushroom VCs that were added as a result of Indigenous engagement activities (see Sections 6.3, 9.6.1.1).

Monitoring activities have been identified for the terrestrial environment, such as checks for SAR in the facility and roadways. Specific monitoring activities have been developed for bats and chimney swifts. In addition, monitoring activities in other environmental components (i.e., atmospheric, surface water, and geological and hydrogeological environments and ambient radioactivity) will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects related to the terrestrial environment. If monitoring identifies concerns in the other environmental components, CNL will assess the implications to the terrestrial environment (e.g., through discussion with CNL biologists).

9.7 Ambient Radioactivity

9.7.1 Selection of VCs

As shown in Section 5.2.4, ambient radioactivity represents features that can be affected by the project and as such would be pathways or mechanisms for transfer of an effect to another environmental component (e.g. aquatic environment, terrestrial environment, human health). As such, no VCs have been selected in the ambient radioactivity (Table 9.7-1). The potential effects of changes in ambient radioactivity are considered in the applicable environmental components.

Table 9.7-1 VC Selection for Ambient Radioactivity

Environmental Component	Pathway	Rationale
Ambient Radioactivity	Pathway to human health	The potential effects on humans associated with changes in ambient radioactivity will be considered in the human health.
	Pathway to aquatic environment	The potential effects on aquatic biota associated with changes in ambient radioactivity will be considered in the aquatic environment.
	Pathway to terrestrial environment	The potential effects on terrestrial biota associated with changes in ambient radioactivity will be considered in the terrestrial environment.

9.7.1.1 Indigenous Engagement Feedback – Key Interests and Concerns related to Ambient Radioactivity VCs

This section describes how the input from Indigenous engagement activities influenced the scope of the ambient radioactivity environment assessment. Table 9.7-2 summarizes the key interests and concerns raised by Indigenous peoples related to the evaluation of potential effects to ambient radioactivity (based on Table 6.3-1 above), and demonstrates how the interest or concern has been addressed in the present assessment.

Table 9.7-2 Summary of Interests and Concerns Raised During Indigenous Engagement Activities that Influenced the Scope of the Ambient Radioactivity Environment Assessment

Interest or Concern	How the Interest Was Included in the Assessment
Indigenous Health: concerns due to introduction of tritium into the Ottawa River	Potential effects on Indigenous peoples health from tritium in the Ottawa River are assessed using the new Indigenous peoples Health VC that was added to the EIS in response to feedback from Indigenous Nations, communities and organizations on VCs (Section 9.10.2).
Protection of the Environment (specifically Ottawa River)	Protection of the environment is assessed throughout the EIS, including: consideration of how the project may interact with the various environment components; developing mitigation measures to minimize project impacts and protect the environment; assessing potential impacts of the project on relevant VCs; determining whether any adverse residual effects may occur; and developing monitoring programs to confirm the findings of the assessment. With respect to protection of the Ottawa River in particular: Potential effects to the Ottawa River from radiological releases are assessed using the aquatic plant and animal VCs and human (public and Indigenous health) receptor VCs selected in the EIS (Sections 9.4.3, 9.8.3, 9.10.2.3).

Notes:
The table above provides a summary of the concerns expressed by multiple Indigenous Nations, communities and organizations. See Table 6.3-1 for a more detailed listing of key interests and concerns from each Indigenous Nation, community and organization.

9.7.2 Assessment Boundaries

9.7.2.1 Spatial Boundaries

Similar to the ambient radioactivity baseline characterization in Section 8.7 above, the Site and Local Study Areas for this assessment are consistent with the general spatial boundaries outlined in Section 5.2.1.1. The Regional Study Area incorporates both the atmospheric and surface water environment Regional Study Areas (see Figure 8.7-1).

9.7.2.2 Temporal Boundaries

The temporal boundaries for this assessment are the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS.

9.7.3 Identification of Residual Effects

9.7.3.1 Project-Environment Interactions

As shown in Table 5.2-1, potential effects to the ambient radioactivity may occur as a result of interaction with activities in the Decommissioning Execution, Institutional Controls and Post-Institutional Controls phases, in particular:

- Grouting of below grade structures;
- Removal of above grade structures;
- Facility performance during the Institutional Controls phase; and

- Facility performance during the Post-Institutional Controls phase.

The rationale for these interactions is included in Table 9.7-3 below.

Table 9.7-3 Project-Environment Interactions in Ambient Radioactivity

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**	
	1.5	Provide slip pipe access to nuclear area.	Drilling of slip pipe access holes could affect the external radiation field.
	2	**Grouting of Below Grade Structure**	
	2.1	Room preparation (e.g., sealing of pipes).	Some associated activities will take place in areas with higher ambient radioactivity, however the *overall* radiation levels remain unchanged.
	2.2	System preparation large vessels.	Some associated activities will take place in areas with higher ambient radioactivity, however the *overall* radiation levels remain unchanged.
	2.3	Grout fill nuclear area.	Grout filling will displace (i.e. release to the environment) air containing tritium from within the facility.
	3	**Removal of Above Grade Structure**	
	3.1	Conventional heavy equipment knockdown of reactor hall.	During demolition, there is potential for surface contamination from the structures to be released into the environment.
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Sizing of material from the facility may release radionuclides to the environment.
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	Storage of potentially contaminated materials may affect ambient radioactivity.
Decommissioning Execution	**3.4**	Steel and rubble emplaced in condenser room.	Emplacing material in the facility will displace air containing tritium which will affect the ambient radioactivity.
	3.5	Grout first level of demolition material in condenser room.	Grout filling will displace (i.e. release to the environment) air containing tritium from within the facility.
	3.6	Steel and rubble emplaced in condenser room.	Emplacing material in the facility will displace air containing tritium which will affect the ambient radioactivity.
	3.7	Grout second level of demolition material in condenser room.	Grout filling will displace (i.e. release to the environment) air containing tritium from within the facility.
	3.8	Steel and rubble emplaced in condenser room.	Emplacing material in the facility will displace air containing tritium which will affect the ambient radioactivity.
	3.9	Grout third level of demolition material in condenser room.	Grout filling will displace (i.e. release to the environment) air containing tritium from within the facility.
	3.10	Demolish block walls and inside walls around control room and change rooms.	During demolition, there is potential for surface contamination to be released into the environment.
	3.11	Collapse ceilings of furnace room and adjacent rooms.	During demolition, there is potential for surface contamination to be released into the environment.
	3.12	Emplace block wall rubble in furnace room or condenser room.	Emplacing material in the facility will displace air containing tritium which will affect the ambient radioactivity.

		Project Works and Activities	Potential Interaction
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Emplacing material in the facility will displace air containing tritium which will affect the ambient radioactivity.
	3.15	Grout furnace room and adjacent areas to ground level.	Grout filling will displace (i.e. release to the environment) air containing tritium from within the facility.
	3.16	Demolish above grade portion of pressure relief pit.	During demolition, there is potential for surface contamination to be released into the environment.
IC*	**6**	**Long-Term Care and Maintenance**	
	6.8	Facility performance during the Institutional Controls phase.	Potential releases of volatilized radioactivity to air through the cap system. Groundwater will start to enter and eventually resaturate the grouted structure and come into contact with contamination. Dissolved radiological contaminants in groundwater will flow out and may reach the Ottawa River.
PIC**	**7**	**Post-Institutional Controls**	
	7.1	Facility performance during the Post-Institutional Controls phase.	Potential releases of volatilized radioactivity to air through the cap system. Groundwater will start to enter and eventually resaturate the grouted structure and come into contact with contamination. Dissolved radiological contaminants in groundwater will flow out and may reach the Ottawa River.

Notes:

* - IC: Institutional Controls phase.

** - PIC: Post-Institutional Controls phase.

9.7.3.2 Proposed Mitigation Measures

In addition to the in-design mitigation measures (e.g., grout creating an alkaline environment that helps to contain radioactivity, isolation of radiological inventory with grout fill and concrete cap) identified in Section 4.1 above, the following mitigation measures have been identified for ambient radioactivity:

- dust suppression measures outlined in Section 9.2.3.2;
- sediment and erosion controls outlined in Section 9.3.3.2;
- use of localized HEPA ventilation as necessary during grouting operations.

The mitigation measures presented above are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required.

9.7.3.3 Effects After Mitigation

Decommissioning Execution

The DecomSA TSD examines the potential effects of Decommissioning Execution activities on ambient radioactivity. Activities such as drilling holes in below grade structures, displacement of air from the facility during grouting and emplacement, and demolition have the potential to affect ambient radioactivity. Since ambient radioactivity is a pathway to VCs in other environmental components (e.g., aquatic environment, terrestrial environment, human health), potential effects on ambient radioactivity are considered for VCs (humans and non-human biota) in those other environmental components (see Sections 9.4.3, 9.6.3, 9.8.3, 9.9.3 and 9.10.3). The DecomSA TSD uses annual dose calculations consistent with the DRL, which accounts for all relevant routes of exposure, including consideration of consumers of country food whose exposure pathways may differ due to cultural norms, as per REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures* (CNSC 2020a, Appendix C.6) requirements (see Table 8.8-4).

Institutional Controls and Post-Institutional Controls

The PostSA TSD examines several potential scenarios for the postclosure period (i.e., Institutional Controls and Post-Institutional Controls phases) as a way to capture and quantify uncertainties in the future conditions at the site (for detail on these scenarios, the reader is directed to the PostSA TSD) and assess the potential for radiological and non-radiological contamination of the atmospheric environment (among other environments) for these scenarios. Since ambient radioactivity is a pathway to VCs in other environmental components (e.g., aquatic environment, terrestrial environment, human health), potential effects on ambient radioactivity are considered for VCs (humans and non-human biota) in those other environmental components (see Sections 9.4.3, 9.6.3, 9.8.3, 9.9.3, 9.10.2 and 9.11.3). The PostSA TSD uses annual dose calculations which account for all relevant routes of exposure, including consideration of consumers of country food, as well as a site resident who fishes, grows crops and raises livestock.

9.7.3.4 Prediction Confidence and Uncertainty

Air displaced from the facility is likely to have variable tritium concentrations. To determine the amount of tritium released when the air is displaced, this variability is accounted for by the assumption that the air has a tritium concentration equal to the highest contaminated room. Additionally, tritium is treated as HTO to be conservative wherever HTO dose calculations are available.

In the PostSA TSD, uncertainties in postclosure conditions (e.g. floods), key parameters (e.g. inventory of contamination) are addressed inherently by assessing several disruptive scenarios. Conservative assumptions are also used to address other uncertainties, such as sediment characteristics.

9.7.3.5 Residual Effects

Table 9.7-4 summarizes the effects assessment above and presents the residual effects that were identified in ambient radioactivity. The residual effects in Table 9.7-4 are grouped by effect rather than by individual interaction as listed in Table 9.7-3.

Table 9.7-4 Summary of Residual Effects to Ambient Radioactivity

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution					
Ambient Radioactivity	Grouting will displace contaminated air from within the facility. This activity includes all air displacement (e.g. from emplacement).	Tritium in air will be released to the environment.	No mitigation measures identified.	Air containing low levels of tritium will be displaced due to the pouring of grout into the facility.	Effects of radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.
Ambient Radioactivity	Demolition may release surface contamination to the environment.	Surface contamination release may affect the environment.	Standard Construction Practices related to dust suppression from demolition, and CNL's Radiation Protection Program requirements.	Contamination in the atmosphere may affect the environment and non-human biota and human health.	Effects of radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.
Ambient Radioactivity	Metal cutting and crushing of masonry may release surface contamination.	Sizing of material may release radionuclides to the environment.	Standard Construction Practices related to dust suppression, and CNL's Radiation Protection Program requirements	The components to be sized will primarily be portions of the aboveground facility, and are unlikely to have high concentrations of radionuclides.	Effects of radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.
Ambient Radioactivity	Material laydown and perform clearance surveys.	Storage of potentially contaminated materials may affect ambient radioactivity.	Standard Construction Practices related to dust and runoff suppression, and CNL's Radiation Protection Program requirements.	Effects are expected to be temporary, while potentially contaminated material is in the lay down area.	Effects of radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Institutional Controls and Post-Institutional Controls					
Ambient Radioactivity	Radioactivity volatilized from surface media.	Radioactivity may volatilize to the environment.	In-design mitigations to isolate and contain the inventory in order to reduce the potential effects on ambient radioactivity.	Radioactivity may be volatilized and inhaled by humans and non-human biota.	Effects of radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.
Ambient Radioactivity	Facility performance during the postclosure period.	Groundwater will flow into the eventually degraded grouted structure. Contaminated groundwater will flow out and eventually into the Ottawa River.	In-design mitigations to isolate and contain the inventory in order to reduce the potential of groundwater contamination.	Groundwater will flow into the eventually degraded grouted structure. Contaminants will reach surface water, river sediment and shoreline sediment.	Effects of radiological exposure are assessed in terms of their dose in humans and non-human biota in Sections 9.4, 9.6 and 9.8.

9.7.4 Assessment of Residual Effects

Since ambient radioactivity is a pathway to other environmental components (e.g., aquatic and terrestrial environments, human health), the adverse residual effects are further assessed within those environmental components (see Sections 9.4.4, 9.6.4, 9.8.4, 9.9.4 and 9.10.2.4).

9.7.5 Monitoring and Follow-up

Ambient radioactivity represents a pathway for transfer of an effect to VCs in other environmental components. Monitoring and follow-up activities related to ambient radioactivity are discussed below and presented in Table 9.7-5 and Table 9.7-6. Monitoring activities (e.g., radiation protection surveys, gamma monitoring, and passive air sampling) will verify that no parameters are above applicable guidelines are identified. It is noted that the monitoring presented in this section pertains to direction radiation monitoring, and some monitoring of radiological contaminants is documented as part of monitoring in the atmospheric and surface water environments (Sections 9.2.5 and 9.3.5 respectively). Further action will be triggered if parameters are above applicable guidelines or other notable changes are observed.

Evaluation criteria for ambient radioactivity, and actions taken to address exceedances were developed and generic actions are presented in Section 9.1.2.3 above.

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

Decommissioning Execution

CNL will conduct routine radiation protection surveys (indoor and outdoor), passive tritium air sampling and ambient radioactivity monitoring at TLD monitoring locations around the NPD site during the Decommissioning Execution phase. Investigative further action will be triggered if parameters are above applicable guidelines are identified.

Institutional Controls

CNL will continue to conduct routine radiation protection surveys (outdoor) and ambient radioactivity monitoring at TLD monitoring locations around the NPD site during the first five years of the Institutional Controls phase. Investigative further action will be triggered if parameters are above applicable guidelines are identified.

Table 9.7-5 Ambient Radioactivity Monitoring during the Decommissioning Execution Phase

Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Ambient Radioactivity	• Within the NPD site, at previously established monitoring areas • Downwind at currently monitored locations	Gamma dose rate	Continuous

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Table 9.7-6 Ambient Radioactivity Monitoring during the Institutional Controls Phase

Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Ambient Radioactivity	• Within the NPD site, at previously established monitoring areas. • Downwind at currently monitored locations	Gamma dose rate	Continuous

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

9.7.6 Conclusion

As shown in Table 9.7-4, the potential effects of exposure to radiation and radioactivity in the environment are evaluated in terms of their dose to human receptors and non-human receptors. This is because ambient radioactivity is a pathway that carries project emissions to receptors (both human and non-human). The potential effects of most radionuclides must be evaluated through the effect of the medium on receptors. When evaluating the potential effects of radioactivity in environmental media on receptors, all relevant pathways that can affect a receptor are cumulatively considered.

Project emissions are not expected to have adverse effects to ambient radioactivity because levels in environmental media were found not to have adverse health effects on human receptors (see Sections 9.8.4 and 9.10.2.4) and not to cause undue risk for relevant biota (see Sections 9.4.4 and 9.6.4).

The assessment of potential effects to ambient radioactivity (Section 9.7.3) took into consideration the concerns expressed by Indigenous Nations, communities, and organizations during engagement activities (Section 9.7.1.1).

Monitoring activities such as the use of TLDs, as well as monitoring of radiological contaminants documented as part of the atmospheric and surface water environments will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects related to ambient radioactivity.

9.8 Human Health

9.8.1 Selection of VCs

As outlined in Section 5.2.4, VCs for human health were selected to encompass the potential effects of the project on human health as well as exposure via pathways from environmental components (e.g., atmospheric environment, surface water environment, geological and hydrogeological environment, ambient radioactivity). The VCs for human health, along with rationale for their selection, are listed in Table 9.8-1.

Table 9.8-1 VC Selection for Human Health

Environmental Component	Sub-Category	VC and Rationale
Human Health	Public	The general public may be exposed to health risk as a result of the project. The potential effects on humans associated with changes in atmospheric, surface water, geological and hydrogeological conditions (radiological and chemical releases and concentrations), and external gamma radiation are considered.
	Worker	Workers may be exposed to health risk as a result of performing their duties relative to the project. The potential effects on humans associated with changes in atmospheric, surface water, geological and hydrogeological conditions (radiological and chemical releases and concentrations) and external gamma radiation are considered.

Notes:

Effects on human health from possible accidents and malfunctions are discussed in Section 9.11 below.
In response to feedback received during Indigenous engagement activities, CNL has added Indigenous health VCs (see Section 9.10.2).

9.8.2 Assessment Boundaries

9.8.2.1 Spatial Boundaries

Similar to the human health baseline characterization in Section 8.8 above, the Site and Local Study Areas for this assessment are consistent with the general spatial boundaries outlined in Section 5.2.1.1. As this area is all owned by the Federal Government, there are no residents present. Workers are, and will continue to be, present in this area for the duration of the decommissioning, and as such the Site/Local Study Areas will describe worker health.

The Regional Study Area for this assessment consists of the Renfrew County and District Health Unit, and Région de l'Outaouis Health Unit, illustrated in Figure 8.8-1 and Figure 8.8-2.

9.8.2.2 Temporal Boundaries

The temporal boundaries for this assessment are the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS.

9.8.3 Identification of Residual Effects

9.8.3.1 Project-Environment Interactions

As shown in Table 5.2-1, potential effects to human health may occur as a result of interaction with Decommissioning Execution operations and activities associated with:

- Grout Batch mixing plant;
- Grouting of below grade structures;
- Removal of above grade structures;
- Installation of concrete cap and engineered cover;
- Final site restoration;
- Facility performance during the Institutional Controls phase; and
- Facility performance during the Institutional Controls phase.

The rationale for these interactions is included in Table 9.8-2 below.

Table 9.8-2 Project-Environment Interactions in Human Health

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**	
	1.1	Designate footprint, create access, temporary fencing (east side of main building).	Work conducted near the facility has the potential to release dust, increase radiation doses to workers.
	1.2	Assign storage area for raw materials, ship in sand. Likely east side of licensed area.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect worker health.
	1.3	Set up mixing stations, hook up electrical power or diesel power.	Work conducted near the facility has the potential to increase radiation doses to workers.
	1.4	Truck in necessary water supply or source water directly from river.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect worker health.
	1.5	Provide slip pipe access to nuclear area.	This activity has the potential to release dust and increase radiation doses to workers. Specifically, to the workers drilling holes for slip pipe access and workers nearby.
	1.6	Construct washout pit. Lined excavation with water transfer. Likely near grout batch mixing station.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect worker health.

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**1.7**	Level area for pumper.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect worker health.
	1.8	Mix grout to required formula.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and equipment emissions may affect worker health.
	1.9a	Truck grout to pumping station (20 trips per day).	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect worker and public health.
	1.11	Sample and dewater the cleaning pit. Emplace sediments into voids in condenser room.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect worker health.
	1.12	Demobilize grout batch mixing plant after cap installation.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect worker health.
	2	**Grouting of Below Grade Structure**	
	2.1	Room preparation (e.g., sealing of pipes).	Work conducted within the facility has the potential to increase radiation doses to workers.
	2.2	Systems Preparation Large Vessels.	The activities associated with this task are routine construction activities. Potential effects on workers as part of this task are grouped with activity **1.5** (Provide slip pipe access to nuclear area).
	2.3	Grout Fill Nuclear Area.	Displacement of air containing dust, tritium, lead and asbestos may result in effects to the public and workers.
	3	**Removal of Above Grade Structure**	
	3.1	Conventional heavy equipment knockdown of reactor hall.	Release of surface contamination may increase exposure to dust, radioactivity and other potential contaminants to the public and workers.
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Release of surface contamination may increase exposure to dust, radioactivity and other potential contaminants to the public and workers.
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	Conducting clearance surveys has the potential to increase radiation doses to workers.
	3.4	Steel and rubble emplaced in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.
	3.5	Grout first level of demolition material in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.
	3.6	Steel and rubble emplaced in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**3.7**	Grout second level of demolition material in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.
	3.8	Steel and rubble in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.
	3.9	Grout third level of demolition material in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.
	3.10	Demolish block walls and inside walls around control room and change rooms.	Release of dust and surface contamination may increase exposure to the public and workers.
	3.11	Collapse ceilings of furnace room and adjacent rooms.	Release of dust and surface contamination may increase exposure to the public and workers.
	3.12	Emplace block wall rubble in furnace room or condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Release of surface contamination may increase radiation doses to the public and workers.
	3.15	Grout furnace room and adjacent areas to ground level.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to the public and workers.
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Release of dust and surface contamination may increase exposure to the public and workers.
	4	**Install Concrete Cap and Engineered Cover**	
	4.1	Concrete Cap (construct forms, install rebar, and pour, level and slope concrete).	Work conducted near the facility has the potential to release dust and increase radiation doses to workers.
	4.2	Engineered Cover (ship in materials, layer and shape mound, install geotextile layer, grade property, install remaining earth layers and seed).	Work conducted near the facility has the potential to release dust and increase radiation doses to workers.
	5	**Final Site Restoration**	
	5.2	Demobilize Site (Remove temporary facilities, decontaminate equipment, remove power upgrades, poles and lines, return transformers).	Work conducted near the facility has the potential to release dust and increase radiation doses to workers.
IC*	**6**	**Long-Term Care and Maintenance**	
	6.8	Facility performance during the Institutional Controls phase	Groundwater will start to enter and eventually resaturate the grouted structure. Contaminated groundwater will flow out and has the potential to affect the public.
PIC**	**7**	**Post-Institutional Controls**	
	7.1	Facility performance during the Post-Institutional Controls phase	Groundwater in the resaturated and eventually degraded grouted structure will become contaminated. Contaminated groundwater will flow out and has the potential to affect the public.

Notes:

* Institutional Controls
** PIC: Post-Institutional Controls

9.8.3.2 Proposed Mitigation Measures

The mitigation measures presented below are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required.

In addition to the in-design mitigation measures identified in Section 4.1 above, mitigation measures identified in other environmental components, such as dust suppression and vehicle maintenance may also reduce the potential for effects on public and worker health. The following mitigation measures are outlined in the DecomSA TSD.

- *General:*
  - Staff and contractors will receive orientation to ensure they are aware of decommissioning activities, hazards, and emergency procedures.
  - Signs will be posted to indicate where decommissioning work is taking place and to alert people to detours where applicable.
  - Work control documents will be developed to guide safe execution of the decommissioning activities.
  - Hazards to personnel will be identified through work control documents and eliminated or controlled using engineered controls, administrative controls, and PPE.
  - Regular updates will be given to site personnel on updates in the proposed decommissioning work plans.
  - CNL health and safety programs are in place to prevent and mitigate injury to personnel.
  - An NPD Emergency Procedure is in place, and is consistent with CNL's Emergency Preparedness Program. This procedure will be updated to include decommissioning activities.
  - Emergency response is available through local municipal Fire Department.
  - Stop work procedures will be followed for power outages.
  - Overall site 'good housekeeping' will be upheld.
  - Contractor Health & Safety Management Program, reviewed by supply chain management and meeting CNL requirements.
  - Periodic communication updates to local residents on the project construction activities, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc.

- *Structural:*
  - Structural assessments will be performed to ensure that all demolition work is done in accordance with safe work practices and civil/engineering requirements.
  - Appropriate methods will be used during the demolition process to provide support and ensure that unintended structural failure does not occur.
  - If inclement weather occurs during the performance of project work, activities would be stopped (if deemed necessary) in order to minimize weather-related risks.
  - A demolition plan is prepared in accordance with PEO standards and approved by a Professional Engineer qualified in this discipline.
  - An exclusion zone will be established for decommissioning activities.

- *Radiation Dose:*

Radiological work assessments will be performed as detailed work packages are developed. They will include specific measures to reduce collective and individual worker dose to ensure that the dose is below relevant dose threshold standards. As per current practice at the NPD site, all internal and external doses received by NPD workers will be monitored and reported as part of the operational dose management program. This system will be in effect during the Decommissioning Execution phase of the project:

  - As mentioned above, work control documents will be prepared for all activities. Where there is the potential for workers to encounter radiological hazards, the preparation of work control. Documents include a radiological assessment completed by CNL health physics personnel. Work control documents are then developed to include radiological aspects as appropriate.
  - Hazards to personnel will be identified through work control documents and eliminated or controlled using engineered controls, administrative controls, and PPE.
  - Utilization of air monitors (including particulate contamination as well as tritium-in-air), dosimeters, and bioassay will be used as required to detect the spread and uptake of contamination before it exceeds limits.
  - Emergency response capability is available from local municipalities.
  - An NPD Emergency Procedure is in place, and is consistent with CNL's Emergency Preparedness Program. This procedure will be updated to include decommissioning activities.
- *Asbestos:*
  - Signage will be installed to indicate asbestos laydown/interim-storage areas.
  - Procedures will be in place for handling and storage of abated asbestos (bagged).
  - Work control documents will be developed for all activities, including those involving handling of abated (bagged) asbestos and transite.
- *PCBs:*
  - Work control documents will be developed for all activities, including those involving handling PCB-containing materials.
  - Sources of PCBs will be confirmed through characterization and will be clearly identified prior to executing activities involving handling of PCB-containing materials (e.g., caulking, paint, cables, light ballasts, etc.).
  - Appropriate personal protection equipment (e.g., respirators and Tyveks) will be available and used.
- *Lead:*
  - Work control documents will be developed for all activities, including those involving lead-containing materials.
  - Sources of lead are known and will be clearly identified prior to executing decommissioning activities.
  - Appropriate personal protection equipment will be used, based on the nature of the activities (e.g. gloves, respirators, etc.).
- *Mercury:*
  - Work control documents will be developed for all activities, including those involving mercury-containing equipment/instrumentation.
  - Sources of mercury are known and will be clearly identified prior to executing decommissioning activities.

- *Hydrogen generation:*
  - Ensuring proper ventilation during grouting.
  - Pouring grout in batches to allow a set up time between pours.

9.8.3.3 Effects After Mitigation

Decommissioning Execution

Site and Local Study Area

Non-radiological

During the Decommissioning Execution phase, the site and local study areas will be occupied primarily by workers. Vehicle and equipment operation and on-site transportation will release NO_x, SO_2, VOCs, TSP, PM_{10}, and $PM_{2.5}$. These activities are discussed in Section 9.2 above. In the DecomSA TSD, it is conservatively assumed that these activities will occur simultaneously (i.e., the maximum potential emissions and releases are considered). Worker exposure to NO_x, SO_2, VOCs, TSP, PM_{10}, and $PM_{2.5}$ for all activities is considered here. The release of these contaminants will be mitigated by standard dust suppression measures listed for the atmospheric environment in Section 9.2.3.2, as well as proper vehicle maintenance to reduce emissions. No adverse health effects to workers are anticipated in the Site and Local Study Areas.

Grouting and removal of the above grade structure will result in the displacement of air from inside the facility, which contains suspended lead and asbestos. This was assessed in Sections 8.5.2 and 8.6.1 of the DecomSA TSD. Exposure to workers will be limited by following the appropriate work control documents described in 9.8.3.2 above. Worker exposures were compared to benchmark values (8-hr limits in this case) to produce (unitless) SI values. An SI of 1 means that the worker exposure is equal to the benchmark value. The maximum SIs for lead and asbestos for near-field workers were 3.88×10^{-5} and 2.14×10^{-8} respectively, indicating that no adverse health effects to workers are expected.

Radiological

Activities that may result in radiation exposure for workers are assessed in the DecomSA TSD. These activities include drilling holes in below grade structures, displacement of air from the facility during grouting and emplacement, and demolition. Radiation protection protocols, work control documents, safeguards and mitigation will reduce the extent of exposure for the workers and are described in Section 9.8.3.2 above.

The maximum total dose rate for workers received during grouting and emplacement was predicted to be 1.35×10^{-5} mSv/y in the DecomSA TSD. The maximum total dose received by a driller while creating slip pipe access was 0.527 mSv. Contaminant release during demolition calculated to result in a maximum total dose of 5.92×10^{-5} mSv. These doses are well below the regulatory limit of 50 mSv/y for NEW (CNSC 2021b); therefore, no adverse health effects to workers are anticipated.

Regional Study Area

Non-Radiological

The DecomSA TSD assesses chemical exposure of members of the public in the Regional Study Area during the Decommissioning Execution phase. During grouting, exposure to lead and asbestos for

members of the public was compared to benchmark values, resulting in maximum SI of 2.09 $x10^{-4}$ and 4.7 $x10^{-7}$ respectively. During demolition, the maximum SI for lead calculated for members of the public was 1.71 $x10^{-1}$. All exposure concentrations are lower than the public benchmark values.

Lastly, the deposition of lead to soil was assessed at receptor locations and compared against the MOE (2011) Table 8 soil criterion for lead of 120 µg/g. The maximum soil concentration calculated from demolition or grouting was four orders of magnitude below this criterion.

Therefore, no adverse health effects are anticipated for the public (e.g., from releases to air or surface water).

Radiological

As determined in the DecomSA, the maximum total dose rate to the public during grouting and emplacement was calculated to be 5.76 $x10^{-6}$ mSv/y. The maximum total dose rate to the public during demolition was calculated to be 8.18 $x10^{-5}$ mSv/y. Both maximum total dose rates are well below the public dose rate limit of 1 mSv/y by 4 orders of magnitude. Thus, no adverse health effects are expected for members of the public in the Regional Study Area.

Institutional Controls and Post-Institutional Controls

Site and Local Study Area

The PostSA TSD examines several potential scenarios for the postclosure period (Institutional Controls and Post-Institutional Controls phases) as a way to capture and quantify uncertainties in the future conditions at the site (for detail on these scenarios, the reader is directed to the PostSA TSD) and assess the potential for radiological and non-radiological contamination to affect human health for these scenarios. The reader is directed to the PostSA TSD, which details the results of the assessment of radiological and non-radiological contamination on human health (among other environmental components) for these scenarios. Human health results are briefly summarized here.

The PostSA TSD considers several potential exposed groups, including:

- Site resident family: A highly conservative group that maximizes potential exposures. This is reflected by a small household (comprising two adults, a child and an infant) residing directly over the disposal facility and pursuing a self-sufficient lifestyle. This includes use of potentially contaminated river water for domestic and agricultural purposes.
- A hunting/recreational group, represented by a small number of adults and children making hunting and/or recreational use of the river and the area surrounding the NPD. Their exposure pathways, including obtaining wild foods, is also representative of the types of habits that might be exhibited by Indigenous Nations, communities and organizations.
- An offsite resident receptor group, represented by two households (adults and children) that reside alongside the Ottawa River at Deep River and Ottawa/Gatineau. These households are assumed to use river water from the Ottawa River for domestic use and as drinking water, and to use the Ottawa River for recreational swimming.

- An Indigenous receptor characterized using information from a dietary study completed by the AOPFN.
- A self-sufficient Indigenous receptor group: represented by adults and children using the area around the NPDDF, including the Ottawa River, for hunting and gathering, following a traditional lifestyle.

The PostSA also considers receptors which are inadvertent intruders to the site. The results of this scenario are presented as part of the site investigation disruptive event scenario below.

Radiological

In the normal evolution scenario, the highest dose rate was received by a Site Resident (0.00008 mSv/y). This is over 1,000 times lower than the dose rate criterion of 0.25 mSv/y.

The peak dose rate to a member of the hunter group is only 0.0000004 mSv/y. These are negligible levels of exposure.

The offsite receptor is also considered, living downstream of the NPDDF and using river water to drink and wash with. Therefore, the only exposure pathways considered are ingestion of the contaminated water, and/or external radiation from the water (e.g., bathing and swimming). As the offsite receptor lives beyond any region that can be subject to institutional control, exposures may occur earlier than 100 years after closure. The results indicate that the peak dose rate is 25 million times lower than the dose rate criterion of 0.25 mSv/y.

The peak dose rate to the indigenous receptor characterized using the AOPFN dietary study is over 10,000 times lower than the dose rate criterion of 0.25 mS/y. These are negligible levels of exposure.

In order to examine the sensitivity of the lifestyle assumptions, and to respond to Indigenous feedback on the project, the PostSA includes a sensitivity case examining a case where an Indigenous person – living what is intended to be representative of a traditional self-sufficient lifestyle – is assumed to live in the vicinity of the NPDDF. This self-sufficient Indigenous group is assumed to ingest a range of wild and naturally-occurring foodstuffs, such as deer, moose, grouse, duck, fish, berries, mushrooms and honey.

Results indicate that the peak dose to adults and children in the self-sufficient Indigenous receptor group is more than 1,000 times lower than the dose rate criterion of 0.25 mSv/y.

The PostSA also assessed several disruptive event scenarios (as described in Section 9.1 above). In all cases the dose results are below the corresponding criterion for disruptive event cases (see the PostSA TSD for further information).

Therefore, all dose rates estimated for the normal evolution and disruptive event scenarios were below the relevant dose rate criteria in the PostSA TSD.

The radiation dose to workers performing duties associated with Institutional Controls, within the Licensed Area, will be negligible based on the anticipated radiological zoning (CNL Radiological Zone 1).

Non-radiological

As discussed in Section 9.5.3.3, the PostSA TSD results show that for Normal Evolution the highest lead concentration in groundwater is 4 x 10^{-7} mg/L. The calculated concentrations of lead in all environmental media are far lower than the relevant MOE generic Site Condition Standards (2011 – Table 6, 7, 8, 9) for groundwater and the Health Canada (2017) drinking water guideline for lead.

The PostSA also assessed two disruptive event scenarios, as described in Section 9.1 above for the same receptors.

- In the site investigation scenario, the peak lead concentrations in all media are the same as for the normal evolution scenario, and well below criteria.
- In the extreme degradation of engineered barrier scenario, the peak lead concentrations in all media are below all applicable guidelines.

Regional Study Area

Since no effects on human health have been identified in the Site and Local Study Areas, no effects are expected in the Regional Study Area for the Post-Institutional Controls phase.

9.8.3.4 Prediction Confidence and Uncertainty

Uncertainty in the DecomSA TSD is addressed through conservative assumptions (i.e., variability in airborne contaminant concentrations in the facility is accounted for by the assumption that concentrations are equal to the most contaminated room for each contaminant).

There is some uncertainty in the characterization of potential effects to Indigenous Nations, communities and organizations, due to lack of site-specific information on diet and lifestyle. However, this has been accounted for by using conservative assumptions. For example, the DRL, which is used in the DecomSA calculations, is scaled to the most conservative receptor (taking into consideration country foods), and the PostSA TSD includes hunter/gatherer and site resident profiles, as well as an Indigenous receptor sensitivity case. Other Indigenous concerns such as effects on land use and socio-economic conditions are assessed separately in subsequent sections of this EIS.

In the PostSA TSD, uncertainties in postclosure conditions and events (e.g. floods, human intrusion) and key parameters (e.g. inventory of contamination) are addressed inherently by assessing several disruptive scenarios. Conservative assumptions are also used to address other uncertainties, such as sediment characteristics.

9.8.3.5 Residual Effects

Table 9.8-3 summarizes the effects assessment above and presents the residual effects that were identified in human health. The residual effects in Table 9.8-3 are grouped by effect rather than by individual interaction as listed in Table 9.8-2.

Table 9.8-3 Summary of Residual Effects in Human Health

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution					
Human Health: Public (non-radiological)	All vehicle and equipment production of NO_x, SO_2, TSP, PM_{10}, and $PM_{2.5}$.	Localized changes in the atmospheric environment may affect nearby residents.	Mitigation measures (e.g. dust suppression, equipment maintenance) for the atmospheric environment are described in Section 9.2.3.2.	For all activities, no measurable changes in air quality are predicted, therefore no effects are expected.	No adverse residual effects.
Human Health: Worker (non-radiological)	All vehicle and equipment production of NO_x, SO_2, TSP, PM_{10}, and $PM_{2.5}$.	Localized effects are expected in the atmospheric environment which may affect workers.	Mitigation measures (e.g. dust suppression, equipment maintenance) for the atmospheric and surface water environments are described in Section 9.2.3.2.	No effects are expected on worker health from changes in air quality.	No adverse residual effects.
Human Health: Worker (radiological)	Establishing footprint.	Workers are expected to be exposed to small amounts of radiation during this activity.	Following work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Human Health: Public (non-radiological)	Stockpile grout ingredients.	Runoff from stockpiles may affect surface water quality which may affect nearby residents.	Mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Ottawa River, therefore no effects to the public are predicted.	No adverse residual effects.

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Human Health: Worker (non-radiological)	Stockpile grout ingredients.	Runoff from stockpiles may affect surface water quality which may affect workers.	Mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Ottawa River, therefore no effects to workers are predicted.	No adverse residual effects.
Human Health: Worker (radiological)	Provide slip pipe access to nuclear area.	Drilling holes for slip pipe access has the potential to increase radiation doses to workers.	Follow work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Human Health: Public (non-radiological)	Construction and operation of washout pits.	Surface water quality may be affected by washout pit construction and operation which may affect nearby residents.	Mitigation measures (e.g., proper washout pit design and management) for the surface water environment are described in Section 9.4.3.2.	Localized site drainage effects are expected, but will not affect the surface water environment as a whole. No measurable changes on water quality in the Ottawa River, therefore, no effects on the public are predicted.	No adverse residual effects.
Human Health: Worker (non-radiological)	Construction and operation of washout pits.	Surface water quality may be affected by washout pit construction and operation which may affect workers.	Mitigation measures (e.g., proper washout pit design and management) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Ottawa River, therefore no effects to workers are predicted.	No adverse residual effects.
Human Health: Public (radiological and non-radiological)	Grout fill nuclear area.	Displacement of air from the facility containing lead, asbestos and tritium which may affect nearby residents.	No mitigation measures have been identified.	Lead and asbestos are well below benchmark values for nearby residents. Tritium exposure calculations for the public are well below the minimum regulatory requirement.	No adverse residual effects.

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Human Health: Worker (radiological and non-radiological)	Grout fill nuclear area.	Displacement of air from the facility containing lead, asbestos and tritium which may affect workers.	Follow work control documents and radiation protection protocol. Airborne monitoring for particulates and tritium in air (described in Section 9.8.3.2).	Lead and asbestos are well below benchmark values for workers. Tritium exposure calculations for workers are below worker dose criterion.	No adverse residual effects.
Human Health: Public (radiological)	Demolition of above grade structures.	Surface contamination of the structure may be released into the atmospheric environment which may affect the public.	Mitigation measures (e.g., runoff diversion, dust suppression) for the atmospheric environment are described in Section 9.3.3.2.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Human Health: Worker (radiological)	Demolition of above grade structures.	Surface contamination of the structure may be released into the atmospheric environment which may affect worker health.	Follow work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Human Health: Public (radiological and non-radiological)	Demolition of above grade structures.	Runoff may affect surface water quality and the public.	Mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.3.3.2.	No measurable changes in water quality in the Ottawa River, therefore no effects to the public are predicted.	No adverse residual effects.
Human Health: Public (radiological and non-radiological)	Sizing of material.	Runoff and release of surface contamination may affect public health.	Relevant mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Ottawa River, therefore no effects to the public are predicted.	No adverse residual effects.

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Human Health: Worker (radiological and non-radiological)	Sizing of material.	Runoff and release of surface contamination may affect worker health.	Relevant mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Ottawa River, therefore no effects to workers are predicted.	No adverse residual effects.
Human Health: Worker (radiological)	Clearance surveys on potentially recyclable material.	Conducting clearance surveys has the potential to increase radiation doses to workers.	Following work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Institutional Controls and Post-Institutional Controls					
Human Health: Public (radiological)	Facility performance during the postclosure period.	Exposure to radionuclides in groundwater, surface water, sediment, food, as well as external radiation could affect human health.	In-design mitigations to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects on human health.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Human Health: Public Engineering Degradation (non-radiological)	Instantaneous degradation of the concrete and grout, altering the hydraulic properties and decreasing contaminant transport times.	Exposure to lead in groundwater, surface water, sediment, soil and food could affect human health.	In-design mitigations to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects on human health.	The PostSA TSD determined that there is no likely exposure pathway from groundwater to humans.	No adverse residual effects.

9.8.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on human health have been predicted.

9.8.5 Monitoring and Follow-up

The VCs for human health are worker and public health. Monitoring and follow-up activities related to human health are discussed below. Further action will be triggered if parameters are above applicable guidelines or other notable changes are observed.

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

Decommissioning Execution

CNL will continue to conduct radiation dose monitoring and indoor air quality monitoring during the Decommissioning Execution phase to confirm that there are no effects on worker health. This work will be undertaken as part of CNL's *Dosimetry Program*. Worker dose is evaluated as part of CNL's Dosimetry Program and will be evaluated based on action levels for workers in the NPD *Decommissioning Licensing Conditions Handbook* in place at the time, and within the *NSCA* (CNSC 1997).

Monitoring conducted in other environmental components (i.e., atmospheric environment and ambient radioactivity) will also confirm EIS predictions for effects on worker and public health during the Decommissioning Execution phase.

Institutional Controls

CNL will conduct radiation dose monitoring during the Institutional Controls phase to confirm that there are no effects on worker health. This work will be undertaken as part of CNL's *Dosimetry Program*. Worker dose is evaluated as part of CNL's Dosimetry Program and will be evaluated based on action levels for workers in the NPD *Decommissioning Licensing Conditions Handbook* in place at the time, and within the *NSCA* (CNSC 1997).

Monitoring conducted in other environmental components (i.e., atmospheric environment, geological and hydrogeological environment and ambient radioactivity), such as radiation protection surveys and groundwater monitoring, will also confirm EIS predictions for effects on worker and public health during the Institutional Controls phase.

9.8.6 Conclusion

As shown in Table 9.8-3, no adverse residual effects were identified for human health.

Monitoring activities in other environmental components (i.e., atmospheric, surface water, and geological, and hydrogeological environments and ambient radioactivity) will verify the accuracy of the EA predictions

and effectiveness of measures implemented to mitigate potential adverse environmental effects related to human health. If monitoring identifies concerns in the other environmental components, CNL will assess the implications to human health (e.g., using human health risk assessment as required).

9.9 Traditional Land and Resource Use

9.9.1 Selection of VCs

As outlined in Section 5.2.4, VCs for traditional land and resource use were selected based on consideration of a number of factors, including the:

- Knowledge of Indigenous traditional land and resource use practices that interact with the environment;
- Aboriginal and/or treaty rights;
- Engagement (as documented in the IER TSD); and,
- Consideration of other EAs.

The VCs for traditional land and resource use, with rationale for their selection, are listed in Table 9.9-1.

Table 9.9-1 VC Selection for Traditional Land and Resource Use

Environmental Component	VC	Rationale
Traditional Land and Resource Use by Indigenous peoples	Trapping	Trapping of fur bearing animals is a traditional and modern-day land and resource use activity practiced by Indigenous peoples in the Ottawa Valley. Trapping is a licenced activity in Ontario on provincial land although trapping on private land is allowed. Fur bearing animals may include marten, beaver, otter, fox, mink, etc. Trapping is an activity that provides important links to cultural continuity and Indigenous ways of life, including but not limited to clothing, gifts. Trapping was specifically identified as a rights-based activity in REGDOC, 3.2.2 (CNSC 2022).
	Hunting	Hunting is a traditional and modern-day land and resource use activity practiced by Indigenous peoples in the Ottawa Valley. The hunting of large game involves deer, moose and elk but also possibly black bear. Small game includes waterfowl, rabbits, grouse, etc. Hunting is an activity that provides important links to cultural continuity and Indigenous ways of life. Hunting was specifically identified as a rights-based activity in REGDOC, 3.2.2 (CNSC 2022).

Environmental Component	VC	Rationale
Traditional Land and Resource Use by Indigenous peoples	Fishing	Fishing is a traditional and modern-day land and resource activity practiced by Indigenous peoples in the Ottawa Valley. The Kichi-Sìbì (Ottawa River) was and is still used for sport and subsistence fishing. Fish species targeted on the Kichi-Sìbì (Ottawa River) in the present likely include walleye, northern pike and smallmouth bass (AECL 2010). Historically, sturgeon, American eel and possibly suckers would have also been an important part of the catch. Fishing was specifically identified as a rights-based activity in REGDOC, 3.2.2 (CNSC 2022).
	Gathering	Gathering is a traditional and modern-day land and resource use activity practiced by Indigenous peoples in the Ottawa Valley. The gathering of plants, berries, mushrooms, etc. is for subsistence, medicines, crafts and other purposes. Gathering is an activity that provides important links to cultural continuity and Indigenous ways of life. Gathering was specifically identified as a rights-based activity in REGDOC, 3.2.2 (CNSC 2022).
	Cultural Resources & Ceremonies	Indigenous peoples place a high degree of value on specific sites of cultural, historical, archaeological, spiritual, social or ecological significance. These sites may have broader cultural significance related to the practice of formal or informal ceremonies and as places to connect to the lands and waters in a culturally and spiritually important way at or near these sites. The conducting of cultural ceremonies was specifically identified as an activity in REGDOC, 3.2.2 (CNSC 2022). This VC will assess whether any known sites of significance and the associated cultural ceremonies will be affected by the proposed undertaking.

9.9.1.1 Indigenous Engagement Feedback – Key Interests and Concerns related to Traditional Land and Resource Use VCs

This section describes how the input from Indigenous engagement activities influenced the selection of VCs in the traditional land and resource use assessment. Table 9.9-2 summarizes the key interests and concerns raised by Indigenous peoples related to VCs for the evaluation of potential effects to the traditional land and resource use assessment (based on Table 6.3-1 above), and demonstrates how the interest or concern has been addressed in the present assessment.

Table 9.9-2 Summary of Interests and Concerns Raised During Indigenous Engagement Activities that Influenced the Scope of the Traditional Land and Resource Assessment

Interest or Concern	How the Interest Was Included in the Assessment
Loss of connection to and use of lands and water, and perceptions of safety and quality of the experience on the land	The EIS discusses concerns about potential loss of connection to land and water (e.g., feeling of discomfort or concern), and loss of land and water use in Section 9.9.5 of the EIS. Safety of using the land is assessed in the EIS using the Indigenous peoples Health VC (Section 9.10.2). CNL's Public Information Program enhances engagement with Indigenous peoples and is meant to address negative perceptions by providing educational opportunities and sufficient factual information. Changes to land and water use are discussed in the EIS as part of the expected outcomes of renaturalization during and after the Institutional Controls phase (Section 9.9.3).
Presence and preservation of cultural landscapes, sites and resources (e.g., burial sites, historically significant sites, spiritual sites) including the Kichi-Sìbì, and changes, past and present, to accessing these sites.	Impacts and access to cultural sites are discussed in the EIS by considering the presence of these sites on the NPD property (Section 8.9.2), and by assessing the effects of the project on the Cultural Resources and Ceremonies VC under traditional land and resource use (Section 9.9.3). No known cultural features have been identified at the NPD site, but the Kichi-Sìbì (Ottawa River) itself is recognized as an important cultural/heritage value for multiple reasons (Section 8.9.2). The EIS assesses potential effects of the project on nearby traditional land use activities (Section 9.9.3). CNL has developed mitigation measures to minimize potential nuisance effects on nearby traditional land uses (Section 9.9.3.3).
Commercial Trapping Wildlife and harvesting and fishing areas Plant and natural materials gathering areas	Potential effects on trapping (traditional and commercial), harvesting, gathering and trapping areas are assessed using the Trapping, Hunting, Fishing and Gathering VCs under the environmental component of traditional land and resource use (Section 9.9.3). CNL acknowledges that fishing, harvesting, traditional and commercial trapping, and gathering of plants and natural materials are valued traditional and modern-day land use activities (Section 8.9.2). It is noted that these activities do not currently occur on the NPD site, and particularly not in the Site Study Area, where proposed project activities will be conducted. CNL has developed mitigation measures to minimize potential nuisance effects on traditional land uses occurring nearby (Section 9.9.3.2).
Indigenous rights	CNL has not conducted an assessment of impacts on rights but has provided evidence in the EIS to support the conduct of a rights impact assessment by the CNSC.

Notes:

The table above provides a summary of the concerns expressed by multiple Indigenous Nations, communities and organizations. See Table 6.3-1 for a more detailed listing of key interests and concerns from each Indigenous Nation, community and organization.

9.9.2 Assessment Boundaries

Indigenous traditional knowledge was considered in the development of the assessment boundaries. CNL drew the assessment boundaries beyond the NPD property boundaries in order to include Crown land in Ontario and Quebec and also to include the Kichi-Sìbì (Ottawa River). As traditional activities most commonly occur on Crown lands and waters (as opposed to private lands), the inclusion of Crown lands beyond the NPD property allows for identification of potential traditional activities near the NPD site.

9.9.2.1 Spatial Boundaries

Similar to the traditional land and resource use baseline characterization in Section 8.9 above, the Site Study Area for this assessment is consistent with the general Site Study Area defined in Figure 5.2-1 above.

The Local Study Area has been defined as the Site Study Area plus an area with a 1-km radius beyond the Site Study Area (Figure 8.9-1).

The Regional Study Area has been defined as the Site Study Area plus an area with a 5-km radius beyond the Site Study Area (Figure 8.9-2).

9.9.2.2 Temporal Boundaries

The temporal boundaries are the same as the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS. The temporal boundaries for the EA establish the timeframes for which the direct, indirect and cumulative effects are assessed. The following three phases were identified for the NPD Closure Project:

- Decommissioning Execution, which includes all activities associated with decommissioning including setup and operation of the grout batch mixing plant, grouting and demolition activities, installation of the concrete cap and engineered cover, as well as site restoration and demobilization;

- Institutional Controls, or a period of at least 100 years, but lasting as long as necessary (as determined by regulatory agencies), that follows the Decommissioning Execution phase. During this phase, long-term care and maintenance, oversight, and environmental monitoring would be performed by CNL in order to ensure that the disposal system performs as expected, that human safety is ensured until the short lived nuclear wastes decay to below the acceptance criteria and that problems that may impact the long-term stability of the facility can be rectified; and

- Post-Institutional Controls, is the period of time following the Institutional Control period, occurring after ~year 2128 and continuing indefinitely.

9.9.3 Identification of Residual Effects

9.9.3.1 Project-Environment Interactions

As shown in Table 5.2-1, potential effects to traditional Land and Resource Use may occur as a result of operations and activities in the Decommissioning Execution, Institutional Controls and Post-Institutional Controls phases, in particular:

- Installation and operation of the grout batch mixing plant;
- Grouting of below grade structures;
- Removal of above grade structures;
- Install concrete cap and engineered cover;
- Final site restoration;
- Renaturalization;
- Facility performance during the Institutional Controls phase; and
- Facility performance during the Post-Institutional Controls phase.

The rationale for these interactions is included in Table 9.9-3 below.

Table 9.9-3 Project-Environment Interactions with Traditional Land and Resource Use

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**	
	1.1	Designate footprint, create access, temporary fencing (east side of main building).	On-site activities may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.2	Assign storage area for raw materials, ship in sand. Likely east side of licensed area.	Raw material transport may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.4	Truck in necessary water supply or source water directly from river.	Trucking may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.5	Provide slip pipe access to reactor side.	On-site activities may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.6	Construct washout pit. Lined excavation with water transfer. Likely near grout batch mixing station.	Earth-moving may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.7	Level area for pumper.	Earth-moving may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.8	Mix grout to required formula.	On-site activities may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.9a	Truck grout to pumping station (20 trips per day).	Trucking may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.11	Sample and dewater the cleaning pit. Emplace sediments into voids in condenser room.	On-site activities may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	1.12	Demobilize grout batch mixing plant after cap installation.	Demobilization activities may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	2	**Grouting of Below Grade Structure**	
	2.1	Room preparation (e.g., sealing of pipes).	Equipment and material transportation may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	2.3	Grout Fill Nuclear Area.	On-site activities may release air containing tritium, lead and asbestos, and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**3**	**Removal of Above Grade Structure**	
	3.1	Conventional heavy equipment knockdown of reactor hall.	Demolition may release surface contamination and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Material sizing may release surface contamination and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.4	Steel and rubble emplaced in condenser pit.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.5	Grout first level of demolition material in condenser room.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.6	Steel and rubble emplaced in condenser room.	On-site material transportation may result in roadkill and may produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.7	Grout second level of demolition material in condenser room.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.8	Steel and rubble in condenser room.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.9	Grout third level of demolition material in condenser room.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.10	Demolish block walls and inside walls around control room and change rooms.	Demolition may release surface contamination and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).

		Project Works and Activities	Potential Interaction
Decommissioning Execution	3.11	Collapse ceilings of furnace room and adjacent rooms.	Demolition may release surface contamination and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.12	Emplace block wall rubble in furnace room or condenser room.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.13	Remove recyclables from guard house.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Demolition may release surface contamination and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.15	Grout furnace room and adjacent areas to ground level.	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Demolition may release surface contamination and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	4	**Install Concrete Cap and Engineered Cover**	
	4.1	Concrete Cap (construct forms, install rebar, and pour, level and slope concrete).	On-site material transportation may result in roadkill and produce nuisance effects for trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	4.2	Engineered Cover (ship in materials, layer and shape mound, install geotextile layer, grade property, install remaining earth layers and seed).	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	5	**Final Site Restoration**	
	5.1	Site Restoration (install fencing, install monitoring wells if required, remediate areas affected by previous operations or decommissioning activities, washout pit, complete closure surveys, etc.).	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).
	5.2	Demobilize Site (Remove temporary facilities, decontaminate equipment, remove power upgrades, poles and lines, return transformers).	On-site material transportation may result in roadkill and produce nuisance effects for nearby trapping, hunting, fishing, gathering, and cultural activities/ceremonies (noise and dust).

		Project Works and Activities	Potential Interaction
IC*	**6**	**Long-Term Care and Maintenance**	
	6.6	Renaturalization.	Land Use may change during and/or after the Institutional Controls phase. Renaturalization of site may lead to an increase of wildlife and may benefit trapping, hunting, and gathering activities.
	6.7	Facility performance during the Institutional Controls phase	Groundwater will start to enter and eventually resaturate the grouted structure. Contaminant release from the grouted structure may affect non-human biota (e.g., game and fish species) health and/or populations.
PIC**	**7**	**Post-Institutional Controls**	
	7.1	Facility performance during the Post-Institutional Controls phase.	Groundwater in the resaturated and eventually degraded grouted structure will become contaminated. Contaminant release from the grouted structure may affect non-human biota (e.g., game and fish species) health and/or populations.
		Renaturalization	Land Use may change during and/or after the Institutional Controls phase. Renaturalization of site may lead to an increase of wildlife and may benefit trapping, hunting, and gathering activities.

Notes:

* - IC: Institutional Controls phase
** - PIC: Post-Institutional Controls phase.

9.9.3.2 Proposed Mitigation Measures

The mitigation measures presented below are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required; including mitigations developed collaboratively with Indigenous peoples that encompass Indigenous Knowledge. CNL has initiated discussions with Indigenous Nations, communities and organizations on project commitments that will help address concerns such as those related to traditional land and resource use VCs (these commitments are identified in the 'Next Steps' column of the *Tables of Interests and Concerns* - Appendix C). CNL looks forward to discussing additional mitigation of effects with Indigenous peoples.

In addition to the in-design mitigation measures identified in Section 4.1, the following mitigation measures have been identified to ensure the protection of the traditional land and resource use environment:

- dust suppression measures as described in Section 9.2.3.2;
- If previously undocumented archaeological resources are discovered, then CNL will suspend decommissioning activities immediately and will engage a licensed consultant to carry out archaeological fieldwork, in compliance with Section 48 (1) of the *Ontario Heritage Act,* and outlined

in CNL's procedure Management of Cultural Resources (CNL 2022a). CNL remains open to engagement with Indigenous Nations, communities and organizations in the event of a discovery of an archaeological resource. If any human remains are identified during construction, CNL will immediately notify the police or coroner and the Registrar of Cemeteries, Ministry of Public and Business Service Delivery, and Indigenous Nations, communities and organizations;

- construction activities will generally occur between 7 am and 7 pm with the overall objective of minimizing nuisance effects (i.e. noise and traffic) on traditional resource users in the Local and Regional Study Areas. It is noted that special or emergency circumstances may require deviation from this restriction; and,
- periodic communication updates on project construction activities to Indigenous Nations, communities and organizations are required, including construction schedule, activities, dedicated contact person for inquiries and emergencies, etc.

9.9.3.3 Effects After Mitigation

In this section, indirect effects to traditional land and resource use are discussed for each phase of the project.

Decommissioning Execution Phase

Site/Local Study Area

As discussed above in Section 9.9.4.2, CNL will minimize potential nuisance effects (i.e., noise) on nearby traditional land uses (e.g., hunting, trapping, fishing, gathering, ceremonies) by instituting restrictions on construction hours and days of the week. Other nuisance-related mitigation measures (e.g., dust suppression) are discussed in Section 9.2.3.2.

Construction activities will not impede traditional resource harvesting activities on adjacent provincial and private lands. Construction activities at the NPD site will be very localized, controlled and temporary in duration. Therefore, any disturbance effects will be minor, localized and temporary in duration.

Any effects on the terrestrial and aquatic environments (i.e., fish and wildlife displacement, contamination) would also affect the ability to hunt and fish in the Local Study Area.

Regional Study Area

As noted in the Socio-economic TSD, the traffic and transportation effects associated with the project are expected to be greatest by far during the Decommissioning Execution phase. Within the Regional Study Area, the transportation/haul route will be limited to Highway 17 and the NPD site access road from the highway. As discussed below in Section 9.11.3.2, CNL will minimize traffic nuisance effects on nearby traditional land users in the Regional Study Area by instituting restrictions on construction hours and days of the week.

There will be nuisance effects (noise and dust) in the Regional Study Area for nearby traditional land uses (e.g., hunting, trapping, fishing, gathering, ceremonies) that should largely be mitigated by a variety of general and specific construction mitigation measures identified in Section 9.9.3.2.

Institutional Controls and Post-Institutional Controls

Site/Local Study Area

As determined in the EcoRA TSD, no adverse residual effects have been predicted for terrestrial or aquatic biota. As the exposure assessment undertaken in the EcoRA TSD demonstrates that the proposed project has no adverse effect on game or sportfish species, the project is not expected to have any adverse effects to Indigenous peoples traditional harvesting that could potentially occur during the Institutional Controls and Post-Institutional Controls phases. Therefore, no potential effects are expected on traditional land and resource use in the Site and Local Study Areas in the postclosure period (Institutional Controls and Post-Institutional Controls phases).

Renaturalization may increase vegetation and habitat for wildlife, providing a potential benefit to traditional hunters, trappers and gatherers in the NPD site and Local Study Areas in the postclosure period.

During the Institutional Controls phase, land in the Local Study Area surrounding the licensed area may be released for other uses by AECL. As lands will only be released as applicable under the soil and groundwater quality guidelines, no residual effects are expected.

Regional Study Area

Since there are no effects expected in the Site and Local Study Areas, no effects to traditional land and resource use are expected in the Regional Study Area for the postclosure period (Institutional Controls and Post-Institutional Controls phases).

9.9.3.4 Prediction Confidence and Uncertainty

There are private lands immediately adjacent to the NPD site and Federal lands, and it is possible but unknown whether traditional land uses occur on these lands. It is conservatively assumed that adjacent lands and waters will be used by hunters, trappers, anglers and gatherers.

REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures* (CNSC 2020a, Appendix C.8) requires identification of any concerns raised by Indigenous peoples about the facility or activity in relation to any Indigenous or treaty rights. This information is provided in the IER TSD.

9.9.3.5 Residual Effects

Table 9.9-4 summarizes the effects assessment above and presents the residual effects that were identified on traditional land and resource use. The residual effects in Table 9.9-4 are grouped by effect rather than by individual interaction as listed in Table 9.9-3.

Table 9.9-4 Summary of Residual Effects on Traditional Land and Resource Use

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution						
Traditional Land and Resource Use	On-site transportation, demolition, material sizing.	Trapping Hunting Fishing Gathering	Nuisance effects (dust, and noise).	Dust suppression, restricting hours of activity, communication with Indigenous Nations, communities and organizations.	Minor, temporary and localized nuisance effect on nearby Indigenous land users.	No adverse residual effects.
Traditional Land and Resource Use	All interactions with the terrestrial environment (see Section 9.6.3.1.	Trapping Hunting	Wildlife displacement, contamination, or mortality affecting hunting activities.	See mitigation measures identified for the terrestrial environment in Section 9.6.3.2.	No measurable habitat or exposure effects, and therefore no effects on hunting or trapping, are expected.	No adverse residual effects.
Traditional Land and Resource Use	All interactions with the aquatic environment (see Section 9.3.3.1.	Fishing	Fish displacement, contamination, or mortality affecting traditional angling activities.	See mitigation measures identified for the aquatic environment in Section 9.4.3.2.	No measurable habitat or exposure effects, and therefore no effects on fishing, are expected.	No adverse residual effect.
Institutional Controls and Post-Institutional Controls phase						
Traditional Land and Resource Use	Renaturalization	Trapping Hunting Gathering	During the Institutional Controls and Post-Institutional Controls phases, renaturalization of site may lead to an increase of wildlife and may benefit trapping, hunting, and gathering activities.	No proposed mitigation.	Potential benefit for traditional hunting, trapping and gathering activities. Access to the licensed area will be restricted, which will limit the total additional area of use, thus no measurable effects are expected.	No adverse residual effects.

9.9.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on traditional land and resource use have been predicted.

9.9.5 Monitoring and Follow-up

Monitoring and follow up programs are not specifically identified for traditional land and resource use; rather, monitoring for environmental media (e.g., for air quality, surface water quality , groundwater quality) will be implemented to verify the environmental effect predictions made by the EIS for land and resource use, and to promote land user comfort around the safety of the Local Study Area, Regional Study Area and surrounding areas for traditional land and resource use (i.e., to reduce perceptions of adverse NPD Closure Project effects on traditional land and resource use that are not anticipated to occur).

CNL has been carrying out discussions with some Indigenous Nations, communities and organizations (AOO, AOPFN and MNO) on greater involvement by them in the environmental follow up monitoring both in the development and implementation of the programs. CNL also recognizes that Indigenous Knowledge is an important aspect to be incorporated into its existing proposed follow-up monitoring program. To date, no specific environmental monitoring has been identified for traditional land and resource use, although preliminary discussions have occurred. Monitoring in other environmental components will confirm the EIS predictions (i.e., that no effects are expected on traditional land and resource use). CNL has workshops planned to gather feedback on its proposed follow-up monitoring program, which will not be finalized until an Environmental Assessment decision is made for this project. CNL looks forward to working together with Indigenous Nations, communities and organizations to integrate an Indigenous Knowledge component into the follow-up monitoring at NPD.

The evidence in the AKLUS indicates, and AOPFN and MNO have explicitly stated, that their citizens have negative perceptions associated with performing traditional activities (such as harvesting) near the NPD site. Some participants in the AOO and AOPFN AKLUS indicated concerns about contamination and the risk associated with harvesting and consuming foods from the area. For the different Indigenous Nations, communities and organizations, this may result in individuals not using an area such as suggested in the MNO study (KnowHistory 2019), or Indigenous peoples harvesting less food in the area, or just promote a feeling of discomfort or concern associated with contamination and risk (SVS, AOO, 2020; SVS, AOPFN, 2020). The perceptions and willingness to consume traditional foods can partially be addressed by an Indigenous-driven risk-informed communication program for the NPD Closure Project which CNL agrees is an important activity to pursue. CNL acknowledges that the AOPFN have identified the key role of the country foods monitoring program in mitigating the concerns of the AOPFN. CNL will continue discussions on the implementation of a Guardian program at the NPD site and more broadly on all CNL sites located in Algonquin traditional territory. An Indigenous driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the AECL properties and build confidence that the decommissioning strategy and mitigation measures are effective.

Monitoring to verify effects predictions will be on-going during the decommissioning and institutional control phases, and the need for and duration of monitoring will be reviewed based on an annual review of monitoring data. This monitoring will be integrated into the CNL Environmental Monitoring Program.

9.9.6 AOPFN Perspective on Effects to Traditional Land and Resource Use

The following subsections (9.9.6.1, 9.9.6.2, and 9.9.6.3) present the AOPFN's view in their own words. The AOPFN has completed three studies (Algonquin Knowledge and Land Use (SVS AOPFN 2020), Diet and Harvest (Fediuk *et al*., 2021) and Culture and Rights (Malone *et al*., 2021) that draw on AOPFN Algonquin Knowledge to expand the understanding of Traditional Land and Resource Use in the NPD Closure Project Study Area. These sections summarize key findings of the studies and differences in the perspective and approach used by the AOPFN to assess potential effects on Traditional Land and Resource Use. These are initial comments only; a more formal AOPFN-relevant effects characterization process for Traditional Land and Resource Use will be provided in the final EIS (if CNL engages with AOPFN in this process) or in an AOPFN submission to the Commission.

9.9.6.1 AOPFN Concerns with CNL's Assessment Approach

It is AOPFN's position that the original Draft EIS for the NPD Closure Project and recent revisions to Sections 8.9 and 9.9 do not yet adequately interpret or consider AOPFN Algonquin Knowledge as reflected in the AOPFN AKLUS Report, the Culture and Rights Study, or the Diet and Harvest Study. While there is reference to each of the three AOPFN studies in the revised Sections 8.9 and 9.9, there are gaps and errors that suggest a more detailed analysis is required. Such analysis would properly integrate the studies' findings into the EIS as they relate to consideration of impacts on traditional land and resource use.

AOPFN has raised these concerns directly with CNL. In summary (and in no particular order) they include the following:

- Specific VCs (listed below) identified by AOPFN Knowledge holders in the three AOPFN studies were not covered in the Draft EIS in a meaningful way, and not adequately considered in the effects assessment on TLRU:
    - Fish spawning areas and fish habitat of importance to AOPFN;
    - Fish Species of Cultural Importance (Including Ashigan (Bass), Lake Trout, and Speckled Trout);
    - Culturally Important Plants (including Cattails and Muskrat root/Sweet flag);
    - Furbearers of Cultural Importance (including Amik (Beaver), Pashkwajàsh (Coyote), Odjìg (Fisher), Wàbisheshi (Marten), Nigig (Otter), Wàbòz (Rabbit), Esiban (Racoon), Wàgosh (Fox), Adjidimò (Squirrel),and Shingosi (Weasel);
    - Mónz and Mónz Habitat;
    - Wawáshkeshi Habitat;
    - Partridge;
    - AOPFN preferred harvesting sites;
    - AOPFN preferred fishing sites;
    - Kichi-Sìbì as a cultural landscape; and
    - AOPFN member cultural continuity and way of life.
- CNL does not identify any valid primary or secondary impact pathways on traditional land and resource use from the proposed project. In contrast, as discussed further in Section 9.9.6.2 below, AOPFN sees obvious primary and secondary pathways for reduced long-term ability and

willingness to conduct Traditional Land and Resource Use practices at and around the NPD site. This is based on AOPFN's understanding that the project will continue in perpetuity to see the location fenced off and in an unnatural condition, and that in-situ disposal will physically turn the site from a temporary radioactive waste storage site to a permanent radioactive waste disposal facility.

- CNL uses the term "renaturalization" to refer to what will occur at the NPD site with in-situ disposal. This is neither defined nor contextualized, and the concept seems to differ from AOPFN's understanding of what is "natural". From AOPFN's perspective, in a future with in-situ disposal, the underground conditions will be unnatural, and on the surface, portions of the site will be unnaturally fenced off, covered with a concrete cap and unable to return to a forested condition. These are unnatural conditions that will lead to longer-term/permanent access restrictions and visible impediments to use and occupancy for AOPFN members.
- CNL suggests that its identified lack of scientifically measurable impact pathways on biophysical VCs can be used as a proxy for impacts on Traditional Land and Resource Use. From AOPFN's perspective, no assessment of Traditional Land and Resource Use can be accurately completed without considering additional factors such as faith in country foods, visible condition of an area, and sense of safety and security on the land. AOPFN has continually advised CNL that using a biophysical proxy for the human endeavour of traditional land and resource use is not a defensible approach to this type of impact assessment. In the NPD Culture and Rights Study, AOPFN identified 17 distinct "Sufficiency Resources" considered by AOPFN members when deciding whether, when and where to harvest, with the intention that impact assessors also consider these when looking at impacts on Traditional Land and Resource Use (Malone *et al.*, 2021). Many of these sufficiency resources go far "beyond the biophysical", but CNL's assessment approach still does not.
- CNL claims that "Indigenous knowledge was considered in the development of the assessment boundaries". This is not an accurate statement. CNL has chosen to ignore the larger Local Study Area and Regional Study Area used by AOPFN peoples in three studies, thus rejecting AOPFN Algonquin Knowledge. The result is Local Study Areas and Regional Study Areas that are 25 times smaller than those chosen by the AOPFN Algonquin knowledge holders themselves. This contributes to the continued lack of understanding of just how large the impact zone on Traditional Land and Resource Use is around the NPD site, which remains an open question in this EA.
- CNL does not integrate into its effects characterization any of the impact pathways identified by AOPFN in the three AOPFN studies, nor is there evidence overall that CNL considered the three AOPFN studies in any meaningful way in Section 9.9.
- CNL suggests that because the site is already off limits to AOPFN members, additional adverse effects on Traditional Land and Resource Use cannot occur in a future with in-situ disposal essentially by definition. The reality is that in the Institutional Control Period, and potentially in the Post-Institutional Control Period, in-situ disposal represents a continuation of several existing barriers to AOPFN Traditional Land and Resource Use, depriving AOPFN of the ability to meaningfully reconnect to an area from which they have been alienated by Canada's actions since the 1960s. This temporal extension of an existing adverse effect is entirely material to this impact assessment and cannot be magically explained away as "no impact" simply because AOPFN members cannot currently access the site for traditional purposes. To suggest that this is the case

is a highly cynical and disrespectful approach to impact assessment that is not reconcilable to the findings of AOPFN's three studies.

- CNL does not identify any concrete new mitigation or monitoring measures over and above what it already has in place. Given that the current version does not include any Indigenous-led monitoring or communication mechanisms to reduce or better monitor impacts on Traditional Land and Resource Use, this mitigation and monitoring must be held in low confidence. For example, CNL's suggestion that its Public Information Program is an effective mitigative measure to reduce fear and stigma associated with NPD is not supported by any evidence, and is contrasted by findings of geographically focused use, occupancy and harvesting avoidance centred around the NPD location (see Fediuk *et al*., 2021 and Malone *et al*., 2021).
- In the end, the only effect identified by CNL on Traditional Land and Resource Use is a beneficial one through eventual "renaturalization", and from AOPFN's perspective this is indicative of the wrong-headedness of CNL's approach to this assessment. In reality, during Institutional Control and possibly permanently, existing adverse effects on access and willingness to harvest from the project area are extremely likely to continue due to a variety of observable and perceptual factors. Such factors are well known to impact on Indigenous use and occupancy, and CNL's inability to recognize or characterize this as an adverse effect is indicative of an assessment approach that is fundamentally flawed. It does not help, nor is it acceptable to AOPFN, that CNL did not engage the traditional land and resource users themselves in developing the methods or conducting the assessment.

Due to the concerns outlined above, substantial gaps thus remain in the Proponent's approach to the assessment on Traditional Land and Resource Use in the current iteration of the EIS. Revised EIS sections continue to place a strong focus on biophysical factors and physical access, ignoring other factors that may diminish or impede AOPFN traditional use such as sensory experience (changes in noise, smell, visual appearance of the landscape) and AOPFN members' sense of safety on the land (fears of contamination real or "perceived"). As has been expressed by members of the AAC directly to CNL (in a meeting on July 22, 2021), impacts from the development of a permanent radioactive waste disposal facility are not just about risk perception; they are about changes to the environment that contradict AOPFN Algonquin values and understandings of how things should be. The three AOPFN studies capture many of AOPFN's concerns about how the project will affect the quality and accessibility of the land, and these concerns should have been incorporated in the effects assessment section of the EIS. Best practice dictates that all potential impact pathways should be considered, and that for impacts on the human environment, these pathways should be considered by the people who would be impacted themselves, not solely by outsiders with no traditional knowledge of how local Indigenous peoples use and value the location and its surroundings.

AOPFN asserts that past and current uses of the NPD area do not define AOPFN's future use or limit the future exercise of Traditional Land and Resource Use practices in the area. AOPFN has a reasonable expectation of resuming the exercise of these Traditional Land and Resource Use practices in the future, as was the case in the past. AOPFN can see from the evidence that portions of the land covered by and impacted on by the project will not be re-naturalized over time or returned to near-natural conditions that allow AOPFN members to reconnect with – or be willing to reconnect with – this site.

9.9.6.2 AOPFN Findings in Relation to Traditional Land and Resource Use

The findings of the three AOPFN studies demonstrates that there is significant AOPFN Algonquin knowledge, land use and occupancy within the NPD Study Area. The site is important to the health, wellbeing, way of life and AOPFN Algonquin rights for AOPFN members. The data provided in the three AOPFN studies also demonstrates that there is a deep cultural connection to the area. According to AOPFN Algonquin knowledge holders, the relationships that participants have with the land extend beyond the simple harvesting of resources. In many instances, these harvesting activities foster relationships with the land in ways that non-Algonquin people do not immediately understand or recognize.

The Culture and Rights Study and Diet and Harvest Study both identified extensive alienation from and loss of use of the area at and around the NPD site, as reported by AOPFN members. For example, the Diet and Harvest Study involved a survey of 250 AOPFN families, the results of which show (among other findings) that the area around the NPD site is one of two areas (the other being the vicinity of Chalk River Laboratories) where AOPFN members have the highest levels of concern about contamination (real or perceived) of country food resources. Perceived risk of contamination plays a critical role in identifying impact pathways. It makes people change their practices and influences the acceptability of the project, and these effects cannot be discounted from their impact on food security, health, and transmission of skills and knowledge to future generations.

Because of the risk of contamination (real or perceived), the NPD site has had a contributory role in the historical reduction of AOPFN members' ability to practice AOPFN rights, both at the site itself and in a yet-to-be-determined zone of influence around the site. Further research to establish the geographic boundaries of this zone of influence and to characterize these historic harms is essential. Such research would require assessing not only the extent of loss of use and alienation from the NPD site and its surroundings over time, but also the factors influencing this loss of use and alienation (such as psychosocial impacts caused by the fear and stigma associated with the NPD site). This would result in a better characterization of the factors that have led to this alienation and loss of use, and better understanding of the implications of psychosocial impacts on AOPFN socio-cultural health and well-being, thus informing the recognition and reconciliation framework.

The Culture and Rights Study (Malone *et al*., 2021) identified the following existing impact pathways related to Traditional Land and Resource Use in the Study Area:

- Lack of access to the NPD site since 1962;
- Diminished quality and quantity of game species in preferred hunting areas;
- Lack of confidence in the health of animals, fish, medicines, and waters, and in their safety for human consumption;
- Diminished access to preferred hunting and fishing areas in the broader Study Area, due to provincial boundaries, land privatization, industrial activity, and increased traffic.

With these existing impact pathways in mind, AOPFN members considered a future with in-situ disposal and identified additional effects of alienation due to contamination (real or perceived) for a number of values (e.g., cultural continuity, fishing, hunting etc.). According to AOPFN members, NPD Closure Project

interactions could impact AOPFN harvesting and traditional use rights in the Study Area by exacerbating concerns about contamination of water, fish, wildlife, and medicines in proximity to the project. Given that oral and experiential transmission of knowledge between generations of Algonquins is the primary source of learning about how and where to use the land and water, these concerns about perceived contamination would also almost certainly carry forward and impact future generations' ability to harvest in the area. These concerns can be further described as follows:

- AOPFN members are concerned about their continued ability to harvest and consume wildlife and natural materials from the area, given the location of the project the unceded Algonquin traditional territory where AOPFN members harvest food, medicines, and other natural materials. Specifically,
    - Some AOPFN members hunt in the vicinity of the project as a source of sustenance. Environmental impacts related to the NPD Closure Project have the potential to impact members' food security;
    - Some AOPFN members harvest plant medicines in the vicinity of the project, and are concerned about the safety and effectiveness of medicines growing close to a nuclear in-situ disposal site;
    - Some AOPFN members are already opting to release their fish catches from this area instead of consuming due to contamination concerns. Such concerns related to bioaccumulation in fish normally harvested from the Kichi-Sìbì could limit both intake and what species are fished, thereby affecting diet and food security;
- Harvesting sites could become compromised in the future, leading to concerns over safety that would impact members' abilities to pass on AOPFN knowledge on harvesting to children. This would in turn affect the ability of future generations to use the area; and
- Project-related activities would exacerbate the issue of alienation and further limit members' access to the area, and perpetuate the difficulty of exercising their Aboriginal rights.

In summary, for AOPFN members, NPD Closure Project impacts related to Traditional Land and Resource Use are likely to include:

- Continuing negative impacts on AOPFN nutrition and food security, harvesting and traditional use due to long-term physical alienation from the land, and uncertainty about contamination of water, land, plants, and wildlife in proximity to the project, including an extension of the period of time the area is both physically and psycho-socially "off limits" to AOPFN members for the practice of harvesting rights; and
- Ongoing impacts on AOPFN cultural continuity at the NPD site due to continued alienation and impacts to the health of the land, water, and resources, thus impacting future generations' ability to learn and practice their culture or harvest resources at and near the NPD sites. The storage of radioactive wastes permanently at the site may extend the number of members who deem it unacceptable to harvest in the vicinity of the NPD site.

9.9.6.3 AOPFN Summary and Recommended Next Steps

As demonstrated in the preceding Sections 9.9.6.1-9.9.6.2, the three AOPFN study findings support the concerns AOPFN has raised over the CNL's underestimation of the project's impacts on traditional land and resource use, as well as on culture and heritage resources. The AOPFN studies confirm the following:

- Not all AOPFN VCs were captured in the EIS;
- Highly valued key cultural areas exist in close proximity to the project;
- AOPFN concerns, including contamination (real and perceived) and stigma associated with permanent radioactive waste disposal at this location, have not been adequately addressed in the EIS; and
- AOPFN members are highly concerned with cumulative effects from the NPD, and existing alienation and loss of use (and related impacts) have not been properly characterized in the draft EIS as an important cumulative effects contextual factor.

The AOPFN studies indicate that there will be both direct and indirect effects on Traditional Land and Resource Use from the proposed decommissioning plan, given that the temporal continuation of existing adverse effects (which, from AOPFN's perspective, can and should be removed through decommissioning) will be maintained into the long-term, effectively permanent future, through: a. fencing in of portions of the site; and b. physically turning the facility into a permanent radioactive waste disposal facility. These will likely have direct effects on the following attributes of Traditional Land and Resource Use:

1) Permanent continuation of lack of physical access to a portion of the NPD site;
2) Permanent continuation of unwillingness of AOPFN members to harvest from around the area covered by a permanent radioactive waste disposal facility and its surroundings (to an areal extent that has yet to be established or even contemplated by CNL);
3) Long-term continuation of in reduced faith in country foods harvesting at and around the NPD site (to an areal extent that has yet to be established or even contemplated by CNL); and
4) The above effects will have associated likely impacts such as increased reliance on store-bought foods, lack of cultural connection to an important part of the AOPFN cultural landscape, inability to pass on Algonquin knowledge about the site, and fear, stigma and alienation effects on individual and community health, among other spin off effects.

AOPFN finds that perception of risk and observation of the nature of the facility by its members are real phenomena. As Algonquin people, AOPFN members are naturally risk-averse when it comes to alterations of the land from natural conditions because:

a. They are highly attuned to what is natural and normal due to their long-term use and occupancy of – and strong cultural connection to – their lands and waters; and
b. They have been subject to many micro- and macro- harms caused by settlers, industries, and governments in the past, that make them both wary of and highly concerned about risk of any future changes.

Add to this the primary impact pathways from the NPD Closure Project – specifically the long-term continuation of an avoidable location-specific effect in the form of fencing off and not allowing the NPD site to return to a natural condition, and the permanent cementing in place of radioactive materials very close to the Kichi-Sìbì, converting the site from a temporary radioactive waste storage facility to a permanent radioactive waste disposal site – and there are legitimate reasons for AOPFN members to have concerns about a future with the project.

AOPFN remains open to working with CNL so that CNL can better understand and integrate the findings of the three AOPFN studies, and the understandings of AOPFN Algonquin knowledge holders (e.g., the people who actually practice Traditional Land and Resource Use in the project area), into a revised approach to assessing impacts on Traditional Land and Resource Use in the EIS. If CNL engages us on this, we expect that this section of the draft EIS will be updated in the final EIS. If it is not, AOPFN will engage the Commission on this in a direct fashion.

AOPFN will also continue to engage with CNL to improve the mitigation and monitoring measures that AOPFN feels need to be in place to improve conditions for – and understanding of – Traditional Land and Resource Use practices by our members in the future, no matter what decommissioning strategy is eventually adopted at the NPD site.

9.9.7 Conclusion

As shown in Table 9.9-4, no adverse residual effects were identified for traditional land and resource use.

CNL's assessment of potential effects to traditional land and resource use (Section 9.9.3.5) evaluated how project activities may affect traditional land and resource use VCs and adheres to the requirements of *CEAA,* 2012. CNL supported several Indigenous Nations, communities, and organizations (AOO, AOPFN and MNO) to complete traditional knowledge and land use studies that include unique community perspectives, incorporating their observations and beliefs, into an assessment of effects to traditional land and resource use. Indigenous Nations, communities and organizations often prefer a different approach, consider different factors and evaluate against a different baseline than CNL and subsequently the findings of the communities and CNL can differ. CNL invited the AOPFN to share their perspective and has included that material within this EIS (Section 9.9.6). CNL is continuing to engage with the AOPFN and other Indigenous Nations, communities, and organizations on the topic of effects to traditional land and resource use and to develop commitments that will alleviate concerns and gain trust about the safety of traditional land use near the NPD site.

Traditional land and resource use VCs were selected based on the potential for the NPD Closure Project to interact with the features of the land and resource use environment. In addition, VCs for traditional land and resource use were selected based on a consideration of knowledge of traditional land and resource use practices that interact with the environment, Indigenous and/or Treaty rights and community engagement. Concerns expressed by Indigenous Nations, communities, and organizations during engagement activities are recorded and taken into consideration (Table 9.9-2).

The NPD Closure Project Site Study Area is located entirely within the Exclusion Zone. Therefore, aside from the operations and activities undertaken by CNL, other land uses of the NPD site are prohibited due to restricted public access. The lands of the Local Study Area have minimal public, Crown and private lands and as such, there is likely limited if any traditional land and resource use occurring there. However, redesignation of the land may occur in the future. Within the Regional Study Area there are provincial Crown lands where traditional land and resource use likely occurs, however, the NPD Closure Project will not have activities that occur on these lands. Furthermore, the project is not predicted to have any biophysical effects beyond the NPD site that would impact on traditional land and resource use including consumption.

Monitoring activities in other environmental components (i.e., atmospheric, surface water, geological and hydrogeological and terrestrial environments, and ambient radioactivity) will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects related to traditional land and resource use. If monitoring identifies concerns in the other environmental components, CNL will assess the implications to traditional land and resource use (e.g., through ongoing Indigenous engagement activities).

9.10 Indigenous Socio-economic and Health

9.10.1 Indigenous Socio-economic Assessment

As required under paragraph 5(1)(c) of *CEAA,* 2012, the EIS should describe the effects of any changes the project may cause to the environment, with respect to Aboriginal Peoples, on socio-economic conditions.

9.10.1.1 Selection of VCs

Six VCs were selected with respect to the Indigenous socio-economic environment. these included: population and demographics; economy and employment; housing and infrastructure; Indigenous resident and use and enjoyment of private property; decision-making, and resource industries. These were selected for three reasons. Some input from Indigenous peoples and the CNSC was provided on Indigenous socio-economic considerations. Most of these are typical socio-economic considerations. Lastly, they were selected to include hard (housing and infrastructure) considerations; quantitative factors (economy, population and demographic); and, softer social considerations (decision-making and use and enjoyment of private property).

The Indigenous socio-economic effects assessment includes both direct effects on socio-economic VCs (e.g., the Economy and Employment VC as affected by potential employment opportunities) and indirect socio-economic effects related to a change in the environment (e.g., Indigenous Resident Use and Enjoyment of the Property as affected by changes in air and noise emissions; and Resource Industries).

While not required under *CEAA* (2012), the scope of the NPD socio-economic effects assessment was expanded to include potential direct socio-economic effects given these effects are of interest to stakeholders and Indigenous Nations, communities and organizations and peoples.

Table 9.10-1 Selection and Rationale of VCs for the Indigenous Socio-economic Environment

Environmental Component	VC	Rationale
Indigenous Socio-economic Environment	Population and Demographics	Population and demography are one of the most common ways to describe a community.
	Economy and Employment	Most Indigenous Nations, communities and organizations strive for improved employment and economic development opportunities.
	Housing and Infrastructure	Housing is a key concern of Indigenous peoples. Physical infrastructure within Indigenous communities is often inadequate, dated and difficult to finance. Water infrastructure might be a concern.
	Indigenous Resident – Use and Enjoyment of Private Property	There may be Indigenous peoples who live within a few kilometers of the NPD site and might experience nuisance effects. Project-related effects on quality of life are driven by potential project-induced changes in environment (i.e., changes in air quality, ambient noise, increases in traffic volume and visual disturbances)
	Decision-Making	Indigenous Nations, communities and organizations often have a decentralized decision-making structure.
	Resource Industries	Indigenous peoples often participate in resource based industries that can be potentially affected by changes to the environment. Resource industries can include: trapping, commercial fishing, commercial resource based tourism and gathering. Resource use industries are different than traditional use as they represent commercial uses associated with these natural resources. Project-related effects on resource based industries are driven by potential project-induced changes in the environment. These changes could include: direct effect on natural resources such as fish, wildlife or animals upon which these resources industries are dependent. As well, project-induced changes in the environment might limit access to these natural resources.

9.10.1.1.1 Indigenous Engagement Feedback – Key Interests and Concerns Related to Indigenous Socio-economic VCs

This section describes how the input from Indigenous engagement activities influenced the selection of VCs in the Indigenous socio-economic environment assessment. Table 9.10-2 summarizes the key interests and concerns raised by Indigenous peoples related to VCs for the evaluation of potential effects to the Indigenous socio-economic environment (based on Table 6.3-1 above), and demonstrates how the interest or concern has been addressed in the present assessment.

Table 9.10-2 Summary of Interests and Concerns Raised During Indigenous Engagement Activities that Influenced the Scope of the Indigenous Socio-economic Assessment

Interest or Concern	How the Interest Was Included in the Assessment
Socio-economic conditions of Indigenous Nations, communities and organizations that are interacting with the NPD site	Based on feedback from Indigenous Nations, communities and organizations, CNL has added sections on Indigenous Socio-economic and Health Conditions and Effects to the EIS (Sections 8.10 and 9.10). The EIS presents information on baseline socio-economic conditions in nearby Indigenous communities. Information that was provided to CNL by Indigenous Nations, communities and organizations has been incorporated into Section 8.10. Indigenous socio-economic interactions are described and assessed in Section 9.10.1.3. Indigenous health interactions are described and assessed in Section 9.10.2.3
Use and enjoyment of the area surrounding the NPD site by Indigenous people	Based on feedback from Indigenous Nations, communities and organizations, CNL added sections on Indigenous Socio-economic Conditions and Effects to the EIS (Sections 8.10.1 and 9.10.1). Indigenous resident use and enjoyment of the area is included as a VC under this new Indigenous socio-economic component.
Inclusion of data provided by Indigenous Nations, communities and organizations	Data from studies provided by Indigenous Nations, communities and organizations have been incorporated into the NPD EIS (Sections 6 and 8). This includes traditional knowledge and land use information (Section 8.9), and information on baseline socio-economic conditions (Section 8.10.1).

Notes:

The table above provides a summary of the concerns expressed by multiple Indigenous Nations, communities and organizations. See Table 6.3-1 for a more detailed listing of key interests and concerns from each Indigenous Nation, community and organization.

9.10.1.2 Assessment Boundaries

9.10.1.2.1 Spatial Boundaries

The Site Study Area for the Indigenous socio-economic environment is the same as the general Site Study Area defined in Figure 5.2-1. The Local Study Area has been defined as the Site Study Area plus a 1 km area beyond the Site Study Area and is the same as that used for traditional land and resource use (see Figure 8.9-1 above) and socio-economic environment (Section 8.10.1). Both the traditional land and resource use and socio-economic environmental components utilized a Regional Study Area that was defined as the Site Study Area and a 5 km radius beyond that. However, there are no Indigenous communities such as First Nations reserves within a 5 km radius of the NPD site. The closest Indigenous community to the NPD site is the AOPFN located on Golden Lake. AOPFN is located 75 km (measured as a straight line) from the NPD site. It is possible that there are some Indigenous peoples that do live within 5 km of the NPD site. Negative socio-economic effects are unlikely outside of the 5 km radius of the site, however, the Regional Study Area extends 100 km beyond the NPD site.

9.10.1.2.2 Temporal Boundaries

The temporal boundaries are the same as the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS.

9.10.1.3 Identification of Residual Effects

9.10.1.3.1 Project-Environment Interactions

As shown in Table 9.10-3, potential effects to the socio-economic environment may occur as a result of operations and activities in the Decommissioning Execution, Institutional Controls and Post-Institutional Controls phases, in particular:

- Installation and operation of the grout batch mixing plant;
- Grouting of below grade structures;
- Removal of above grade structures;
- Install concrete cap and engineered cover;
- Final site restoration;
- Renaturalization;
- Facility performance during the Institutional Controls; and
- Facility performance during the Post-Institutional Controls phase.

Table 9.10-3 Project-Environment Interactions in the Indigenous Socio-economic Environment

		Project Works and Activities	Potential Interaction
	n/a	Engagement with the project	Engaging with the project takes time and may place undue demands on Indigenous leadership and impact the administrative capacity of Indigenous Nations, communities and organizations. This may impact the decision-making VC.
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**	
	1.1	Designate footprint, create access, temporary fencing (east side of main building).	Establishing the project footprint and installing fencing may affect the landscape and visual setting from the Kichi-Sìbì (Ottawa River). On-site activities may produce nuisance effects for nearby Indigenous residents (noise, dust and traffic) or Indigenous resource industries.
	1.2	Assign storage area for raw materials, ship in sand. Likely east side of licensed area.	Raw material transport may produce nuisance effects for nearby Indigenous residents or Indigenous resource industries.
	1.4	Truck in necessary water supply or source water directly from river.	Trucking in water supply will affect traffic and transportation and produce exhaust and dust. Trucking may produce nuisance effects for nearby Indigenous residents or Indigenous resource industries.
	1.5	Provide slip pipe access to reactor side.	On-site activities may produce nuisance effects for nearby Indigenous residents or Indigenous resource industries.

		Project Works and Activities	Potential Interaction
	1.6	Construct washout pit. Lined excavation with water transfer. Likely near grout batch mixing plant.	Earth-moving may produce nuisance effects for nearby Indigenous residents or Indigenous resource industries.
	1.7	Level area for pumper.	Earth-moving may produce nuisance effects for nearby Indigenous residents or Indigenous resource industries.
	1.8	Mix grout to required formula.	On-site activities may produce nuisance effects for nearby Indigenous residents or Indigenous resource industries.
	1.9a	Truck grout to pumping station (20 trips per day).	Trucking will affect traffic and transportation and produce exhaust and dust. Trucking may produce nuisance effects for nearby Indigenous residents (noise and dust) or Indigenous resource industries.
	1.11	Sample and dewater the cleaning pit. Emplace sediments into voids in condenser room.	On-site activities may produce nuisance effects for nearby Indigenous residents (noise) or Indigenous resource industries.
	1.12	Demobilize grout batch mixing plant after cap installation.	Demobilization will require removal of equipment and materials from the site via truck, thereby affecting traffic and transportation. Demobilization activities may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	2	**Grouting of Below Grade Structure**	
	2.1	Room preparation (e.g., sealing of pipes).	Equipment and material transportation may produce nuisance effects for nearby Indigenous residents (traffic).
	2.3	Grout Fill Nuclear Area.	On-site activities may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3	**Removal of Above Grade Structure**	
	3.1	Conventional heavy equipment knockdown of reactor hall.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic. Demolition may produce nuisance effects for nearby Indigenous residents/land users (noise, dust, traffic) or Indigenous resource industries.
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Material sizing may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.4	Steel and rubble emplaced in condenser room.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.5	Grout first level of demolition material in condenser room.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.

		Project Works and Activities	Potential Interaction
	3.6	Steel and rubble emplaced in condenser room.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.7	Grout second level of demolition material in condenser room.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.8	Steel and rubble in condenser room.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.9	Grout third level of demolition material in condenser room.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.10	Demolish block walls and inside walls around control room and change rooms.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.11	Collapse ceilings of furnace room and adjacent rooms.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.12	Emplace block wall rubble in furnace room or condenser room.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.13	Remove recyclables from guard house.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.15	Grout furnace room and adjacent areas to ground level.	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.

		Project Works and Activities	Potential Interaction
	4	**Install Concrete Cap and Engineered Cover**	
	4.1	Concrete Cap (construct forms, install rebar, and pour, level and slope concrete).	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	4.2	Engineered Cover (ship in materials, layer and shape mound, install geotextile layer, grade property, install remaining earth layers and seed).	Shipping in materials will affect traffic and on-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	5	**Final Site Restoration**	
	5.1	Site Restoration (install fencing, install monitoring wells if required, remediate areas affected by previous operations or decommissioning activities, washout pit, complete closure surveys, etc.).	On-site material transportation may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
	5.2	Demobilize Site (Remove temporary facilities, decontaminate equipment, remove power upgrades, poles and lines, return transformers).	Removal of temporary facilities, equipment and utilities will improve the landscape and visual setting. On-site material transportation will affect transportation safety and may produce nuisance effects for nearby Indigenous residents (noise, dust, traffic) or Indigenous resource industries.
IC*	**6**	**Long-Term Care and Maintenance**	
	6.6	Renaturalization.	Land Use designation may change during the Institutional Controls phase.
	6.7	Facility performance during the Institutional Controls phase.	Groundwater will start to enter and eventually resaturate the grouted structure. Contaminant release from the grouted structure may affect non-human biota (e.g., game and fish species) health and/or populations.
PIC**	**7**	**Post-Institutional Controls**	
	7.1	Facility performance and renaturalization during the Post-Institutional Controls phase.	Groundwater in the resaturated and eventually degraded grouted structure will become contaminated. Contaminant release from the grouted structure may affect non-human biota (e.g., game and fish species) health and/or populations.
	7.2	Renaturalization	Land Use may change during and/or after the Institutional Controls phase. Renaturalization of site may lead to an increase of wildlife and may benefit Indigenous land users (e.g. hunters, trappers, etc.).

Notes:

N/A – not applicable
* - IC: Institutional Controls phase
** - PIC: Post-Institutional Controls phase

9.10.1.3.2 Proposed Mitigation Measures

The mitigation measures presented below are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required.

In addition to the in-design mitigation measures identified in Section 4.1 above, the following mitigation measures have been identified to ensure the protection of the Indigenous socio-economic environment:

- dust suppression measures as described in Section 9.2.3.2;
- post speed limits on-site as described in Section 9.6.3.2;
- if previously undocumented archaeological resources are discovered, then CNL will suspend decommissioning activities immediately and will engage a licensed consultant to carry out archaeological fieldwork, in compliance with Section 48 (1) of the *Ontario Heritage Act,* and outlined in CNL's procedure Management of Cultural Resources (CNL 2022a). CNL remains open to engagement with Indigenous Nations, communities and organizations in the event of a discovery of an archaeological resource. If any human remains are identified during construction, CNL will immediately notify the police or coroner and the Registrar of Cemeteries, Ministry of Public and Business Service Delivery, and Indigenous Nations, communities and organizations;
- the greatest effect of traffic and transportation associated with the project will occur during the Decommissioning Execution phase. Within the Local and Regional Study Areas, the transportation/haul route is limited to Highway 17 and the NPD site access road from the highway;
- review of a company's safety records which includes any traffic accidents or driver's records, as per CNL's contracting and hiring practices;
- construction activities will generally occur between 7 am and 7 pm wherever possible, with the overall objective of minimizing nuisance effects (i.e. noise and traffic) on residents in the Local and Regional Study Areas. It is noted that special or emergency circumstances may require deviation from this restriction;
- when a significant amount of off-site transportation is required (e.g., during raw material delivery), the timing of equipment and material shipping to the site should be staggered to minimize the contribution of the project to peak traffic volumes;
- during the Decommissioning Execution and Institutional Controls phases, restrict access to the licensed area via a fence with a locked gate to deter trespassing;
- periodic communication updates on project construction activities to local residents including local Indigenous residents are recommended, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc. Periodic communication updates can occur with Indigenous Nations, communities and organizations if requested;
- the NPD Closure Project may provide contracting and supplier opportunities to Indigenous local and regional businesses. CNL has been working with Indigenous Nations, communities and organizations on facilitating such economic and contracting opportunities; and,
- CNL and the CNSC have provided funding for Indigenous participation in the NPD Closure Project, including funding for consultation and engagement sessions, participation in third-party reviews, preparation of traditional knowledge and land use studies.

As there are potentially positive economic and employment benefits to Indigenous peoples there are enhancement measures that could be employed in order to capitalize on these potential opportunities. Some discussions have occurred on the types of economic opportunities associated with the NPD Closure Project. CNL will proactively seek, engage and support meaningful discussion on issues and opportunities related to the NPD Closure Project as part of the Public Information Program, which can be found on the CNL website (www.CNL.ca). CNL, as part of the Public Information Program, will notify residents of NPD Closure Project decommissioning commencement via door-to-door delivery of letters, where stakeholders will be have the opportunity to voice their questions or concerns about activities related to the decommissioning execution part of the notification, the letter will include all CNL contact details (e.g., website, telephone, email etc.) to provide clear direction on how to contact CNL if they have questions, concerns or complaints related to the NPD Closure Project. A web link to a Feedback Form that is currently on the NPD Closure Project webpage on www.CNL.ca will also be included in the notification and will outline the above process of when an issue or concern is submitted. CNL will continually evaluate both the process and the outcome of the ongoing engagement and communication activities to address and manage issues as they arise.

9.10.1.3.3 Effects After Mitigation

In this section, potential Indigenous socio-economic effects are discussed for each phase of the project. Potential effects of the project are assessed relating to population and demographics, economy and employment, housing and infrastructure, use of private property, decision-making and resource industries.

9.10.1.3.3.1 Discussion of Indigenous Socio-economic Effects

Population and Demographics

The NPD Closure Project would have no negative effect on the populations or demographic characteristics of the Indigenous populations in any of the study areas. It is possible that economic opportunities associated with the project might provide some employment opportunities and therefore keep more Indigenous peoples living in the region. This would be a positive effect, but these individuals may stay in the region anyways. Overall, no effect on population and demographic characteristics is predicted.

Economy and Employment

The project could have a minor positive effect on Indigenous economic and employment opportunities in the region. These could include contract construction, monitoring and other opportunities.

Housing and Infrastructure

There are no known Indigenous-owned/managed water intake structures or other infrastructure downstream of the NPD site. The closest Indigenous community to the NPD site is Pikwàkanagàn First Nation which is 75 kilometers southwest of the NPD site on Golden Lake. There would be no effect of the project on either the housing or infrastructure of the AOPFN or any other Indigenous community, all of which are a greater distance away.

Indigenous Resident – Use and Enjoyment of Private Property

As demonstrated in Table 9.10-3, the proposed project without mitigation may result in some nuisance effects that might impact Indigenous peoples who own or rent homes within a few kilometers of the NPD site. Those assessment of residual effects are described further below.

Decision-Making

The project would have no effects on the governance structures within Indigenous Nations, communities or organizations. Participant funding has been provided by the CNSC and CNL to help Indigenous Nations, communities and organizations review materials associated with the NPD Closure Project.

Resource Industries

The project is predicted to have no effect on Indigenous resource industries.

As indicated in the Traditional Land Resource Use section, the NPD Closure Project Site Study Area is located entirely within the Exclusion Zone. Therefore, aside from the operations and activities undertaken by CNL, other land uses of the site are prohibited due to restricted public access. The lands of the Local Study Area have minimal public Crown and private lands and as such, there is likely limited if any resource use industry activities occurring there. Within the Regional Study Area there are provincial Crown lands where traditional land and resource use likely occurs, however, the NPD Closure Project will not have activities that occur on these lands. Furthermore, the project is not predicted to have any biological effects beyond the NPD site that would impact on resource industry uses including consumption.

With respect to the different resource industries: there is no commercial fishery on the Kichi-Sìbì (Ottawa River); the two traplines surrounding the NPD site have not been identified as Indigenous; there are no known Indigenous tourism enterprises operating in close proximity to the NPD site; and, it is possible that there is some gathering activity occurring in the local and regional study areas.

Renaturalization of the site may increase vegetation and habitat for wildlife, providing a potential benefit to resource activities should they develop in the area.

Decommissioning Execution Phase

Site Study Area

No effects after mitigation are expected in the Site Study Area during the Decommissioning Execution phase. As discussed in the Socio-economic TSD, the project may affect transportation operations and safety through the transportation of materials and equipment on-site. This will largely be mitigated by posting and adhering to speed limits on-site. The remaining effect is minor and inherent in vehicle operation.

There are no Indigenous residents within the Site Study Area, and no nuisance effects are expected on land users (i.e. anglers, hunters, trappers, tourists) in the Site Study Area.

Local Study Area

As discussed on the Socio-economic TSD, the traffic and transportation effects associated with the project are expected to be greatest during the Decommissioning Execution phase. Within the Local Study Area, the transportation/haul route will be limited to Highway 17 and the NPD site access road from the highway.

There are approximately ten residents within the Local Study Area, and there may be nuisance effects (i.e. noise, traffic) associated with the Decommissioning Execution phase. It is unknown what percent of these ten may be Indigenous, but 2021 Census data identified that 11.8% of the population of Town of Laurentian Hills identified itself as Indigenous.

The project is expected to result in increased traffic volumes, which may be reflected in a potential increase in incidents and delays, even after mitigation measures. The increase traffic volume is expected to be temporary and minor, thus the effects on transportation safety and Highway 17 traffic not significant. The MTO has reviewed the project and concluded that it has no traffic or transportation-related concerns with respect to the project (MTO 2016).

Regional Study Area

As discussed in the Socio-economic TSD, the traffic and transportation effects associated with the project are expected to be greatest during the Decommissioning Execution phase. The transportation/haul route will be limited to Highway 17 and the NPD site access road from the highway. As discussed in Section 9.11.3.2, CNL will minimize potential traffic nuisance effects on residents and by instituting restrictions on construction hours and days of the week. No measurable noise or dust nuisance effects are expected for residents and land users in the Regional Study Area.

The project is expected to result in increased traffic volumes and an increased likelihood of incidents and delays, even after mitigation measures. The MTO has reviewed the project, and concluded that it has no traffic or transportation-related concerns with respect to the project (MTO 2016).

There will be nuisance effects (noise, dust, traffic) for Indigenous residents if they live within a few kilometers of the NPD site, however they should largely be mitigated by a variety of general and specific construction mitigation measures identified in Section 9.10.1.3.2 above.

Institutional Controls Phase and Post-Institutional Controls Phase

Site and Local Study Areas

No potential Indigenous socio-economic effects have been identified in the Site and Local Study Areas for the Institutional Controls and Post-Institutional Controls phases.

Regional Study Area

No potential Indigenous socio-economic effects have been identified in the Regional Study Area for the Institutional Controls and Post-Institutional Controls phases.

9.10.1.3.4 Prediction Confidence and Uncertainty

There are private lands immediately adjacent to the NPD property and it is unknown whether the residents Indigenous or non- Indigenous, however this assessment has assumed that they may be Indigenous.

9.10.1.3.5 Residual Effects

Table 9.10-4 summarizes the effects assessment above and presents the residual effects that were identified for the Indigenous socio-economic environment. The residual effects in Table 9.10-4 are grouped by effect rather than by individual interaction as listed in Table 9.10-3.

9.10.1.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on the Indigenous socio-economic environment have been predicted.

9.10.1.5 Monitoring and Follow-Up

No specific environmental monitoring has been identified for the Indigenous socio-economic environment. Monitoring in other environmental components will confirm the EIS predictions (i.e., that no effects are expected in the Indigenous socio-economic environment). Ongoing Indigenous, public and stakeholder engagement activities will take place throughout the Decommissioning Execution and Institutional Controls phases to identify any changing concerns or perceptions related to the project. CNL is willing to discuss socioeconomic monitoring measures during construction activities with Indigenous Nations, communities and organizations.

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

9.10.1.6 Conclusion

As shown in Table 9.10-4, no adverse residual effects were identified for the Indigenous socio-economic environment.

The assessment took into consideration the concerns expressed by Indigenous Nations, communities, and organizations during engagement activities (Section 9.10.1.1.1).

Monitoring activities in other environmental components (i.e., atmospheric, surface water, geological and hydrogeological and terrestrial environments, ambient radioactivity and human health) will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects related to the socio-economic environment. If monitoring identifies concerns in the other environmental components, CNL will assess the implications to the Indigenous socio-economic environment (e.g., through ongoing Indigenous, public and stakeholder engagement activities).

Table 9.10-4 Summary of Residual Effects in the Indigenous Socio-economic Environment

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution						
Indigenous Socio-economic Environment	Employee, material and equipment transportation to and from site	Traffic and transportation	Increased traffic volume could affect the safety of road users	Timing of shipments will be staggered when possible	Traffic delays and the probability of traffic incidents may increase temporarily during the Decommissioning Execution phase as a result of increased volume	No adverse residual effects
Indigenous Socio-economic Environment	On-site transportation, demolition, material sizing	Residents – use/enjoyment of property	Nuisance effects (dust, noise and traffic)	Dust suppression, restricting hours of activity, communication with public	Minor, temporary and localized nuisance effect on residents and nearby land users use and enjoyment of land	No adverse residual effects
Institutional Controls						
Indigenous Socio-economic Environment	Renaturalization	None	None	No proposed mitigation	None	No adverse residual effects
Post-Institutional Controls						
Indigenous Socio-economic Environment	Renaturalization	None	None	No proposed mitigation	None	No adverse residual effects

9.10.2 Indigenous Health

As required under paragraph 5(1)(c) of *CEAA,* 2012, the EIS should describe the effects of any changes the project may cause to the environment, with respect to Aboriginal Peoples, on health.

9.10.2.1 Selection of VCs

As outlined in Section 5.2.4, VCs for Indigenous Health were selected to encompass the potential effects of the project on Indigenous health as well as exposure via pathways from environmental components (e.g., atmospheric, surface water environment, geological and hydrogeological environment, ambient radioactivity). The VCs for Indigenous health, along with rationale for their selection, are listed in Table 9.10-5.

Table 9.10-5 Selection and Rationale of VCs for Indigenous Health

Environmental Component	Sub-Category	VC and Rationale
Indigenous Health	Indigenous People	Indigenous People may be exposed to health risk as a result of the project. The potential effects on humans associated with changes in atmospheric, surface water, geological and hydrogeological conditions (radiological and chemical releases and concentrations), and external gamma radiation are considered.
	Indigenous Worker	Indigenous workers may be exposed to health risk as a result of performing their duties relative to the project. The potential effects on humans associated with changes in atmospheric, surface water, geological and hydrogeological conditions (radiological and chemical releases and concentrations) and external gamma radiation are considered.

Note:

Effects on human health from possible accidents and malfunctions are discussed in Section 9.11 below.

9.10.2.1.1 Indigenous Engagement Feedback – Key Interests and Concerns related to Indigenous Health VCs

This section describes how the input from Indigenous engagement activities influenced the selection of VCs in the Indigenous Health assessment. Table 9.10-6 summarizes the key interests and concerns raised by Indigenous peoples related to VCs for the evaluation of potential effects to Indigenous health (based on Table 6.3-1 above), and demonstrates how the interest or concern has been addressed in the present assessment.

Table 9.10-6 Summary of Interests and Concerns Raised During Indigenous Engagement Activities that Influenced the Scope of Indigenous Health Assessment

Interest or Concern	How the Interest Was Included in the Assessment
Separate consideration of Indigenous Health Conditions	In response to feedback received during Indigenous engagement activities, CNL has added new environmental components (and associated VCs) to the EIS, describing current Indigenous health conditions (Section 8.10.2) and potential effects to Indigenous health VCs (Section 9.10.2).
Inclusion of Indigenous group receptor	In response to feedback from Indigenous Nations, communities and organizations, CNL has created a new environmental component: Indigenous Health. The VCs identified for the assessment of Indigenous Health are Indigenous People and Indigenous Workers. Potential impacts to Indigenous People and Indigenous Workers are assessed in Section 9.10.2.3. Additionally, CNL has incorporated information on Indigenous health indicators provided by Indigenous Nations, communities and organizations into the description of baseline Indigenous health (Section 8.10.2).
Safety of harvesting and consuming harvested foods.	Safety of harvesting and consuming harvested foods is assessed using the Human Health Public VCs (Section 9.8.3) and Indigenous peoples Health VCs (Section 9.10.2.3). The Indigenous peoples Health VC, which was added to the EIS based on Indigenous Nation, community and organization feedback on VCs (new Section 9.10.2).
Concerns due to introduction of tritium into the Kichi-Sìbì (Ottawa River)	Potential effects on Indigenous peoples health from tritium in the Kichi-Sìbì (Ottawa River) are assessed using the new Indigenous peoples Health VC that was added to the EIS in response to feedback from Indigenous Nations, communities and organizations on VCs (Section 9.10.2). The assessment of risk to human receptors includes consideration of exposures received from domestic and agricultural use of the Kichi-Sìbì (Ottawa River), including irrigation, drinking, swimming and fishing activities. Wherever possible, conservative assumptions about future lifestyles and habits have been adopted in the assessment, to help ensure that potential exposures have not been underestimated (Section 9.8.3.3, 9.10.2.3).
Concern about the assumptions related to dietary pathways (and changes due to perceived contamination), occupancy factors, locations of activities.	The assumptions made in developing the exposure profiles for the Indigenous Health VCs (i.e., Indigenous peoples and Indigenous Workers) are summarized in Section 8.10.2 (food sources and water use) and Section 9.10.2 (dietary intake values, time spent at various outdoor activity locations). CNL acknowledges that there is uncertainty in the assessment of potential effects to Indigenous VCs. This has been accounted for by using conservative assumptions wherever possible. For example, with the exception of hunters, receptors during the Post-Institutional Controls phase were assumed to obtain 100% of their water from the Kichi-Sìbì (Ottawa River), and all foods except grain were obtained 100% locally (Section 9.10.2.3.3). CNL has reviewed the results of a harvest and diet study that was conducted by a nearby Indigenous group. The results are used to validate the conservative assumptions used to characterize the diet of the Indigenous VCs (as described above).

Notes:

The table above provides a summary of the concerns expressed by multiple Indigenous Nations, communities and organizations. See Table 6.3-1 for a more detailed listing of key interests and concerns from each Indigenous Nation, community and organization.

9.10.2.2 Assessment Boundaries

9.10.2.2.1 Spatial Boundaries

The spatial boundaries with respect to the Indigenous Health are the same as employed for Human Health.

Similar to the human health baseline characterization in Section 8.2 above, the Site and Local Study Areas for this assessment are consistent with the general spatial boundaries outlined in Section 5.2.1.1. As this area is all owned by the Federal Government, there are no residents present. Workers (including Indigenous workers) are, and will continue to be, present in this area for the duration of the decommissioning, and as such the Site/Local Study Areas will describe baseline worker health.

The Regional Study Area for this assessment consists of the Renfrew County and District Health Unit, and Région de l'Outaouis Health Unit, illustrated in Figure 8.8-1 and Figure 8.8-2.

9.10.2.2.2 Temporal Boundaries

The temporal boundaries for this assessment are the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS.

9.10.2.3 Identification of Residual Effects

9.10.2.3.1 Project-Environment Interactions

As shown in Table 9.10-7, potential effects to Indigenous health may occur as a result of interaction with Decommissioning Execution operations and activities associated with:

- Grout batch mixing plant;
- Grouting of below grade structures;
- Removal of above grade structures;
- Installation of concrete cap and engineered cover;
- Final site restoration;
- Facility performance during the Institutional Controls phase; and
- Facility performance during the Post-Institutional Controls phase.

Table 9.10-7 Project-Environment Interactions in Indigenous Health

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**	
	1.1	Designate footprint, create access, temporary fencing (east side of main building).	Work conducted near the facility has the potential to release dust, increase radiation doses to Indigenous workers.
	1.2	Assign storage area for raw materials, ship in sand. Likely east side of licensed area.	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers. Dust and vehicle emissions may affect Indigenous worker health.
	1.3	Set up mixing stations, hook up electrical power or diesel power.	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers.
	1.4	Truck in necessary water supply or source water directly from river.	Work conducted near the facility has the potential to increase radiation doses to workers. Dust and vehicle emissions may affect Indigenous worker health.
	1.5	Provide slip pipe access to nuclear area.	This activity has the potential to release dust and increase radiation doses to Indigenous workers. Specifically, to the Indigenous workers drilling holes for slip pipe access and workers nearby.
	1.6	Construct washout pit. Lined excavation with water transfer. Likely near grout batch mixing station.	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers. Dust and vehicle emissions may affect Indigenous worker health.
	1.7	Level area for pumper.	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers. Dust and vehicle emissions may affect Indigenous worker health.
	1.8	Mix grout to required formula.	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers. Dust and equipment emissions may affect Indigenous worker health.
	1.9a	Truck grout to pumping station (20 trips per day).	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers. Dust and vehicle emissions may affect Indigenous worker health.
	1.11	Sample and dewater the cleaning pit. Emplace sediments into voids in condenser room.	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers. Dust and vehicle emissions may affect Indigenous worker health.
	1.12	Demobilize grout batch mixing plant after cap installation.	Work conducted near the facility has the potential to increase radiation doses to Indigenous workers. Dust and vehicle emissions may affect Indigenous worker health.

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**2**	**Grouting of Below Grade Structure**	
	2.1	Room preparation (e.g., sealing of pipes).	Work conducted within the facility has the potential to increase radiation doses to Indigenous workers.
	2.2	Systems Preparation Large Vessels.	The activities associated with this task are routine construction activities. Potential effects on Indigenous workers as part of this task are grouped with activity **1.5** (Provide slip pipe access to nuclear area).
	2.3	Grout Fill Nuclear Area.	Displacement of air containing dust, tritium, lead and asbestos may result in effects to Indigenous peoples and workers.
	3	**Removal of Above Grade Structure**	
	3.1	Conventional heavy equipment knockdown of reactor hall.	Release of surface contamination may increase exposure to dust, radioactivity and other potential contaminants to Indigenous peoples and workers.
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Release of surface contamination may increase exposure to dust, radioactivity and other potential contaminants to Indigenous peoples and workers.
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	Conducting clearance surveys has the potential to increase radiation doses to Indigenous workers.
	3.4	Steel and rubble emplaced in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.5	Grout first level of demolition material in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.6	Steel and rubble emplaced in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.7	Grout second level of demolition material in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.8	Steel and rubble in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.9	Grout third level of demolition material in condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.10	Demolish block walls and inside walls around control room and change rooms.	Release of dust and surface contamination may increase exposure to Indigenous peoples and workers.

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**3.11**	Collapse ceilings of furnace room and adjacent rooms.	Release of dust and surface contamination may increase exposure to Indigenous peoples and workers.
	3.12	Emplace block wall rubble in furnace room or condenser room.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Release of surface contamination may increase radiation doses to Indigenous peoples and workers.
	3.15	Grout furnace room and adjacent areas to ground level.	Displacement of dust, lead, asbestos and tritium in air from the facility has the potential to increase exposure to Indigenous peoples and workers.
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Release of dust and surface contamination may increase exposure to Indigenous peoples and workers.
	4	**Install Concrete Cap and Engineered Cover**	
	4.1	Concrete Cap (construct forms, install rebar, and pour, level and slope concrete).	Work conducted near the facility has the potential to release dust and increase radiation doses to Indigenous workers.
	4.2	Engineered Cover (ship in materials, layer and shape mound, install geotextile layer, grade property, install remaining earth layers and seed).	Work conducted near the facility has the potential to release dust and increase radiation doses to Indigenous workers.
	5	**Final Site Restoration**	
	5.2	Demobilize Site (Remove temporary facilities, decontaminate equipment, remove power upgrades, poles and lines, return transformers).	Work conducted near the facility has the potential to release dust and increase radiation doses to Indigenous workers.
IC*	**6**	**Long-Term Care and Maintenance**	
	6.8	Facility performance during the Institutional Controls phase	Groundwater will start to enter and eventually resaturate the grouted structure. Contaminated groundwater will flow out and has the potential to affect Indigenous peoples.
PIC**	**7**	**Post-Institutional Controls**	
	7.1	Facility performance during the Post-Institutional Controls phase	Groundwater in the resaturated and eventually degraded grouted structure will become contaminated. Contaminated groundwater will flow out and has the potential to affect Indigenous peoples.

Notes:

*Institutional Controls
**PIC: Post-Institutional Controls

9.10.2.3.2 Proposed Mitigation Measures

The same mitigation measures as proposed with Human Health are proposed below.

The mitigation measures presented below are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required.

In addition to the in-design mitigation measures identified in Section 4.1 above, mitigation measures identified in other environmental components, such as dust suppression and vehicle maintenance may also reduce the potential for effects on Indigenous worker and people health. The following mitigation measures are outlined in the DecomSA TSD.

- *General:*
  - Staff and contractors will receive orientation to ensure they are aware of decommissioning activities, hazards, and emergency procedures.
  - Signs will be posted to indicate where decommissioning work is taking place and to alert people to detours where applicable.
  - Work control documents will be developed to guide safe execution of the decommissioning activities.
  - Hazards to personnel will be identified through work control documents and eliminated or controlled using engineered controls, administrative controls, and PPE.
  - Regular updates will be given to site personnel on updates in the proposed decommissioning work plans.
  - CNL health and safety programs are in place to prevent and mitigate injury to personnel.
  - An NPD Emergency Procedure is in place and is consistent with CNL's Emergency Preparedness Program. This procedure will be updated to include decommissioning activities.
  - Emergency response is available through local municipal Fire Department.
  - Stop work procedures will be followed for power outages.
  - Overall site 'good housekeeping' will be upheld.
  - Contractor Health & Safety Management Program, reviewed by supply chain management and meeting CNL requirements.
  - Periodic communication updates to local residents on the project construction activities, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc.
  - Communications with Indigenous Nations, communities and organizations and individuals (to be discussed further with Indigenous Nations, communities and organizations).
- *Structural:*
  - Structural assessments will be performed to ensure that all demolition work is done in accordance with safe work practices and civil/engineering requirements.
  - Appropriate methods will be used during the demolition process to provide support and ensure that unintended structural failure does not occur.

- If inclement weather occurs during the performance of project work, activities would be stopped (if deemed necessary) in order to minimize weather-related risks.
- A demolition plan is prepared in accordance with PEO standards and approved by a Professional Engineer qualified in this discipline.
- An exclusion zone will be established for decommissioning activities.

o *Radiation Dose:*

Radiological work assessments will be performed as detailed work packages are developed. They will include specific measures to reduce collective and individual Indigenous worker dose to ensure that the dose is below relevant dose threshold standards. As per current practice at the NPD site, all internal and external doses received by NPD workers will be monitored and reported as part of the operational dose management program. This system will be in effect during the Decommissioning Execution phase of the project:

- As mentioned above, work control documents will be prepared for all activities. Where there is the potential for workers to encounter radiological hazards, the preparation of work control documents include a radiological assessment completed by CNL health physics personnel. Work control documents are then developed to include radiological aspects as appropriate.
- Hazards to personnel will be identified through work control documents and eliminated or controlled using engineered controls, administrative controls, and PPE.
- Utilization of air monitors (including particulate contamination as well as tritium-in-air), dosimeters, and bioassay will be used as required to detect the spread and uptake of contamination before it exceeds limits.
- Emergency response capability is available from local municipalities.
- An NPD Emergency Procedure is in place and is consistent with CNL's Emergency Preparedness Program. This procedure will be updated to include decommissioning activities.

o *Asbestos:*

- Signage will be installed to indicate asbestos laydown/interim-storage areas.
- Procedures will be in place for handling and storage of abated asbestos (bagged).
- Work control documents will be developed for all activities, including those involving handling of abated (bagged) asbestos and transite.

o *PCBs:*

- Work control documents will be developed for all activities, including those involving handling PCB-containing materials.
- Sources of PCBs will be confirmed through characterization and will be clearly identified prior to executing activities involving handling of PCB-containing materials (e.g., caulking, paint, cables, etc.).
- Appropriate personal protection equipment (e.g., respirators and Tyveks) will be available and used.

o *Lead:*

- Work control documents will be developed for all activities, including those involving lead-containing materials.

- Sources of lead are known and will be clearly identified prior to executing decommissioning activities.
- Appropriate personal protection equipment will be used, based on the nature of the activities (e.g. gloves, respirators, etc.).

o *Mercury:*
- Work control documents will be developed for all activities, including those involving mercury-containing equipment/instrumentation.
- Sources of mercury are known and will be clearly identified prior to executing decommissioning activities.

o *Hydrogen Generation:*
- Ensuring proper ventilation during grouting.
- Pouring grout in batches to allow a set up time between pours.

9.10.2.3.3 Effects After Mitigation

Decommissioning Execution

Site and Local Study Area

Non-radiological

During the Decommissioning Execution phase, the site and local study areas will be occupied primarily by workers. Vehicle and equipment operation and on-site transportation will release NO_x, SO_2, VOCs, TSP, PM_{10}, and $PM_{2.5}$. These activities are discussed in Section 9.2 above. In the DecomSA TSD, it is conservatively assumed that these activities will occur simultaneously (i.e., the maximum potential emissions and releases are considered). Worker exposure to NO_x, SO_2, VOCs, TSP, PM_{10}, and $PM_{2.5}$ for all activities is considered here. The release of these contaminants will be mitigated by standard dust suppression measures listed for the atmospheric environment in Section 9.2.3.2, as well as proper vehicle maintenance to reduce emissions. No adverse health effects to Indigenous workers are anticipated in the Site and Local Study Areas.

Grouting and removal of the above grade structure will result in the displacement of air from inside the facility, which contains suspended lead and asbestos. This was assessed in Sections 8.5.2 and 8.6.1 of the DecomSA TSD. Exposure to workers will be limited by following the appropriate work control documents described in 9.8.3.2 above. Worker exposures were compared to benchmark values (8-hr limits in this case) to produce (unitless) SI values. An SI of 1 means that the worker exposure is equal to the benchmark value. The maximum SIs for lead and asbestos for near-field workers were 3.88 $x10^{-5}$ and 2.14 $x10^{-8}$ respectively, indicating that no adverse health effects to workers are expected.

Radiological

Activities that may result in radiation exposure for workers are assessed in the DecomSA TSD. These activities include drilling holes in below grade structures, displacement of air from the facility during grouting and emplacement, and demolition. Radiation protection protocols, work control documents, safeguards

and mitigation will reduce the extent of exposure for the workers and are described in Section 9.10.2.3.2 above.

The maximum total dose rate for workers received during grouting and emplacement was predicted to be 1.35 x 10^{-5} mSv/y in the DecomSA TSD. The maximum total dose received by a driller while creating slip pipe access was 0.527 mSv. Contaminant release during demolition calculated to result in a maximum total dose of 5.92x10^{-5} mSv. On an annual basis, these doses are well below the regulatory limit of 50 mSv/y for NEW (CNSC 2015); therefore, no adverse health effects to Indigenous workers are anticipated.

Regional Study Area

Non-Radiological

The DecomSA TSD assesses chemical exposure of members of the public in the Regional Study Area during the Decommissioning Execution phase. During grouting, exposure to lead and asbestos for members of the public was compared to benchmark values, resulting in maximum SI of 2.09 x10^{-4} and 4.7 x10^{-7} respectively. During demolition, the maximum SI for lead for members of the public was 1.71 x10^{-1}. All exposure concentrations are lower than the public benchmark values.

Lastly, the deposition of lead to soil was assessed at receptor locations and compared against the MOE (2011) Table 8 soil criterion for lead of 120 µg/g. The maximum soil concentration calculated from demolition or grouting was four orders of magnitude below this criterion.

Therefore, no adverse health effects are anticipated for Indigenous peoples (e.g., from releases to air or surface water).

Radiological

As determined in the DecomSA, the maximum total dose rate to the public during grouting and emplacement was calculated to be 5.76 x10^{-6} mSv/y. The maximum total dose rate to the public during demolition was calculated to be 8.18 x10^{-5} mSv/y. Both maximum total dose rates are well below the public dose rate limit of 1 mSv/y by 4 orders of magnitude. Thus, no adverse health effects are expected for Indigenous peoples in the Regional Study Area.

Institutional Controls and Post-Institutional Controls

Site and Local Study Area

The PostSA TSD examines several potential scenarios for the postclosure period (Institutional Controls and Post-Institutional Controls phases) as a way to capture and quantify uncertainties in the future conditions at the site (for detail on these scenarios, the reader is directed to the PostSA TSD) and assess the potential for radiological and non-radiological contamination to affect human health (including Indigenous health) for these scenarios. The reader is directed to the PostSA TSD, which details the results of the assessment of radiological and non-radiological contamination on human health (among other environmental components) for these scenarios. Human health results are briefly summarized here.

The PostSA TSD considers several potential exposure groups, for example:

- Site resident family: A highly conservative group that maximizes potential exposures. This is reflected by a small household (comprising two adults, a child and an infant) residing directly over the disposal facility and pursuing a self-sufficient lifestyle. This includes use of potentially contaminated river water for domestic and agricultural purposes.
- A hunting/recreational group, represented by a small number of adults and children making hunting and/or recreational use of the river and the area surrounding the NPD. Their exposure pathways, including obtaining wild foods, is also representative of the types of habits that might be exhibited by Indigenous Nations, communities and organizations.
- An offsite resident receptor group, represented by two households (adults and children) that reside alongside the Kichi-Sìbì (Ottawa River) at Deep River and Ottawa/Gatineau. These households are assumed to use river water from the Kichi-Sìbì (Ottawa River) for domestic use and as drinking water, and to use the Kichi-Sìbì (Ottawa River) for recreational swimming.
- An Indigenous receptor characterized using information from a dietary study completed by the AOPFN. In keeping with the study's findings, it is assumed that the indigenous receptor supplements their diet with additional (uncontaminated) groceries purchased from local shops. This receptor also includes additional pathways for smoke inhalation and rubbing of medicinal plants into the skin. Their exposure pathways include:
    - time spent on the shoreline for recreation and fishing;
    - time spent swimming in the river;
    - ingestion of fish caught from the river;
    - hunting of game that uses the river for drinking water, foraging of wildfoods and honey;
    - inhalation of smoke from burning medicinal plants; and
    - rubbing medicinal plants into the skin.
- A self-sufficient Indigenous receptor group (investigated as a sensitivity case), represented by adults and children following a traditional lifestyle using the area around the NPD, including the Kichi-Sìbì (Ottawa River), for hunting and gathering. The exposure pathways for the self-sufficient Indigenous receptor group include:
    - time spent on the shoreline for recreation and fishing;
    - time spent swimming in the river;
    - ingestion of fish caught from the river; and
    - hunting of game that uses the river for drinking water, foraging of wildfoods and honey.

For the normal evolution scenario, potential wildlife exposures are limited to those that may occur in the river and at the shoreline. The radionuclide concentrations in the surface environment are expected to be highest in these areas. Aside from the hunter/recreational receptor group, all other receptors are assumed to obtain 100% of their water from the Kichi-Sìbì (Ottawa River) for the normal evolution.

In the postclosure period, dietary intake values for site resident group were adopted from CSA (2022), which were conservatively based on 95th percentile energy intakes. The assessment also conservatively assumed that all foods except grain were obtained 100% locally by site resident, as shown in Table 9.10-8 below.

Table 9.10-8 Dietary Intakes for the Site Resident Group (Table E-48 in PostSA TSD)

Category	Local Fraction	Infant	Child	Adult	Notes
Fish (g/d)	1	6.4	18.5	28.1	1
Shellfish (g/d)	1	0.6	2.1	5.7	1
Cows' milk (g/d)	1	837.5	787.6	464.5	2
Goat's milk (g/d)	1	93.1	87.5	51.6	2
Beef (g/d)	1	18	53.2	194.9	3
Beef liver (g/d)	1	1.9	5.5	8.5	1
Pork (g/d)	1	13.4	40.1	81.4	1
Lamb (g/d)	1	0.1	3.9	2.4	1
Poultry (g/d)	1	31.6	83.8	159.8	1
Eggs (g/d)	1	8.2	30.9	79	1
Grain (g/d)	0	211.7	539.7	671.8	4
Fruit & vegetables (g/d)	1	308.5	607.9	935	5
Potatoes (g/d)	1	33.1	118.4	196.7	1
Honey (g/d)	1	1.8	5.2	6.7	1

Notes:

1 Table G.9c of CSA (2022).
2 Total milk from Table G.9c of CSA (2022) split assuming that 90% comes from cows' milk and the remaining 10% comes from goat's milk.
3 Combines beef and veal from Table G.9c of CSA (2022).
4 The climate and small self-sufficient lifestyle are not amenable to providing grain.
5 Combines fruit and berries plus vegetables Table G.9c of CSA (2022).

Table 9.10-9 presents the dietary intakes for the recreational/hunter receptor and Table 9.10-10 presents the dietary intakes for the self-sufficient Indigenous receptor.

Table 9.10-9 Dietary Intakes for the Recreational/Hunter Group (Table E-49 in PostSA TSD)

Category	Local Fraction [1]	Infant	Child	Adult	Notes
Fish (g/d)	0.1	6.4	18.5	28.1	2
Shellfish (g/d)	0.1	0.6	2.1	5.7	2
Deer (g/d)	0.1	0.09	0.3	1.14	3
Rabbit (g/d)	0.1	0.24	0.75	2.82	3
Goose (g/d)	0.1	15.8	41.9	79.9	4
Duck (g/d)	0.1	15.8	41.9	79.9	4

Notes:

1 The recreational/hunter group is taken to spend 10% of their recreational/hunting time in the potentially contaminated area.
2 Based on the default dietary intakes in Table G.9c of CSA (2022).
3 High intake rates of deer and rabbit are assumed. These are taken to be three times the default dietary intakes in Table G.9c of CSA (2022).
4 The default poultry intake in Table G.9c of CSA (2022) is taken to be equally distributed between goose and duck meat.

Table 9.10-10 Dietary Intakes for the Self-Sufficient Indigenous Receptor Group (Table E-62 in PostSA TSD)

Category	Local Fraction*	Ingestion Rate (g/day)		
		Infant	Child	Adult
Deer[1]	0.1 [1]	189.7 [5]	270.4	557.3
Moose[1]	0.1 [1]	189.7 [5]	270.4	557.3
Grouse	0.44 [1]	94.9 [5]	135.4	278.7
Duck	0.44 [1]	147.6 [6]	278.7	278.7
Fish [2]	1	207.03 [5]	295.1	608.2
Berries[3]	0.2 [1]	918.6 [6]	1,734.2	1,038.1
Mushrooms[4]	1	1.0	3.9	4.8
Honey	1	1.8	5.2	6.7

Notes:

* Local fractions are based on the scenario description and on the nature of the receptor.
1 The local fraction for deer and moose assumes that all hunting occurs in the contaminated area, however, is set to 0.1 to account for the likely use of less contaminated foraging sites within a large home range, as recommended in CSA 2022. The local fraction of grouse, duck and berries are taken from CSA 2022.
2 Fish are assumed to be taken from the Kichi-Sìbì (Ottawa River).
3 Berries will be considered separately from other fruits and vegetables, and will be modeled as strawberries (as per CSA 2022).
4 Modeled as Generic Fruit and Vegetables from CSA (2022).
5 Derived by scaling the adult intake value.
6 Derived by scaling the child intake value.

Radiological

In the normal evolution scenario dose rate estimates, the highest dose rate was received by a Site Resident (0.00008 mSv/y). This is over 1,000 times lower than the dose rate criterion of 0.25 mSv/y.

The peak dose rate to a member of the hunter group is only 0.0000004 mSv/y. These are negligible levels of exposure.

The offsite receptor is also considered, living downstream of the NPDDF and using river water to drink and wash with. Therefore, the only exposure pathways considered are ingestion of the contaminated water, and/or external radiation from the water (e.g., bathing and swimming). As the offsite receptor lives beyond any region that can be subject to institutional control, exposures may occur earlier than 100 years after closure. The results indicate that the peak dose rate is around 25 million times lower than the dose rate criterion of 0.25 mSv/y.

The peak dose rate to the indigenous receptor characterized using the AOPFN dietary study occurs at is over 10,000 times lower than the dose rate criterion of 0.25 mSv/y. These are negligible levels of exposure.

In order to examine the sensitivity of the lifestyle assumptions, and to respond to Indigenous feedback on the project, the PostSA includes a sensitivity case examining a case where an Indigenous person – living what is intended to be representative of a traditional self-sufficient lifestyle – is assumed to live in the vicinity of the NPDDF. This self-sufficient Indigenous group is assumed to ingest a range of wild and naturally-occurring foodstuffs, such as deer, moose, grouse, duck, fish, berries, mushrooms and honey.

Results indicate that the peak dose to adults and children in the self-sufficient Indigenous receptor group is more than 1,000 times lower than the dose rate criterion of 0.25 mSv/y.

The PostSA also assessed several disruptive event scenarios (as described in Section 9.1 above). In all cases the dose results are below the corresponding criterion for disruptive event cases (see the PostSA TSD for further information).

Therefore, all dose rates estimated for the normal evolution and disruptive event scenarios were below the relevant dose rate criteria in the PostSA TSD.

The radiation dose to workers performing duties associated with Institutional Controls, within the Licensed Area, will be negligible based on the anticipated radiological zoning (CNL Radiological Zone 1).

Non-radiological

As discussed in Section 9.5.3.3, the PostSA TSD results show that for Normal Evolution the highest lead concentration in groundwater is 4 x 10^{-7} mg/L and occurs in the overburden at 12,000 years after closure. The calculated concentrations of lead in all environmental media are far lower than the relevant MOE generic Site Condition Standards (2011 – Table 6, 7, 8, 9) for groundwater and the Health Canada (2017) drinking water guideline for lead.

The PostSA also assessed two disruptive event scenarios, as described in Section 9.1 above for the same receptors.

- In the site investigation scenario, the peak lead concentrations in all media are the same as for the normal evolution scenario, and well below criteria.
- In the extreme degradation of engineered barrier scenario, the peak lead concentrations in all media are below all applicable guidelines.

Regional Study Area

Since no effects on Indigenous human health have been identified in the Site and Local Study Areas, no effects are expected in the Regional Study Area for the Post-Institutional Controls phase. The offsite receptor (Deep River and Ottawa/Gatineau resident) is discussed above.

9.10.2.3.4 Prediction Confidence and Uncertainty

Uncertainty in the DecomSA TSD is addressed through conservative assumptions (i.e., variability in airborne contaminant concentrations in the facility is accounted for by the assumption that concentrations are equal to the most contaminated room for each contaminant).

There is some uncertainty in the characterization of potential effects to Indigenous Nations, communities and organizations, due to lack of site-specific information on diet and lifestyle. However, this has been accounted for this using conservative assumptions of a self-sufficient Indigenous traditional lifestyle. Other Indigenous concerns such as effects on land use and socio-economic conditions are assessed separately in subsequent sections of this EIS.

In the PostSA TSD, uncertainties in postclosure conditions and events (e.g. floods, human intrusion) and key parameters (e.g. inventory of contamination) are addressed inherently by assessing several disruptive scenarios. Conservative assumptions are also used to address other uncertainties, such as sediment characteristics.

*9.10.2.3.5 R*esidual Effects

Table 9.10-11 summarizes the effects assessment above and presents the residual effects that were identified in human health. The residual effects in Table 9.10-11 are grouped by effect rather than by individual interaction as listed in Table 9.10-7.

Table 9.10-11 Summary of Residual Effects in Indigenous Health

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution					
Indigenous Health: Public (non-radiological)	All vehicle and equipment production of NO_x, SO_2, TSP, PM_{10}, and $PM_{2.5}$.	Localized changes in the atmospheric environment may affect nearby Indigenous residents.	Mitigation measures (e.g. dust suppression, equipment maintenance) for the atmospheric environment are described in Section 9.2.3.2.	For all activities, no measurable changes in air quality are predicted, therefore no effects are expected.	No adverse residual effects.
Indigenous Health: Worker (non-radiological)	All vehicle and equipment production of NO_x, SO_2, TSP, PM_{10}, and $PM_{2.5}$.	Localized effects are expected in the atmospheric environment which may affect Indigenous workers.	Mitigation measures (e.g. dust suppression, equipment maintenance) for the atmospheric and surface water environments are described in Section 9.2.3.2.	No effects are expected on worker health from changes in air quality.	No adverse residual effects.
Indigenous Health: Worker (radiological)	Establishing footprint.	Indigenous workers are expected to be exposed to small amounts of radiation during this activity.	Following work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Indigenous Health: Public (non-radiological)	Stockpile grout ingredients.	Runoff from stockpiles may affect surface water quality which may affect nearby Indigenous residents.	Mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Kichi-Sìbì (Ottawa River), therefore no effects to the public/Indigenous are predicted.	No adverse residual effects.
Indigenous Health: Worker (non-radiological)	Stockpile grout ingredients.	Runoff from stockpiles may affect surface water quality which may affect Indigenous workers.	Mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Kichi-Sìbì (Ottawa River), therefore no effects to Indigenous workers are predicted.	No adverse residual effects.

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Indigenous Health: Worker (radiological)	Provide slip pipe access to nuclear area.	Drilling holes for slip pipe access has the potential to increase radiation doses to Indigenous workers.	Follow work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Indigenous Health: Public (non-radiological)	Construction and operation of washout pits.	Surface water quality may be affected by washout pit construction and operation which may affect nearby Indigenous residents.	Mitigation measures (e.g., proper washout pit design and management) for the surface water environment are described in Section 9.4.3.2.	Localized site drainage effects are expected but will not affect the surface water environment as a whole. No measurable changes on water quality in the Kichi-Sìbì (Ottawa River), therefore, no effects on the public are predicted.	No adverse residual effects.
Indigenous Health: Worker (non-radiological)	Construction and operation of washout pits.	Surface water quality may be affected by washout pit construction and operation which may affect Indigenous workers.	Mitigation measures (e.g., proper washout pit design and management) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Kichi-Sìbì (Ottawa River), therefore no effects to workers are predicted.	No adverse residual effects.
Indigenous Health: Public (radiological and non-radiological)	Grout fill nuclear area.	Displacement of air from the facility containing lead, asbestos and tritium which may affect nearby Indigenous residents.	No mitigation measures have been identified.	Lead and asbestos are well below benchmark values for nearby residents. Tritium exposure calculations for the public are well below the minimum regulatory requirement.	No adverse residual effects.
Indigenous Health: Worker (radiological and non-radiological)	Grout fill nuclear area.	Displacement of air from the facility containing lead, asbestos and tritium which may affect Indigenous workers.	Follow work control documents and radiation protection protocol.	Lead and asbestos are well below benchmark values for workers. Tritium exposure calculations for workers are below worker dose criterion.	No adverse residual effects.
Indigenous Health: Public (radiological)	Demolition of above grade structures.	Surface contamination of the structure may be released into the atmospheric environment which may affect Indigenous peoples.	Mitigation measures (e.g., runoff diversion, dust suppression) for the atmospheric environment are described in Section 9.3.3.2.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Indigenous Health: Worker (radiological)	Demolition of above grade structures.	Surface contamination of the structure may be released into the atmospheric environment which may affect Indigenous worker health.	Follow work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.

Environmental Component	Source of Effect	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Indigenous Health: Public (radiological and non-radiological)	Demolition of above grade structures.	Runoff may affect surface water quality and Indigenous peoples.	Mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.3.3.2.	No measurable changes in water quality in the Kichi-Sìbì (Ottawa River), therefore no effects to the public are predicted.	No adverse residual effects.
Indigenous Health: Public (radiological and non-radiological)	Sizing of material.	Runoff and release of surface contamination may affect Indigenous peoples health.	Relevant mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Kichi-Sìbì (Ottawa River), therefore no effects to the public are predicted.	No adverse residual effects.
Indigenous Health: Worker (radiological and non-radiological)	Sizing of material.	Runoff and release of surface contamination may affect Indigenous worker health.	Relevant mitigation measures (e.g., runoff diversion, dust suppression) for the surface water environment are described in Section 9.4.3.2.	No measurable changes in water quality in the Kichi-Sìbì (Ottawa River), therefore no effects to workers are predicted.	No adverse residual effects.
Indigenous Health: Worker (radiological)	Clearance surveys on potentially recyclable material.	Conducting clearance surveys has the potential to increase radiation doses to Indigenous workers.	Following work control documents and radiation protection protocol.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Institutional Controls and Post-Institutional Controls					
Indigenous Health: Public (radiological)	Facility performance during the postclosure period.	Exposure to radionuclides in groundwater, surface water, sediment, food, as well as external radiation could affect Indigenous health.	In-design mitigations to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects on Indigenous health.	All doses are expected to be well below relevant dose criteria.	No adverse residual effects.
Indigenous Health: Public (non-radiological)	Instantaneous degradation of the concrete and grout, altering the hydraulic properties and decreasing contaminant transport times.	Exposure to lead in groundwater, surface water, sediment, soil and food could affect Indigenous health.	In-design mitigations to isolate and contain the inventory in order to reduce the potential of groundwater contamination and effects on Indigenous health.	The PostSA TSD determined that there is no likely exposure pathway from groundwater to humans.	No adverse residual effects.

9.10.2.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on Indigenous health have been predicted.

9.10.2.5 Monitoring and Follow-Up

The VCs for Indigenous Health are worker and Indigenous peoples (general) health. Monitoring and follow-up activities related to human health are discussed below and in Table 9.10-12. Further action will be triggered if parameters are above applicable guidelines or other notable changes are observed.

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

Decommissioning Execution

CNL will continue to conduct radiation dose monitoring and indoor air quality monitoring during the Decommissioning Execution phase to confirm that there are no effects on worker health.

Monitoring conducted in other environmental components (i.e., atmospheric environment and ambient radioactivity) will also confirm EIS predictions for effects on Indigenous worker and public health during the Decommissioning Execution phase.

Institutional Controls

CNL will conduct radiation dose monitoring during the Institutional Controls phase to confirm that there are no effects on worker health.

Monitoring conducted in other environmental components (i.e., atmospheric environment, geological and hydrogeological environment and ambient radioactivity), such as radiation protection surveys and groundwater monitoring, will also confirm EIS predictions for effects on Indigenous worker and Indigenous public health during the Institutional Controls phase.

Table 9.10-12 Monitoring and Follow-up Activities in Human Health

Environmental Component	Environmental Subcomponent	Conceptual Monitoring Program	Monitoring Program Objective	Suggested Duration	Relation to Current NPD Monitoring Program
Decommissioning Execution Phase					
Indigenous Health	Indigenous Worker health	Potential Source(s) of Effects: - Grout batch mixing plant. - Grouting of below grade structures. - Removal of above grade structures. - Installation of concrete cap and engineered cover. - Final site restoration Proposed monitoring: - Perform routine bioassays as well as TLDs to monitor whole-body dose. Routine radiation protection surveys, as per ambient radioactivity above. - Monitor indoor air quality. - Estimate combustible gases (e.g., based on project-related traffic and equipment), as per atmospheric environment above. - Monitor parameters of concern (e.g., lead, asbestos, tritium) in air displaced from grouting the below grade structure and removal of the above grade structure, as per atmospheric environment above. - Wildlife: noise monitoring, as per atmospheric environment above. - Conduct monitoring for each new activity for a short time period to confirm no effect, as per atmospheric environment above. Trigger for further action: Investigation if parameters are above applicable guidelines identified.	Verify EA prediction (i.e., no adverse residual effect on worker health).	Air quality parameters and industrial hygiene: For each new activity, monitor for minimum one week. Estimation of combustible gases: event-based (e.g., as required for reporting). Routine radiation protection surveys: periodic.	Workers within the NPDWF are currently monitored by CNL Dosimetry Services, which includes routine bioassay as well as assignment of TLDs to monitor whole-body dose. NPDWF currently conducts annual industrial hygiene assessment of lead, asbestos and mould in air within the facility.
Institutional Controls phase					
Indigenous Health	Indigenous Worker health	Potential Source(s) of Effects: - Radiological exposure during worker presence on-site (e.g., for monitoring and long-term care and maintenance of the site). Proposed monitoring: - Perform routine bioassays as well as TLDs to monitor whole-body dose. - Routine radiation protection surveys, as per ambient radioactivity above. - Monitor parameters of concern in air, as per the atmospheric environment above. Trigger for further action: Investigation if parameters are above applicable guidelines identified.	Verify EA prediction (i.e., no adverse residual effect on worker health).	Air quality parameters: For each new activity, monitor for minimum one week. Routine radiation protection surveys: periodic.	Workers within the NPDWF are currently monitored by CNL Dosimetry Services, which includes routine bioassay as well as assignment of TLDs to monitor whole-body dose.
Indigenous Health	Indigenous General Public health	Potential Source(s) of Effects: - Potential leaching of soluble contaminants from degradation of grouted structure. Proposed Monitoring: - Routine groundwater analyses for parameters of concern (chemical and/or radiological) as per the geological and hydrogeological environment.	Verify EA prediction (i.e., no adverse residual effect on groundwater quality or related VCs).	Sampling and analysis of groundwater: periodic.	NPDWF currently conducts non-periodic (i.e., occasional event-based) groundwater monitoring.

9.10.2.6 Conclusion

As shown in Table 9.10-11, no adverse residual effects were identified on Indigenous health.

The assessment took into consideration the concerns expressed by Indigenous Nations, communities, and organizations during engagement activities (Section 9.10.2.1.1). For example, other medicinal pathways have been added to CNL's assessment in addition to ingestion (inhalation and skin application).

Monitoring activities in other environmental components (i.e., atmospheric, surface water, and geological, and hydrogeological environments and ambient radioactivity) will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects related to Indigenous health. If monitoring identifies concerns in the other environmental components, CNL will assess the implications to Indigenous health (e.g., using human health risk assessment as required).

9.11 Socio-economic Environment

Section 9.5 of the Generic Guidelines for the Preparation of the Environmental Impact Statement states the following:

"The proponent will use the information in appendix A, section A.3.7, Socio-economic environment, of the CNSC (2016b) REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures*, to assess the project's indirect socio-economic effects." In Section A.3.7 of CNSC (2020a), it is stated that:

"The applicant should characterize the socio-economic environment and identify all indirect socio-economic effects. An indirect effect is a secondary environmental effect that occurs as a result of a change that a project may cause in the environment. Paragraph 5(2)(b) of CEAA 2012 refers to any change to the environment caused by the project on health and socio-economic conditions, physical and cultural heritage, or any structure, site or thing that is of historical, archaeological, paleontological or architectural significance. For additional guidance, refer to Technical Guidance for Assessing Physical and Cultural Heritage or any Structure, Site or Thing that is of Historical, Archaeological, Paleontological or Architectural Significance under the Canadian Environment Assessment Act, 2012 [22]."

In this EIS and in the Socio-economic TSD, the socio-economic factors examined include those that are potentially affected by the effects of the project to the natural environment. Requirements specific to socio-economic conditions under CNSC REGDOC-2.9.1 are addressed in the EIS and TSD.

9.11.1 Selection of VCs

As outlined in Section 5.2.4, VCs in the socio-economic environment were selected to encompass potential effects on human uses and enjoyment of the land (e.g., hunting, tourism, forestry, etc.), land use designations, and traffic and transportation. The VCs for the socio-economic environment, with rationale for their selection, are listed in Table 9.11-1.

Table 9.11-1 Socio-economic VC Selection

Environmental Component	VC	Rationale
Socio-economic Environment	Walleye	Socio-economic importance as a sportfish.
	White-tailed deer	Socio-economic importance as a game species.
	Residents – Use/ Enjoyment of Property	Potential disruption to use and enjoyment of property because of nuisance-related effects (e.g., dust, noise, traffic) during the Decommissioning Execution phase for residents living in the Regional Study Area. This includes residents potentially hunting/trapping in the Local Study Area.
	Land Use and Planning Regime	The proposed project may allow for redesignation of some or all of the NPD property for other uses following the Decommissioning Execution and Institutional Controls phases.
	Landscape and Visual Setting	Due to the proximity of the site to the Ottawa River, the project may affect the quality of views from the river. It is not visible from Highway 17.
	Highway 17	Highway 17 is the main vehicular artery in the area. Project-related increases in traffic may affect capacity and safety of the Highway and represents a risk to human health and safety (e.g., accidents), as well as a risk to the natural environment (e.g., spills, wildlife mortality from increased volume, sensory disturbance from increased noise, increased emissions).

Note:

In response to feedback received during Indigenous engagement activities, CNL has added Indigenous socio-economic VCs (see Section 9.10.1).

9.11.2 Assessment Boundaries

9.11.2.1 Spatial Boundaries

Similar to the socio-economic environment baseline characterization in Section 8.10 above, the Site Study Area for this assessment are consistent with the general Site Study Area outlined in Section 5.2.1.1. The Local and Regional Study Areas for the socio-economic environment are the same as those outlined for traditional land and resource use (Section 8.9.1).

9.11.2.2 Temporal Boundaries

The temporal boundaries are the same as the standard temporal boundaries outlined in Section 5.2.1.2 of this EIS.

9.11.3 Identification of Residual Effects

9.11.3.1 Project-Environment Interactions

As shown in Table 5.2-1, potential effects to the socio-economic environment may occur as a result of operations and activities in the Decommissioning Execution, Institutional Controls and Post-Institutional Controls phases, in particular:

- Installation and operation of the grout batch mixing plant;
- Grouting of below grade structures;

- Removal of above grade structures;
- Install concrete cap and engineered cover;
- Final site restoration;
- Renaturalization;
- Facility performance during the Institutional Controls; and
- Facility performance during the Post-Institutional Controls phase.

The rationale for these interactions is included in Table 9.11-2 below.

Table 9.11-2 Project-Environment Interactions in the Socio-economic Environment

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**1**	**Grout Batch Mixing Plant**	
	1.1	Designate footprint, create access, temporary fencing (east side of main building).	Establishing the project footprint and installing fencing may affect the landscape and visual setting from the Ottawa River. On-site activities may produce nuisance effects for nearby residents/land users (noise, dust and traffic).
	1.2	Assign storage area for raw materials, ship in sand. Likely east side of licensed area.	Trucking in raw materials will affect traffic and transportation. Raw material transport may produce nuisance effects for nearby residents/land users (noise, dust, traffic). A minor depletion of local grout materials reserves may occur.
	1.4	Truck in necessary water supply or source water directly from river.	Trucking in water supply will affect traffic and transportation, and produce exhaust and dust. Trucking may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	1.5	Provide slip pipe access to reactor side.	On-site activities may produce nuisance effects for nearby residents/land users (noise, dust).
	1.6	Construct washout pit. Lined excavation with water transfer. Likely near grout batch mixing station.	Earth-moving may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	1.7	Level area for pumper.	Earth-moving may produce nuisance effects for nearby residents/land users (noise, dust).
	1.8	Mix grout to required formula.	On-site activities may produce nuisance effects for nearby residents/land users (noise, dust).
	1.9a	Truck grout to pumping station (20 trips per day).	Trucking will affect traffic and transportation, and produce exhaust and dust. Trucking may produce nuisance effects for nearby residents/land users (noise and dust).
	1.11	Sample and dewater the cleaning pit. Emplace sediments into voids in condenser room.	On-site activities may produce nuisance effects for nearby residents/land users (noise).

		Project Works and Activities	Potential Interaction
Decommissioning Execution	1.12	Demobilize grout batch mixing plant after cap installation.	Demobilization will require removal of equipment and materials from the site via truck, thereby affecting traffic and transportation. Demobilization activities may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	2	**Grouting of Below Grade Structure**	
	2.1	Room preparation (e.g., sealing of pipes).	Equipment and material transportation may produce nuisance effects for nearby residents/land users (traffic).
	2.3	Grout Fill Nuclear Area.	On-site activities may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3	**Removal of Above Grade Structure**	
	3.1	Conventional heavy equipment knockdown of reactor hall.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic. Demolition may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.2	Sizing of material such as cutting steel beams or crushing masonry for fitting into void areas.	Material sizing may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.3	Set up laydown area and perform clearance surveys on materials for possible recycle.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.4	Steel and rubble emplaced in condenser room.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.5	Grout first level of demolition material in condenser room.	On-site material transportation y and may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.6	Steel and rubble emplaced in condenser room.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.7	Grout second level of demolition material in condenser room.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.8	Steel and rubble in condenser room.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.9	Grout third level of demolition material in condenser room.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.10	Demolish block walls and inside walls around control room and change rooms.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby residents/land users (noise, dust, traffic).

		Project Works and Activities	Potential Interaction
Decommissioning Execution	3.11	Collapse ceilings of furnace room and adjacent rooms.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.12	Emplace block wall rubble in furnace room or condenser room.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.13	Remove recyclables from guard house.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.14	Demolish guard house and emplace in furnace room and adjacent rooms.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.15	Grout furnace room and adjacent areas to ground level.	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	3.16	Demolish above grade portion of pressure relief pit. Fill with grout.	Demolition equipment transportation to the site, and on-site material transportation will affect traffic and transportation. Demolition may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	4	**Install Concrete Cap and Engineered Cover**	
	4.1	Concrete Cap (construct forms, install rebar, and pour, level and slope concrete).	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	4.2	Engineered Cover (ship in materials, layer and shape mound, install geotextile layer, grade property, install remaining earth layers and seed).	Shipping in materials will affect traffic and on-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).

		Project Works and Activities	Potential Interaction
Decommissioning Execution	**5**	**Final Site Restoration**	
	5.1	Site Restoration (install fencing, install monitoring wells if required, remediate areas affected by previous operations or decommissioning activities, washout pit, complete closure surveys, etc.).	On-site material transportation may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
	5.2	Demobilize Site (Remove temporary facilities, decontaminate equipment, remove power upgrades, poles and lines, return transformers).	Removal of temporary facilities, equipment and utilities will improve the landscape and visual setting. On-site material transportation will affect transportation safety and may produce nuisance effects for nearby residents/land users (noise, dust, traffic).
IC*	**6**	**Long-Term Care and Maintenance**	
	6.6	Renaturalization.	Renaturalization may attract bird watchers to the site. Land Use designation may change during the Institutional Controls phase.
	6.7	Facility performance during the Institutional Controls phase.	Groundwater will start to enter and eventually resaturate the grouted structure. Contaminant release from the grouted structure may affect non-human biota (e.g., game and fish species) health and/or populations.
PIC**	**7**	**Post-Institutional Controls phase**	
	7.1	Facility performance and renaturalization during the Post-Institutional Controls phase.	Groundwater in the resaturated and eventually degraded grouted structure will become contaminated. Contaminant release from the grouted structure may affect non-human biota (e.g., game and fish species) health and/or populations.
		Renaturalization	Land Use may change during and/or after the Institutional Controls phase. Renaturalization of site may lead to an increase of wildlife and may benefit land users and tourism (e.g. hunters, trappers, bird watchers, etc.).

Notes:

* - IC: Institutional Controls phase
** - PIC: Post-Institutional Controls phase

9.11.3.2 Proposed Mitigation Measures

The mitigation measures presented below are preliminary and have been developed based on the current understanding of the project. As the project approaches detailed work planning, details will be refined, and additional mitigation measures may be developed as required.

In addition to the in-design mitigation measures identified in Section 4.1 above, the following mitigation measures have been identified to ensure the protection of the socio-economic environment:

- dust suppression measures as described in Section 9.2.3.2;
- post speed limits on-site as described in Section 9.6.3.2;
- if previously undocumented archaeological resources are discovered, then CNL will suspend decommissioning activities immediately and will engage a licensed consultant to carry out archaeological fieldwork, in compliance with Section 48 (1) of the *Ontario Heritage Act,* and outlined in CNL's procedure Management of Cultural Resources (CNL 2022a). CNL remains open to engagement with Indigenous Nations, communities and organizations in the event of a discovery of an archaeological resource. If any human remains are identified during construction, CNL will immediately notify the police or coroner and the Registrar of Cemeteries, Ministry of Public and Business Service Delivery, and Indigenous Nations, communities and organizations;
- the greatest effect of traffic and transportation associated with the project will occur during the Decommissioning Execution phase. Within the Local and Regional Study Areas, the transportation/haul route is limited to Highway 17 and the NPD site access road from the highway;
- review of a company's safety records which includes any traffic accidents or driver's records, as per CNL's contracting and hiring practices;
- construction activities will generally occur between 7 am and 7 pm wherever possible, with the overall objective of minimizing nuisance effects (i.e., noise and traffic) on residents in the Local and Regional Study Areas. It is noted that special or emergency circumstances may require deviation from this restriction;
- when a significant amount of off-site transportation is required (e.g., during raw material delivery), the timing of equipment and material shipping to the site should be staggered to minimize the contribution of the project to peak traffic volumes;
- during the Decommissioning Execution and Institutional Controls phases, restrict access to the licensed area via a fence with a locked gate to deter trespassing; and,
- periodic communication updates on project construction activities to local residents are recommended, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc.

No mitigation measures have been identified for land use in the study area, as formal changes in land use designation are not expected to occur during the Decommissioning Execution. Land use redesignation will only be applied as appropriate during the Institutional Controls phase. During the Institutional Controls phase, land in the Local Study Area surrounding the licensed area may be released for other uses.

No mitigation measures have been identified with respect to depletion of grout materials, as the effect is expected to be minor, and accompanied by positive economic benefits.

9.11.3.3 Effects After Mitigation

In this section, potential indirect socio-economic effects are discussed for each phase of the project. The Socio-economic TSD assesses potential effects of the project relating to land use, forestry, trapping, hunting, fishing, tourism and recreation, grout materials, minerals and residences.

Decommissioning Execution Phase

Site Study Area

No effects after mitigation are expected in the Site Study Area during the Decommissioning Execution phase. As discussed in the Socio-economic TSD, the project may affect transportation operations and safety through the transportation of materials and equipment on-site. This will largely be mitigated by posting and adhering to speed limits on-site. The remaining effect is minor and inherent in vehicle operation.

There are no residents within the Site Study Area, and no nuisance effects are expected on land users (i.e. anglers, hunters, trappers, tourists) in the Site Study Area.

A Stage 1 archaeological assessment was conducted for the NPD property, and it was determined that there are no expected impacts to the NPD property. Details are provided in the Archaeological TSD.

Local Study Area

As discussed on the Socio-economic TSD, the traffic and transportation effects associated with the project are expected to be greatest during the Decommissioning Execution phase. Within the Local Study Area, the transportation/haul route will be limited to Highway 17 and the NPD site access road from the highway.

There are approximately ten residents within the Local Study Area, and there may be nuisance effects (i.e. noise, traffic) associated with the Decommissioning Execution phase. Similarly, tourists in the Local Study Area may also experience nuisance effects. No nuisance effects are expected on land users (i.e. anglers, hunters, trappers) in the Local Study Area.

The project is expected to result in increased traffic volumes, which may be reflected in a potential increase in incidents and delays, even after mitigation measures. The increase traffic volume is expected to be temporary and minor, thus the effects on transportation safety and Highway 17 traffic is not significant. The MTO has reviewed the project, and concluded that it has no traffic or transportation-related concerns with respect to the project (MTO 2016).

There may be a minor depletion of grout materials in the Local Study Area should these be sourced locally. Grout materials will be sourced on the open market, and no residual effects are expected.

Within the Local Study Area, the landscape and visual setting may be affected by the general activities and footprint of the project. The visual character of the shoreline, as viewed from the Ottawa River, may decrease. In order to mitigate this potential effect, CNL will ensure that the existing natural buffer (made

up of the treed slope) remains in place during the Decommissioning Execution phase. The site is not visible from Highway 17; therefore, the visual setting from Highway 17 is not likely to be affected.

No effects are expected on walleye and white-tailed deer populations. Therefore, no effects are expected on the ability to hunt and fish in the Local Study Area.

As discussed earlier, the Stage 1 archaeological assessment (documented in the Archaeology TSD) states that no effects on archaeology are expected on the NPD property.

Regional Study Area

As discussed in the Socio-economic TSD, the traffic and transportation effects associated with the project are expected to be greatest during the Decommissioning Execution phase. Within the Regional Study Area, the transportation/haul route will be limited to Highway 17 and the NPD site access road from the highway. As discussed above in Section 9.11.3.2, CNL will minimize potential traffic nuisance effects on residents and nearby land users in the Regional Study Area by instituting restrictions on construction hours and days of the week. No measurable noise or dust nuisance effects are expected for residents and land users in the Regional Study Area.

The project is expected to result in increased traffic volumes and an increased likelihood of incidents and delays, even after mitigation measures. The MTO has reviewed the project, and concluded that it has no traffic or transportation-related concerns with respect to the project (MTO 2016).

In the Regional Study Area, there may be material depletion associated with the grouting and concreting activities during the Decommissioning Execution phase if grout materials are sourced locally. However, these effects are expected to be minor and also to provide positive economic benefit. Grout materials will be sourced on the open market.

There will be nuisance effects (noise, dust, traffic) in the Regional Study Area for residences and nearby land users (e.g. tourists, hunters, trappers, anglers) that should largely be mitigated by a variety of general and specific construction mitigation measures identified in Section 9.11.3.2 above.

Institutional Controls Phase and Post-Institutional Controls Phase

Site and Local Study Areas

Renaturalization may increase vegetation and habitat for wildlife, providing a potential benefit to hunters and trappers in the Site and Local Study Areas. Renaturalization on the site, and protection of chimney swift habitat may attract bird watchers to the site. This may be a potential minor economic benefit to nearby businesses.

Forest resources may become available for forestry activities in the Site and Local Study Areas during the Institutional Controls and Post-Institutional Controls phases. Renaturalization may also increase forest resources.

During the Institutional Controls and Post-Institutional Controls phases, it is assumed that the licensed area will be abandoned, making the land available for other uses. It is unknown how the licensed area might be redesignated. Changes in land use planning designation are not expected to result in residual effects.

As determined in the EcoRA TSD, no adverse residual effects have been predicted for the white-tailed deer or walleye.

Therefore, no potential effects are expected on the socio-economic environment in the Site and Local Study Areas in the Institutional Control and Post-Institutional Controls phases.

Regional Study Area

No potential socio-economic effects have been identified in the Regional Study Area for the Institutional Controls and Post-Institutional Controls phases.

9.11.3.4 Prediction Confidence and Uncertainty

There are private lands immediately adjacent to the NPD property, and it is possible but unknown whether private landowners hunt or trap on their property. It is conservatively assumed that adjacent lands and waters will be used by hunters, trappers and anglers.

There is uncertainty about locations where grout materials will be obtained. This may change the potential effects on local grout resource levels as well as traffic and transportation along Highway 17.

It is unknown whether or how land use may be redesignated during the Institutional Controls phase. During the Post-Institutional Controls period, it is unknown how the licensed area might be redesignated. This uncertainty in the Post-Institutional Controls phase is accounted for through the use of conservative assumptions, sensitive receptors and various scenarios.

The location of various elements of the Decommissioning Execution phase is undetermined, which could affect the project footprint, and the extent of the effect of the project on landscape and visual setting.

9.11.3.5 Residual Effects

Table 9.11-3 summarizes the effects assessment above and presents the residual effects that were identified for the socio-economic environment. The residual effects in Table 9.11-3 are grouped by effect rather than by individual interaction as listed in Table 9.11-2.

.

Table 9.11-3 Summary of Residual Effects in the Socio-economic Environment

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Decommissioning Execution						
Socio-economic Environment	General activities and project footprint.	Landscape and visual setting	A decrease in the visual character of the shoreline from the Ottawa River.	Maintaining current natural buffer for the duration of the Decommissioning Execution phase.	The project may be temporarily slightly more visible than the current facility.	No adverse residual effects.
Socio-economic Environment	Employee, material and equipment transportation to and from site.	Traffic and transportation	Increased traffic volume could affect the safety of road users.	Timing of shipments will be staggered when possible.	Traffic delays and the probability of traffic incidents may increase temporarily during the Decommissioning Execution phase as a result of increased volume.	No adverse residual effects.
Socio-economic Environment	On-site transportation, demolition, material sizing.	Residents – use/enjoyment of property	Nuisance effects (dust, noise and traffic).	Dust suppression, restricting hours of activity, communication with public.	Minor, temporary and localized nuisance effect on residents and nearby land users use and enjoyment of land.	No adverse residual effects.
Socio-economic Environment	All interactions with the terrestrial environment (see Section 9.6.3.1.	White-tailed deer	Wildlife displacement, contamination, or mortality affecting hunting activities.	See mitigation measures identified in Section 9.6.3.2.	No effects on hunting are expected, as there are no predicted habitat or exposure effects on white-tailed deer.	No adverse residual effects.

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Socio-economic Environment	All interactions with the surface water environment (see Section 9.3.3.1.	Walleye	Fish displacement, contamination, or mortality affecting angling activities.	See mitigation measures identified in Section 9.3.3.2.	No effects on fishing are expected, as there are no predicted habitat or exposure effects on walleye.	No adverse residual effect.
Socio-economic Environment	Grout material use	N/A	Minor depletion of existing reserves of grout material.	No proposed mitigation.	A potential minor depletion of existing reserves of grout material, however there is a positive economic benefit.	No adverse residual effects.
Institutional Controls						
Socio-economic Environment	Land Use Redesignation	Land Use and Planning Regime	During the Institutional Controls phase, the project may allow for redesignation of the NPD property.	No proposed mitigation.	Land outside of the licensed area may become available for other uses.	No adverse residual effects.
Socio-economic Environment	Renaturalization	N/A	During the Institutional Controls phase, wildlife, bird watchers and tourists may be attracted to the site.	No proposed mitigation.	Potential benefit for tourism and recreation. Access to the licensed area will be restricted, which will limit exposure of bird watchers. Bird watchers will be present infrequently and irregularly for short periods of time, thus no measurable effects are expected.	No adverse residual effects.

Environmental Component	Source of Effect	Potentially Affected VCs	Potential Effect	Proposed Mitigation	Potential Effect After Mitigation	Residual Effect
Post-Institutional Controls						
Socio-economic: Land Use	Land Use Redesignation.	Land Use and Planning Regime.	During the Post-Institutional Controls phase, the project may allow for redesignation of the NPD property.	No proposed mitigation.	Land will be available for other uses.	No adverse residual effects.
Socio-economic Environment	Renaturalization	N/A	During the Post-Institutional Controls phase, wildlife, bird watchers and tourists may be attracted to the site.	No proposed mitigation.	Potential benefit for tourism and recreation, hunting and trapping.	No adverse residual effects.
Socio-economic Environment	Contaminant releases affecting the aquatic environment.	Walleye	Groundwater will flow into the eventually degraded structure. Contaminated groundwater will flow out and eventually into the Ottawa River.	In-design mitigations to isolate and contain the inventory in order to reduce the potential effects on the socio-economic environment.	No effect expected on walleye.	No adverse residual effects.
Socio-economic Environment	Contaminant releases affecting the terrestrial environment.	White-tailed deer	Eventual releases to the atmospheric environment through the cap system. Groundwater will flow into the eventually degraded structure. Contaminated groundwater will flow out and eventually into the Ottawa River, which could transfer to biota through drinking water.	In-design mitigations to isolate and contain the inventory in order to reduce the potential effects on the socio-economic environment.	No effect expected on white-tailed deer.	No adverse residual effects.

Note:

N/A - not applicable

9.11.4 Assessment of Residual Effects

Based on the assessment described above, no adverse residual effects on the socio-economic environment have been predicted.

9.11.5 Monitoring and Follow-up

No specific environmental monitoring has been identified for the socio-economic environment. Monitoring in other environmental components will confirm the EIS predictions (i.e., that no effects are expected in the socio-economic environment). Ongoing public and stakeholder engagement activities will take place throughout the Decommissioning Execution and Institutional Controls phases to identify any changing concerns or perceptions related to the NPD Closure Project.

CNL will proactively seek, engage and support meaningful discussion on issues and opportunities related to the NPD Closure Project as part of the Public Information Program, which can be found on the CNL website (www.CNL.ca). CNL, as part of the Public Information Program, will notify residents of the commencement of Decommissioning Execution activities via door-to-door delivery of letters, where stakeholders will have the opportunity to voice their questions or concerns. As part of the notification, the letter will include all CNL contact details (e.g., website, telephone, email etc.) to provide clear direction on how to contact CNL if they have questions, concerns or complaints related to the NPD Closure Project. A web link to a Feedback Form that is currently on the NPD Closure Project webpage on www.CNL.ca will also be included in the notification and will outline the above process of when an issue or concern is submitted. CNL will continually evaluate both the process and the outcome of the ongoing engagement and communication activities to address and manage issues as they arise.

Other more general considerations of the EA Follow-up Program (e.g., sampling and analysis procedures, information management and reporting) are presented in Section 12.

9.11.6 Conclusion

As shown in Table 9.11-3, no adverse residual effects were identified in the Socio-Economic Environment.

Monitoring activities in other environmental components (i.e., atmospheric, surface water, geological and hydrogeological and terrestrial environments, ambient radioactivity and human health) will verify the accuracy of the EA predictions and effectiveness of measures implemented to mitigate potential adverse environmental effects related to the socio-economic environment. If monitoring identifies concerns in the other environmental components, CNL will assess the implications to the socio-economic environment (e.g., through ongoing public and stakeholder engagement activities).

9.12 Accidents and Malfunctions

In accordance with the EIS Guidelines (CNSC 2016a) and associated regulatory documents (such as REGDOC-2.9.1, CNSC 2020a), the EIS includes an assessment of the potential environmental effects of accidents or malfunctions that may occur in connection with the designated project.

The assessment of potential accidents and malfunctions considered both radiological and chemical events:

- radiological accidents and malfunctions: events that involve radioactive substances and components and therefore could result in the acute release of radioactivity as well as non-radiological substances; and
- conventional accidents and malfunctions: events that involve only non-radiological substances, and therefore have no potential for release of radioactivity.

Accidents and malfunctions that may occur during the project were identified, characterized and evaluated in the DecomSA TSD for both the Decommissioning Execution and Institutional Controls phases. This is because the Decommissioning Execution phase is when work will actively be taking place, and when the facility will be most susceptible to initiating events. Following the Decommissioning Execution phase, monitoring and long-term care and maintenance will take place during the Institutional Controls phase. In addition, the PostSA TSD considered disruptive event scenarios and “what if” cases which examine the potential effects of unlikely disruptive events that lead to possible penetration of barriers and abnormal degradation and loss of containment. These disruptive scenarios are designed to test the robustness of the project plan. These disruptive scenarios are not considered accidents and malfunctions, and as such have been assessed throughout Section 9, above. In the Post-Institutional Controls phase, there will be no workers or activities on site, and as such there is no possibility for accidents or malfunctions to occur.

9.12.1 Regulatory Guidelines and CNL Procedures

The EIS Guidelines (CNSC 2016a) dictate that the information in Appendix A.3.4 of REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures* (CNSC 2020a) be used to assess the potential health and environmental effects from postulated accident and malfunction scenarios.

As per REGDOC-2.9.1 (CNSC 2020a), the applicant must provide an assessment of the potential health and environmental effects that occur from radiological and conventional accidents and malfunctions. The EIS should also include any mitigation measures such as monitoring, contingency, clean-up or restoration work in the surrounding environment that would be required during or immediately following the postulated malfunction and accident scenarios.

The assessments of accidents and malfunctions must provide a description of postulated accidents and malfunctions sequences, considering:

- initiating events: internal, external and human-induced;
- the frequency of these events; and
- either a bounding approach or facility-specific information.

Furthermore, the EIS should include details of the source, quantity, mechanism, pathway, rate, form and characteristics of any potential releases resulting during the hypothetical malfunction or accident.

The assessments of accidents and malfunctions focused on those events that are considered credible in the context of the project, i.e., those that have a reasonable probability of occurrence based on professional judgement in a context of project-specific conditions. The threshold identified by the CNSC for credibility of a nuclear accident scenario is that it has a one in one million (i.e., 1×10^{-6}) or greater chance of occurring in any year (CNSC 2020b).

If an accident or malfunction situation occurs, CNL has procedures in place which address requirements for immediate response and post-event clean-up or restoration. Of note, CNL's Emergency Preparedness Program (described in Section 10.2 below) has been designed for immediate response to emergency situations. The program ensures emergency readiness and emergency management to support programs such as reactor safety/accident management, decommissioning, radiation and environmental protection, fire and occupational health and safety. In terms of post-event clean-up or restoration CNL's Environmental Protection Program (see Section 10.2) includes procedures that address the identification, management and remediation of lands that are contaminated.

9.12.2 Postulated Accidents and Malfunctions

A bounding scenario approach has been selected for the assessment of accidents and malfunctions in the Decommissioning Execution and Institutional Controls phases.

Section 7 of the DecomSA TSD details the approach used to identify bounding scenarios. The identification of potential accident and malfunction scenarios began with a systematic review of activities during the Decommissioning Execution and Institutional Controls phases to identify hazards. Hazards were identified and characterized by assigning conservative (i.e., erring on the side of greater consequence and greater frequency) preliminary frequency, severity and risk ratings. Frequency ratings were estimated based on initiating event probabilities, and any other relevant probabilities. Initiating events considered in the hazard identification process included:

- Operational initiating events (such as power and equipment failure);
- Human Error initiating events (such as improper handling and spills); and,
- Natural, external, or environmental initiating events (such as earthquakes and forest fires).

Detailed information on these preliminary initiating event estimates is presented in Section 7 of the DecomSA TSD.

Credible scenarios (i.e., those with $>10^{-6}$ probability and non-negligible potential consequences) were grouped based on similar consequence types. Within these groups, the scenario with the greatest potential consequence was identified. These scenarios are called bounding scenarios, and are the focus of the accidents and malfunctions assessment in the DecomSA TSD. Each hazard identified is encompassed within the selected bounding scenarios (i.e., if a hazard is not selected as a bounding scenario, it is bounded by another scenario that is expected to have greater consequence). For each bounding scenario, the

potential source term release was estimated. The resulting concentrations at receptor locations - and the resulting exposure to these concentrations - were calculated and compared to appropriate criteria.

A total of 10 bounding scenarios were selected based on the expected risk identified through the hazard identification process (Table 9.12-1). All selected bounding scenarios occur in the Decommissioning Execution phase. Of the bounding scenarios identified below, scenarios 1, 2, 6, 7, 8, 9 and 10 are considered in the assessment of accidents and malfunctions in this section of the EIS because they could be caused by human activities. Bounding scenarios 1, 2, 3, 4, and 5 are discussed as part of effects of the environment on the project (in Section 9.14 of this EIS) because they are caused by natural events. Scenarios 1 and 2 involve forest fires, which could be caused by natural events or human activities, and so they are included in both sections.

Conventional accident and malfunction events identified are addressed collectively, and will be discussed further in Section 9.11.5.

Table 9.12-1 Resulting Bounding Scenarios

Number	Bounding Scenario	Consequence
1	Forest fire	Release of **radioactivity** due to fire spreading to the building and subsequently mobilizing and releasing radionuclides.
2	Forest fire	Release of **chemicals** (e.g. mercury, combustion by-products) due to fire spreading to the building and subsequently mobilizing and releasing chemicals.
3	Tornado	Release of **radioactivity** due to damage to the building and subsequently mobilizing and releasing radionuclides
4	Tornado	Release of **chemicals** due to damage to the building and subsequently mobilizing and releasing chemicals.
5	Flood	Release of **radioactivity** due to water ingress and subsequently mobilization of radionuclides.
6	Accidental exposure to **radioactivity.**	Radiological dose during demolition of walls, cutting holes, cutting vessels and pipes. *Note: though radiological doses are anticipated as part of normal operations, this accident scenario represents exposure* beyond *the levels anticipated as part of normal planned demolition activities. See Section 8 of the DecomSA TSD for assessment of normal operations.*
7	Accidental exposure to **chemicals.**	Exposure to chemicals during demolition of walls, cutting holes, cutting vessels and pipes. *Note: limited to exposure* beyond *the levels anticipated as part of normal planned demolition activities. See Section 8 of the DecomSA TSD for assessment of normal operations.*
8	Underground fire (including equipment fire).	Airborne release of **radionuclides** and subsequent exposure.
9	Underground fire (including equipment fire)	Airborne release of fire by-products (smoke and chemicals), as well as chemicals involved in the fire and subsequent exposure.
10	Collapse of ventilation stack.	Release of **radioactivity** and exposure.

In addition to the bounding scenarios listed above, the DecomSA TSD also considers hydrogen production and concentration during grouting. The primary measure that will be used to maintain the hydrogen levels at a safe concentration will be to control the environment in the vault with active ventilation that can sufficiently sweep out the produced hydrogen. Given the maximum hydrogen generation rate of 3.18×10^{-4} m^3/s, an air flow rate of 3.18×10^{-1} m^3/s (674 cubic feet per minute) would ensure the hydrogen concentration does not rise above 1%. Ventilation can be sized accordingly. A standard 2000 cubic feet per minute ventilator should be adequate. Additional measures to reduce hydrogen generation include pouring grout in batches to allow a set up time between pours or lowering grout temperature (< 20°C) which also reduces the hydrogen production rate. With the implementation of these hydrogen safety measures, adverse effects on workers are not anticipated.

9.12.3 Dose and Exposure Limits

9.12.3.1 Radiological Dose Criteria

Dose/acceptance criteria for assessing accidents and malfunctions were obtained from CNL's existing Safety Analysis Report (Athauda-Arachchige 2015); these are outlined in Table 9.12-2 below. These dose criteria depend on the frequency with which a receptor is exposed. Four event frequency ranges (with an associated dose band) are used to define the accidents and malfunctions. The upper bound of the dose band is considered as the safety goal, while the lower bound is considered as the safety target. Predicted doses below the safety target are acceptable, while doses above the safety target must be justified. Doses in excess of the safety goal are unacceptable.

Table 9.12-2 Dose Acceptance Criteria – Accidents and Malfunctions (based on Athauda-Arachchige 2015)

Frequency Range (Events/year)	Description of Event Occurrence	Dose Range per Event (mSv)	
		On-Site Personnel (Workers)	Off-Site Personnel (Public)
$>3\times10^{-1}$	**Frequent**; Events that are expected to occur several times during the lifetime of the facility. *(e.g. frequency of approx. 1 every 3 years)*	<1	<0.1
3×10^{-1} to 3×10^{-2}	**Occasional**; Events may occur a few times during the lifetime of the facility. *(e.g. frequency of approx. 1 every 3 years to 1 every 30 years)*	1 to 5	0.1 to 0.5
$<3\times10^{-2}$ to 10^{-4}	**Rare**; Events have slight chance of occurring during the lifetime of the facility. *(e.g. frequency of approx. 1 every 30 years to 1 every 10,000 years)*	>5 to 50	>0.5 to 5.0
$<10^{-4}$ to 10^{-6}	**Extremely Rare**; Events are not expected to occur during the lifetime of the facility. *(e.g. frequency of approx. 1 every 10,000 years to 1 every 1,000,000 years)*	>50 to 100	>5 to 100

Note:

Frequency ranges for rare and extremely rare events have been adjusted to avoid overlapping of these frequency ranges.

Furthermore, in addition to the dose criteria explained above, the NEW annual dose criteria (50 mSv/y) has been used to ensure that doses are sufficiently low.

9.12.3.2 Non-Radiological Benchmarks

The following non-radiological contaminants were identified in the COPC screening in Section 5.2.3 of this EIS for assessment of potential health effects to human receptors, based on the chemical inventory of the facility and on the nature of bounding scenario events (e.g. combustion products from fires):

- Lead;
- Mercury;
- Asbestos; and,
- PCBs (assumed >54%Cl).

The DecomSA also assessed dioxins and furans (by-products of PCBs combustion) for fire-related accident scenarios only.

Worker Receptors

For worker receptors, the chosen benchmarks are the Immediately Dangerous to Life or Health (IDLH) values. Where IDLH values were unavailable, the public Protective Action Criteria (PAC) -1 values were used (PAC values in the subsequent section). The chosen benchmarks are presented in Table 9.12-3.

Table 9.12-3 Non-Radiological Criteria – Worker Receptors – Accidents and Malfunctions

Chemical	Benchmark Value	Reference
Mercury Vapor	10 mg/m^3	IDLH (NIOSH 2016a)
PCB	13 mg/m^3	IDLH value not available. Public PAC-1 value used to fill gap.
Dioxins & Furans ***(as 2,3,7,8-Tetrachlorodibenzo-p-dioxin)***	0.00013 mg/m^3	IDLH value not available. Public PAC-1 value used to fill gap.
Asbestos	0.05 mg/m^3	IDLH value not available. Public PAC-1 value used to fill gap.
Lead	100 mg/m^3	IDLH (NIOSH 2016b)

Public Receptors

The benchmarks selected for assessing public exposure to non-radiological species under one-hour accidents and malfunctions scenarios (exposure time) are the U.S. DOE PACs (U.S. DOE 2016). PACs are developed and maintained by the U.S. Department of Energy (DOE) / National Nuclear Security Administration (NNSA). PACs are a comprehensive set of short-term public exposure guidelines based on hierarchical selection of criteria from among U.S. Environmental Protection Agency AEGLs (Acute

Exposure Guideline Levels), American Industrial Hygiene Association one-hour ERPGs (Emergency Response Planning Guidelines), or internal TEELs (Temporary Emergency Exposure Limits) where AEGLs or ERPGs are not available.

PAC values are divided into four different categories based on the associated type of health effects:

- PAC 0 – no adverse health effects;
- PAC 1 – mild, transient health effects;
- PAC 2 – irreversible or other serious health effects that could impair ability to take protective action;
- PAC 3 – life threatening health effects.

PAC-1 values are chosen for this assessment, as they represent the maximum concentration in air below which it is believed nearly all individuals could be exposed without experiencing other than mild transient adverse health effects or perceiving a clearly defined, objectionable odour. Table 9.12-4 presents the benchmark values identified for public receptors.

Table 9.12-4 Non-Radiological Criteria – Public Receptors – Accidents and Malfunctions

Chemical	PAC-1 Criteria (US DOE 2016) [in mg/m^3]
Mercury [a]	0.15
PCBs [b]	13
Dioxins & Furans [c]	0.00013
Asbestos	0.05
Lead	0.15

Notes:

[a] As mercury vapour; Hg_2O is not stable.
[b] DOE 2016 generic value for PCBs/Aroclor.
[c] As 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD).

Dioxins & Furans

Public (and worker) benchmark criteria for dioxins and furans are based on TCDD. Table 9.12-5 presents the toxic equivalence factors (TEQs), for other dioxin and furan congeners. TCDD has the highest toxicity, and thus a toxicity equivalence ratio of 1.0; the toxicity of the other congeners is less (i.e., TEQs less than 1.0). Therefore, it is conservative to use TCDD as the representative dioxin and furan compound.

Table 9.12-5 TEQs for Dioxin & Furan Congeners

Dioxins		Furans	
Congeners	**Toxic Equivalence Factor**	**Congeners**	**Toxic Equivalence Factor**
2,3,7,8-TCDD	1	2,3,7,8-TCDF	0.1
1,2,3,7,8-PeCDD	1	1,2,3,7,8-PeCDF	0.03
-	-	2,3,4,7,8-PeCDF	0.3
1,2,3,4,5,8-HxCDD	0.1	1,2,3,4,7,8-HxCDF	0.1
1,2,3,6,7,8-HxCDD	0.1	1,2,3,6,7,8-HxCDF	0.1
1,2,3,7,8,9-HxCDD	0.1	1,2,3,7,8,9-HxCDF	0.1
-	-	2,3,4,6,7,8-HxCDF	0.1
1,2,3,4,6,7,8-HpCDD	0.01	1,2,3,4,6,7,8-HpCDF	0.01
-	-	1,2,3,4,7,8,9-HpCDF	0.01
OCDD	0.0003	OCDF	0.0003

Note:

A dioxin counterpart does not exist for every furan congener because the dioxin structure is more symmetric than the furan structure.

9.12.4 Radiological Accidents and Malfunctions Effects

This section presents the expected effects of the radiological accidents and malfunctions. As discussed above, radiological accidents and malfunctions are events that involve radioactive substances and components and therefore could result in the acute release of radioactivity as well as non-radiological substances.

For detailed information and analysis of these scenarios, please see Section 9 and Appendix F of the DecomSA TSD. Mitigation measures for the bounding scenarios, including safeguards and CNL's planned responses, are discussed in Appendix B of the DecomSA TSD.

All scenarios were assessed for worker and public receptors, however only bounding scenarios 1 through 5, 8 and 9 (from Table 9.12-1) were determined to have the potential to affect non-human biota (EcoRA TSD).

The results below are presented as maximum SIs. An SI is the ratio (i.e., unitless) of an estimated exposure level (or an estimated environmental concentration) divided by a corresponding toxicity reference value or benchmark value. An SI of <1 means that no effects are expected. An SI of >1 means that effects may occur.

9.12.4.1 Forest Fire

Radiological

The forest fire bounding scenario (Scenario #1) results in doses to non-human biota, public, and workers that are below their respective acceptance criteria. The maximum calculated total dose received was 1.48×10^{-5} mSv for a worker. On an annual basis, this dose is below the regulatory limit of 50 mSv/y for NEW by 5 orders of magnitude.

Non-Radiological

The forest fire bounding scenario (Scenario #2) results in exposure concentrations for non-human biota, public and workers that are below the appropriate exposure limit for each contaminant. The maximum calculated SIs for any receptor are shown below in Table 9.12-6.

Table 9.12-6 Forest Fire - Screening Indices

Non-Rad Chemicals	**Maximum Screening Index** *[unitless; comparison of estimated concentration to benchmark value]*
Asbestos (inhalation)	6.00×10^{-1}
Lead (inhalation)	1.61×10^{-3}
Lead (soil)	1.45×10^{-8}

The above SI values are below 1, indicating that calculated potential non-human biota, public, and worker exposures are below the relevant benchmark values.

9.12.4.2 Accidental Exposure

Radiological

The accidental exposure to radiation bounding scenario (Scenario #6) results in doses to workers that are below their respective acceptance criteria. A worker spends additional time drilling, thereby increasing exposure time. The maximum calculated total dose is 2.19 mSv. On an annual basis, these doses are below the regulatory limit of 50 mSv/y for NEW by an order of magnitude.

Non-Radiological

As discussed in Section 9.3.7 of the DecomSA TSD, there is no exposure route to hazardous chemicals from the assessed activities. Therefore, no exposure to hazardous chemicals is expected in this bounding scenario.

9.12.4.3 Indoor Fire

Radiological

The indoor fire bounding scenario (Scenario #8) results in doses to non-human biota, public and workers that are below their respective acceptance criteria. The maximum calculated total dose is 1.12 x10^{-3} mSv. On an annual basis, this dose is below the regulatory limit of 50 mSv/y for NEW by 4 orders of magnitude.

Non-Radiological

The indoor fire bounding scenario (Scenario #9) results in exposure concentrations for non-human biota, public and workers that are below the appropriate exposure limit for each contaminant. Two scenarios are considered:

i) A fire in the fueling machine room results in the release of lead. The maximum SI is shown in Table 9.12-7.

Table 9.12-7 Indoor Fire in Fueling Machine Room - Screening Index

Non-Rad Chemicals	Maximum Screening Index *[unitless; comparison of estimated concentration to benchmark value]*
Lead (inhalation)	7.95 x 10^{-1}
Lead (soil)	6.53 x 10^{-8}

ii) The inhalation SI for a fire in the boiler room (resulting in mercury release) are shown in Table 9.12-8.

Table 9.12-8 Indoor Fire in Boiler Room – Inhalation Screening Index

Non-Rad Chemicals	Maximum Screening Index *[unitless; comparison of estimated concentration to benchmark value]*
Mercury	2.39 x 10^{-1}

9.12.4.4 Stack Collapse

Radiological

As per Section 4, the project does not plan to demolish the ventilation stack, however the DecomSA TSD does examine the probability of an accidental stack collapse event. Specifically, it focuses on 3 potential causes: Earthquake, Tornado, and accidental Heavy Equipment collision. There are specific probabilities determined for each of these.

The ventilation stack collapse bounding scenario (Scenario #10) results in doses to both public and workers that are below their respective acceptance criteria. The maximum calculated total dose is 5.16×10^{-2} mSv. On an annual basis, this dose is below the regulatory limit of 50 mSv/y for NEW by 3 orders of magnitude.

Section 7.4 of the DecomSA TSD discusses the safeguards taken during the decommissioning work. With respect to structural demolition, it notes that:

- Structural assessments will be performed to ensure that all demolition work is done in accordance with safe work practices and civil/ engineering requirements.
- Appropriate methods will be used during the demolition process to provide support and ensure that unintended structural failure does not occur.
- If inclement weather occurs during the performance of project work, activities would be stopped (if deemed necessary) in order to minimize weather-related risks.
- A plan for demolition of structural components will be developed and followed closely.
- An exclusion zone will be established for decommissioning activities.

The above text applies broadly to all of the above-grade structural elements. These safeguards will reduce the likelihood of an accidental Heavy Equipment collision during structural demolition of the main building.

9.12.4.5 Risk Evaluation Conclusions

Each of the 10 bounding scenarios underwent a consequence assessment to determine the source term (radiological and chemical) involved, estimated dispersion/transport to receptor locations, and corresponding dose estimates at each receptor location. These dose estimates were assigned severity ratings. Each of the 10 bounding scenarios then underwent a likelihood assessment to determine their probability of occurrence and the probability mechanisms involved, i.e. the initiating events and conditional probabilities, as applicable. These probability estimates were assigned frequency ratings. Lastly, the severity ratings and frequency ratings for each bounding scenario were used, in conjunction with a risk matrix, to calculate a risk rating for each bounding scenario. Table 9.12-9 presents the risk matrix overlaid with all 10 bounding scenarios (abbreviated as B.Scn), according to their severity, frequency, and risk ratings.

Table 9.12-9 Risk Matrix Showing all Bounding Scenarios

Frequency Ratings	Severity Ratings				
	S0	**S1**	**S2**	**S3**	**S4**
F0	R0	R0 **B.Scn.#3** **B.Scn.#4**	R0	R0	R1
F1	R0 **B.Scn.#5**	R0 **B.Scn.#1** **B.Scn.#2** **B.Scn.#10**	R0	R1	R2
F2	R0 **B.Scn.#7**	R0 **B.Scn.#8** **B.Scn.#9**	R1 **B.Scn.#6**	R2	R3
–F3	R0	R1	R2	R3	R3

Notes:

R0 - The risk is negligible; no further action is necessary.
R1 - The risk is tolerable, further protective measures are not essential but should be considered.
R2 - The risk for internal events is unacceptable, additional engineered solutions must be put in place to protect against the risk. For external events that cause damage and injury, but not due to failure of the process, the risk is tolerable.
R3 - The risk is unacceptable, the proposed process is inherently unsafe, major modifications to the proposed design are required.
Bounding Scenario #1 – Forest Fire (radiological releases)
Bounding Scenario #2 – Forest Fire (chemical releases)
Bounding Scenario #3 – Tornado (radiological releases)
Bounding Scenario #4 – Tornado (radiological releases)
Bounding Scenario #5 – Flood (radiological releases)
Bounding Scenario #6 – Drilling (exposure accident) (radiological releases)
Bounding Scenario #7 – Drilling (exposure accident) (chemical releases)
Bounding Scenario #8 – Indoor Fire (radiological releases)
Bounding Scenario #9 – Indoor Fire (chemical releases)
Bounding Scenario #10 – Collapse of Ventilation Stack (radiological releases)
See Table 7-4 in the DecomSA TSD for descriptions of Frequency Ratings.
See Table 7-5 in the DecomSA TSD for descriptions of Severity Ratings.

As shown in Table 9.12-9, all bounding scenarios except one were assessed to have negligible risk scores. Although scenario #6 was ranked as tolerable, due to the conservative assumptions used in its calculation (DecomSA TSD), consideration of further protective measures is not warranted. The potential risks to non-human biota are addressed in the EcoRA TSD.

9.12.5 Non-Radiological Accidents and Malfunctions Effects

This section presents the predicted effects of the non-radiological accidents and malfunctions as reported in the DecomSA. As discussed above, conventional accidents and malfunctions are events that involve only non-radiological substances, and therefore have no potential for release of radioactivity.

9.12.5.1 Conventional Accidents, Malfunctions & Safeguards

Conventional Accidents and Malfunctions Statistics for Construction Projects

Since statistics of conventional accidents during reactor decommissioning are scarce, generic fatality statistics from the construction industry are used for comparison.

Major construction projects (which includes decommissioning activities) involve the interaction of personnel with hazards such as moving and stationary heavy equipment/machinery, electricity and temporary power lines, working at heights, working in confined spaces, working with potentially unstable structures, working with pneumatic tools and techniques, etc. In contrast to specific industrial facilities where each activity/position is routine, with little variability, well characterized, and the occupational settings are well defined, construction projects can involve several ad-hoc tasks performed by workers as part of the execution of a larger overall activity. Such projects may also use equipment that are generally rotated from one site to another (e.g., cranes). In these situations, conventional occupational accidents and malfunctions are governed by the limits of human performance as well as the reliability of the equipment (related to its maintenance).

According to the Ontario Ministry of Labour (MOL) 2017-2018 report entitled *Occupational Health & Safety in Ontario* (MOL 2019), data from 2011 to 2017 indicate 26% to 36% of traumatic fatalities and 26% to 37% of occupational disease fatalities occurred in the construction sector while this sector accounted for 8.0% of total employment under provincial jurisdiction. These statistics indicate that higher fatality rates occur in the construction industry compared with other industrial sectors. The MOL (2019) report also noted that for the last 10 years, construction and transportation sectors has been the top two sectors in terms of the fatality rates.

As indicated by the MOL (2019) data, the fatality rate in the construction sector has not changed significantly over this time period. This consistency over time suggests that the rates of these accidents in these sectors are being controlled by human performance in typical industry-practices, and as such, rates have reached as-low-as- human performance limits allow, under the existing health and safety regulatory framework. Given the awareness of the roles of human factors in these accidents, provisions including training, procedures, and safeguards have been put in place by CNL to achieve as-low-as-reasonably-practicable accident rates.

It should also be noted that the work-place accident statistics mentioned above are aggregated data collected from a large number of industrial sectors, some of which may not have robust occupational health and safety programs. In contrast, the work carried out for the NPD Closure Project will be subject to additional oversight, as a result of the safety culture developed in the nuclear industry.

Fundamental Safety

Principles

The Fundamental Safety Principles outlined in the Safety Analysis Report (Athauda-Arachchige 2015) are expected to be followed for decommissioning activities. The DecomSA TSD includes information on these principles, based on Athauda-Arachchige (2015) but with revisions to apply to conventional safety of the planned decommissioning activities. This information from the DecomSA TSD is presented below.

A safety culture governs the actions of all individuals and organizations engaged in activities related to radioactive waste management. The principles relating to safety culture include operating organization responsibility, quality and management system, human factors, and safety analysis and verification. The CNSC has issued REGDOC-2.1.2, Safety Culture (CNSC 2018c), which provides a definition of safety culture and highlights general safety culture requirements that apply to all licensees. CNL abides by this document that describes the expected and suggested criteria for licensees to self-assess, establish corrective action plans and report on safety culture.

- Operating Organization Responsibility

The primary responsibility for assuring safety rests with CNL as the licensee. This responsibility includes, but is not limited to, the provision of trained, qualified staff and the provision of competent engineering and technical support staff.

The organization, responsibilities and processes are in place to: satisfy the CNL's policies on Health and Safety, and Environment; to ensure conformance with the Radiation Protection (RP) Program; to manage radiological hazards; and, to establish a safe working environment that ensures the protection of environment and personnel. See Section 10.2 for a description of relevant CNL management programs.

- Quality Assurance

A Management System meeting the requirements of the Canadian Standards Association Standard N286 is applied to the decommissioning phases of the project. All CNL employees must comply with the requirements of CNL's Quality Policy and those of the Management Manual (see Athauda-Arachchige 2015 for specific references).

- Feedback of Experience

CNL maintains an Operational Experience Database containing information obtained internally at CNL. In addition to this, CNL also has access to external operating experience. CNL has examined both of these sources of data to identify the lessons learned from previous operating experience that may be relevant for planning decommissioning activities.

- In-design Mitigation

Features are included in the project design for the purpose of pre-empting possible environmental effects (e.g., isolation and containment of inventory) (See Section 4.1.1 of this EIS).

Relevance to Project Decommissioning Activities

The activities identified for the NPD Closure Project share similarities to those of conventional construction and demolition projects. The hazard identification process presented in Section 7 and Appendix B of the

DecomSA TSD identified 29 conventional accident and malfunction scenarios, 13 of these 29 have the *potential* for severe consequences (e.g., fatalities). Five (5) of these 13 represent the potentially severe consequences of natural phenomena (i.e., from forest fires, tornados, flooding, and earthquakes), which are considered in Section 9.14 (Effects of the Environment on the Project) this EIS. The other 16 of the 29 scenarios represent the consequences of: conventional construction accidents and malfunctions (e.g., trips or fall or equipment-related injuries); electric shock; crane failure and load drop (and resulting crushing injuries); and structural collapse (and resulting crushing injuries) outlined in Appendix B of the DecomSA TSD.

In contrast to typical construction projects (and typical safeguards), the project's planned decommissioning activities will be performed with an *additional* degree of training, procedures, and safeguards in place since this project involves decommissioning of an historic nuclear reactor and radiation protection principles are involved. Staff and contractors will receive orientation to ensure they are aware of decommissioning activities, hazards, and emergency procedures. Additionally, hazards to personnel will be identified through work control documents, and eliminated or controlled using engineered controls, administrative controls, and PPE. This includes provisions for common construction hazards such as working at heights, working with electricity, confined spaces, etc.

To further emphasize the role of safety, a non-exhaustive list outlining many examples of safeguards that will be applied to the project is presented in Section 7.4 of the DecomSA TSD covering conventional accidents and malfunctions safeguards, routing/transportation safeguards, fueling safeguards, weather and natural event safeguards, security safeguards, grouting safeguards, and many other topics.

Therefore, given the fundamental safety principles that govern project planning and execution, and the many safeguards involved, conventional accidents are considered to be managed to as low as reasonably possible.

9.13 Cumulative Effects

9.13.1 Background

Section 19(1) of *CEAA* (2012) requires the assessment of cumulative environmental effects, defined in *CEAA* (2012) as effects that are "*likely to result from the designated project in combination with other physical activities that have been or will be carried out.*" Similarly, REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures* (CNSC 2020a) prescribes that:

- the applicant shall assess any residual adverse environmental effects of the project in combination with other past, present or reasonably foreseeable projects and/or activities within the study area, as per *CEAA* (2012), Paragraph 19(1)(a); and
- the approach and methods should be consistent with the CEAA's Interim Technical Guidance on Assessing Cumulative Environmental Effects under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2018).

According to the CEAA (2018) Interim Technical Guidance:

"The approach and level of effort applied to assessing cumulative environmental effects in a project EA is established on a case-by-case basis taking into consideration:

- *the characteristics of the project;*
- *the risks associated with the potential cumulative environmental effects;*
- *the state (health, status or condition) of VCs that may be impacted by the cumulative environmental effects;*
- *the potential for mitigation and the extent to which mitigation measures may address potential environmental effects; and,*
- *the level of concern expressed by Aboriginal groups or the public.*

All cumulative environmental effects assessments should include the five steps described below – scoping, analysis, mitigation, significance, and follow-up. EA documentation must clearly explain and justify the methodologies that have been used to assess cumulative environmental effects.

1. ***Scoping** – identifying VCs for which residual environmental effects are predicted, determining spatial and temporal boundaries to capture potential cumulative environmental effects on these VCs, and examining the relationship of the residual environmental effects of the designated project with those of other physical activities.*
2. ***Analysis** – consideration of how the physical activities may affect the VCs identified in Step 1.*
3. ***Mitigation** – Mitigation measures must be identified for any significant adverse cumulative environmental effects.*
4. ***Significance** – considering the significance of likely cumulative environmental effects, taking mitigation measures into account.*
5. ***Follow-up** – developing follow-up programs that address the cumulative environmental effects."*

9.13.2 Assessment of Cumulative Effects

The NPD Closure Project has no measurable residual effects and therefore, a cumulative effects assessment is not required.

Although no cumulative effects are identified as a result of the NPD Closure Project, CNL understands that cumulative effects from its current and future projects and operations are a topic of significant interest for Indigenous Nations, communities, and organizations. Through established relationships and engagement with Indigenous Nations, communities, and organizations, CNL is sharing information on upcoming projects and/or activities. Engagement with Indigenous Nations, communities, and organizations is directly guided by their feedback on what topics or activities are of interest to that individual Nation, community and organization.

Reasonably foreseeable projects (Table 9.13-1) within the Regional Study Area are provided for context. Using the definition of 'reasonably foreseeable' from the Policy Framework for Assessing Cumulative Effects under the *Impact Assessment Act* (IAAC 2024), the CNL projects identified in Table 9.13-1 are those

where CNL has publicly disclosed its intention to seek the necessary impact assessment or other authorizations required to proceed. Table 9.13-1 also includes publicly available information regarding projects by third parties within the Regional Study Area.

The Regional Study Area includes the stretch of the Ottawa River from near the Des Joachims Generating Station, to 30 km downstream of the NPD site (which includes CRL) and extends across the river to include the Quebec shoreline (see Figure 8.3-1).

The temporal boundaries of the NPD Closure Project begin in 2026 (depending on the regulatory decision-making process) and encompass three phases: Decommissioning Execution, Institutional Controls, and Post-Institutional Controls phases, which are defined in Section 5.2.1.2.

Table 9.13-1 Reasonably Foreseeable Developments in the Regional Study Area

Type of Project	Location	Activity Description	Timeframe
Activities related to CNL's Long-Term Strategy (10-year Integrated Plan (CNL 2017))			
Near-Surface Disposal Facility (NSDF)	CRL	Construction and operation of a NSDF for the disposal of solid LLW at CRL. This project involves clearing of approximately 37 hectares.	2025 and onward
Micro Modular Reactor	CRL	Global First Power (GFP) is proposing to construct and operate a Small Modular Reactor (SMR) sited on the CRL property. Bounding estimated dates indicate site preparation and construction is planned to occur over approximately 2 years between 2025 and 2031. The construction of the SMR may overlap with the NPD Closure Project. The proposed project footprint is located on a previously disturbed area of the CRL site (i.e. paved parking lot), therefore only a limited amount of clearing and grubbing of vegetation would be part of the site preparation activities.	2025 to 2031 (approximately 2 years within this timeframe)
New/upgraded research and development facilities	CRL	Construction of an Advanced Nuclear Material Research Centre. This facility will be a modern laboratory research complex that will serve as the backbone of CNL's research and development infrastructure and a major facility in the delivery of its nuclear science and technology programs. It will be sited in the developed area of the CRL site. Minimal tree clearing is required for site preparation. As part of CNL's Tritiated Heavy Water Management Program, CNL is proposing the construction of a new facility in the developed area of the CRL site to carry out activities consistent with operations that are permitted under the current CRL licence. The proposed Modernized Combined Electrolysis & Catalytic Exchange Facility is intended to disposition AECL's inventory of heavy water acquired over the past 20-30 years, by reducing its tritium content into two reusable products.	2022 and onward
New support infrastructure	CRL	New support infrastructure includes office buildings, maintenance facility and a logistics facility. New support infrastructure and research and development facilities will generally be located within existing disturbed areas on the CRL site (i.e., no disturbance to largely undeveloped areas)	2018-2026
Infrastructure decommissioning	CRL	Over 100 buildings on CRL site have been decommissioned including nuclear laboratories and conventional buildings to make	2016-2028

Type of Project	Location	Activity Description	Timeframe
		room for new, renovated and repurposed facilities. The end-state plan for the CRL site will be to return lands disturbed by site activities to a condition that is physically stable and safe in keeping with the land use and landscape of the day. Once existing infrastructure is removed and the CRL site is reclaimed and ceases to be frequented by large numbers of employees, the level of anthropogenic disturbance within the site will be greatly reduced.	
Environmental remediation	CRL	Remediation of affected lands and non-operating waste management areas (WMAs). The end-state plan for the CRL site will be to return lands disturbed by site activities to a condition that is physically stable and safe in keeping with the land use and landscape of the day. Once existing infrastructure is removed and the CRL site is reclaimed and ceases to be frequented by large numbers of employees, the level of anthropogenic disturbance within the site will be greatly reduced.	ongoing
Other Projects			
OPG Dam repair	Vicinity of Des Joachims Dam, Rapides-des-Joachims, QC	Two dams upstream of the NPD site (Des Joachims dam and McConnell dam) are scheduled to undergo improvements from 2017 to 2026. These OPG projects involve in-water works, and additional spilling of water from the dam may be required to lower reservoir levels (Bradley 2017).	2017-2026

The Ottawa River is a highly valued resource for both the public and Indigenous Nations, communities and organizations, therefore, additional context summarizing potential project interactions with the Ottawa River is repeated here.

The spatial distribution of potential effects of the activities related to the NPD Closure Project on the surface water environment (e.g., wetlands, tributaries, and the Ottawa River) encompasses the aquatic environment for biota such as fish, and their habitats. The sustainability and health of the aquatic environment which hosts integral fish and aquatic habitat is highly dependent on and connected with the hydrology of the surrounding aquatic environment. The selection of the Local Study Area and Regional Study Area with regard to the connectivity of surface water bodies is based on the fundamentals of watershed eco-hydrology. Therefore, in order to ensure the health of biota such as fish, their habitats and migratory pathways, these key physical hydrology features are considered.

Fish productivity and community structure are common ecological measurement indicators that characterize the ecological health of fish communities in wetlands, tributaries, and the Ottawa River; if they change, then this will prompt further investigation of what would cause them to change. Therefore, because they did not change (i.e., there is no significant change in productivity of community structure), then it can be expected that these fish communities are not impacted by activities at the NPD site.

Surface water sampling locations are currently monitored routinely at the NPD site. CNL also undertook baseline studies of fish habitat, benthic macroinvertebrate, sediment quality and water quality in the Ottawa River in the summer of 2020. Samples were taken upstream, downstream and adjacent to the NPD facility. The results support the description of the baseline aquatic environment in the EIS. CNL's assessment addressed potential effects to VCs, including fish species and habitat, in the aquatic environment. No

measurable changes in surface water environment are predicted in the Ottawa River as a result of the NPD Closure Project.

If follow-up monitoring identifies a residual effect not predicted or anticipated by the EIS, the need for an NPD Closure Project cumulative effects assessment would be re-evaluated.

9.14 Effects of the Environment on the Project

In accordance with the EIS Guidelines (CNSC 2016a) and associated regulatory documents (such as REGDOC-2.9.1 on *Environmental Principles, Assessments and Protection Measures* CNSC 2020a), this EIS includes an assessment of the potential effects of the environment on the project. This assessment was carried out as an evaluation of how climate change, severe weather conditions and other environmental events may interact with and potentially alter the condition and function of the project, such that there would be resultant effects on the environment or human health and safety. The approach to the assessment of the effects of the environment on the project, detailed below, involved:

- Identifying and describing those environmental conditions (i.e., events) with a reasonable probability of occurring and that have potential to affect the project, including associated hazards to workers or the public;
- Describing the significance of any likely effects on the project, including hazards to workers and the public (if any).

The effects of the environment on the project are assessed in the:

- DecomSA TSD (for humans in the Decommissioning Execution phase);
- PostSA TSD (for humans in the Post-Institutional Controls phase); and
- EcoRA TSD (for non-human biota in both the Decommissioning Execution and Post-Institutional Controls phase).

Each TSD assesses a number of scenarios, including scenarios where the environment affects the facility. This section provides an overview of the results of these assessments for a number of environmental effects on the project, including climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River.

Additional discussion of potential effects of the environment on the project with respect to accidents and malfunctions is provided in Section 9.12.

9.14.1 Regulatory Guidelines and CNL Documents

The EIS Guidelines (CNSC 2016a) dictate that the information in Appendix A.3.9 of REGDOC-2.9.1 (CNSC 2020a) be used to assess the potential effects of the environment on the project. As per REGDOC-2.9.1 (CNSC 2020a):

> *the EIS shall take into account how the environment could adversely affect the project. The applicant shall also take into account any potential effects of climate change on the project, including an*

assessment of whether the project might be sensitive to changes in climate conditions during its lifecycle.

Some adverse environmental conditions are flooding, severe weather, biophysical hazards (such as algae), geotechnical hazards and seismic events.

9.14.2 Climate Change

Changes in the global and regional climate could affect the NPD Closure Project during the Institutional Controls and Post-Institutional Controls phases. The CNSC requires that effects assessments take into account any potential effects of climate change on a project, including an assessment of whether the project might be sensitive to changes in climate condition during its life span (CNSC 2017). As such, an effect assessment of climate change was originally completed that follows the guidance provided by the FPTCCCEA. This general guidance document is for practitioners incorporating climate change issues into an EA (FPTCCCEA 2003).

Since the original assessment using the FPTCCCEA, the Strategic Assessment of Climate Change (SACC), revised October 2020 (ECCC 2020) has been issued. The SACC requires that a climate change resiliency assessment be conducted that takes into account the vulnerabilities under both the mean climate conditions and extreme climate events over project's lifetime from construction to decommissioning and includes more details than the FPTCCCEA. The resiliency assessment should be based on future climate projections and associated impacts, and identifies how the project is resilient to the future climate. The general approach for conducting a climate change resiliency assessment can follow Infrastructure Canada's Climate Lens - General Guidance (Infrastructure Canada 2019).

Based on this new guidance, the effects assessment has been updated with a climate change resiliency assessment conducted for the NPD Closure Project based on the requirements of SACC 2020. The following sections, as well as Section 8.12.4.3, provide a summary of the climate change trends used to support the climate change resiliency assessment as well as the climate change resiliency assessment.

9.14.2.1 Climate Change Effects on the Project

Climate change may result in shifts in the frequency and/or intensity of the extreme weather events and forest fires. When evaluating the potential effects from climate change, project design features and mitigation as well as management and monitoring practices are also considered. The effects of climate change are typically measured over longer periods, with the potential for climate change effects increasing as the period over which they are measured increases.

Shifts in the frequency and/or intensity of extreme weather events are expected to accompany the general warming of surface air temperatures. Increased evaporation will result in more moisture in the air and warmer air can hold more moisture, therefore, more intense precipitation events (i.e., rainstorms and snowmelts) are expected. The surface drainage system and overburden for the NPDDF site will have physical characteristics similar to natural drainage systems in the general geographic region in terms of dynamic stability, robustness and longevity. A multi-component concrete cap and engineered cover system

will be located on top of the NPDDF, which will be graded to promote positive drainage from the site towards the Ottawa River.

The annual snowfall for Canada has increased by about 4% over the time period of 1950 to 2009 (Mekis and Vincent 2011) and the current climate General Circulation Models (GCM) for the project indicate that snowfall is increasing further.

Climate change has the potential to greatly influence forests, since even small changes in temperature and precipitation can affect forest growth and survival. A small increase in temperature can result in a longer growing season, increased plant growth and a shift in tree species occurrence and abundance (NRCan 2014). None of these biological changes could directly affect the NPD Closure Project; however, the probability of forest fires increases with dry conditions due to the warming of surface air temperatures and probability of lightning strike. A forest fire could affect the project infrastructure and workers' safety during closure (see Section 9.14.4 Forest Fires).

For background info, NSDF's Climate Change Assessment TSD (232-509220-TD-001) states that current climate parameters are recorded by the most representative climate station as the basis for further analysis to be performed.

The following sections provide further descriptions of the projected future climate change trends at the global, regional and site level. These more detailed projections, in addition to the climate discussion in this section and Section 8.12.4.3, are used to support the climate resilience assessment presented in Section 9.14.2.2.

9.14.2.2 Climate Change Resilience Assessment

CNL plans to start the decommissioning activities (Decommissioning Execution phase) in 2026 which would last till 2028. Following that, the Institutional Controls phase will last at least for 100 years. Post-institutional control will occur indefinitely; however, the timeframe defined for the assessment of potential effects, as part of the normal evolution of the PostSA TSD is 10,000 years.

As the Decommissioning Execution phase has a shorter time frame (2026-2028), it has a smaller potential for meaningful interactions with the climate trends outside of the normal seasonal variation experienced in the region. The climate change resilience assessment includes identifying the effects of climate change on project infrastructure during the Institutional Controls and Post-Institutional Controls phases.

Though climate projections for mean temperature and mean precipitation are available up to the year 2300 (IPCC 2013), climate projections for extremes (e.g., extreme rainfall events, freeze-thaw cycles) are only available up to 2100. Hence, the Mid Term likelihood rankings represent the Decommissioning Execution phase and early Institutional Controls phase (up to 2050), while the far-term rankings represent the Institutional Controls phase in the long run (2051-2080).

The climate projections between 2100 and 3000 indicate that temperatures will stabilize before 3000 (IPCC 2013). In the absence of further projections, these projections could be applied qualitatively for the 10,000-year time frame of the project's safety assessment. The models that have been used to predict long-term releases in the PostSA TSD include considerations for the potential changes in the climatic

setting (see Appendix E of the PostSA TSD). Climate change may result in an increased occurrence and/or severity of extreme weather phenomena, such as flooding, drought, and forest fires. In addition, several features, events or processes that will occur as a result of climate changes have been acknowledged in Appendix C of the PostSA TSD and thus incorporated into the scenarios evaluated in the PostSA TSD (e.g., flooding and surface erosion, changes to the Ottawa River).

As climate science continues to progress, projections further into the future will become available with decreased uncertainty (e.g., past 2100 or 3000). As part of a continual improvement process, this updated climate science could be considered to identify risks to the NPD Closure Project beyond 3000 or for the Post-Institutional Controls phase.

9.14.2.2.1 Approach for the Climate Change Resilience Assessment

The climate change resilience assessment employs a risk management approach that anticipates the future climatic conditions for the NPD area, and anticipates how climate change related impacts may affect the NPD Closure Project. A qualitative approach has been used based on the available design information. For the assessment, the high-level principles of Infrastructure Canada's Climate Lens - General Guidance (Infrastructure Canada 2019) and Mining Association of Canada's Guide on Climate Change Adaptation in the Mining Sector (MAC 2021) have been used. The following methodology was used to complete the assessment:

Future Climate Projections: A review of the current and future projected changes in climate is completed to identify potential climate hazards relevant to the NPD Closure Project region.

Climate-Infrastructure Interactions: Inventory of on-site infrastructure components (concrete cap and engineered cover, drainage system, and final site restoration) which may interact with various climate hazards are identified. Based on the site infrastructure and identified hazards, a list of climate-infrastructure interactions is developed for further consideration.

Risk Ranking Assessment: Likelihood and consequence rankings of climate-infrastructure interactions are then estimated to identify climate risks under future climate conditions. Likelihood rankings are estimated under two future periods, Mid Term (2021-2050) and Far Term (2051-2080). In absence of projections past 3000, these projections could be applied qualitatively and reviewed as part of a continual improvement process when updated climate projections become available. The current mitigation measures identified for the NPD Closure Project have been considered for the likelihood rankings.

Current Mitigation Measures: Using available NPD Closure Project information, current mitigation measures that would be implemented are identified and used in the risk ranking process.

9.14.2.2.2 Likelihood, Consequence and Risk Ranking Scales

Climate-infrastructure interactions include any potential interaction of a climate event (e.g., heavy rainfall, extreme temperature, high winds, storms and lightning, snow) with a given infrastructure component. The likelihood in which the interaction may occur, and the consequence associated with this interaction are then assigned qualitatively using a categorical numeric scale. The likelihood rankings for this assessment have

a scale from Very Low (1) to Very High (5) and are summarized in Table 9.14-1 . The consequence rankings for this assessment have a scale from Very Low (1) to Very High (5) and are summarized in Table 9.14-2.

Table 9.14-1 Likelihood Scale for Climate Infrastructure Interactions [Modified from Climate Lens - General Guidance (Infrastructure Canada 2019)]

Qualitative Descriptor	Description
Very Low	Less than 1% annual probability of the event occurring, event is not likely to occur
Low	Between 1 to 10% annual probability of the event occurring
Moderate	Between 10% to 50% annual probability of the event occurring
High	Between 50% to 90% annual probability of the event occurring
Very High	More than 90% annual probability of the event occurring, event may occur multiple times a year

Table 9.14-2 Consequence Scale for Climate Infrastructure Interactions [Modified from Climate Lens - General Guidance (Infrastructure Canada 2019)]

Qualitative Descriptor	Description
Very Low	Likely to cause no impacts on the project. No damage to infrastructure.
Low	Likely to cause few to no impacts on the project. Minimal damage or repair costs.
Moderate	Likely to cause disruptions to facility, or manageable damage to infrastructure but repair costs would be higher than previously budgeted.
High	Likely to cause impacts that would disrupt the facility operations leading to closures, or damage infrastructure that would require replacement and high repair costs.
Very High	Likely to cause impact that may require full replacement of infrastructure.

The consequence and likelihood of climate interactions are used to identify key climate risks. If an interaction has a high consequence, but very low likelihood, the overall risk would be assessed as low. Conversely, if an interaction has a very low consequence but its likelihood is very high, the risk is assessed as moderate. A risk matrix has been identified which illustrates this concept and is summarized in Table 9.14-3. This table has been used to identify climate risk based on the likelihood and consequence of an interaction. The risk rating descriptors are summarized in Table 9.14-4 .

Table 9.14-3 Climate Risk Matrix Based on Consequence and Likelihood Scales [Source: Climate Lens - General Guidance (Infrastructure Canada 2019)]

Likelihood	Consequence				
	Very Low	Low	Moderate	High	Very High
Very High	Moderate	High	High	Extreme	Extreme
High	Low	Moderate	High	High	Extreme
Moderate	Low	Low	Moderate	High	High
Low	Negligible	Low	Low	Moderate	Moderate
Very Low	Negligible	Negligible	Low	Low	Low

Table 9.14-4 Risk Rating Definitions [Modified from Climate Lens - General Guidance (Infrastructure Canada 2019)]

Qualitative Description	Descriptor
Negligible Risk	An identified interaction between the climate hazard and project component has a negligible risk if the hazard has: • A very low/low likelihood of occurrence and a very low consequence; or • A very low likelihood of occurrence and a low consequence. Negligible risk includes no permanent damage. Risks do not require further consideration.
Low Risk	An identified interaction between the climate hazard and project component has a low risk if the hazard has: • A moderate/high likelihood of occurrence and a very low consequence; • A low/moderate likelihood of occurrence and a low consequence; • A very low/low likelihood of occurrence and a moderate consequence; or • A very low likelihood of occurrence and a high/very high consequence. Low risk includes minor damage. Actions might not be required.
Moderate Risk	An identified interaction between the climate hazard and project component has a medium risk if the hazard has: • A very high likelihood of occurrence and a very low consequence; • A high likelihood of occurrence and a low consequence; • A moderate likelihood of occurrence and a moderate consequence; or • A low likelihood of occurrence and a high/ very high consequence. Medium risk includes limited damage to infrastructure/operations. Some adaptation actions might be required.
High Risk	An identified interaction between the climate hazard and project component has a high risk if the hazard has: • A very high likelihood of occurrence and a low/moderate consequence; • A high likelihood of occurrence and a moderate/high consequence; or • A moderate likelihood of occurrence and a high/very high consequence. High risk may result in permanent damage to infrastructure, assets, operations. High priority adaptation actions need to be implemented.
Extreme Risk	An identified interaction between the climate hazard and project component has an extreme risk if the hazard has: • A very high likelihood of occurrence and a high/very high consequence; or • A high likelihood of occurrence and a very high consequence. Extreme risk may result in permanent damage or loss of asset and operations. Immediate adaptation actions need to be implemented.

9.14.2.2.3 Climate-Infrastructure Interactions

Identifying potential interactions between site infrastructure and climate is an important step in assessing climate risk. Future climate projections indicate changes in temperature, precipitation, and extreme events, potentially interacting with different components of the NPD Closure Project. The Decommissioning Execution phase takes place during a short time frame, which has a smaller potential for meaningful interactions with the climate trends outside of the normal seasonal variation experienced in the region. There is a larger potential for changes in both the climate mean and extreme weather events during the Institutional Control phase.

Table 9.14-5 identifies the potential climate events and change factors that may interact with the infrastructure components. The presence of a climate interaction for a given infrastructure category is denoted by a checkmark. Through this process, it is demonstrated that each infrastructure category may be affected by various climate related events having an impact on different aspects of site operation.

Increase in freeze-thaw cycles and extreme weather events such as droughts and forest fires could cause physical damage to the concrete cap and engineered cover. The concrete cap would be protected from freeze-thaw cycles during the Institutional Controls phase. Changes in precipitation, including extreme rainfall events could cause changes to the on-site hydrology including increase in surface run-off leading to erosion of the concrete cap and engineered cover. Increased snowmelt events could also cause increase in the run-off events causing erosion of the concrete cap and the engineered cover. Changes to temperatures, precipitation, and extreme events such as drought could affect the on-site hydrology and the hydrogeology, impacting the drainage system and causing on-site erosion. Any erosion of the engineered cover occurring during the IC period would be repaired. Lastly, changes to temperature, precipitation, and extreme events such as drought could impact the selections of plant species for revegetation programs during the postclosure period. Increase in mean annual temperatures and extreme heat could impact selection of plant species, and more drought-resilient plant species might have to be selected for revegetation. Interactions with wind/ tornadoes are not considered as it is unlikely that they could affect the concrete cap and engineered cover and the drainage system.

Table 9.14-5 Climate-Infrastructure Interactions Matrix

Infrastructure Components	Potential Climate Events and Change Factors							
	Temperature				Precipitation		Extreme Events	
	Extreme Heat	Extended Cold Spell	Growing Season Length	Freeze-Thaw Cycles	Frequency/ Amount of Heavy Rainfall Events	Changes in Snowfall	Forest Fires	Droughts
Concrete Cap and Engineered Cover				✓	✓	✓	✓	
Drainage System	✓		✓		✓	✓		✓
Final Site Restoration (Planting/ Landscaping over the Site)	✓	✓	✓		✓		✓	✓

9.14.2.2.4 Climate Change Resilience Profile

A qualitative climate risk assessment based on likelihood and consequence rankings has been conducted and summarized in Table 9.14-6 . The likelihood of climate-infrastructure interactions occurring are evaluated qualitatively using the likelihood scale presented in Table 9.14-1 . The resulting likelihood rankings are provided for near-term (2050s) and far-term (2080s) time periods that represent the Decommissioning Execution and Institutional Controls phases for the NPD Closure Project. Due to the projected increasing frequency of temperature, precipitation, and extreme events, the likelihood rankings generally reflect an increase in likelihood from 2050s to 2080s. The consequence of climate-interactions is independent to their likelihood of occurrence and represent the severity of impacts if an interaction were to occur and are based on the consequence scales presented in Table 9.14-2. The likelihood and consequence rankings consider the mitigation measures that would be implemented for the project to reduce the climate impacts. Risk rankings are then derived by combining the likelihood and consequence rankings for each climate-infrastructure interaction.

In the near future (2050s) and far future (2080s), most interactions seem to have a negligible to moderate risk due to changes to temperature, precipitation, and extreme events. Overall, the lower level of risk is due to the existing mitigation measures and the monitoring and surveillance plans that would be in place during the Decommissioning Execution and Institutional Controls phases.

Table 9.14-6 Qualitative Climate Risk Assessment

Infrastructure	Climate Variable	Interaction Description	Current Mitigation Measures	Climate Rankings					
				Near-term (2026 to 2050)			Far-term (2051 2080)		
				Likelihood	Consequence	Risk	Likelihood	Consequence	Risk
Concrete Cap and Engineered Cover	Temperature	Increase in freeze-thaw cycles might cause physical damage to the concrete cap and engineered cover.	Changes in temperature will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management. The concrete cap and engineered cover for will be designed to limit damage due to natural freeze-thaw cycles. To limit damage from freeze-thaw cycles, the engineered cover includes layers of granular/soil materials of sufficient thickness above the concrete cap to effectively avoid frost penetration.	Low	Low	Low	Very Low	Low	Negligible
	Precipitation	Extreme rainfall events and increased snowfall could result in an increase in surface water runoff and subsequently cause erosion of the concrete cap and engineered cover.	The concrete cap and engineered cover system will be designed to minimize water infiltration, to direct infiltration away from the grouted structure and to resist degradation by surface geologic processes and biotic activity (e.g., deter intrusion by burrowing of animals). The concrete cap and engineered cover system have been designed to cover the nuclear area of the NPDWMF and the engineered cover will be graded to promote drainage.	Very Low	Moderate	Low	Low	Moderate	Low
	Extreme events	Forest fires could cause erosion of the soil cover and cause physical damage to the concrete cap and the engineered cover.	A Fire Protection Program would be implemented for the closure phase activities that would include preventing fire losses, providing responsible fire protection management, demonstrating compliance to applicable fire protection codes and standards and providing reliable facilities from a fire protection perspective. During the postclosure period, protection from forest fires will be provided by the thick soil cover over the concrete cap, and it is unlikely for the forest fires to cause complete erosion of the soil cover. Period maintenance during institutional control period will be provided to control vegetation growth and erosion of the soil cover. Changes in extreme events, will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management.	Low	Low	Low	Low	Low	Low
Drainage System	Temperature	Extreme heat could affect hydrology and subsequently hydrogeology (i.e., changes in water table). Increase in the growing season length could cause overgrowth in the ditches and impact the drainage system.	Changes in groundwater elevation will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management.	Low	Low	Low	Moderate	Low	Low
	Precipitation	Extreme precipitation events and changes in snowfall could affect hydrology and subsequently hydrogeology (i.e., changes in water table) and surface geology (i.e., erosion).	Changes in precipitation will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management.	Low	Moderate	Low	Moderate	Moderate	Moderate
	Extreme events	Increase in droughts could affect the site hydrology and subsequently hydrogeology (i.e., changes in water table).	Changes in groundwater elevation will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management.	Low	Moderate	Low	Moderate	Moderate	Moderate
Final Site Restoration	Temperature	Extreme heat or extended cold spells could impact the type of species selected for the restoration during the postclosure period. Changes to the length of the growing season could impact the species selection and rehabilitation of vegetation.	Changes in temperature will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management. Meteorological data will be collected on an annual basis to track local changes to hydrogeological and climatological processes during the institutional control period.	Low	Low	Low	Moderate	Low	Low
	Precipitation	Changes in extreme precipitation could impact the final site restoration and the type of species selected for the restoration during the postclosure period.	Changes in precipitation, will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management.	Low	Low	Low	Moderate	Low	Low
	Extreme events	Increased drought-like conditions could impact the type of species selected for the restoration during the postclosure period. Forest fires could cause damage to the restored areas.	As identified in Section 10.2, CNL has an existing Fire Protection Program which will continue to be implemented during closure phase. The Fire Protection Program is dedicated to providing the highest level of fire and life safety to all CNL employees and facilities, which subsequently also provides protection to the surrounding areas. Changes in extreme events, will be tracked through the Environmental Assessment Follow-up Program to inform the need for adaptive management.	Low	Moderate	Low	Moderate	Moderate	Moderate

9.14.2.2.5 Summary of Climate Change Resilience

A climate change resilience assessment was conducted to meet the requirements of the Strategic Assessment of Climate Change, Revised October 2020 (Government of Canada 2020). The assessment follows the approach outlined in Infrastructure Canada's Climate Lens - General Guidance (Infrastructure Canada 2019). The assessment includes identifying climate-infrastructure interactions of the project infrastructure with a range of climate variables for near term (2026 to 2050) and far term (2051 to 2080).

All the climate risks associated with the project have negligible to moderate risks under the future climate. To ensure ongoing resiliency for the project and reduce the climate impacts, ongoing monitoring will be implemented to monitor the performance of the infrastructure under the changing climate. Hence, based on the existing project design and the monitoring and surveillance plans, the project is resilient in the near term (2026 to 2050) and the far term (2051 to 2080) for a range of different climate variables.

9.14.3 Glaciation

Current understanding of the long-term effects of global warming indicates that the next ice age will not occur for 100,000 y as a result of anthropogenic climate change (Ganopolski *et al.*, 2016). The long-term assessment timeframe for this project is 10,000 years. Therefore, glaciation is not being considered in this study.

9.14.4 Forest fire

Given that the NPD is surrounded by nearby forests, the occurrence of a forest fire has the potential to affect the project. In the DecomSA TSD, it was determined that the annual probability of forest fire on the NPD property is 2.8×10^{-3}. Forest fires could be caused by natural (e.g., dry conditions and lightning) or anthropogenic sources. As such, forest fires are also considered in Section 9.12 above. A large forest fire could potentially engulf the entire above grade structure, causing damage and potentially releasing both radiological and chemical contamination.

The EcoRA TSD found that all contaminants (radiological and non-radiological) were below screening levels, and as such did not warrant further investigation. The DecomSA TSD found that all worker and public exposures were also below acceptable limits for both radiation and chemicals. The maximum calculated total dose received for workers and public was 1.48×10^{-5} mSv. Maximum SIs for asbestos and lead were 6.0×10^{-1} and 1.61×10^{-3} respectively. An SI value below one indicates that no effects are expected. Forest fires are unlikely to affect the project following the Decommissioning Execution phase when the facility is below grade.

9.14.5 Tornado

The distribution of tornadoes, particularly in Ontario, appears to be random and extremely localized. A tornado usually affects a limited area and only for a short period of time; however, serious property damage and injury, including fatalities, may occur along its path. The annual probabilities of the NPD site falling within the affected area of an EF-2 tornado has been calculated as 6.2×10^{-5} as shown in the DecomSA TSD. An EF-2 tornado is not anticipated to cause serious damage to the facility, but may cause damage to the ventilation system or release surface contamination.

As calculated in Section 9 of the DecomSA, the maximum predicted dose calculated for the tornado scenario is 1.81 x 10^{-6} mSv. The maximum SIs (environmental concentrations compared to relevant worker and public benchmarks) for asbestos and lead were 6.60 x 10^{-1} and 2.79 x 10^{-3} respectively. An SI value below one indicates that no effects are expected.

During the life of the ventilation stack, a tornado could potentially result in the collapse of the ventilation stack, which is discussed in Section 9.12.4.4 (For further information, please see the EcoRA and DecomSA TSDs).

9.14.6 Flood

A flood at the NPD site could occur due to high water in the Ottawa River, heavy precipitation and/or failure of the dams on the Ottawa River upstream of the site. A flood at the NPD site would have the potential to remove surface contamination from the above ground facility and carry it downstream.

The facility Safety Analysis Report (Athauda-Arachchige 2015) reports that flooding from high water levels in the Ottawa River is unlikely due to control of the water level by the Des Joachims Generating Station. Based on conservative estimates of annual flooding the probability that a given area falls within a localized flood affected area is 7.3x10^{-3}, as calculated in the DecomSA TSD. The facility Safety Analysis Report (Athauda-Arachchige 2015) notes this localized flooding from heavy precipitation is extremely unlikely due to the drainage provided by the site topography. The facility is also currently assessed for damage following any flooding event. Flooding also has the potential to occur as a result of dam failure. The facility Safety Analysis Report determined that the probability of dam failure is negligible (Athauda-Arachchige 2015) (For further information, please see the EcoRA/DecomSA TSDs).

Flooding was assessed as part of the surface erosion disruptive event scenario in the PostSA TSD. The highest resulting dose rate (0.004 mSv/y) to human receptors is elevated relative to the normal evolution scenario, however it is still well below the dose rate criterion for disruptive events (1 mSv/y). The peak lead concentrations in all media are below all applicable guidelines. As shown in the EcoRA TSD, all contaminant concentrations were below screening levels for non-human biota.

9.14.7 Earthquake

The NPD site lies within a zone categorized as a region with moderate seismic risk. As such, the likelihood of an earthquake of sufficient strength to damage the buildings is estimated to be less than 4x10^{-4}, as shown in the DecomSA TSD. This scenario is considered as a part of hazard identification in the DecomSA; however, it is bounded by other scenarios considered during the Decommissioning Execution phase (including forest fire, tornado, and conventional health and safety). In the Decommissioning Execution phase, an earthquake could result in the collapse of some structures, including the ventilation stack. The potential effects of the ventilation stack collapsing are discussed in Section 9.12.4.4.

The NPD Closure Project's Surveillance Plan (Taylor 2019) discusses the proposed surveillance activities and frequencies required on-site for the Institutional Controls phase. Damages that occur to the fence or ventilation stack will be assessed for their potential adverse impact on facility performance and repairs made as necessary. The ventilation stack would be retained as a valuable roosting site for chimney swifts

for an estimated duration of 50 years to support the expected recovery period for the species. As part of care and maintenance of the site during Institutional Control, the ventilation stack would undergo routine surveillance and repair until it is safely decommissioned. If stack failure were to occur during the Institutional Controls phase, the engineered cover/barrier would be repaired to ensure structural integrity. Despite the NPD Closure Project's plan to remove the stack during the Institutional Controls phase, the PostSA TSD assesses radiological and non-radiological consequences from cracks in the facility (via the seismic event scenario).

The engineered cover has been designed to resist an earthquake with a 2,500-year return period. If the slopes of the engineered cover become unstable during the design life of 100 years from a seismic or other event, maintenance activities during the period of institutional control will be able to restore the slope and thus function of the engineered cover. The slopes of the barrier are expected to remain stable for the duration of the design life, after which it will begin to degrade (AECOM 2023).

The design of the engineered cover included a review to assess the potential for liquefaction of the overburden. The results of this review indicated the overburden was not homogeneous in nature, and thus did not have a high potential for liquefaction. Additionally, the soil materials chosen for the engineered cover were selected in part for their resistance to liquefaction (AECOM 2023).

Liquefaction occurs when vibrations or water pressure within a mass of soil cause the soil particles to lose contact with one another. As a result, the soil behaves like a liquid, has an inability to support weight and can flow down even gentle slopes. This condition is usually temporary and is most often caused by an earthquake vibrating water-saturated fill or unconsolidated soil. Liquefaction is possible for cohesionless soils for M=4 to M=6 earthquakes, which can produce ground shaking levels up to VIII on the Modified Mercalli Intensity.

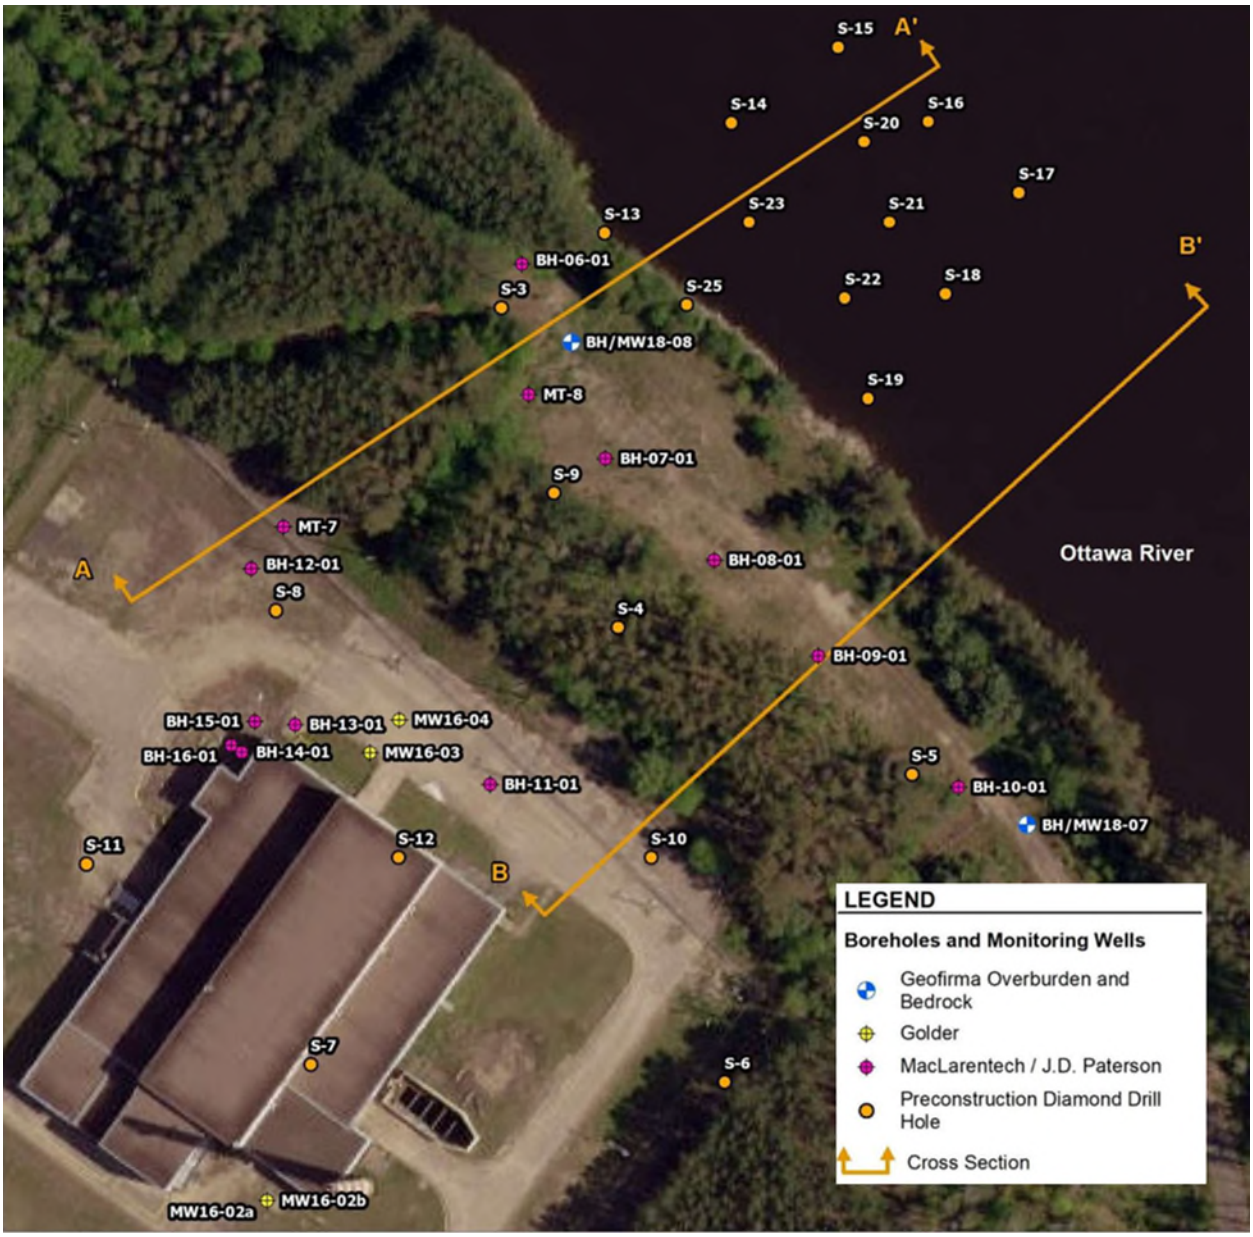
A preliminary slope stability assessment was performed for the NPD site that considers earthquake-induced soil liquefaction (Arcadis and Quintessa 2021), this assessment shows that the North Slope under current water level conditions is stable under static loading conditions and under loading conditions associated with a 1:2,250-year earthquake. Parts of the North Slope (cross section A-A') are stable, and parts of the North Slope (slightly steeper slope of cross section B-B'), are unstable under a 1:10,000-year earthquake. Both cross sections of the North Slope are likely to fail during a 1;50,000-year earthquake.

For cross section A-A', initial liquefaction failure of the silt to boulder till at the toe of the slope for the 1:50,000-year earthquake has the potential to destabilize the overall slope causing retrogressive failure of the back slope down to the bedrock surface and toward the NPDWF. Such retrogressive failure has potential to cause failure of the sloping engineered earth cover in the area northeast of the NPDWF building footprint.

For cross section B-B', the predicted slope failures for the 1:10,000-year and 1:50,000-year earthquakes both occur at the crest of the North Slope within the sand and gravel fill. For cross section B-B' migration of the crest failure toward the NPDWF is unlikely. The identified slope failures on cross sections A-A' and B-B' are unlikely to expose the grouted NPDWF.

It is unlikely that the predicted failures of the North Slope at cross section A-A' and B-B' will result in the direct exposure of groundwater to a new ground surface that would be established following earthquake induced slope failures. Slope failures at the North Slope are expected to result in accumulations of failed granular materials on the lower half of the North Slope because the angles of repose of the failed granular materials are much more than the slope angles of the bedrock surface. Given the permeable nature of all soils that comprise the North Slope, the expected redistribution of soils following slope failure is unlikely to change groundwater flows from the NPDWF to the Ottawa River.

Figure 9.14-1 Locations of Boreholes, Monitoring Wells and Stratigraphic Cross Sections at the NPD North Slope



The scenario of the failure of the north slope exposing some or all of the NPD structure is bounded by the Surface Erosion disruptive event scenario considered in the PostSA TSD. The Surface Erosion scenario examined the effects of a triple dam break, leading to flooding and scouring of the overburden, and bounds any other situation that could lead to scouring of the overburden. The peak dose from this scenario results from exposure and use of sediments contaminated with groundwater leaking from the NPD Disposal Facility, and was assessed at 0.004 mSv/y, well below the threshold dose for a Disruptive Event Scenario. The peak lead concentrations in all media are below all applicable guidelines.

During the Post-Institutional Controls phase, the facility will be filled with grout, and will be entirely below ground, therefore eliminating the risk of collapse. However, if an earthquake of sufficient strength was to occur, ground acceleration could result in degradation of the barrier properties of the grouted facility which would result in faster release of contamination in groundwater. This is assessed as part of the extreme degradation of engineered barriers disruptive event scenario in the PostSA TSD. The maximum resulting dose rate received by humans is 0.0003 mSv/y, and is well below the dose rate criterion for disruptive events (1 mSv/y). The peak lead concentrations in all media are below all applicable guidelines. As discussed in the EcoRA TSD, no effects were predicted for non-human biota.

Detailed quantitative assessments of seismic hazard near and at the NPDDF site are provided by McCrank (2016b) and AECOM (2018) for the CRL property and by Arjmand (2018) and Zhang (2021) as part of a cracking assessment of the underground NPDDF structures.

McCrank (2016b) summarizes the results of a probabilistic seismic hazard assessment (PSHA) completed in support of a geologic waste management facility at the CRL property. This work is translatable to the NPDDF site given the close proximity to CRL and similar nature of historical seismicity in regions surrounding the NPD and CRL sites. This work has been updated by AECOM (2018), who completed a PSHA in support of the NSDF at CRL.

The updated PSHA used the areal seismic source zones developed by the Geological Survey of Canada (GSC) that assume a uniform rate of earthquake occurrence within a spatial region. For each zone, the GSC model defines the area, seismogenic thickness, maximum earthquake magnitude and recurrence parameters. This GSC model was recently used to update the 2015 National Building Code of Canada seismic design data. AECOM (2018) evaluated earthquake-induced ground motions with return periods of 2,500, 10,000 and 100,000 years, which are equivalent to annual frequency of occurrence (AFE) of 4.0×10^{-4}, 1.0×10^{-4} and 1.0×10^{-5}, respectively. Table 9.14-7 summarizes the estimated seismic hazard at selected AFEs determined from the PSHA for the CRL property. Table 9.14-7 lists peak ground acceleration (PGA) in units of gravity (g = 9.81 m/s^2) as well as the approximate earthquake magnitude (M) for these AFEs.

Table 9.14-7 Summary of Seismic Hazards Estimated for CRL Property (from AECOM Canada Ltd., 2018)

AFE	Earthquake Probability (years)	Approximate M	PGA on Hard Rock (g)
4.0×10^{-4}*	1/2,500	6.3	0.25
1.0×10^{-4}	1/10,000	6.4	0.55
1.0×10^{-5}	1/100,000	6.6	1.48

Note:

*AFE for 2015 National Building Code of Canada

Arjmand (2018) and Zhang (2021) provide an assessment of the potential for cracking of the underground structural walls of the NPDDF due to ground shaking from earthquakes. The Arjmand (2018) assessment considered 1/2,250- and 1/10,000-year earthquakes. The Zhang (2021) assessment is a revision of the Arjmand (2018) assessment considering an additional 1/50,000-year event. The Arjmand and Zhang analyses are based on a Design Basis Earthquake (DBE) for the CRL property and extrapolated earthquakes developed for the NPD site based on the GSC seismic hazard model (NRCan, 2018). Further detail on the basis for these estimates can be found in Geofirma (2019). Table 9.14-8 summarizes the seismic hazards used in the Arjmand (2018) and Zhang (2021) assessments.

Table 9.14-8 Summary of Seismic Hazards Estimated for NPD Property (from Arjmand, 2018 and Zhang, 2021)

AFE	Earthquake Probability (years)	Approximate M	PGA on Hard Rock (g)
4.4×10^{-4}	1/2,250	6.0	0.24
1.0×10^{-4}	1/10,000 (1)	>6.5	0.623
2.0×10^{-5}	1/50,000 (2)	>>6.5	1.75

Notes:

1 Design Basis Event (DBE)
2 Beyond Design Basis Event (BDBE)

The analyses of Arjmand (2018) and Zhang (2021) considered dead load and seismic load as well as earth pressure and seismic earth pressure. A 3-D finite element model based on NPDDF building stick representation was used to assess the cracking potential of concrete walls. The cracking of underground walls of the NPDDF structure would likely occur due to both flexural and shear loading at elevations from near the top of bedrock to the ground surface for all seismic events. The seismically induced cracking would be due to a lack of shear capacity in the building structure above the bedrock surface. The studies did not indicate cracking of the NPDDF structure below the bedrock surface as the concrete backfill and bedrock provide sufficient bearing resistance to seismic forces.

9.14.8 Lightning Strike

A lightning strike hitting the facility is a realistic possibility. Lightning strikes generally happen during thunderstorms, which are more common during the warmer months of the year (May to September). The potential effect of a lightning strike would depend on what phase of the decommissioning process the strike occurred in. In the current SwS phase, and early in the Decommissioning Execution phase, a lightning strike that hits the facility could result in a fire or other damage. The potential effects of a forest fire, from any source, including lightning, are discussed in Section 9.14.4, and in the DecomSA and EcoRA TSDs. No potential effects from a lightning strike are expected after the Decommissioning Execution phase.

9.14.9 Ice Storm

Ice storms are caused when the atmosphere is layered - a layer of warm air above the denser cold air near surface. As precipitation falls in the warm layer, rain forms. The rain then falls into the shallow cold layer

and freezes. Ice storms can damage structures because of the weight of accumulated ice. Ice storms are known to occur in the region of NPD. On average, Ottawa and Montreal receive freezing precipitation 12 to 17 days a year. However, this type of precipitation generally lasts only a few hours. Though it did not occur at the NPD site, a severe ice storm occurred in Eastern Ontario and Quebec; over 90 millimetres of freezing drizzle fell during the 5-day storm. This magnitude has an annual probability of occurrence of about 1 in 100 (Ontario Hydro 1998). The potential effects of such an ice storm may include the buildup of ice on buildings, power lines and other structures. This could result in a loss of power, and potentially the loss of ventilation. It is not expected that an ice storm would result in any significant damage to structures. It is possible, in the future, that a severe ice storm could result in the collapse of the ventilation stack, if the concrete has degraded sufficiently to weaken the structural integrity. The potential effects of ventilation stack collapse are discussed above in Section 9.12.4.4.

9.14.10 Changes to the Ottawa River

The Ottawa River is a dominant surface water feature of the area. All surface drainage on the NPD site is to the Ottawa River. Changes to the flow, level or location of the Ottawa River could affect the releases from the project and the resultant effects to people and the environment. If the water level of the Ottawa River were to drop significantly, the groundwater could begin to discharge to the shoreline, as opposed to in the river. This would result in the contaminants from the facility being released onto the shore, and this has been assessed as a “What if” case in the PostSA TSD. This is expected to result in higher shoreline sediment concentrations in a small patch near the discharge site and a peak dose rate is unchanged from the normal evolution scenario. The peak lead concentrations in all media are below all applicable guidelines. As discussed in the EcoRA TSD, no effects were predicted for non-human biota. “What if” cases represent a deliberately extreme set of assumptions that can be used to understand the absolute limits of the safety performance. Due to the extreme conservatism, the effect results are not compared with any criteria, and these cases are not included in the identification and assessment of effects; however, the results are presented here to provide perspective.

The collapse of the ventilation stack, which is being retained to provide habitat for chimney swifts, could be caused by changes in the Ottawa River, and is considered in the DecomSA TSD. This scenario is considered in Section 9.12 Accidents and Malfunctions.

Flooding and surface erosion were assessed as a disruptive event scenario in the PostSA TSD. All dose rates received were estimated to be well below the relevant dose rate criterion. These results are summarized in Section 9.8.3 and in the PostSA TSD.

10 MITIGATION MEASURES

This section provides a summary of the mitigation measures identified in Section 9 to satisfy regulatory requirements outlined in the CNSC (2016a) EIS Guidelines. CNL, as project proponent, will be responsible for implementation of the proposed mitigation measures.

10.1 Regulatory Requirements

The CNSC Reg Doc 2.9.1 on *Environmental Principles, Assessments and Protection Measures* and Section 2 of *CEAA* define mitigation as "*…the elimination, reduction or control of the adverse environmental effects of the project, and includes restitution for any damage to the environment caused by such effects through replacement, restoration, compensation or other means" (CEAA,* 2012 and CNSC 2020a*).*

The EIS Guidelines (CNSC 2016a) state that:

> *Every EA conducted under the CEAA 2012 will consider measures that are technically and economically feasible and that would mitigate any significant adverse environmental effects of the project. Measures that are technically and economically feasible include application of best industry practices, pollution prevention principles such as best available technology and techniques economically achievable (BATEA), and radiation protection principles such as keeping radiation exposure and doses as low as reasonably achievable (ALARA).*
>
> *Each measure will be specific, achievable, measurable and verifiable, and described in a manner that avoids ambiguity in intent, interpretation and implementation. Mitigation measures may be considered for inclusion as conditions in the EA decision statement and/or in other compliance and enforcement mechanisms provided by other authorities' permitting or licensing processes.*
>
> *As a first step, the proponent is encouraged to use an approach based on the avoidance and reduction of the effect(s) at the source. Such an approach may include the modification of the design of the project or relocation of project components.*
>
> *The EIS will describe the standard mitigation practices, policies and commitments that constitute technically and economically feasible mitigation measures and that will be applied as part of standard practice regardless of location (including the measures directed at mitigating adverse socio-economic effects). The EIS will then describe the project's environmental protection plan and its environmental management system, through which the proponent will deliver this plan. The plan will provide an overall perspective on how potentially adverse effects would be minimized and managed over time. The EIS will further discuss the mechanisms the proponent would use to require its contractors and sub-contractors to comply with these commitments and policies and with auditing and enforcement programs.*
>
> *The EIS will then describe mitigation measures that are specific to each environmental effect identified. Measures will be written as specific commitments that clearly describe how the proponent intends to implement them and the environmental outcome the mitigation is designed to address.*

The EIS will describe mitigation measures in relation to species and/or critical habitat listed under the Species at Risk Act (SARA). These mitigation measures will be consistent with any SARA permit, applicable recovery strategy and/or action plan.

The EIS will specify the actions, works, minimal disturbance footprint techniques, best available technology, corrective measures or additions planned during the project's various phases to eliminate or reduce the significance of potential adverse effects. The impact statement will also present an assessment of the effectiveness of the proposed technically and economically feasible mitigation measures. The reason(s) for determining if the mitigation measure reduces the significance of a potential adverse effect will be made explicit. The proponent is also encouraged to identify mitigation measures for effects that are adverse although not significant.

The EIS will indicate what other technically and economically feasible mitigation measures were considered, and explain why they were rejected. Trade-offs between cost savings and effectiveness of the various forms of mitigation will be justified. The EIS will identify who is responsible for the implementation of these measures and the system of accountability.

For proposed mitigation measures for which there is little experience or that have questionable effectiveness, the potential environmental risks and effects – should those measures not be effective –will be clearly and concisely described. In addition, the EIS will identify the extent to which technological innovations will help mitigate environmental effects. Where possible, it will provide detailed information on the nature of these measures, their implementation and management and how these are integrated in the follow-up program.

The IAEA SSG-29 specific safety guide for Near Surface Disposal Facilities for Radioactive Waste contains best practice guidance, though it does not comprise regulatory requirements. It states, *"that potential adverse impacts can be mitigated to an acceptable degree, technical, economic, social and environmental factors being taken into account" (*IAEA 2014b*).* It is noted that as the NPDDF contains ILW, SSG-29 is not applicable to the NPD Closure Project; however, where relevant, guidance given in SSG-29 has been taken into account.

For SARs defined by the federal *Species at Risk Act* (*SARA* 2002), pursuant to subsection 79(1) of that Act, Responsible Authorities under the *Canadian Environmental Assessment Act* must notify the appropriate federal Minister if any listed wildlife species, its critical habitat or the residences of individuals of that species may be adversely affected by the project. Pursuant to subsection 79(2) of the *Species at Risk Act*, if the project is carried out, Responsible Authorities must also ensure that measures are taken to avoid or lessen those effects and to monitor them; these measures must be taken in a way that is consistent with any applicable recovery strategy and action plans (*SARA* 2002).

10.2 CNL Management Programs

The following presents an overview of CNL's existing programs related to environment, safety and security. CNL is responsible for and committed to providing for the health and safety of its employees and the public and the protection of the environment. Mitigation measures developed for the NPD Closure Project will be

developed in alignment with these programs. The relevant management programs include, but are not limited to:

Radiation Protection Program

CNL's Radiation Protection Program is designed and implemented so that CNL complies with, or exceeds, the level of radiation safety that is required by the relevant regulations pursuant to the NSCA and CNL's Health and Safety Policy.

The fundamental objectives of the CNL Radiation Protection Program are to:

- limit the doses to less than the regulatory limits;
- limit doses to employees and members of the public to levels as low as reasonably achievable, social and economic factors being taken into account (ALARA principle); and,
- prevent detrimental non-stochastic (deterministic) health effects caused in employees and members of the public by CNLs use of radiation.

These objectives are achieved through facility design, staff training, administrative exposure control procedures, contamination control requirements, and work planning and supervision. A combination of Action Levels and dose management tools are used to keep radiation doses to employees and the public below regulatory limits.

Environmental Protection Program

CNL's Environmental Protection Program provides compliance with applicable environmental regulatory requirements and requirements that CNL has adopted as a matter of policy. The program is registered under ISO 14001 and is designed to provide for the protection of the environment and the public in relation to CNL's activities. The Environmental Protection Program incorporates the following key elements of the ISO-14001 Environmental Management System (EMS) Standard:

Environmental Policy

- Commitment to pollution prevention.
- Setting environmental objectives and targets to support continual improvement of environmental performance.
- Complying with applicable laws, recognized standards and guidelines applicable to CNL activities.
- Reviewing the impacts of CNL facilities, projects, services and products on the environment.

Planning

- Identification and determination of significance of those environmental aspects associated with CNL's activities.
- Establishment of environmental objectives and targets.
- Development of appropriate plans and/or programs to achieve the objectives and targets.

Implementation and Operation

- Defining and documenting appropriate roles and responsibilities.
- Establishment and maintenance of operational controls over environmental aspects.

Checking and Corrective Action

- Monitoring to verify environmental performance and compliance.
- Maintaining non-conformance and corrective and preventative action procedures.

Management Review

- Periodic review by CNL's management to ensure the ongoing suitability, adequacy and effectiveness of the EMS.

Waste Management Program

CNL's Waste Management Program includes requirements and processes to ensure that CNL activities that involve planning for, handling, transporting, processing, storage and disposal of wastes are performed in a manner that complies with applicable regulatory and licence requirements and protects workers, the public and the environment.

The Waste Management Plan for the NPD Closure Project (Riopel 2020) includes identification of waste types that will be generated, a waste minimization plan, waste monitoring, analysis, and packaging requirements.

Occupational Health and Safety Program

CNL's Occupational Safety and Health Program is designed to provide for the protection of workers and public health and safety in relation to CNL activities. CNL and its contractors will meet all applicable health and safety legislative requirements. Canadian Nuclear Laboratories requires that contractors and their subcontractors maintain a level of safety equivalent to that of CNL employees while on-site.

All activities related to the NPD Closure Project will be assessed using CNL's Integrated Work Control (IWC) process, which is a structured approach to defining the work, identifying the hazards, controlling the hazards, performing the work and providing feedback (lessons learned). The overall approach is accountability for the work through a single job supervisor and a team approach to safe and efficient work.

Emergency Preparedness Program

CNL's Emergency Preparedness Program comprises planning and response elements to provide that processes are in place to control and mitigate the consequences of an emergency (whether related to a nuclear/radiological or conventional incident) both on- and off-site. In accordance with the Ontario Nuclear Emergency Plan, the program includes infrastructure, assigned response staff and other resources, and periodic exercises to test and demonstrate emergency preparedness. The Emergency Preparedness Program takes into consideration guidance provided in the CNSC's Nuclear Emergency Preparedness and Response document (CNSC 2016c).

Fire Protection Program

CNL is dedicated to the delivery of a compliant Fire Protection Program that will provide the highest level of fire and life safety to all CNL employees and facilities. The objectives of the Fire Protection Program include preventing fire losses, providing responsible fire protection management, demonstrating compliance to applicable fire protection codes and standards, and providing reliable facilities from a fire protection perspective.

The Fire Protection Program provides services including developing fire prevention processes and conducting fire safety inspections. Fire hazard analyses, code compliance reviews and fire protection screenings are also conducted as part of the program.

10.3 Scope

Mitigation is the elimination, reduction or control of the adverse environmental effects of the project, and includes restitution for any damage to the environment caused by such effects through replacement, restoration, compensation or any other means. The proponent must describe general and specific measures intended to mitigate the potentially adverse environmental effects of the project. The proponent must indicate which measures respond directly to statutory or regulatory requirements.

The proposed mitigation measures for the project are summarized by project phase in Table 10.3-1. In the Post-Institutional Controls phase, no mitigation measures have been identified beyond in-design mitigation measures (such as the delay of contaminant transport through grouting). In-design mitigation measures are discussed in Section 3 of the PostSA TSD and Section 4.1 above. The mitigation measures below have been developed based on the current understanding of the project. As the project approaches detailed work planning, additional mitigation measures may be developed as required. Specific plans outlining environmental protection measures will be developed by contractors engaged to undertake the decommissioning activities, ensuring that CNL programs are adhered to and mitigation measures defined as part of this EIS are incorporated.

Information on methods, procedures and policies associated with the proposed mitigation measures are also discussed and/or referenced below. The mitigation measures are described in further detail within each environmental component in Section 9 of this EIS.

In the table below, the asterisk denotes mitigation measures to be undertaken when working at night, or during inclement weather, or if triggered by chimney swift monitoring activities (i.e., disturbance or roost abandonment is detected).

Table 10.3-1 Summary of Mitigation Measures

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
Decommissioning Execution Phase		
Atmospheric Environment (Section 9.2.3.2; Table 9.2-4)	Air Quality	Regular maintenance of machinery to efficiently reduce emissions
		Haulage trucks covered to minimize dust emissions
		Minimization of dust generation through planning and site layout
		Water misting for dust suppression to reduce resuspension;
		Temporary local ventilation with HEPA filtration, as required;
		Cover storage piles when not in use, prior to workers leaving the site, and during heavy rainstorms
		Compaction of disturbed soil after completion of activities
		Minimization of drop heights for materials
		Barriers to prevent dispersion of materials
		Safe work practices for loading debris
		Avoidance of prolonged storage of debris
		Proper techniques for the use and handling of chemicals
		Roads and areas will be wetted/misted as needed in dry conditions to minimize dust generation
		Post speed limits on-site (see Terrestrial Environment) to minimize dust emissions
		Limit idling of vehicles and equipment on-site to minimize emissions (Lambert 2022)
		Dust suppression during demolition and material sizing activities
	Noise	Operation of grout batch mixing plant between 7 am and 7 pm only to be allowed outside this period in exceptional circumstances (e.g., to complete a critical grout fill step that cannot be interrupted to ensure the safety of the structure or integrity of the grout)
		Limit decommissioning activities to between 7 am and 7 pm as much as possible
		Sequencing work to minimize the simultaneous operation of noisy equipment
		Location of the grout batch mixing plant at least 1 km from nearby residences
		Direct piping of grout into facility, where reasonable
		Trucks operating at the site are well maintained with appropriate mufflers
		Placement of generator in enclosure to reduce noise (if required)
		Maintenance of noise levels in compliance with CNL's Occupational Safety and Health requirements
		Post speed limits on-site (as described in Terrestrial Environment)
		Maintenance of roads in good condition to prevent uneven roadway

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
Surface Water Environment (Section 9.3.3.2; Table 9.3-5)	Site Drainage and Water Quality	Retention of existing vegetation (where feasible)
		Maintenance of low runoff velocities (control run-off)
		Impedance of rainwater inflow into facility with construction of grout and concrete monolith
		Restriction on heavy construction equipment to within approved work areas
		Diversion of runoff away from exposed areas and stockpiles, and strategic placement away from concentrated stormwater flows
		Revegetation of disturbed areas after construction (seasonal)
		Proper design, inspection and management of washout pits and material storage site(s)
		Use of paved (impermeable) areas for stockpile laydown to reduce infiltration and cover when not in use, prior to workers leaving the site, and during heavy rainstorms
		Dust suppression measures (as described in Atmospheric Environment)
		Road maintenance activities, as per guidelines (Hawkins 2024)
		Utilization of spill kits and secondary containment of storage tanks to contain releases from spillage or tank rupture (Hawkins 2024)
		Use of secondary containment for any hazardous liquids stored on-site.
		Reuse washout pit water for grout batch mixing plant (to the extent practicable); retention and emplacement of settled sediment in the facility
		Sediment and erosion controls consistent with Morin (2018)
		All liquids generated will be handled as non-routine discharges
Aquatic Environment (Section 9.4.3.2; Table 9.4-4)	All	No additional mitigation measures identified. The existing dry hydrant was installed with measures to minimize the impact to the aquatic environment in consultation with the DFO. Mitigation measures taken in other environmental compartments which serve as pathways will also reduce potential effects.
Geological and Hydrogeological Environment (Section 9.5.3.2; Table 9.5-4)	Soil Quality	Survey and remediation of localized areas of contamination on a regular basis throughout the project
		Dust suppression and sedimentation, runoff and erosion control (see Atmospheric and Surface Water Environment)
		Proper design, inspection and management of washout pits and material storage site(s)
		Spill prevention, management, practices and clean-up procedures (consistent with the Environmental Monitoring Program (Boileau 2018) and CNL's Management of Land and Habitat Procedure (Hawkins 2024) to minimize risk of accidental spills.
		Storage of only material expected to be clean in lay down areas
Terrestrial Environment	Vegetation communities and wildlife	Dust and noise suppression measures (see Atmospheric Environment)
		Delineation of work areas, limiting project activities to disturbed areas, including wildlife exclusion fencing (if required)

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
(Section 9.6.3.2; Table 9.6-4)		Posted speed limits in the Site Study Area and access road
		Heavy equipment entering the site will be inspected to ensure they are free of dirt clogs coming from outside of the site, to prevent the spread of invasive species via seeds (Hawkins 2024).
		Site restoration: localized surface scarifying with a track machine to break up soil-compacted areas, top-dressed (as required), replanted with native vegetation or allowed to revegetate naturally, subsoil tilled and cultivated (as needed)
		Disposal of garbage on-site, particularly food waste, in proper containers to deter wildlife
		Removal of milkweed will occur only during a period of time when the host plant is not known to be occupied by any life stages of the species; removal will occur between October 01 and April 30;
		no removal of milkweed outside of the Site Study Area; and
		Vegetation removal by way of mowing or brushing of nectaring plants along the side of the roads and rights-of-way will be avoided during the period of time the monarch is present in the area (May 1 to September 30).
		During final site restoration, the 1.2-hectare area will be seeded with milkweed.
	SAR	SAR training for employees and contractors, and frequent visual inspections and site sweeps for wildlife and SARs (milksnakes, nests, bats, bat roosts, barn swallows, monarchs) prior to work and decommissioning.
		No tree clearing planned, but if it is necessary, will avoid during bird breeding season (if possible) and will follow CNL's Environmental Evaluation process.
		Limitation of decommissioning activities to between 7 am and 7 pm as much as possible (i.e., daylight hours, when chimney swifts are not roosting in ventilation stack) during chimney swift roosting season (i.e., May 1 to September 1)
		Noisy equipment and activities minimum 5m and directed away from ventilation stack (MNRF 2013), but should preferably be located as far as possible to suppress noise, during chimney swift roosting season (i.e., May 1 to September 1)
		Orientation of all external lighting fixtures so that top of the ventilation stack is not illuminated, during chimney swift roosting season (i.e., May 1 to September 1)*
		In order to minimize the impact to chimney swifts during grouting of the base of the stack and creating penetrations at base of stack for drainage and ventilation, this work will be performed when chimney swifts are not present in the stack.
Terrestrial Environment (Section 9.6.3.2; Table 9.6-4)	SAR	Keep demolition dust to a minimum, insofar as possible (see Atmospheric Environment dust mitigation measures)*
		Activities with substantial vibration and noise done between 7 am and 7 pm, during chimney swift roosting season (i.e., May 1 to September 1) will employ a 'soft-start' approach, wherever possible. Each time the activity

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
		is initiated after a period of inactivity (>24 hours), the disturbance levels will be gradually increased over a 30-minute period to allow chimney swifts an opportunity to acclimate. Noise and vibration should be minimized without compromising demolition requirements (MNRF 2013).*
		Major demolition activities should follow a planned schedule, during chimney swift roosting season (i.e., May 1 to September 1) *
		Consideration of noise performance in selection of mechanical equipment and vehicles, during chimney swift roosting season (i.e., May 1 to September 1)*
		Dramatic and sudden disturbances only between 7 am and 7 pm if possible, during chimney swift roosting season (i.e., May 1 to September 1)*
		Noise level of audible warning devices should be kept to the CNL Occupational Safety and Health minimum*
		If significant vibration impacts cannot be avoided, consider relocation of sources away from ventilation stack (i.e., no direct line of sight), during chimney swift roosting season (i.e., May 1 to September 1) *
		Low speed limit on NPD property.
		Daily road mortality surveys conducted (only on days when activities occur), during the herpetofauna active season (April 15 to Sept 30th). If any individual mortality is detected, consider exclusionary fencing
		Brake-for-Snakes road signs installed.
Ambient Radioactivity (Table 9.7-4)	All	dust suppression measures as outlined for the atmospheric environment
		sediment and erosion controls as outlined for the surface water environment
		use of localized HEPA ventilation as necessary during grouting operations
Human Health (Section 9.8.3.2; Table 9.8-3)	All	Staff and contractor orientation to ensure awareness of decommissioning activities, hazards, and emergency procedures
		Signage to indicate where decommissioning work is taking place
		Development of work control documents to guide safe execution of the decommissioning activities
		Hazards will be identified through work control documents and eliminated or controlled using engineered controls, administrative controls, and PPE
		Regular updates to site personnel on changes in the proposed decommissioning work plans
		CNL health and safety programs in place to prevent and mitigate injury to personnel
		An NPD Emergency Procedure is in place, and is consistent with CNL's Emergency Preparedness Program. This procedure will be updated to include decommissioning activities.
		Emergency response is available through local municipal Fire Department
		Adherence to stop work procedures for power outages
		Overall site 'good housekeeping' will be upheld

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
		CNL Contractor Health & Safety Management Program
		Periodic communication update to local residents on the project construction activities, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc.
		Radiological work assessments will be performed as detailed work packages are developed. They will include specific measures to reduce collective worker dose to the extent possible.
	All	Monitoring and reporting all internal and external doses received by NPD workers
		Utilization of air monitors, dosimeters, and bioassay as required to detect the spread and uptake of contamination
		Signage to indicate asbestos laydown/interim-storage areas.
		Procedures for handling and storage of abated asbestos (bagged). (MOE 1994)
		Sources of asbestos, PCBs, lead and mercury will be confirmed through characterization and will be clearly identified prior to executing activities.
Traditional Land and Resource Use (Section 9.9.3.2; Table 9.9-4)	All	Dust suppression measures (as described in Atmospheric Environment)
		Should previously undocumented archaeological resources be discovered, CNL will suspend decommissioning activities immediately and will engage a licensed consultant to carry out archaeological fieldwork, in compliance with Section 48 (1) of the *Ontario Heritage Act*, and outlined in CNL's procedure Management of Cultural Resources (CNL 2022a). CNL remains open to engagement with Indigenous Nations, communities and organizations in the event of a discovery of an archaeological resource. If any human remains are identified during construction, CNL will immediately notify the police or coroner and the Registrar of Cemeteries, Ministry of Public and Business Service Delivery, and Indigenous Nations, communities and organizations
		Construction activities will generally occur between 7 am and 7 pm, with the overall objective of minimizing nuisance effects (i.e. Noise and traffic) on traditional resource users in the Local and Regional Study Areas. It is noted that special or emergency circumstances may require deviation from this restriction
		Periodic communication updates on project construction activities to Indigenous Nations, communities and organizations are required, including construction schedule, activities, dedicated contact person for inquiries and emergencies, etc.
Indigenous Socio-economic and Health (Section 9.10.1.3.2, Table 9.10-4,	Indigenous Socio-economic	Dust suppression measures (as described in Atmospheric Environment)
		Post speed limits on-site (as described in Terrestrial Environment)
		Should previously undocumented archaeological resources be discovered, CNL will suspend decommissioning activities immediately and will engage a licensed consultant to carry out archaeological fieldwork, in compliance with Section 48 (1) of the *Ontario Heritage Act,* and outlined in CNL's

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
Section 9.10.2.3.2, Table 9.10-11)		procedure Management of Cultural Resources (CNL 2022a). CNL remains open to engagement with Indigenous Nations, communities and organizations in the event of a discovery of an archaeological resource. If any human remains are identified during construction, CNL will immediately notify the police or coroner and the Registrar of Cemeteries, Ministry of Public and Business Service Delivery, and Indigenous Nations, communities and organizations
		The transportation/haul route is limited to Highway 17 and the NPD site access road from the highway
		Review of a company's safety records which includes any traffic accidents or driver's records, as per CNL's contracting and hiring practices
		Construction activities will generally occur between 7 am and 7 pm with the overall objective of minimizing nuisance effects (i.e. noise and traffic) on residents in the Local and Regional Study Areas. It is noted that special or emergency circumstances may require deviation from this restriction
		When a significant amount of off-site transportation is required (e.g., during raw material delivery), the timing of equipment and material shipping to the site should be staggered to minimize the contribution of the project to peak traffic volumes
		Restrict access to the licensed area via a fence with a locked gate to deter trespassing
		Periodic communication updates on project construction activities to local residents are recommended, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc.
		CNL and the CNSC have provided funding for Indigenous participation in the NPD Closure Project, including funding for consultation and engagement sessions, participation in third-party reviews, and preparation of traditional knowledge and land use studies
	Indigenous Health	Staff and contractor orientation to ensure awareness of decommissioning activities, hazards, and emergency procedures
		Signage to indicate where decommissioning work is taking place
		Development of work control documents to guide safe execution of the decommissioning activities
		Hazards will be identified through work control documents and eliminated or controlled using engineered controls, administrative controls, and PPE
		Regular updates to site personnel on changes in the proposed decommissioning work plans
		CNL health and safety programs in place to prevent and mitigate injury to personnel
		An NPD Emergency Procedure is in place, and is consistent with CNL's Emergency Preparedness Program. This procedure will be updated to include decommissioning activities.
		Emergency response is available through local municipal Fire Department
		Adherence to stop work procedures for power outages

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
		Overall site 'good housekeeping' will be upheld
		CNL Contractor Health & Safety Management Program
		Periodic communication update to local residents on the project construction activities, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc.
		Radiological work assessments will be performed as detailed work packages are developed. They will include specific measures to reduce collective worker dose to the extent possible.

Environmental Component	Environmental Sub-Component	Proposed Mitigation Measures
		Periodic communication updates on project construction activities to local residents are recommended, including construction schedule, activities, dedicated contact person for inquiries and emergencies etc.
Institutional Controls Phase		
Surface Water Environment (Section 9.3.3.2; Table 9.3-5)	Site Drainage and Water Quality	Retention of existing vegetation (where feasible)
		In-design mitigation to maintain low runoff velocities (control run-off)
		In-design mitigation to impeded of rainwater inflow into facility with grout and concrete monolith
Geological and Hydrogeological Environment (Section 9.5.3.2; Table 9.5-4)	Soil and Groundwater Quality	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination
Post-Institutional Controls Phase		
Surface Water Environment (Section 9.3.3.2; Table 9.3-5)	All	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination
Aquatic Environment (Section 9.4.3.2; Table 9.4-4)	All	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination
Geological and Hydrogeological Environment (Section 9.5.3.2; Table 9.5-4)	All	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination
Terrestrial Environment (Section 9.6.3.2; Table 9.6-4)	All	In-design mitigation to isolate and contain the inventory in order to reduce the potential of groundwater contamination

Note:
* Denotes mitigation measures to be undertaken when working at night, or during inclement weather, or if triggered by chimney swift monitoring activities (i.e., disturbance or roost abandonment is detected).

10.4 Relation to EA Follow-up Program

The purpose of an EA Follow-up Program (see Section 12 of this EIS), in part, is to verify whether the required mitigation measures identified in the EIS were implemented effectively. This compliance monitoring on its own does not satisfy the requirements for a follow-up program, but serves to track conditions or issues during the project lifespan or at certain times (CNSC 2016b).

The NPD Closure Project has developed a proposed follow-up monitoring program to support the EA Follow-up Program, in accordance with relevant CSA N288 standards for effluent, environmental and groundwater monitoring. The proposed follow-up monitoring program was submitted to the CNSC in 2018 October (64-CNNO-18-0026-E and 64-CNNO-18-0027-E). These documents are available upon request.

The proposed follow-up monitoring program was developed for the Decommissioning Execution and Institutional Controls phases of the project. It will address the monitoring of radioactive and non-radioactive contaminants present in the environment and in effluent, as well as physical stressors and VCs, helping to verify the environmental effect predictions made by the EIS and its TSDs. The monitoring program was developed following a systematic informed planning process based on CSA guidance. The proposed follow-up monitoring program address the monitoring of radioactive and non-radioactive contaminants present in the environment and in effluent, as well as physical stressors and VCs, helping to verify the environmental effect predictions made by the EIS and its TSDs. It was developed following a systematic informed planning process based on CSA guidance.

10.5 Consideration of Alternate Mitigation Measures

This section includes mitigation measures that were considered by CNL during project planning, but ultimately discounted.

Alternate Chimney Swift Habitat

CNL has considered several alternate mitigation measures related to the chimney swifts, including building a replacement habitat that would mimic the current conditions and physical characteristics of the ventilation stack. There is uncertainty related to the success of the new alternative habitat due to an incomplete understanding what makes a roosting structure attractive to chimney swifts. In Canada's cold climate, artificial nesting chimneys have not been successful in attracting breeding chimney swifts or roosting groups. A panel of experts from academia, government agencies and NGOs was assembled by the project to discuss the challenges associated with alternative habitat available to chimney swifts in Canada. It was decided that the current preferred alternate is to retain the existing ventilation stack, ensuring minimal disruption to the thousands of chimney swifts that migrate to the NPD stack each year.

Disassembly

CNL considered disassembly to reduce noise effects. However, CNL instead chose controlled mechanical demolition due to its advantages such as lower economic cost and less dose and conventional risk to workers. Considering these benefits, along with noise mitigation measures (e.g., restricting controlled demolition activities to between 7am and 7pm where possible), controlled mechanical demolition is the preferred option.

Alternate Strategies

Alternate strategies (e.g., the use of bentonite as fill, the use of a groundwater diversion system) were assessed in an early iteration of the PostSA to optimize the design of the current preferred strategy.

Other Alternatives

CNL considered the use of an off-site batch mixing plant for grout and concrete, however it was decided that the grout batch mixing plant would be located at the NPD site, resulting in reduced traffic and related effects. Concrete may be trucked in from off-site.

11 CONCLUSION ON SIGNIFICANCE

11.1 Assessment Findings

This EIS discusses project-environment interactions, proposed mitigation measures, potential adverse residual effects after mitigation, determination of significance of adverse residual effects, and recommended monitoring and follow-up activities.

The NPD Closure Project will not result in any adverse residual environmental effects, including effects from accidents and malfunctions, cumulative effects, and effects of the environment on the project. The absence of adverse residual effects during the Institutional Controls and Post-Institutional Controls phases demonstrates the effectiveness of in-design mitigation measures and viability of the project. During any phase of the project, including the years following closure, doses to members of the public are lower than the regulatory limit. The assessment shows that doses are lower than regulatory limits by a factor of at least 1,000.

Indigenous and public and stakeholder engagement identified interest in a number of topics, including water quality in the Ottawa River, chimney swift, moose, gathering activities (e.g., berries), and land use and planning. No residual effects were identified for these.

11.1.1 AOPFN Perspective on Assessment Findings

This subsection (11.1.1) was prepared by AOPFN and presents their findings of potential effects. AOPFN's assessment considered additional impact pathways that were not used in CNL's assessment which followed the requirements of *CEAA,* 2012.

The AOPFN has found there is high potential for additional adverse effects from the proposed NPD decommissioning via in-situ disposal, over and above those identified by CNL, and that there is uncertainty about other potential impact pathways that merit further attention in this EA. In particular, the temporal extension of the time period where already existing cumulative effects from development of a nuclear reactor at the site, including through fencing off the area and by the introduction of radioactive materials at the reactor site, is an impact unto itself. An impact assessment of a decommissioning project, a project that by definition is meant to improve conditions at an already industrialized site, needs to focus not only on changes from current conditions, but changes required to get the site back to a natural, desired condition. By extending the amount of time that portions of the site will be inaccessible into the long distant future, and by cementing in place in the ground near the Kichi-Sìbì, the radioactive materials that cause fear, stigma, alienation and concerns about the quality of country foods and medicines, and whether they are harvestable, in-situ disposal has the potential to adversely impact on AOPFN traditional land and resource use and cultural practices. AOPFN's three studies on Algonquin Knowledge and Land Use, Diet and Harvest, and Culture and Rights, all support these as valid impact pathways, but these impact pathways have not been recognized in CNL's draft EIS. Section 9.9.6 of the draft EIS and the three AOPFN studies provide evidence regarding these valid impact pathways and identifies gaps in the approach used by CNL that allowed for these valid impact pathways to remain unidentified by CNL. In addition, there are legitimate

remaining questions about whether these impact pathways will have spin-off effects on Indigenous health and well-being, including mental health, and their magnitude. Those questions have not been adequately considered in the draft EIS.

AOPFN has requested that CNL integrate these valid impact pathways into its EIS. CNL has not altered its effects assessment and instead has provided room in the EIS for AOPFN to share its initial concerns and initial impact pathway identification. Further work is necessary to conduct a full and proper effects characterization and significance estimation on these valid impact pathways. AOPFN continues to request that CNL work with AOPFN to recognize these valid impact pathways and to integrate them into its effects characterization and significance estimation in the final EIS.

Because CNL has not included these legitimate impact pathways, CNL has also not adequately identified mitigation that will avoid, reduce or otherwise accommodate for these impacts. CNL has identified some existing mitigations that are in place such as its environmental protection mitigations and the Public Information Program. AOPFN notes that the current environmental protection mitigations have been developed without the benefit of either a Traditional Knowledge baseline or inclusion of Indigenous peoples in the development of the environmental monitoring and management measures for the site. AOPFN also notes that there is no evidence that the existing Public Information Program has been or will be effective in reducing fear, stigma, alienation, and risk perception of Indigenous peoples about the NPD site. AOPFN has recommended CNL adopt multiple additional commitments to improve on these and other elements of the site monitoring and management systems. To date, and as reported in Table C-4 and Section 6.2.4.3 of this draft EIS, only some of those recommendations have been adopted. AOPFN remains willing to work with CNL to find the most appropriate and protective mitigation and monitoring measures necessary to protect AOPFN rights, interests and the resources they rely upon, regardless of what decommissioning strategy is eventually adopted for the NPD site.

AOPFN and CNL plan to continue working together to find common understandings of valid impact pathways and their significance, and to find appropriate and collaborative ways to monitor and manage the NPD site and will update the CNSC on these efforts in the final EIS.

11.2 Confidence in Assessment Findings

The facility has been in storage with surveillance for over 30 years with the same inventory that is proposed to be retained in the grouted facility, with no undue impact on the environment.

All proposed Decommissioning Execution activities will be carried out in accordance with CNL policies and procedures, provincial and federal regulations, and measures designed to mitigate effects on human health and the environment. The proposed technologies are known and proven. In-situ disposal has been in use for at least 50 years.

In the long-term, following the defence-in-depth principle, the PostSA has demonstrated that the failure of any of the physical engineered barriers will not compromise the performance of the system. For the purposes of this EIS, the defence-in-depth principle is defined as the use of multiple barriers to prevent the escalation of anticipated operational occurrences and to maintain the effectiveness of physical barriers in

place between a radiation source or radioactive material and workers, members of the public and the environment, under normal evolution and disruptive events. It should be noted that while time is elapsing and eventually leading to the degradation of the engineered barriers (which is taken into account in the assessment), the radioactivity is progressively decaying. The assessment has shown that the effectiveness of the engineered barriers over time and as they progressively degrade is adequate to protect the ever-decreasing radiological hazard at any given point in time.

The EIS highlights areas of uncertainty (e.g., contaminant concentrations, contaminant transport characteristics, land use near NPD, etc.) that could affect the EIS findings. Therefore, consistent with regulatory and international best practices, these uncertainties are addressed as follows:

- Process: a systematic, transparent and auditable process for developing and analysing safety in all phases of the project is used;
- Comparison with regulatory safety criteria: the safety assessment results are orders of magnitude below these criteria; and
- Range of performance indicators: a wide range of indicators (e.g., releases, environmental concentrations, doses, etc.) has been used.

In addition, a range of scenarios has been assessed, to encompass possible conditions during all project phases. The range of results for the various scenarios is a valuable confidence-building measure, as it demonstrates that even under a range of different assumptions and conditions, the safety criteria are met illustrating the intrinsic robustness of the system. This is further supported by observations of the engineered barriers' durability under natural conditions.

It is CNL's conclusion that with the identified mitigation measures, the NPD Closure Project is not likely to result in any significant adverse residual effects. Follow-up and monitoring activities (summarized in Section 12 below) will verify EA predictions and determine the effectiveness of mitigation measures.

12 FOLLOW-UP PROGRAM

This section provides a preliminary plan for an EA Follow-up Program to satisfy regulatory requirements outlined in the EIS Guidelines (CNSC 2016a). As the proponent of the project, CNL will be responsible for implementing and managing the proposed EA Follow-up Program. The responsible owner of the site, AECL (Government of Canada), will be responsible for the provision of funds to maintain the EA Follow-up Program.

CNL currently conducts environmental performance monitoring activities at the NPD site, including compliance, effluent and groundwater monitoring programs as well as inspections and surveillance activities. The following are aspects of the current environmental performance monitoring that are currently reported on an annual basis:

- effluent monitoring program consisting of NPRI monitoring, airborne release monitoring through tritium and gross beta/gamma analysis of the ventilation stack and tritium and gross beta/gamma monitoring of groundwater diversion systems;
- groundwater monitoring program consisting of routine sampling and analysis of groundwater from a series of wells. Analysis includes radiological (e.g., tritium, gross beta, gross alpha), and non-radiological (e.g., major cations, anions, metals, alkalinity, PCBs, and various petroleum hydrocarbons); and
- environmental monitoring consisting of tritium and Cs-137 analysis of the Ottawa River, as well as tritium analysis of water from surface soil and vegetation.

CEAA (2012) requires that the EIS include a framework or preliminary program upon which EA follow-up actions will be managed throughout the life of the project (which in this case, applies until the end of the Institutional Controls phase, which is a minimum of 100 years).

The NPD Closure Project has developed a proposed follow-up monitoring program in accordance with relevant CSA N288 standards for effluent, environmental and groundwater monitoring. The draft program was submitted to the CNSC in October 2018 (64-CNNO-18-0026-E and 64-CNNO-18-0027-E) and is part of the EIS Supplementary Documentation TSD (as discussed in Section 8.1).

Although the monitoring program has identified different objectives from CSA and CNL company-wide objectives, at a minimum the program will follow the objectives specified in REGDOC-2.9.1 (CNSC 2020a) and *CEAA* (2012):

- verify the accuracy of EA predictions;
- determine the effectiveness of any measures implemented to mitigate potential adverse environmental effects.

12.1 Scope

The EA Follow-up Program will provide data to support future stages of the project, i.e., the initiation of the Post-Institutional Controls Phase. The program includes regular reporting, review, and audits. It will be adjusted on regular basis in order to account for evolving site conditions, outcomes of stakeholder and Indigenous engagement, and any feedback from the monitoring program. Regulatory license conditions may also stipulate additional monitoring not related to the EA Follow-up Program, but if this occurs, data will be shared to meet the collective requirements.

The CNSC, as the regulatory authority for the project, will coordinate the review of the EA Follow-up Program with Environment Canada and other interested Federal and Provincial agencies. Input from the public and Indigenous peoples will also be considered.

The current proposed follow-up monitoring program will continue to be improved and refined throughout the NPD Closure Project EA process. In accordance with Section 12 of the Generic Guidelines for Preparation of an EIS, the NPD Closure Project is seeking to incorporate feedback from Indigenous Nations, communities and organizations, and the public and stakeholders.

The proposed program was developed for the Decommissioning Execution and Institutional Controls phases of the project. It will address the monitoring of radioactive and non-radioactive contaminants present in the environment and in effluent, as well as physical stressors and VCs, helping to verify the environmental effect predictions made by the EIS and its TSDs. The proposed program was developed following a systematic informed planning process based on CSA guidance.

12.2 Relationship of EA Follow-up Program to Other Programs

CNL's Environmental Protection Program (CNL 2022a) is designed to ensure protection of the environment and the public from CNL's activities. Adherence to this program ensures that potential environmental adverse effects resulting from CNL activities are prevented or mitigated.

CNL is committed to achieving continual improvement in environmental performance through its management systems. CNL manages environmental related matters through an existing Environmental Management System (EMS). The EMS is registered within the requirements of the International Organization for Standardization 14001:2015 standard (ISO 2015). It includes compliance and improvement systems to evaluate areas for improvement or trending. It will continue to be implemented for the NPD Closure Project and will be updated, as needed, as part of an annual management review process. As site conditions and monitoring dictate, or as new technology emerges, CNL will adaptively manage site practices and the monitoring program to meet the defined objectives. This may include regular evaluation of predictive models; which will be defined in the detailed EA Follow-up Program.

If the EA Follow-up Program identifies that adverse environmental effects are greater than predicted, then CNL will evaluate whether they result in changes to the conclusions in this EIS. If changes are confirmed, then CNL will evaluate the need for revised mitigation actions and management practices to manage effects.

In general, the monitoring plans follow CNL's Management Control Procedure - Improvement Action (IMPACT) Corrective Action Program when dealing with exceedances of performance criteria. Specific mitigation measures would depend on the nature of the exceedance and would be defined after the exceedance is characterized. For example, contingency plans to address exceedances in groundwater include a pump-and-treat system or permeable reactive barrier to mitigate contaminated groundwater.

12.3 EA Follow-up Program Details

The proposed monitoring and follow-up activities may be modified, and activities may be added pending the actions needed to satisfy regulatory and/or stakeholder concerns identified during engagement activities prior to finalizing the EA Follow-Up Program.

12.3.1 Effluent Monitoring

Following the identified objectives, systematic informed planning process, and consideration of each effluent stream in the NPD Closure Project, the detailed design of effluent monitoring was developed.

The effluent stream sampling locations are outlined below in Table 12.3-1 and Figure 12.3-1. Table 12.3-2 and Table 12.3-3 summarize the effluent monitoring that will be implemented during the Decommissioning Execution phase and Institutional Controls phase, respectively. These summary tables show the process by which effluent streams and parameters are screened in or out, as well as the monitoring frequencies for each stream or type of parameter. The locations at which effluent streams are sampled are appropriate to the monitoring objectives of the plan and characteristics of each effluent stream, and are also consistent with existing locations monitored in the NPD Effluent Monitoring Plan (CNL 2022b).

The elements of this proposed follow-up effluent monitoring will be subject to annual monitoring program reviews and will incorporate considerations from public and Indigenous stakeholder feedback as well as regulatory requirements, in addition to the outcomes of internal technical reviews by CNL subject matter experts.

Table 12.3-1 Effluent Stream Sampling Locations

Effluent Stream	Sampling Location
Decommissioning Execution Phase	
Ventilation exhaust	Monitored in the Static State Control Area (SSCA) within the Main Building where the monitoring equipment is located. Although the location is post-fan and in proximity of potential flow disturbances (bends in the ductwork), it is nevertheless considered well-mixed and representative of the effluent stream given the high flow and is ideally located for ease and safety of sample collection and station maintenance and personnel. Following the decommissioning of the ventilation system, portable ventilation will be used, and the sampling will be conducted on this portable ventilation. The location of sampling and discharge will vary based on the task requiring ventilation. Once finalized, the FUMP will reflect the most up-to-date details for this task.
Release of surface contamination during demolition	Air monitoring location should be where the greatest concentrations were reported in the DecomSA near the demolition site. Once finalized, the FUMP will reflect the most up-to-date details for this task.
Displacement of contaminated air during grouting of below grade structures	Air monitoring location should be where the greatest concentrations were reported in the DecomSA near the demolition site. Once finalized, the FUMP will reflect the most up-to-date details for this task.
Halocarbon release	Estimation of total released mass of halocarbons.
Solvent use	Estimation of solvent use.
Dust emissions	Air monitoring location should be where the greatest concentrations were reported in the DecomSA near the demolition site.
Diesel emissions	N/A - Diesel emissions will be calculated based on the amount of fuel used
Water collection points throughout the facility	Locations will be determined by observation or planned at the time of grouting. They cannot be predicted at this time. Following final grouting there will no longer be a need for water collection and the effluent stream will cease.
Washout pit	Manual liquid grab sample taken directly from the washout pit.
Institutional Controls Phase	
Dust emissions	Estimation (verification of hours worked).
Diesel emissions	Estimation (verification of hours worked).

Figure 12.3-1 NPDWF Effluent Release Locations and Monitoring Locations During the Decommissioning Execution Phase

Notes:
Locations are approximate, subject to change
** Ventilation releases will be made from the vent stack until the ventilation system is decommissioned. Following this, ventilation will be provided by portable ventilation and releases will be from the area being worked on
† Monitored at source prior to release

12.3.1.1 Decommissioning Execution

Table 12.3-2 Summary of the Proposed Effluent Monitoring during the Decommissioning Execution Phase

	Effluent Stream	Monitoring Required (Y/N)	Parameters to be Monitored	Monitoring Frequency[1]
Airborne Emissions	Ventilation exhaust, including portable ventilation.	Y	Radionuclides	Continuous while exhaust fan running (ventilation will remain in place until grouting is completed).
			Flow	Monthly
			Fan Run Time	Monthly
	Fugitive releases from the main building non-nuclear area	N (minimal or no source of airborne radioactivity)		
	Fugitive releases from the external areas or structures	N (minimal or no source of airborne radioactivity)		
	Release of surface contamination during demolition	Y	Radionuclides	Continuous during demolition
			Metals	Continuous during demolition
			Flow	Monthly
			Fan Run Time	Monthly
	Displacement of air during grouting of below grade structures	Y	Radionuclides	Continuous during grouting
			Metals	Continuous during grouting
			Asbestos	Continuous during grouting
			Flow	Monthly
			Fan Run Time	Monthly
	Halocarbon release (in support of annual estimation of GHG emissions, not related to project impacts)	Y	Halocarbons	Per release
	Solvent use	Y	Solvent Use	Annually
	Dust emissions (also in support of NPRI reporting requirements)	Y	Suspended particulate matter	Continuous
	Noise Emissions	Y	Monitored as part of the follow-up environmental monitoring (Section 12.3.2)	
	Diesel Emissions (also in support of NPRI reporting requirements)	Y	Air pollution gases	N/A

Environmental Impact Statement - NPD Closure Project

12 Follow-Up Program

	Effluent Stream	Monitoring Required (Y/N)	Parameters to be Monitored	Monitoring Frequency[1]
	Former Landfill 1 (in support of annual estimation of GHG emissions, not related to project impacts)	Y	Greenhouse Gas	Annually
Waterborne Emissions	Water collection points throughout the facility	Y	Radionuclides	Prior to every batch shipment to CRL
			Metals	Prior to every batch shipment to CRL
			Toxic chemicals	Prior to every batch shipment to CRL
			Volume	Per batch
	Subsurface drainage	Y	Monitored as part of the follow-up environmental (Section 12.3.2) and groundwater (Section 12.3.3) monitoring	
	Surface water drainage	Y	Monitored as part of the follow-up environmental (Section 12.3.2) monitoring	
	Washout pit	Y	Radionuclides	Prior to every batch shipment to CRL
			Water Clarity	Prior to every batch shipment to CRL
			pH	Prior to every batch shipment to CRL
			Volume	Per batch

Notes:

GHG – Greenhouse Gas; N/A – Not Applicable
1 - Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each effluent stream are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

12.3.1.2 Institutional Controls

Table 12.3-3 Summary of the Proposed Follow-up Effluent Monitoring during the Institutional Controls Phase

	Effluent Stream	Monitoring Required (Y/N)	Parameters to be Monitored	Monitoring Frequency
Airborne Emissions	Fugitive releases through the cap and barrier	Y	Monitoring is considered as part of the follow-up environmental (Section 12.3.2) monitoring	
	Dust emissions	N	Suspended Particulate Matter	
		Y	Hours worked	Annual
			Vehicle kilometers travelled	Annual
	Diesel emissions	N	Suspended Particulate Matter	
		Y	Hours worked/ fuel used	Annual

Notes:

N/A – Not Applicable
1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each effluent stream are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

12.3.2 Environmental Monitoring

This section provides a concise summary of the proposed follow-up environmental monitoring. The tables included in this section outline the design of those environmental components designated as requiring empirical monitoring. Justification is provided for both the monitoring (or not) of various parameters, and for the required monitoring frequency.

The elements of this proposed follow-up environmental monitoring will be subject to annual monitoring program reviews and will incorporate considerations from public and Indigenous stakeholder feedback as well as regulatory requirements, in addition to the outcomes of internal technical reviews by CNL subject matter experts.

12.3.2.1 Decommissioning Execution

Table 12.3-4 summarizes the proposed follow-up environmental monitoring that will be implemented during the Decommissioning Execution Phase.

Table 12.3-4 Summary of Proposed Follow-up Environmental Monitoring During the Decommissioning Execution Phase

Environmental Component	Subcomponent	Sampling Locations	Parameters to be Monitored	Monitoring Frequency[1]
Atmospheric Environment	Air Quality	*(if triggered by tier 2 exceedances in atmospheric effluent monitoring)* • Site boundary • Sensitive receptors within the Regional Study Area	• Radionuclides	Continuous for one week during new activities or modifications to existing activities (while activities are occurring)
			• Air pollution gases	Continuous for one week during new activities or modifications to existing activities (while activities are occurring)
			• Suspended particulate matter	Continuous during decommissioning activities (while activities are occurring)
			• Metals • Asbestos	Continuous for one week during new activities or modifications to existing activities (while activities are occurring)
	Noise	• Site boundary *(if triggered)* • Sensitive receptors within the Regional Study Area.	• Noise	Continuous during periods of high activity (while activities are occurring)
Surface Water Environment	Erosion	Visual inspection of site drainage and erosion will be undertaken as part of CNL's Routine Inspections Procedure (CNL 2018a)		
	On-site Surface Water Quality	• Ottawa River shoreline, downgradient of effluent points	• Radionuclides	Monthly
	Ottawa River Water Quality	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	• Radionuclides • pH • Water Clarity • Metals	Quarterly
	Sediment Quality (*if triggered by tier 2 surface water or groundwater exceedances*)	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	Parameters dependent upon exceedances in other environmental media.	Annually
Aquatic Environment	Fish (*if triggered by tier 1 surface water exceedances)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	Parameters dependent upon exceedances in other environmental media.	Annually
	Benthic Macroinvertebrate community (*if triggered by sediment exceedances)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	Benthic macroinvertebrate community metrics	Semi-annually
Geological Environment	Wet and Dry Deposition *(if triggered by tier 2 atmospheric exceedances)*	• Site boundary • Sensitive receptors within the Regional Study Area.	(*if triggered)* parameters dependent upon exceedances in other environmental media.	Continuous
	Soil quality *(if triggered by tier 2 groundwater exceedances)*	• Established monitoring points within the Site Study Area	• Radionuclides (*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually

Environmental Impact Statement - NPD Closure Project

12 Follow-Up Program

Environmental Component	Subcomponent	Sampling Locations	Parameters to be Monitored	Monitoring Frequency[1]
Terrestrial Environment	Chimney Swift	• NPD Site	Chimney swift roost disturbance	• During the non-breeding season (May 1-June 21 and July 31-September 1): 1-hour observation during inclement weather • During breeding season (June 22 to July 30): daily roost counts
	Species at Risk	Along the main road, other transportation routes, and areas of where new activities are taking place on site.	Roadkill mortality	Daily during eastern milksnake active season (April 15 to September 30), only when decommissioning activities are occurring
			SAR disturbance	Prior to commencement of new or modified activities
		• NPDWF structure (crawlspace, voids outside of facility), as well as areas of bat emergence	Bat presence	Preceding the initiation of decommissioning activities: Visual inspections to be conducted in both summer (during high activity) and winter (during hibernation).
	Wildlife	Along the main road, other transportation routes, and areas of where new activities are taking place on site.	Disturbance of locally rare species, migratory birds' nests, etc.	Prior to new activities or modifications to existing activities
	Vegetation *(if triggered by tier 2 groundwater exceedances)*	• Established monitoring points within the Site Study Area	• Radionuclides *(if triggered)* Parameters dependent upon exceedances in other environmental media.	Quarterly
Ambient Radioactivity	Ambient Radioactivity	• Within the NPD site, at previously established monitoring areas • Downwind at currently monitored locations	• Gamma dose rate	Continuous
Human Health	Worker Health	Worker dose is assessed as part of CNL's *Dosimetry Program*		

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.

Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

12.3.2.2 Institutional Controls

Many of the locations selected for monitoring during the Institutional Controls phase are the same as those selected for the Decommissioning Execution phase. Some of the specific points within the Site Study Area will no longer be available during the Institutional Controls phase.

Atmospheric monitoring locations associated with predictions in the Decommissioning Execution phase are no longer relevant, and monitoring may occur (if triggered) at locations associated with potential groundwater exceedances.

Table 12.3-5 summarizes the proposed follow-up environmental monitoring that will be implemented during the Institutional Controls Phase.

Table 12.3-5 Summary of the Proposed Follow-up Environmental Monitoring During the Institutional Controls Phase

Environmental Component	Subcomponent	Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Atmospheric Environment	Air quality *(if triggered by tier 2 groundwater exceedances)*	• Atmospheric monitoring will be co-located with groundwater exceedances.	• Parameters dependent upon exceedances in other environmental media.	Continuous
Surface Water Environment	On-site surface water quality	• Ottawa River shoreline, downgradient of effluent points	• Radionuclides	Monthly
	Site drainage	Visual inspection of site drainage and erosion will be undertaken as part of CNL's *Surveillance Plan* (Taylor 2019)		
	Ottawa River Water Quality	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	• Radionuclides (alpha and beta emitters) • pH • Metals *If triggered* • Radionuclides (gamma emitters)	Quarterly
	Sediment Quality *(if triggered by tier 2 surface water or groundwater exceedances, or a potential seismic event scenario)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	(*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annual, if triggered
Aquatic Environment	Fish *(if triggered by tier 2 surface water exceedances)*	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	(*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annual, if triggered
	Benthic Macroinvertebrate community (*if triggered by sediment exceedances*)	• Ottawa River at the NPD Site • Ottawa River downstream of the NPD Site • Ottawa River upstream of the NPD Site	Benthic macroinvertebrate community metrics	Semi-annually
Geological Environment	Soil quality *(if triggered by tier 2 groundwater exceedances)*	• Soil monitoring will be co-located with groundwater exceedances. • Established monitoring points within the Site Study Area.	• Radionuclides (*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually
	Soil vapour quality *(if triggered by tier 2 groundwater exceedances)*	• Soil vapour monitoring will be co-located with groundwater exceedances. • Established monitoring points within the Site Study Area.	(*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually
	Topography	Inspection of slope stability and changes in topography in the disposal facility footprint will be undertaken as part of CNL's *Surveillance Plan* (Taylor 2019)		
Terrestrial Environment	Chimney Swift	• NPD site	Chimney swift roost disturbance	Weekly for the first three years of institutional control
		Inspection of ventilation stack integrity will be undertaken as part of CNL's *Surveillance Plan* (Taylor 2019)		
	Vegetation quality *(if triggered by tier 2 groundwater exceedances)*	• Vegetation monitoring will be co-located with groundwater exceedances. • Established monitoring points within the Site Study Area.	• Radionuclides (*if triggered)* Parameters dependent upon exceedances in other environmental media.	Annually
Ambient Radioactivity	Ambient Radioactivity	• Within the NPD site, at previously established monitoring areas. • Downwind at currently monitored locations	Gamma dose rate	Continuous
Human Health	Worker Health	Worker dose is assessed as part of CNL's *Dosimetry Program.*		

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

12.3.3 Groundwater Monitoring

This section provides a concise summary of the proposed follow-up groundwater monitoring. Table 12.3-6 and Table 12.3-7 summarize the follow-up groundwater monitoring that will be implemented during the Decommissioning Execution Phase and Institutional Controls Phase, respectively.

The elements of this proposed follow-up groundwater monitoring will be subject to annual monitoring program reviews and will incorporate considerations from public and Indigenous stakeholder feedback as well as regulatory requirements, in addition to the outcomes of internal technical reviews by CNL subject matter experts.

12.3.3.1 Decommissioning Execution Phase

Table 12.3-6 Summary of Proposed Follow-up Groundwater Monitoring during the Decommissioning Execution Phase

Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Reference Wells (upgradient of the facility); Existing Wells and/or Proposed New Wells (downgradient of the facility)	Groundwater Level	*Groundwater Levels (Obj. #1):* 4 campaigns (1 per quarter), over 1 year, at the completion of DE
	Wellhead Parameters	*Groundwater Quality (Obj. #2):* 2 campaigns over 1 year (i.e. semi-annually) and, 1 one-time campaign at the completion of DE
	Radionuclides	
	Anions	
	Alkalinity	
	Major Cations	
	Metals	
	Petroleum Components (F1 - F4)	

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

12.3.3.2 Institutional Controls Phase

Table 12.3-7 Summary of Proposed Follow-up Groundwater Monitoring during the Institutional Controls Phase

Sampling Location	Parameters to be Monitored	Monitoring Frequency[1]
Reference Wells (upgradient of the facility); Existing Wells and/or Proposed New Wells (downgradient of the facility)	Groundwater Level	*Groundwater Levels (Obj. #3):* During resaturation: semi-annually After resaturation: to be determined in future using the periodic review process.
	Wellhead Parameters Radionuclides Anions Alkalinity Major Cations Metals Petroleum Components (F1 - F4)	*Groundwater Quality (Obj. #4):* 1st year: Quarterly 2nd year to completion of resaturation: Semi-annual After resaturation: 1 one-time campaign at the completion of resaturation *Performance Monitoring (Obj. #5):* *(Tritium, Gross Beta/Gamma, pH, and Alkalinity)* 1st year: Quarterly 2nd year to completion of resaturation: Semi-annual After Resaturation: 1st year: Periodic (Quarterly) for 1 year After resaturation: 2nd year and beyond: Periodic (semi-annually).

Notes:

1 – Based on observations and monitoring data collected, the frequency of monitoring is subject to change.
Monitoring program objectives for each environmental component are to verify EA predictions and/or determine effectiveness of mitigation measures unless otherwise stated.

Parameter monitoring frequencies during the IC Phase at monitoring wells downgradient of the building should be increased to quarterly if a change in the chemistry of the groundwater has been detected, which may indicate that resaturation has occurred.

After resaturation has occurred, the number of sampling locations may be reduced based on the professional judgement of CNL's Environmental Protection Program, provided that the parameters applied in the monitoring are not key performance indicating parameters, if in the previous 10 sampling events or 5 years of monitoring:

- detections (or anomalous concentrations) have not occurred; or
- no temporal trend has been detected; or
- temporal trend has been detected, indicating improving groundwater quality.

12.4 Records and Data Management

The development and implementation of mitigation identified for the NPD Closure Project and housed in the proposed follow-up program are tracked in relevant management plans, where data management, including collection, storage, standards, and responsible roles, are defined. Data collection will meet the required guidelines for collection and quality assurance and control. CNL will store information generated from the environmental results from the monitoring and follow-up monitoring in a robust database for future analysis and reporting. Analysis of results from the EA Follow-up Program will be reported and submitted to the relevant regulatory agencies as required.

12.5 Quality Assurance and Quality Control

The NPD site operates under CNL's Cleanup Program (Morrison 2023, 2022). In order to verify the validity of analytical results for the EA Follow-up Program, the laboratories that will perform sample and data analysis have rigid Quality Assurance / Quality Control (QA/QC) programs as required by CNL's Environmental Protection Program.

12.6 Data Interpretation

The general requirements on the handling of uncertainty, significant figures, and dose assessment are outlined in CNL's internal Environmental Monitoring Program (Boileau 2018).

12.6.1 Data Evaluation

Evaluation criteria are developed for each environmental media, location and parameter identified in each monitoring plan. These criteria are used as a framework for evaluating the monitoring data and determining the appropriate response, and are comprised of the following:

- Site-specific baseline data (collection of any additional baseline data required will be initiated before commencement of the project);
- Environmental concentrations predicted as part of the EIS and TSDs; and,
- Relevant guidelines (e.g., CCME Water Quality Guidelines, Health Canada Guidelines for Drinking Water Quality).

Proposed evaluation criteria are outlined in the proposed follow-up monitoring program.

The data evaluation criteria allow for interpretation of monitoring data and provides a tiered system to increase or decrease monitoring based on the results. The responses to these exceedances are commensurate with the level of risk associated with that respective tier. In general, exceedances are to be addressed by at least one of the suggested methods as follows:

- Tier 1 exceedances:
    - Data review (e.g., trend evaluation, secondary sampling to confirm exceedance);

  - Investigate source of exceedance;
  - Consider increased monitoring frequency.

- Tier 2 exceedances:
  - Data review (e.g., trend evaluation, secondary sampling to confirm exceedance);
  - Investigate source of exceedance;
  - Apply additional mitigation measures, consider remediation (if applicable);
  - Consider stop work;
  - Increase monitoring (e.g., increased frequency, additional parameters, additional locations).

It is noted that the CNSC verifies and monitors all EA follow-up activities through the CNSC licensing and compliance process.

12.7 Information Management and Reporting

During the operation of the EA Follow-Up Program there are several forms of reporting that are generated, including the annual report, annual and periodic reviews, and audits. Annual reporting may be a requirement under the terms and conditions of the SARA permit relating to chimney swift monitoring. Reporting, review and audit requirements are set out in N288.4 (CSA 2019). Reporting requirements will also be dictated by *REGDOC-3.1.2* (CNSC 2018), the CNSC decision relating to the NPD Closure Project EA.

12.7.1 Annual Report

The annual monitoring report for the NPD Closure Project EA Follow-up Program may include:

a) The results, including:
   i. completeness of monitoring activities (identify if all planned activities were accomplished);
   ii. measurements of the monitored hazardous and/or nuclear substances, physical stressors, and physical and biological parameters, including their statistical analyses (i.e., assessments of changes through time and space);
   iii. an assessment of the monitoring results compared with the performance indicator targets;
   iv. documentation and justification of any deviations from field sampling, and analytical and data management procedures;
   v. the amount or concentration of radioactive nuclear substances and hazardous substances released, as required to demonstrate compliance with regulatory limits and performance with respect to any other release target (e.g., action levels);
   vi. a discussion of the past monitoring results, and any notable differences from current monitoring results;
b) relevant groundwater and hydrogeological characteristics;
c) a summary of the audit and review results and subsequent corrective actions; and
d) a summary of any proposed modifications to the monitoring plans.

12.7.2 Annual Review

A review of the EA Follow-up Program is to be completed annually to evaluate the adequacy of the various elements of the program and to institute changes as needed to improve or optimize the administration and design of the program in meeting the environmental monitoring objectives. Optimization can include adding or removing monitoring activities, including terminating routine monitoring where justified.

The annual review is to be conducted in the form of a meeting, using a methodology based on the CNL Quality Assurance Procedure for *"Quality Assurance Program Reviews and Special Investigations"* (Marshall 2001).

A range of actions of general and specific nature, should then be identified from the review. The results of the review are documented in detailed meeting minutes, which form a formalized record of changes made to the program and the rationale for the changes.

Environmental performance functions such as the operational feedback review process and the non-conformance management process may also result in process improvement. Further detail on these processes can be found in each monitoring plan. During the course of evaluating the performance of the facilities and sites undergoing environmental monitoring, changes to the program scope can be triggered in order to improve the methods of environmental monitoring, e.g., additional monitoring locations and/or additional parameters. Changes can also be triggered from investigating or evaluating non-conformances to the environmental performance criteria. In this case, the changes can include adjustments to the environmental performance criteria in order to correct false (nuisance) performance indicators.

12.7.3 Periodic Review

A periodic review of the EA Follow-up Program involves re-examining the need for and the adequacy of the EA Follow-up Program components through:

a) a review of the criteria for determining the need to establish the monitoring plans; and

b) a review of the adequacy of the program with respect to the identified environmental risks on the site which were identified through the ERA, or other studies of similar type.

Documentation of the review in the form of a formal report or memo is prepared.

The timing of this routine review is dependent on the timing of the following site activities but in general occurs at least once per five years:

(a) following an update or revision of the risk assessment performed within the NPD Closure Project EIS (every five years);
(b) prior to applying for the site license renewal (license valid until December 31, 2034); or
(c) Following any change with the potential to substantially alter the predictions of the EIS and technical support documents or the implementation of the EA Follow-Up Program, which can include a change in:
    (i) the design or operation of the facility;

(ii) the population or land use in the surrounding community;
(iii) the scientific understanding of the interactions of the facility with the environment;
(iv) the nature of the surrounding environment;
(v) the statutes, regulations, licenses, or permits that govern the operation of the facility;
(vi) any reassessment of the environmental risks and the hazardous substances of concern; or
(vii) the commitments made by the licensee to any regulatory agency, stakeholder, or Indigenous Nation, community or organization.

12.7.4 Audit

To confirm that the EA Follow-Up Program is carried out in compliance with its procedures and elements, an audit of the core elements of the EA Follow-Up Program will be completed at least once every five years, or more frequently if operational conditions change and require such an audit. This audit will address the core elements of the EA Follow-Up Program, including:

- sampling design;
- sampling and analytical procedures;
- data analysis;
- interpretation;
- QA; and
- reporting, review, and audit.

This audit will be conducted by an individual who is not responsible for the EA Follow-Up Program in any way to ensure an unbiased review. The process and findings of this audit will be documented and recorded in an audit report, identifying the procedures, results, disposition of corrective actions, and verification of effectiveness of corrective actions.

12.8 Program Responsibilities, Qualifications, and Training Requirements

CNL will implement the EA Follow-up Program during the decommissioning and institutional control phases of the NPD Closure Project. Follow-up, surveillance, and monitoring activities proposed in support of the NPD Closure Project will be set to meet the objectives of monitoring the prediction in the environmental assessment for the project.

As the proponent of the project, CNL will be responsible for implementing and managing the EA Follow-Up Program. AECL, the owner of the site, is responsible for providing funding to CNL for the management and operation of its sites as per contractual arrangement, including funding for the EA Follow-Up Program.

If the EA Follow-up Program for the project identifies that adverse environmental effects are greater than predicted or results for any monitored contaminants of potential concern are above the established limits,

then CNL will investigate the results, which may include additional sampling and analysis to help determine/confirm the source and extent of the contamination. CNL would also evaluate whether they result in changes to the conclusions in the EIS. If changes are confirmed, then CNL will evaluate the need for revised mitigation actions and management practices to manage effects, with engagement with Indigenous Nations, communities and organizations for openness and transparency. Any proposals on modifications to the monitoring program will be communicated to the CNSC.

CNL is committed to reviewing and adapting the proposed follow-up monitoring program for the NPD site to incorporate Traditional Knowledge that has been collected through the EA for the NPD Closure Project, as well as through ongoing engagement and relationship building, in order to provide each Nation with the information that is relevant and important to them. CNL will continue to work with Indigenous Nations, communities, and organizations as the proposed EA Follow-Up Program for the NPD Closure Project evolves, to address concerns and incorporate them into the program as appropriate.

APPENDIX A: SUMMARY OF SUPPORTING DOCUMENTS

Appendix A: Summary of Supporting Documents

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
Ecological Land Classification (ELC) Report	(1)	Entire document is applicable to the NPD Closure Project	Description of the vegetation communities at NPD site. Judgement was used to identify representative areas of the site. Information from this study was added to the EIS Description of the Existing Environment.	Factual evidence based on a field surveys completed at the site	None
Stakeholder Engagement	(2)	Entire document is applicable to the NPD Closure Project	To inform stakeholders and enable public to provide feedback. Information from this study was added to the EIS Section on Public and Stakeholder Engagement.	Factual evidence based on interactions with stakeholders and public	Commensurate with the extent and detail of the inputs received and the data available and considered adequate to support assessment.
Indigenous Engagement Report	(3)	Entire document is applicable to the NPD Closure Project	To solicit input from potentially affected Indigenous Nations, communities and organizations; to document traditional land uses. Information from this study was added to the Indigenous Engagement and Traditional Land and Resource Use (Baseline and Effects) sections of the EIS.	Factual based on interactions with Indigenous Nations, communities and organizations	Commensurate with the extent and detail of the inputs received and the data available and considered adequate to support assessment.
Alternative Means Assessment	(4)	Entire document is applicable to the NPD Closure Project	A comparison of the relative risk to VCs (grouped together by environmental component) from each alternative to the baseline (continued storage with surveillance). The assessment also considers absolute risk. Information from this study was added to the EIS Section on Alternative Means of Carrying out the project.	The assessment of relative risk is qualitative and is based on the consideration of the differences between the alternatives.	The limitation is the semi-qualitative nature of the assessment. The level of the assessment is commensurate with the level of understanding of the alternative means and is sufficient to rank the alternative means.

Environmental Impact Statement - NPD Closure Project

Appendix A: Summary of Supporting Documents

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
Decommissioning Safety Assessment (DecomSA)	(5)	Entire document is applicable to the NPD Closure Project	Air dispersion of contaminants was modelled using available up-to-date information on a number of factors, including quantities of hazardous substances, distribution of inventory, time required to complete demolition, meteorological data etc. Information from this study informs the Ecological Risk Assessment (EcoRA) as well as the EIS Assessment and Mitigation of Environmental Effects, including Accidents and Malfunctions and Effects of the Environment on the project.	Models are based on available factual information and conservative assumptions of unknown parameters where necessary.	Limitations due to predictive modelling are minimized by: - Using an iterative, systematic, transparent and auditable process - Applying regulatory safety criteria and constraints derived from them that are been set so as to prevent an unacceptable level of harm or risk to people or the environment. - Considering a range of performance measures (dose, total amount of contaminants and their location, environmental concentrations)
Postclosure Safety Assessment (PostSA)	(6)	Entire document is applicable to the NPD Closure Project	Human health results and environmental concentrations of contaminants resulting from a number of scenarios during the postclosure period. There is uncertainty with respect to future conditions, geosphere and biosphere, data/parameters etc. Information from this study informs the Ecological Risk Assessment (EcoRA) as well as the EIS Assessment and Mitigation of Environmental Effects, including the Effects of the	Environmental concentrations and screening indices are predictions modelled based on available information on current and future conditions.	Limitations due to predictive modelling are minimized by: - Using an iterative, systematic, transparent and auditable process - Applying regulatory safety criteria and constraints derived from them that are been set so as to prevent an unacceptable level of harm or risk to people or the environment. - Considering a range of

			Environment on the project.		performance measures (dose, total amount of contaminants and their location, environmental concentrations). Conducting a range of calculations exploring uncertainties, including "Defence-in-Depth" cases.
Groundwater Modelling	(7)	Entire document is applicable to the NPD Closure Project	Modelling the existing groundwater conditions at NPD site based on available information and conservative assumptions on hydraulic conductivity, recharge, head, etc. Information from this study informs the PostSA and was also used in the EIS Characterization of Baseline.	Groundwater flow is calculated based on fact-based evidence and assumptions based on site knowledge.	Limitations due to modelling are manage using calibration.
Ecological Risk Assessment (EcoRA)	(8)	Entire document is applicable to the NPD Closure Project	Screening indices are used to determine the potential for undue effects on non-human biota. The screening indices rely on a number of parameters. Some uncertainties exist with respect to these parameters, such as receptor occupancy on the site, diet, transfer factors. Where possible, these uncertainties are addressed through the use of conservative estimates (e.g., 100% occupancy on the site). Information from this study informs the EIS Assessment and Mitigation of Environmental Effects.	Screening indices are values calculated based on fact-based evidence, up-to-date available parameters (e.g., transfer factors), and conservative assumptions of unknown parameters.	Limitations due to predictive modelling are minimized by: - Using an iterative, systematic, transparent and auditable process. - Applying regulatory safety criteria and constraints derived from them that are been set so as to prevent an unacceptable level of risk to the environment. - Considering a range of performance measures (dose, total amount of contaminants and

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
					their location, environmental concentrations). Conducting a range of calculations exploring uncertainties, including "Defence-in-Depth" cases.
Socio-economic Assessment	(9)	Entire document is applicable to the NPD Closure Project	To describe the existing and predicted future socio-economic conditions (e.g., land use, tourism, forestry, etc.) and the effects of the project on these conditions. The assessment of effects is qualitative. Information from this report is used in the EIS sections on Existing Socio-economic Environment and Assessment of Effects on Socio-economic Environment.	Factual evidence is used to describe existing conditions. The potential effects are assessed qualitatively based on the current understanding of the project.	None
Chimney Swift Studies	(10)	Entire document is applicable to the NPD Closure Project	This TSD outlines an approach for determining whether the project is resulting in residual effects to chimney swifts and applying the appropriate mitigation measures. Used to identify potential interactions, mitigation measures and monitoring activities when chimney swifts are present in the NPD ventilation stack. Information from these studies is used in the EIS sections on Existing Environment, Assessment of Effects and Follow-up Monitoring.	The approach in the TSD is dependent on observations, i.e., based on factual information.	Uncertainties are acknowledged and addressed using variable response thresholds in the monitoring plan.

Environmental Impact Statement - NPD Closure Project

Appendix A: Summary of Supporting Documents

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
Archaeological Assessment	(11)	Entire document is applicable to the NPD Closure Project	Information, particularly relic shorelines and historical roadways, is used to evaluate the archaeological potential for the NPD property outside of the project footprint. Information from this study is used in the EIS sections on Existing Environment and Assessment of Effects.	Archaeological potential is a prediction of the likelihood of the presence of archaeological material/artefacts in a given area.	None
Greenhouse Gas Emissions	(12)	Entire document is applicable to the NPD Closure Project	Emissions are calculated based on information on project activities and material quantities. Assumptions were made with respect to length of activities, equipment used, material quantities, as well as default assumptions relating to grout and concrete production and transport. Information from this TSD is used in the EIS section on Assessment of Effects.	Emissions are estimated based on the available information about the project and were estimated based on U.S. EPA AP-42 (19) emission factors, conservative time frames, and default values for cement and grout production and transport.	Since the Greenhouse Gas Emissions Technical Supporting Document was prepared in 2016, the NPD Closure Project has refined the technical approach and engineering design for the project. The main project changes are: 1) using blast furnace slag in the grout mix instead of fly ash; 2) reducing the volume of clay used in the cover system; and 3) delivering grout to the facility through a pipeline or a Reimer truck (instead of four trucks per hour travelling from the grout batch mixing plant to the nuclear area). The conclusion of the original Greenhouse Gas Emissions Technical Supporting Document was that the project's GHG emissions (direct and life-cycle combined)

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
					are negligible in comparison to Ontario's total GHG emissions (i.e., less than 0.005%) and are approximately 0.3% of the Ontario total for cement production. The changes in engineering design described above would result in further reductions in greenhouse gas emissions. Therefore, CNL has determined that the original Greenhouse Gas Emissions Technical Supporting Document bounds the changes in engineering design. The Introduction of the Greenhouse Gas Emissions Technical Supporting Document includes this discussion, with additional quantitative rationale.
Geosynthesis Report	(13)	Entire document is applicable to the NPD Closure Project	Includes a review of available geoscientific (geological, hydrogeological, and geomechanical) data, including regional geological setting, and overburden and bedrock geological mapping for the NPD site, supplemented by key summary geoscientific data from the Chalk River (CRL) site to develop a regional understanding of geological history and evolution for the area.	Factual evidence is used to describe existing conditions	None

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
			Information from this report has been added to the Description of the Baseline Environment		
Cementitious Materials Synthesis Report	(14)	Entire document is applicable to the NPD Closure Project	Material specifications for cement grout and data on structural concrete at NPD have been collated and a description of materials properties developed. A review of international peer-reviewed literature and documentation produced by radioactive waste management organizations has been undertaken and implications for NPD summarized. The implications for cement evolution on contaminant behavior and metal corrosion, and their consideration in the safety analysis of the facility is outlined. Some results are not site-specific; they are based on literature from similar situations. Information from this study affects the conditions used in the PostSA, the results of which inform the EIS Assessment of Effects.	Factual report	Some results are not site-specific; they are based on literature from similar situations. The level of assessment in the cementitious materials synthesis report is commensurate with the level of understanding of the available information and is sufficient to inform the PostSA.
Description of Baseline for Decommissioning	(15)	Entire document is applicable to the NPD Closure Project	Baseline information collected in support of the NPD Closure Project. Information from this report has been added to the EIS Description of the Existing Environment (Atmospheric, Surface Water, Aquatic, Geological and Terrestrial Environments, Ambient Radioactivity).	Content is factual; it is based on environmental monitoring data	None

Environmental Impact Statement - NPD Closure Project

Appendix A: Summary of Supporting Documents

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
NPD Biodiversity Report	(16)	Entire document is applicable to the NPD Closure Project	Information from this report was used to inform the VC selection process and was added to the EIS Description of the Existing Environment (e.g., aquatic biota, terrestrial vegetation and wildlife species) as well as in the Assessment of Effects (e.g., mitigation measures).	Content is factual	Biodiversity is ever-changing and the report documents survey results at the time the study was undertaken.
Groundwater Quality Report	(17)	Entire document is applicable to the NPD Closure Project	Information from this report was added to the EIS Description of the Existing Environment (primarily groundwater quality data).	Content is factual; it is based on environmental monitoring data	None
Effluent Streams Sampling Results	(18)	Presents results of effluent sampling and analysis campaigns at several sites, including NPD. NPD results are applicable to the NPD Closure Project	Information on surface water releases and measurement data from this report was added to the EIS Description of the Existing Environment.	Content is factual; it is based on environmental monitoring data	None
Phase II ESA	(19)	Entire document is applicable to the NPD Closure Project	Information from this report was added to the EIS Description of the Existing Environment (primarily sediment, soil and groundwater quality data).	Content is factual; it is based on environmental monitoring data	None
Balance of Site Characterization	(20)	Entire document is applicable to the NPD Closure Project	Information from this report was added to the EIS Description of the Existing Environment (primarily sediment, soil and groundwater quality data)	Content is factual; it is based on environmental monitoring data	None

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
Draft Follow-up Monitoring Plans	(21)	Entire document is applicable to the NPD Closure Project	Information from this report was used in the EIS sections related to Follow-up Monitoring. The reports are Draft because CNL is seeking input on the plans from Indigenous Nations, communities and organizations, the public and stakeholders. The final EA Follow-up Program will be required to meet any objectives and activities prescribed in the EA Report (to be prepared by the CNSC). The reports identify information gaps in baseline data.	The document is procedural, designed to follow regulatory guidance and be consistent with CNL documents and CSA standards.	Uncertainties are acknowledged and can be addressed by additional baseline monitoring Also; the content of the follow-up monitoring plans are evolving based on public and Indigenous input
Safety Analysis Report	(22)	Entire document is applicable to the NPD Closure Project	Information from this report was used in the EIS Description of Existing Environment and Assessment of Effects, including Accidents & Malfunctions.	Content is factual	None
Interim End State Report	(23)	Entire document is applicable to the NPD Closure Project	Used in the description of site and vicinity, including some figures	Content is factual	None
ECCC Climate Normals	(24)	Data from selected climate monitoring stations were applied to the NPD Closure Project	Wind, precipitation and temperature data were used to summarize the existing climate environment. Limitation is the location: Chalk River (CRL) Site.	Content is factual; it is based on environmental monitoring data	There is uncertainty associated with using data from a location 25 km away; however, this uncertainty is deemed to be very minor. Overall the CRL climate data are considered to be an adequate representation of the climate in the Site, Local and Regional Study Areas for the following reasons: both sites are rural, close to

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
					the Ottawa River, share a similar topography and are at a similar latitude
CNSC IEMP Data	(25)	Data from selected locations in this program were applied to the NPD Closure Project, to characterize the Regional Study Area	Radiological data from off-site locations were used in the EIS section on Existing Environment. Limitation is the location: offsite locations only.	Content is factual; it is based on environmental monitoring data	None. Data are applied to the Regional Study Area
Historical Site Assessment Report for NPD	(26)	Entire document is applicable to the NPD Closure Project	Site characterization data and figures from this report were used in the EIS section on Existing Environment.	Content is factual; it is based on environmental monitoring data	None.
Grout Flushing Models Report	(27)	Entire document is applicable to the NPD Closure Project	The objective of the work described herein is to produce “flushing” models of LSM grout evolution that show how pH may change over time as a function of number of pore flushes. These data can then be used to inform further development of safety assessment models and calculations	The report contains modelled information (not empirical), however the model is based on the specific grout formulation for the NPD Closure Project	None
Waste Inventory Report	(28)	Entire document is applicable to the NPD Closure Project	Results of characterization in the facility is used to augment the radioactive and non-radioactive inventory information	Content is factual; it is based on characterization and analysis of samples within the NPD facility	None
Baseline Conditions for Ottawa River Sediment, Benthic Invertebrates and Fish Habitat Features	(29)	Presents results of baseline monitoring of sediment, benthic macroinvertebrate community and fish habitat in the Ottawa River near the NPD site	Information from this report was added to the EIS Description of the Existing Environment (primarily Sections 8.3 and 8.4).	Content is factual; it is based on environmental monitoring data	None

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
Resaturation Modelling	(30)	Entire document is applicable to the NPD Closure Project	Modelling the resaturation of the facility in order to provide information on the infiltration rate of water through the engineered cover (including the concrete cap) and providing an estimate of the time of resaturation. Input is required from the Groundwater Modelling Report (7). Information from this study informs the Near Field Groundwater Model whose results are used in the PostSA.	Model parameters are based on Groundwater Modelling Report and information regarding the engineered cover and concrete cap.	Limitations are due to uncertainties in results of the Groundwater Modelling and the selected parameters for the engineered cover, concrete cap and hydraulic conductivities of the facility structure. Uncertainties are managed through use of sensitivity analyses and analyses of various scenarios.
Alkaline Plume Modelling	(31)	Entire document is applicable to the NPD Closure Project	Geochemical modelling to understand potential development of an alkaline plume in groundwater. Conservative assumption that solids in soil and fill are chemically inert. Model assumed that the entire volume of the facility comprises 90% Blast Furnace Slag / 10% Ordinary Portland Cement. Information from this study informs the PostSA and was also used in the EIS Assessment of Environmental Effects.	Models are based on available factual information and conservative assumptions of unknown parameters where necessary.	The limitation is that the model is conservative, and that more work would need to be completed in order to make the model more realistic.
Slope Stability Assessment	(32)	Entire document is applicable to the NPD Closure Project	Assessment of the stability of the slope located to the north of the NPDWF, grain size analyses, and liquefaction assessment. The assessment is based on current groundwater table assuming that the tile drain system continues to function. Material properties for the north slope were conservatively selected based on extrapolations from areas southwest of the NPDWF.	Assessments are based on professional judgement, available factual information and conservative assumptions of unknown parameters where necessary.	The assessment provides a preliminary screening-level evaluations.

Name of Reference Document	Ref	Portion of information or data applying to NPD Closure Project	How information/data is applied; outline of assumptions, limitations or differences	Distinguish factual evidence from inference	Limitations on inferences or conclusions that can be made
Near Field Groundwater Model	(33)	Entire document is applicable to the NPD Closure Project	Modelling to quantify the groundwater flow through the facility structure. Input is required from the Groundwater Modelling Report (7) and the Resaturation Modelling report. Uncertainties in hydraulic conductivities of geological media and facility structure are investigated using sensitivity and scenario analyses. Information from this study informs the PostSA model.	Model parameters are based on the findings of the Groundwater Modelling (7), the Resaturation Modelling (30) and the literature for the facility structure.	Limitations are due uncertainties in the results of the Groundwater and Resaturation Modelling and the selected parameter values for the facility structures. Uncertainties are managed through use of sensitivity analyses and analyses of various scenarios.
Lead Assessment	(34)	Entire document is applicable to the NPD Closure Project – Postclosure Phase.	Reviews and summarizes work undertaken on lead behaviour, in particular lead solubility and sorption as a function of pH. The pH of the system and its evolution is determined by the grout/groundwater interaction. Information from this study informs the PostSA.	Data are based on extensively peer-reviewed scientific literature	The assessment addresses uncertainties in the effect of groundwater on the solubility and mobility of lead.
Waste Form Synthesis	(35)	The report is applicable to the NPD Closure Project – Postclosure Phase	Reviews the expected corrosion behaviour of various metallic waste forms. Information is taken from a number of sources, including: general scientific literature, specific studies from international nuclear waste programs, and the study of anthropogenic analogues. Identified conservatism includes the assumption of room-temperature conditions for the sub-surface facility. Information from this study informs the PostSA.	The breadth of the information reviewed, and the conservative assumptions used support the corrosion rates used in the PostSA.	Uncertainties in the selected corrosion rates are addressed using a sensitivity analysis.

APPENDIX B: MASTER LIST OF CANDIDATE VALUED COMPONENTS (VCs) for NPD

Appendix B – Master List of Candidate VCs for NPD (SAR Status Queries conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
FEDERAL LEGAL REQUIREMENTS			
Species at Risk Act, Schedule 1			
American ginseng			• END • Has not been observed on the site (no known patch north of Pembroke).
Bank swallow		x	• THR • Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Barn swallow			• THR (SC – COSEWIC) • No sightings in the site or local study area.
Blanding's turtle	x	x	• CRL VC • END • To be assessed for exposure-related effects. • Sighting near the Local Study Area by Highway 17.
Bobolink			• THR (SC – COSEWIC) • No habitat in local study area.
Butternut tree			• CRL VC • END • Butternut tree presence at NPD is linked to an old homestead. The NPD site is outside of the normal range for the species.
Canada warbler		x	• CRL VC • THR (SC – COSEWIC) • Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Cerulean warbler			• END • There is no breeding evidence in regional study area (BSC *et al.*, 2006).
Chimney swift	x	x	• CRL VC • THR • To be assessed for exposure- and habitat-related effects. • Large roost in the NPD ventilation stack in the site study area.

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Common nighthawk		x	• CRL VC • THR • Common nighthawks are territorial and would respond to calls played at NPD, if present. Therefore, despite a sighting at NPD, it is unlikely that common nighthawks are nesting there. • Represented by bald eagle (exposure) and chimney swift (habitat).
Eastern hog-nosed snake			• THR • No sightings in the regional study area (ON 2016).
Eastern meadowlark			• THR • No habitat in local study area.
Eastern milksnake	x	x	• CRL VC • SC • To be assessed for exposure- and habitat-related effects. • A milksnake was found within the facility in 2015 (Morin 2016).
Eastern musk turtle (Stinkpot)			• CRL VC • SC • Has not been observed in the regional study area (ON 2016).
Eastern ribbonsnake (Great Lakes St. Lawrence populations)			• SC • Has not been observed in the regional study area (ON 2016).
Eastern spiny softshell turtle			• END • Outside of typical range. No known sighting in regional study area.
Eastern whip-poor-will			• CRL VC • THR (SC) • Regional presence • Represented by ruffed grouse (similar diet).
Eastern wolf	x		• CRL VC • THR • Regional presence • No known sighting in the site study area.
Eastern wood-pewee		x	• CRL VC • SC • Confirmed sighting at NPD. • Represented by ruffed grouse (similar diet).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Evening grosbeak			• SC • Represented by ruffed grouse (similar diet).
Golden-winged warbler			• CRL VC • THR • Excluded as 300 minutes of audio files were analysed and species was not detected.
Grasshopper sparrow			• SC • No habitat in local study area.
Hickorynut			• END • Represented by benthic invertebrates.
Kirtland's warbler			• END • No sightings in regional study area (BSC *et al.*, 2006).
Least bittern			• THR • No sightings in regional study area (BSC *et al.*, 2006).
Little brown myotis	x	x	• END • To be assessed for exposure- and habitat-related effects. • Determined to be present within the site study area during a bat survey in 2015 (Murrant 2016).
Loggerhead shrike eastern subspecies			• END • No sightings in regional study area (BSC *et al*., 2006).
Midland painted turtle		x	• SC • Represented by Blanding's turtle.
Monarch butterfly	x	x	• CRL VC • END • Found in the site study area. • Monarchs are migrants and are sensitive to habitat fragmentation and disturbance.
Northern barrens tiger beetle			• END • The closest reported population is at Île aux Allumettes QC (COSEWIC 2009). The Canadian Wildlife Service conducted a survey in 2016 and no individuals were found.

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Northern brook lamprey (Great Lakes – Upper St. Lawrence populations)			• SC • The northern brook lamprey is a sediment-dwelling filter feeder, and is represented by benthic invertebrates and lake sturgeon.
Northern map turtle			• CRL VC • SC • Confirmed sighting in regional study area, however no sightings have been made in the site or local study areas (ON 2016).
Northern myotis	x	x	• END • To be assessed for exposure- and habitat-related effects. • Determined to be present within the site study area during a bat survey in 2015 (Murrant 2016).
Olive-sided flycatcher		x	• CRL VC • SC • Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Red-headed woodpecker			• CRL VC • END • Represented by ruffed grouse (similar diet).
River redhorse			• SC • Represented by the white sucker.
Rusty blackbird			• SC • Regional breeding evidence (BSC *et al.*, 2006). • No habitat in site study area.
Rusty-patched bumble bee			• END • The only sightings of this bee in Canada since 2002 were at the Pinery Provincial Park near Lake Huron.
Short-eared owl			• SC (THR) • No breeding evidence in the regional study area (BSC *et al.*, 2006).
Snapping turtle			• CRL VC • SC • No sightings in the site or local study area.

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Tri-colored bat	x	x	• END • To be assessed for exposure- and habitat-related effects. • Species known to be present at NPD.
Western chorus frog			• THR • Outside of typical range (ON 2016), unlikely to be found in the Ottawa River.
Wood thrush		x	• CRL VC • THR • Found in site study area (WSP 2023). • Represented by ruffed grouse and Chimney Swift (diet).
Wood turtle			• THR • No habitat in the site study area.
Migratory Birds Convention Act, 1994 and Regulations			
Great blue heron colony			• CRL VC • No known colony on site. • Represented by great blue heron.
Migratory birds		x	• CRL VC • Represented by specific species *e.g.,* bald eagle, chimney swift, great blue heron, and mallard.
Migratory bird eggs and nests		x	• CRL VC • Represented by individual species *e.g.,* bald eagle, chimney swift, great blue heron, and mallard.
Fisheries Act			
Fish		x	• CRL VC • Represented by individual species *e.g.,* white sucker, lake sturgeon, walleye, etc.
Fish habitat		x	• CRL VC • Pathway to biota *e.g.,* white sucker, lake sturgeon, walleye, etc.
Lakes, ponds and streams		x	• CRL VC • Pathway to biota *e.g.,* white sucker, lake sturgeon, walleye, etc.
Ottawa river water quality		x	• CRL VC • Pathway to VCs in other environmental components.

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
PROPOSED FEDERAL LEGAL REQUIREMENTS AND POLICY			
Species at Risk Act, Schedule 2 and 3			
Red-shouldered hawk			• CRL VC • SC (Schedule 3 – i.e., no legal requirement for protection or management) • Represented by bald eagle (similar diet and habitat).
The Federal Policy on Wetland Conservation			
Wetlands		x	• CRL VC • Pathway to VCs in other environmental components.
COSEWIC Assessment			
American eel			• THR (proposed) • The range of the eel has been reduced due to barriers in the Ottawa River (e.g. dams). Eels are uncommon upstream of the Cheneaux generating station (>100 km downstream) (Haxton and Chubbuck 2002).
Lake sturgeon (Great Lakes – Upper St. Lawrence populations)	x	x	• CRL VC • THR (proposed) • Regional presence • Large, long-lived benthivorous fish. • No habitat impact is expected. • The lake sturgeon is included for consideration of exposure-related effects.
Silver-haired bat		x	• END (proposed) • Observed at the NPD site in 2019. • Represented by little brown myotis.
Canadian Heritage Rivers System			
Ottawa River		x	• CRL VC • Pathway to VCs in other environmental components.
PROVINCIAL REQUIREMENTS			
Endangered Species Act and associated Regulations			
Eastern cougar			• END • Represented by the eastern wolf.
Eastern small-footed myotis	x	x	• END • To be assessed for exposure- and habitat-related effects. • Species determined to be present within the site study area during a bat survey in 2015 (Murrant 2016).

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Peregrine falcon			• SC • No breeding evidence in the site and local study area (BSC *et al.*, 2006). • No suitable habitat for breeding (cliff).
MNRF Forest Management Guide for Conserving Biodiversity at the Stand and Site Scales			
Bat hibernacula			• Represented by specific bat species.
Occupied cavity tree		x	• CRL VC • Represented by specific tree species.
Occupied dens (all species)		x	• CRL VC • Represented by specific species.
Old-growth forest			• Not in site study area.
Provincially significant wetlands			• CRL VC • Not in local study area.
Stick nests (all species)		x	• CRL VC • Represented by specific species.
Waterfowl staging area			• CRL VC • Represented by mallard.
White-tailed deer wintering		x	• Represented by white-tailed deer.
REGIONALLY SIGNIFICANT FEATURES			
Ontario Landbird Conservation Plan			
Bald eagle	x	x	• CRL VC • Cultural and ecological significance. • There was a bald eagle nest on the site until the tree fell down in 2021.
Bay-breasted warbler		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Belted kingfisher		x	• Found in site study area (WSP 2023). • Represented by bald eagle and great blue heron (similar diets).
Black-billed cuckoo			• Excluded as 300 minutes of audio files were analysed and species was not detected.
Blackburnian warbler		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Black-throated blue warbler		x	• CRL VC • Represented by ruffed grouse (similar diet).
Black-throated green warbler		x	• Represented by the ruffed grouse.
Broad-winged hawk		x	• CRL VC • Found in site study area (WSP 2023). • Represented by bald eagle and great blue heron (similar diet and habitat).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Brown thrasher		x	• CRL VC • Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Chestnut-sided warbler		x	• CRL VC Represented by ruffed grouse (similar diet).
Common yellowthroat		x	• Represented by the ruffed grouse.
Field sparrow			• Excluded as 300 minutes of audio files were analysed and species was not detected.
Great gray owl			• Represented by bald eagle (diet).
Least flycatcher		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Mourning warbler			• CRL VC Excluded as 300 minutes of audio files were analysed and species was not detected.
Nashville warbler		x	• Represented by ruffed grouse.
Northern flicker		x	• CRL VC • Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Northern goshawk			• Represented by bald eagle.
Northern rough-winged swallow			• No breeding evidence in regional study area (BSC *et al*., 2006).
Purple finch		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse (diet).
Red crossbill		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse (diet).
Rose-breasted grosbeak		x	• CRL VC • Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Ruffed grouse	x	x	• CRL VC • Representative of ground birds. No habitat impact is expected. The ruffed grouse is included for consideration of exposure-related effects.
Sedge wren			• No recent breeding evidence in regional study area (BSC *et al*., 2006).
Swamp sparrow			• CRL VC • Excluded as 300 minutes of audio files were analysed and species was not detected.
Veery		x	• Represented by ruffed grouse (similar diet and habitat).
White-throated sparrow		x	• CRL VC • Represented by ruffed grouse (similar diet).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Willow flycatcher			• No sightings in local study area.
Yellow-bellied sapsucker		x	• CRL VC • Regional presence (BSC *et al*., 2006). • Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Conservation Priorities for the Birds of Southern Ontario			
American bittern			• CRL VC • No sightings in the local study area.
Black tern			• No breeding evidence in regional study area (BSC *et al*., 2006).
Clay-colored sparrow		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse (diet).
Common loon		x	• CRL VC • Represented by walleye (diet) and mallard (habitat).
Eastern bluebird		x	• CRL VC • Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Magnolia warbler		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Northern mockingbird			• Excluded as 300 minutes of audio files were analysed and species was not detected.
Pied-billed grebe			• No habitat in site study area.
Savannah sparrow			• No sightings in local study area.
Sora			• No habitat in site study area.
Virginia rail			• No habitat in site study area.

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
NatureServe			
Crested arrowhead			• CRL VC • Not detected in local study area.
Halberd-leaved tear-thumb			• CRL VC • Not detected in local study area.
Houghton's flatsedge			• CRL VC • Not detected in local study area.
Prickly hornwort			• CRL VC • Not detected in local study area.
Schweinitz's flatsedge			• CRL VC • Not detected in local study area.
Red spruce			• CRL VC • Not detected in local study area.
Woolly beach-heath			• CRL VC • Not detected in local study area.
North American Waterfowl Management Plan 2004			
American black duck			• CRL VC • Represented by mallard.
Blue-winged teal			• Represented by mallard.
Common goldeneye			• Represented by mallard.
Lesser scaup			• Represented by mallard.
Mallard	x		• CRL VC • The Ottawa river is an important stopover for waterfowl in the Atlantic flyway. • No habitat impact is expected. Mallard is included for consideration of exposure-related effects.
Northern pintail			• Represented by mallard.
Atlas of the Breeding Birds of Ontario 2005			
Alder flycatcher		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
American crow		x	• Represented by ruffed grouse (similar diet).
American goldfinch		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse (diet).
American redstart		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
American robin		x	• Represented by ruffed grouse (similar diet).
American woodcock			• Represented by ruffed grouse (similar diet).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Baltimore oriole			• Represented by ruffed grouse (similar diet).
Black-and-white warbler		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Black-backed woodpecker			• Represented by ruffed grouse (similar diet).
Black-capped chickadee		x	• Represented by ruffed grouse (similar diet).
Blue-headed vireo		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Blue jay		x	• Represented by ruffed grouse (similar diet).
Brown creeper		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Canada goose		x	• Represented by mallard.
Cape May warbler			• Represented by ruffed grouse (similar diet).
Cedar waxwing		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Chipping sparrow		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Common grackle		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Common merganser		x	• Found in site study area (WSP 2023). • Represented by bald eagle and great blue heron (similar diet).
Common raven		x	• Represented by common loon.
Dark-eyed junco			• Represented by ruffed grouse (similar diet).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Downy woodpecker		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Eastern kingbird			• Represented by ruffed grouse (similar diet).
Eastern phoebe		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Eastern towhee			• Represented by ruffed grouse (similar diet).
European starling			• Represented by ruffed grouse (similar diet).
Golden-crowned kinglet		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).
Gray catbird		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Great blue heron	x		• Large wading piscivorous bird. • Sensitive to human disturbance. • Regional presence.
Great crested flycatcher		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Green-winged teal			• Represented by mallard.
Hairy woodpecker		x	• Represented by ruffed grouse (similar diet).
Hermit thrush		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Herring gull		x	• Found in site study area (WSP 2023). • Represented by bald eagle and great blue heron (similar diets).
House wren		x	• Found in site study area (WSP 2023). • Represented by chimney swift (diet).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Indigo bunting		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Killdeer			• Represented by ruffed grouse (similar diet).
Lincoln's sparrow			• Represented by ruffed grouse (similar diet).
Mourning dove		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse (similar diet).
Northern parula		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Northern saw-whet owl			• THR • No sightings in local study area.
Northern waterthrush		x	• Found in site study area (WSP 2023). • Represented by chimney swift and mallard (similar diets).
Ovenbird		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Pileated woodpecker		x	• Represented by ruffed grouse (similar diet).
Pine grosbeak			• Represented by ruffed grouse (similar diet).
Pine siskin		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Pine warbler		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Red-breasted nuthatch		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Red-eyed vireo		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse and chimney swift (similar diets).
Red-tailed hawk			• Represented by bald eagle.
Red-winged blackbird			• Represented by ruffed grouse (diet).
Rock pigeon			• Represented by ruffed grouse (diet).
Ruby-crowned kinglet			• Represented by ruffed grouse (diet).
Ruby-throated hummingbird		x	• Added to the Master list of candidate VCs after the selection of VCs had taken place; was not identified as part of engagement.
Scarlet tanager		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse and chimney swift (similar diets).
Song sparrow		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse and chimney swift (similar diets).
Spotted sandpiper		x	• Found in site study area (WSP 2023). • Represented by mallard, ruffed grouse and chimney swift (diet).
Swainson's thrush		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (diet).
Tennessee warbler			• Represented by ruffed grouse (similar diet).
Tree swallow			• Represented by ruffed grouse (diet).
Turkey vulture		x	• Represented by bald eagle.
Vesper sparrow		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse (similar diet).
Warbling vireo			• Represented by ruffed grouse (similar diet).

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
White-breasted nuthatch		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse and chimney swift (diet).
Wilson's warbler			• Represented by ruffed grouse (similar diet).
Winter wren		x	• Found in site study area (WSP 2023). • Represented by ruffed grouse and chimney swift (similar diets).
Yellow warbler		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Yellow-rumped warbler		x	• Found in site study area (WSP 2023). • Represented by chimney swift and ruffed grouse (similar diets).
Ontario Reptile and Amphibian Atlas			
American bullfrog		x	• Represented by green frog.
American toad			• Represented by green frog.
Eastern garter snake		x	• Represented by eastern milksnake.
Eastern red-backed salamander			• Represented by green frog.
Gray treefrog			• Represented by green frog.
Green frog	x	x	• Present in the local study area (e.g. wetlands). • No habitat impact is expected. Green frog is included for consideration of exposure-related effects.
Mink frog			• Represented by green frog.
Northern leopard frog			• Represented by green frog.
Spotted salamander		x	• Represented by green frog.
Spring peeper			• Represented by green frog.
Wood frog			• Represented by green frog.
OTHER CANDIDATE VCs			
Fish			
Black crappie			• Represented by walleye.
Brown bullhead			• Represented by lake sturgeon.
Burbot			• Represented by white sucker.

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Channel catfish			• Represented by lake sturgeon.
Emerald shiner	x		• Numerically important pelagic forage species. • No habitat impact is expected. The emerald shiner is included for consideration of exposure-related effects.
Fallfish			• Represented by white sucker.
Lake herring			• Represented by emerald shiner.
Lake trout			• Represented by walleye.
Lake whitefish			• Represented by walleye.
Largemouth bass			• Represented by walleye.
Longnose gar			• Represented by walleye.
Mooneye			• Represented by walleye.
Muskellunge			• Represented by walleye.
Northern pike			• Represented by walleye.
Pumpkinseed			• Represented by emerald shiner.
Rock bass			• Represented by walleye.
Sauger			• Represented by walleye.
Shorthead redhorse			• Represented by white sucker.
Smallmouth bass			• Represented by walleye.
Walleye	x		• Socio-economic importance as a sportfish.
White sucker	x		• Benthivorous fish. • Sufficient data availability. • No habitat impact is expected. The white sucker is included for consideration of exposure-related effects.
Yellow perch			• Represented by walleye.
Reptiles			
Northern redbelly snake			• Represented by eastern milksnake.
Northern ringneck snake			• Represented by eastern milksnake.
Northern water snake			• Represented by eastern milksnake, and great blue heron (similar diet).
Birds			
American kestrel			• Represented by bald eagle.
Cliff swallow			• Represented by chimney swift (similar diet).
Common tern			• Represented by bald eagle.
Cooper's hawk			• Represented by bald eagle.
Green heron			• Represented by great blue heron.
Hooded merganser			• Represented by mallard.

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Marsh wren			• Represented by ruffed grouse.
Merlin		x	• Represented by bald eagle.
Northern harrier			• Represented by bald eagle.
Osprey			• Represented by bald eagle (similar diet and habitat)
Purple martin			• Represented by chimney swift (diet).
Ring-billed gull		x	• Represented by bald eagle.
Ring-necked duck			• Represented by mallard.
Upland sandpiper			• Represented by mallard.
Wilson's Snipe			• Represented by mallard.
Wood duck			• Represented by mallard.
Mammals			
Beaver		x	• Represented by muskrat.
Big brown bat			• Represented by little brown myotis.
Black Bear	x	x	• Large terrestrial omnivore. • Cultural significance and public interest.
Coyote		x	• Represented by eastern wolf.
Deer mouse			• Represented by meadow vole.
Eastern chipmunk		x	• Represented by meadow vole.
Eastern cottontail			• Represented by meadow vole.
Eastern gray squirrel			• Represented by meadow vole.
Ermine			• Represented by short-tailed shrew and muskrat.
Hoary bat			• Represented by little brown myotis.
Lynx			• Represented by eastern wolf.
Marten			• Represented by muskrat.
Meadow vole	x		• Soil-dwelling (burrowing) small herbivore. • To be assessed for habitat- and exposure-related effects.
Mink	x		• Small carnivorous mammal with both terrestrial and aquatic prey • To be assessed for exposure-related effects.
Moose	x	x	• Identified through Indigenous Engagement.

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
Muskrat	x		• Aquatic piscivore/herbivore. • Regional presence. • No habitat impact is expected. The muskrat is included for consideration of exposure-related effects.
Northern flying squirrel			• Represented by meadow vole.
Northern water shrew			• Represented by short-tailed shrew.
Raccoon		x	• Represented by muskrat.
Porcupine			• Represented by meadow vole.
Red squirrel			• Represented by meadow vole.
Red fox	x		• Sufficient data availability. • Omnivorous, medium-sized mammal. • No habitat impact is expected. The red fox is included for consideration of exposure-related effects.
Short-tailed shrew	x		• Sufficient data availability. • Carnivorous small, burrowing mammal. • No habitat impact is expected. The short-tailed shrew is included for consideration of exposure-related effects.
Short-tailed weasel	x		• Sufficient data availability. • Carnivorous small mammal • No habitat impact is expected.
Snowshoe hare			• Represented by meadow vole.
Southern flying squirrel			• Represented by meadow vole.
Striped skunk			• Represented by short-tailed shrew.
White-footed mouse			• Represented by meadow vole.
White-tailed deer	x	x	• Socio-economic importance as a game species.
Woodchuck			• Represented by muskrat.
Vegetation			
Poplar		x	• Represented by red maple.
White water lily		x	• Represented by aquatic vegetation.
Red maple	x	x	• Upland/wetland deciduous tree common at NPD. • No physical impacts expected. The red maple is included for consideration of exposure-related effects.

Environmental Impact Statement - NPD Closure Project

Appendix B: Master List of Candidate VCs for NPD (SAR Status Queries Conducted in August 2023)

Proposed Valued Components	Selected as NPD Closure Project VC	Likely Present at NPD Site	Rationale for Inclusion/ Exclusion as VC
White pine		x	• Represented by red maple.
Mixed upland conifers – clear cut		x	• Represented by red maple.
Red pine		x	• Represented by red maple.
Mixed woods – clear cut		x	• Represented by red maple.
Tolerant hardwoods		x	• Represented by red maple.
Berries	x		• Identified during Indigenous engagement
Aquatic Vegetation (see ELC TSD)	x	x	• A fundamental element of ecosystem health and function.
Terrestrial vegetation (see ELC TSD)		x	• Represented by red maple.
Other			
Cultural and heritage sites			• No cultural or heritage sites likely within the Site Study Area (the project footprint).
Benthic Invertebrates	x	x	• Exposed to sediment. • Used to evaluate overall ecosystem health.
Soil invertebrates		x	• Soil-dwelling invertebrates (e.g. earthworm). • Exposure from soil.
Fungi	x		• Identified during Indigenous engagement
Fishing		x	• Represented as walleye, a common sportfish in the region.
Resident use and enjoyment of property	x		• Potential project-related nuisance effects (e.g. traffic, noise, dust).
Hunting/trapping			• Represented as white-tailed deer, a common game species in the region.
Land use planning	x	x	• Land use may change during the project.
Landscape and visual setting	x	x	• Potential impact on the quality of views from the Ottawa River
Highway 17	x	x	• Primary transportation route in the area.

Notes:

THR – Threatened, SC – Special Concern, END – Endangered.

APPENDIX C: RECORD OF ENGAGEMENT AND TABLES OF INTERESTS AND CONCERNS

Appendix C.1 – Record of Engagement and Tables of Interests and Concerns for the Algonquins of Ontario (AOO)

This appendix provides a complete record of all engagement between CNL and the AOO from June 2016 to March 2024 (Table C-1). Table C-1 includes the date and method of the communication/engagement, the topics discussed and the role or title of participants. The table also highlights engagements where key EA topics were discussed using a grid with checks. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement is a mapping of how the summary of interests and concerns were compiled (Table C-2), as well as a summary of interests and concerns raised by AOO (Table C-3).

Section 6.2.4.2.1. of the EIS summarizes the engagement activities that have taken place to date between CNL and the AOO.

Table C-1 Record of Engagement with Algonquins of Ontario (AOO)

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
June 24, 2016 Incoming letter	This letter was addressed to the CNSC's Director, Environmental Assessment Division, from the Algonquins of Ontario (AOO)'s Executive Director, copying the General Manager of the NPD Closure Project. The letter enclosed the AOO's comments on the Project Description, which outlined the AOO's preliminary interests in the following: • Acknowledgement that the NPD site is in the Algonquin Settlement Area; • Protection of the Ottawa River; • Protection of Flora and Fauna; • Archaeology; • Engagement and Communications; • Technical; • Monitoring.					√				√	√
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to AOO's Executive Director introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c) the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	√
August 10, 2016 Meeting	This meeting included CNL representatives (CNL's Director of Corporate Communications, Communications Officers and the General Manager of the NPD Closure Project and other key project staff) and AOO representatives (Executive Director and Consultation Office and Technical Staff) for discussions on the NPD Closure Project (and the NSDF Project) at the CRL and NPD sites. This visit included a Chimney Swift viewing at the NPD ventilation stack, as well a discussion of particular topics of interest, including: alternative means, future use of land, monitoring and VCs.	√	√	√	√					√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
November 07, 2016 Outgoing email	This email to the AOO's Executive Director from CNL's Director of Corporate Communications was in follow-up to the phone call of November 03, 2016 and involved a discussion on archaeological work and the possibility of AOO employment as archaeological liaisons.									√	
December 05, 2016 Outgoing letter	This letter to the AOO's Executive Director from CNL's Director of Corporate Communications was confirming misunderstanding on archaeological work, offering future opportunities to be involved and proposing moving forward with a work plan. Specific interests discussed included studies to obtain Algonquin traditional knowledge, archaeology and employment.	√			√		√			√	
February 15, 2017 Outgoing letter	This letter from CNL's Director of Corporate Communications to the AOO's Executive Director enclosed six requested documents, including compliance and monitoring reports, archaeological information and information on the existing environment at the NPD site.	√								√	
April 12, 2017 Meeting	This meeting between CNL representatives (including the Director of Corporate Communications and communications officers and project staff) and Algonquins of Ontario (including the Executive Director, Algonquin Negotiation Representatives and Consultation and Technical staff) was held in Pembroke to discuss engagements on the NPD Closure Project and particular interests of the AOO, including: protection of the Ottawa River, capacity, development of a work plan, future land use and EA methodology.			√	√					√	√
June 09, 2017 Meeting	This meeting between CNL representatives (including the Director of Corporate Communications, Environmental Protection and project staff) and representatives of the AOO (including four Algonquin Negotiation Representatives) The AOO representatives attended the NPD site to learn more about the project and existing environment. Information shared relating to AOO interests included: protection of the Ottawa River, protection of flora and fauna, alternative means, future use of lands, technical information, VC information, monitoring details and EA methodology.	√	√	√	√				√	√	
June 19, 2017 AOO Community Information Session	This information session for AOO citizens was held in Pembroke. CNL representatives (including the General Manager of the NPD Closure Project and key technical staff, and the Director of Corporate Communications and other communications staff) were on hand to discuss the project, better understand community perspectives and share information. The information session was hosted and advertised by the AOO with approximately 15 AOO members in attendance. Focus topics included specific areas of interest to the AOO, such as: monitoring (current and proposed follow-up), future land use, protection of the Ottawa River, and EA methodology.	√	√	√	√		√		√	√	
November 15, 2017 Outgoing email	This email from CNL's Corporate Communications Director to the AOO's Executive Director enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the environmental assessment process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
November 17, 2017 Outgoing email	This email CNL's Corporate Communications Director to the AOO's Executive Director enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and asked for community input, per CEAA, 2012 requirements: "CNL would be pleased to update information in this current draft with input from your community."	√	√	√	√	√	√	√	√	√	√
January 30, 2018 Outgoing email	This email from a communications officer with CNL to the AOO's technical consultant (Shared Value Solutions) was to share the complete set of technical support documents to support the AOO's review of the draft EIS.	√	√	√	√		√	√	√	√	
February 22, 2018 Incoming email	This email from the AOO's Communications and Policy Strategist to CNL's Director of Corporate Communications was in follow-up to the conversation of February 7, 2018 and discussed formalizing the engagement relationship between CNL and the AOO. This email explicitly indicated the AOO's interest in a formal agreement between CNL and the AOO.									√	
February 28, 2018 Letter	This email (letter) was addressed to an Environmental Assessment Officer with the CNSC from the AOO's Executive Director, copying CNL's Director of Corporate Communications. The letter enclosed the AOO's comments on the Project Description, which outlined the AOO's interests in the following: • Potential effects on traditional land use and Indigenous rights (commercial harvesting); • Potential effects on health; • Potential socio-economic effects; • Potential effects on cultural heritage and archaeological resources; • Protection of the Ottawa River; • Protection of flora and fauna (environment beyond water); • Environmental monitoring; • Future land use.	√	√		√	√	√	√	√	√	
May 14, 2018 Meeting	This meeting between CNL's Corporate Communications staff (including the Director of Corporate Communications) and AOO staff (including the Executive Director of the AOO) involved a discussion on developing an MOU between CNL and the AOO.									√	
June 8, 2018 Meeting	This meeting between CNL's Corporate Communications staff (including the Director of Corporate Communications) and AOO staff (including the Executive Director of the AOO) involved a discussion on developing an MOU between CNL and the AOO.									√	
July 24, 2018	The MOU between the AOO, AECL and CNL related to the NPD Closure Project and NSDF Project was signed.									√	√
October 4, 2018 Meeting	This meeting between representatives of the AOO (including the Executive Director), CNL (including the Director of Corporate Communications) and AECL (including the Director of Communications and Government Reporting) was with respect to developing a long-term relationship agreement (LTRA) between the three parties.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
October 10, 2018 Outgoing email	This email from a CNL communications officer to the Executive Director of the AOO was an invitation to an online webinar discussion on October 17, 2018. The webinar consisted of a short presentation on the NPD Closure Project's scheduling and EIS feedback themes. A Q&A session followed.										√
November 27, 2018 Virtual meeting	This teleconference between representatives of the AOO (including the Executive Director), CNL (including the Director of Corporate Communications) and AECL (including the Director of Communications and Government Reporting) was with regards to the development of an LTRA.									√	
January 18, 2019 Outgoing email	This email from CNL's Corporate Communications Director to the AOO's Policy and Strategic Initiatives Advisor enclosing a partial set of responses to the AOO comments on the 2017 draft EIS. These included a focus on alternative means, future land use (site restoration), mitigation and monitoring, traditional land use, VCs and socio-economic interests.	√	√		√	√	√	√	√	√	
April 11, 2019	The AOO and CNL signed a contribution agreement to provide funds for engagement and participation in the EA process for the NPD Closure Project and the NSDF Project.									√	
May 7, 2019 Incoming letter	This letter from the AOO's Executive Director to CNL's Corporate Communications Director enclosed a review of CNL's responses (sent on January 18, 2019) to the AOO comments on the draft EIS (provided on February 28, 2018) done by the AOO consultant on behalf of the AOO, as well as information on the LTRA. In this letter the AOO confirmed that what CNL had proposed for responses to comments regarding the following areas of interest was acceptable: • Alternative Means; • Future Land Use; • Follow-up Monitoring; • AKLUS; • Socio-economic information; • Engagement and communications; • Archaeology; • Monitoring. The AOO provided specific discussion on why or why not each comment had been addressed to the AOO's satisfaction. This letter also mapped out the path forward to resolving the AOO's remaining issues through the LTRA and Technical Working Group.	√	√		√	√	√	√	√	√

		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
August 30, 2021 Outgoing email	This email from a CNL Communications Officer to the AOO's designated point of contact (AOO consultant) was a follow-up requesting a meeting with AOO to discuss and prioritize a schedule of engagement on the NSDF and NPD Closure Project.										√
September 3, 2021 Incoming email	This email from the AOO's designated point of contact (AOO consultant) to the CNL Communications Officer confirmed that AOO was working to find a time to discuss and prioritize a schedule of engagement on the NSDF and NPD Closure Project.										√
September 8, 2021 Outgoing letter	This email from a CNL Communications Officer to the AOO's designated point of contact (AOO consultant) enclosed CNL's responses to the AOO's recommendations from the Final Algonquin Knowledge and Land Use Study (AKLUS) for the NPD Closure Project.	√		√	√				√	√	√
September 28, 2021 Outgoing email	This email from a CNL Communications Officer to the AOO's designated point of contact (AOO consultant) followed up on setting a meeting time to prioritize a schedule of engagement on the NSDF and NPD Closure Project.										√
September 29, 2021 Outgoing email	This email from a CNL Communications Officer to the AOO's back up designated point of contact followed up on setting a meeting time to prioritize a schedule of engagement on the NSDF and NPD Closure Project.										√
October 4, 2021 Incoming email	This email from the AOO's designated point of contact (consultant) to the CNL Communications Officer indicated availability by the AOO to meet during the second week of October to discuss and prioritize a schedule of engagement on the NSDF and NPD Closure Project.										√
October 14, 2021 Virtual meeting	This meeting between the AOO (including the Policy and Strategic Operations Advocate and AOO consultants and AOO staff) and CNL (including the Manager of ERM Stakeholder Relations, Senior Communications Officers and the Manager of Regulatory Approvals for the NPD Closure Project) was to discuss how to prioritize the work plan for the NPD Closure Project and the NSDF Project. A path forward to verify the AOO's interests and concerns for the NPD Closure Project was also discussed and the AOO agreed to review the interests and concerns by the end of November.									√	√
October 21, 2021 Outgoing Email	This email from CNL Senior Communications Officer to AOO's Policy and Strategic Operations Advocate was to inform AOO of the decision to postpone the submission of the revised draft EIS in order to enable AOO's Planning and Environment Working Group and Algonquin and Negotiation Representative (ANR) meeting in November to review and approve the content that CNL is proposing to include in the EIS. This email requested verification in writing that AOO's concerns and interests regarding the proposed NPD Closure Project had been accurately summarized.									√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
October 25, 2021 Incoming Email	This email from AOO's Policy and Strategic Operations Advocate to ERM Communications staff requested more time to review the issues and concerns summary table before meeting in person and confirmed that the AOO would provide comments for November 26, 2021. The AOO attached a copy of their work-back schedule for the Planning and Environment Working Group (PEWG) for 2022.			√						√	√
October 25, 2021 Outgoing Email	This email from CNL Senior Communications Officer to AOO's Policy and Strategic Operations Advocate was to inform AOO of CNL's commitment to share the draft NSDF/NPD prioritized schedule which will help to align the NSDF/NPD prioritized schedule with the PEWG work-back schedule. CNL also acknowledged AOO's need to have more advance notice of discussion topics moving forward and asked AOO if November 30th was appropriate for the next monthly meeting.									√	
October 27, 2021 Incoming Email	This email from AOO's Policy and Strategic Operations Advocate to a CNL Senior Communications Officer was to inform CNL of their ongoing review of the issues and concerns table, specifically the version of the table that CNL sent AOO in June of 2021, and informed CNL of their intention to continue to review this specific table. A previous email from the CNL ERM Stakeholder Relations team included a less-detailed version of the table. This email was to provide some clarification.										√
October 27, 2021 Outgoing Email	This email from a Senior Communications Officer to AOO's Policy and Strategic Operations Advocate was to follow up on the previous email to say that CNL welcomes AOO's review of the full summary and concerns table but acknowledges that there will be more work to do after submission of the draft. The email stated that CNL hopes to come to a mutual agreement on the first two columns of the table in the next month.										√
November 1, 2021 Outgoing Email	This email from a Senior Communications Officer to AOO's Policy and Strategic Operations Advocate included an attachment of the draft prioritization schedule for review which included some comments from CNL for AOO to review and confirm. This email was to confirm the purpose of the meeting scheduled for November 30, 2021, which is to discuss the summary and concerns table in detail. Finally, this email was to confirm with AOO that CNL accurately understood the review process for the AOO with ANR and PEWG.										√
November 9, 2021 Outgoing Email	This email from a Senior Communications Officer at CNL to AOO's Policy and Strategic Operations Advocate was to provide consolidated the NSDF and NPD Closure Project priorities for the AOO to confirm receiving. CNL noted that they were seeking the AOO's feedback on the NSDF and NPD Closure project prioritization schedule and next steps. CNL also noted some other items that they required feedback on and confirmation for regarding the two individual projects.									√	√
November 9, 2021 Incoming Email	This email from AOO's Policy and Strategic Operations Advocate to a Senior Communications Officer at CNL was to confirm receipt of the previous email and to agree to the items for review noted within. AOO confirmed that they would be reviewing internally and noted that they would respond as soon as possible.										√

May 17, 2023 Outgoing email	This email from a CNL Communications Officer to the AOO Senior Policy Strategist seeking validation of the AOO I&C Table. CNL respectfully requested a response by 2023 June 20. AOO confirmed receipt.									√	
June 07, 2023 Outgoing email	This email from a CNL Communications Officer to AOO Senior Policy Strategist is to provide AOO with a simplified Commitments table. CNL also identified that the next step would be reviewing the table at the next working group and welcomed feedback and/ or comments.			√							√
June 08, 2023 Incoming email	The AOO notified CNL that they hired a new Executive Director.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
June 14, 2023 Meeting	This meeting is between representatives of CNL (including the Senior Communications Officer, Indigenous Engagement Coordinator, Manager, NPD Regulatory Approvals and Decommissioning and Environmental Specialist) and AOO (Including, Senior Policy Strategist, Director and Cultural Heritage Researcher and Coordinator) to discuss NPD Project next steps and identify funding. The AOO to share the proposal for the socio-economic study. Both parties reviewed CNL's incorporation of comments on Commitments 3 & 9, and the I&C table and identify commitments that address next steps in the final column of the table.			√	√					√	
June 14, 2023 Incoming email	This email from AOO Senior Policy Strategist to CNL Senior Communications is to provide CNL with a copy of the AOO proposed construction/mitigation measures prepared by the AOO Cultural Heritage Researcher and Coordinator.										√
June 15, 2023 Incoming email	This email from CNL Indigenous Engagement Coordinator to the AOO Senior Policy Strategist provided the AOO with the actions captured at the 2023 June 14 NPD Closure Project Monthly Meeting. AOO confirmed receipt of the email.										√
June 16, 2023 Incoming email	This email from CNL Senior Communications officer to AOO Senior Policy Strategist is to provide the AOO with the summary of AOO valued components that were previously agreed on.										√
July 04, 2023 Emails	This email from CNL Communications officer to AOO Senior Policy Strategist is to provide the AOO with the draft agenda for the Wednesday, July 12th AOO-NPD monthly meeting. On the draft agenda is the review of Commitments and the Table of Interests and Concerns next steps and validation. AOO confirmed the agenda and noted they would invite Shared Value Solutions to attend briefly while discussing the Socio-Economic Study commitment. CNL also asked if AOO is still interested in the tour and AOO confirmed.						√			√	√
July 12, 2023 Meeting (Virtual)	This meeting is between representatives of CNL (including the Communications Officer, Indigenous Engagement Coordinator, Manager, NPD Regulatory Approvals and Decommissioning and Environmental Specialist, and Manager Communications and Engagement) and AOO (Including, Senior Policy Strategist, and Cultural Heritage Researcher and Coordinator) to discuss NSDF, NPD Project next step, summer 2023 NPD site tour and AOO/NPD commitments.						√			√	
July 12, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to AOO Senior Policy Strategist is to provide the AOO with the actions captured at the 2023 July 12 NPD Closure Project Monthly Meeting. AOO confirmed receipt of the email.										√
July 12, 2023 Outgoing Email	This email from CNL Communications Officer to AOO Senior Policy Strategist is to provide the AOO an updated version of the AOO NPD workplan.										√

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
July 14, 2023 Outgoing Email	This email from CNL Communications Officer to AOO Senior Policy Strategist is to provide the AOO with an updated version of the AOO Interest and Concerns table and the commitments table.									√	
July 17, 2023 Outgoing Email	This email from CNL Communications Officer to AOO Senior Policy Strategist is to request that due to resourcing, the AOO NPD site tour be moved to 2023 August 15. AOPFN confirmed date change.										√
July 25, 2023 Outgoing Email	This email from CNL Communications Officer to AOO Senior Policy Strategist is to propose a draft agenda for the 2023 August 15 NPD site tour.										√
July 27, 2023 Outgoing Email	This meeting is between CNL Communications Officer and AOO Senior Policy Strategist is to discuss NPD text and language edits.						√			√	√
August 01, 2023 Outgoing Email	This email from CNL Communications Officer to AOO Senior Policy Strategist is to confirm the logistics of the 2023 August 15 NPD Site tour.										√
August 09, 2023 Outgoing Email	This email from CNL Communications Officer to AOO Senior Policy Strategist is to confirm the logistics of the 2023 August 15 NPD Site tour, and to provide the AOO with the draft agenda for the tour. CNL also requested AOO staff names for who is attending the tour. AOO confirmed the six staff would be attending.										√
August 09, 2023 Telephone Call	This phone call from AOO Senior Policy Strategist to CNL Communications Officer is to discuss the logistics of the 2023 August 15 NPD tour and invoicing.										√
August 10, 2023 Telephone Call	This email from CNL Communications Officer to AOO Senior Policy Strategist is to provide AOO with the funding-related information requested during the call on 2023 August 09.										√
August 15, 2023 Tour	CNL hosted an AOO-NPD site tour on 2023 August 15 NPD. Participants included CNL (Manager, Communications and Engagement, Indigenous Engagement Coordinator, Manager NPD Regulatory Approvals,) and AOO (Including Senior Policy strategist, Executive director, Meeting Coordinator, Sr. Communications Strategist, Cultural and Heritage Researcher & Coordinator and Fisheries and Wildlife Management Advisor)						√		√	√	√
August 15, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to AOO Cultural and Heritage Researcher and Coordinator is to provide AOO with links to the 2022 CRL and 2021 NPD environmental reports.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
August 16, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to AOO is to provide them with the actions from the 2023 August 15 AOO NPD Site Tour.										√
August 22, 2023 Outgoing Email	This email from CNL Communications Officer to AOO is to provide them with the presentation and photos cleared by CNL security for release. CNL also provided the link to the CNL YouTube page to view the walking tour-type videos of NPD.										√
August 22, 2023 Outgoing Email	This email from CNL Communications Officer to AOO is to provide them with the Benthic Invertebrates Study. AOO Senior Project Development Manager thanked CNL for the NPD Site tour and informed CNL that being onsite to see the remaining infrastructure, vegetation and ground water wells really helped to put commitments into perspective. AOO also noted that they will be sending the vegetation survey report in the coming week.										√
September 01, 2023 Outgoing Email	This email from CNL Communications Officer to the AOO is to provide the AOO with the draft agenda for the 2023 September 13 monthly working group.										√
September 13, 2023 Meeting	This meeting between CNL (including the Manager of Communications and Engagement Manager, of NPD, Decommissioning and Environmental Specialist, Communications Officer and Indigenous engagement coordinator,), AECL (including Director of Communications, Manager of Communications and Engagement), and AOO (Senior Project Development Manager, and Cultural and Heritage Researcher and Coordinator) is to discuss the NSDF pre-constructions commitments, Additional site visit and any follow up from the 2023 August tour, Introduction to monitoring current and planned, and November ANR meeting.								√		√
September 14, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to AOO Senior Policy Strategist is to provide the AOO with the actions captured at the 2023 September 13 NPD Closure Project Monthly Meeting. AOO confirmed receipt of the email.										√
September 19, 2023 Incoming Email	This email from AOO Senior Project Development Manager is to provide CNL with a copy of the AOO-NPD Site visit field notes, as well as the date for the 2023 November AOO- ANR Monthly working group. CNL thanked AOO for the field note files.									√	√
September 26, 2023 Outgoing Email	This email from CNL Communications Officer to the AOO is to confirm the dates of the 2023 October AOO - CNL monthly meeting. The meeting date was confirmed for 2023 October 18th.										√

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
October 06, 2023 Outgoing Email	This email from CNL Communications Officer to the AOO is to provide a response to AOO's question about rainwater in the NPD Stack. CNL provided a written answer to this question.										√
October 16, 2023 Outgoing Email	This email from CNL Communications Officer to the AOO is to provide the AOO with the draft agenda for the 2023 October 18 monthly working group meeting on NPD.										√
October 17, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to AOO is to provide an invite to the 2023 October 20 Career Fair being held In Pembroke. AOO confirmed receipt of the invitation and noted it was distributed to ANRs and Algonquin Businesses.										√
October 18, 2023 Meeting	This meeting is between CNL (including the Communications Officer, Indigenous Engagement Coordinator, Manager, Communications and Engagement, Manager, NPD Regulatory Approvals, Decommissioning and Environmental Specialist Communications Officer) and the AOO (including, Executive Director, Senior Policy Strategist, and Cultural Heritage Researcher and Coordinator). This meeting was to discuss the NSDF Footprint and NSDF commitments, NPD, and the 2023 November ANR meeting.										√
October 18, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to AOO is to provide the actions from the 2023 October 18 AOO - CNL monthly meeting.										√
October 18, 2023 Outgoing Email	This email from CNL Communications Officer to the AOO is to provide the AOO with the draft slide deck for the 2023 November ANR Meeting.										√
November 03, 2023 Outgoing Email	This email from CNL communications officer to the AOO is to provide the draft agenda for the 2023 November 08 Monthly Working group meeting.										√
November 07, 2023 Incoming Email	This email from AOO Senior Project Development Manager to CNL Communications Officer is to inform CNL that the 2023 November ANR meeting is cancelled. The AOO noted that working group meetings will be placed on hold.										√
November 28, 2023 Webinar	AOO representatives attended the webinar NPD – Planning for Site Restoration.										√

Environmental Impact Statement - NPD Closure Project

December 05, 2023 Outgoing Email	This email from CNL Communications Officer to AOO Senior Project Development Manager is to confirm if the NPD Closure Project is still on hold. AOO confirmed that the ANRs have not yet convened and asked to postpone until the New Year.										√
January 04, 2024 Outgoing Email	This email from CNL Communications Officer to AOO Senior Project Development Manager is to confirm the 2024 January AOO - CNL Monthly NPD Meeting scheduled for 2024 January 10. AOO informed CNL that the meeting should be postponed and noted their interest in beginning discussions on the management of archaeological resources. CNL proposed a meeting to discuss logistics.									√	√
January 10, 2024 Meeting	This meeting between AOO (including, Senior Project Development Manager, Cultural Heritage Researcher and Coordinator, Natural Resource and Cultural Strategist, and Cultural Heritage Advisor), and CNL (Including Acting Director, Indigenous Engagement Coordinator, Decommissioning and Environmental Specialist, and Communications Officer) is to discuss the AOO - CNL Archeological Management Workshop.									√	√
January 10, 2024 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to AOO is to provide the actions from the 2024 January 10 AOO - CNL Archeological Resource Management Workshop Planning meeting.										√
January 16, 2024 Outgoing Email	This email from CNL Communications Officer to AOO Senior Project Development Manager is to confirm the dates for the 2024 spring AOO - CNL Archeological Resource Management Workshop. CNL proposed 5 dates. AOO confirmed that 2 of the options proposed were suitable.									√	√
January 17, 2024 Incoming Email	This email from AOO Senior Project Development Manager to CNL is to provide the draft article on AOOs visit to NPD.										√
January 18, 2024 Outgoing Email	This email from CNL NPD Closure Project Director to AOO Senior Project Development Manager provided notes and suggestions on the draft article on AOOs visit to NPD.										√
February 09, 2024 Outgoing Email	This email from CNL Communications Officer to AOO Senior Project Development Manager is to confirm the AOO - CNL 2024 February 14 NPD Meeting. AOO confirmed the meeting date.										√

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communication
February 14, 2024 Meeting	This meeting is between representatives of CNL (including the Communications Officer, Director, NPD, Decommissioning and Environmental Specialist, and Manager and Director of Communications and Engagement, NPD environmental Analyst) and AOO (including, Senior Project Development Manager and Cultural Heritage Researcher and Coordinator, and Project Consultation Advisor) to act as the February monthly NPD meeting. Discussion included, NPD Invoicing, updating the NPD Workplan, and a meeting date for Cultural Heritage workshop.									√	√
February 14, 2024 Outgoing Email	This email from CNL Communications Officer to AOO Senior Project Development Manager with follow up on a few of the action items noted at the meeting on 2024 February 14. CNL attached a field monitoring schedule.										√
February 15, 2024 Outgoing Email	This email from CNL Communications Officer to AOO Senior Project Development Manager provided the requested 2023 meeting dates, who attended the meetings and the topics. AOO confirmed receipt.										√
February 21, 2024 Emails	This email exchange between the AOO Senior Project Development Manager and a CNL Communications Officer shared information about 2022 meeting dates.										√
March 05, 2024 Outgoing Email	This email from a CNL Communications Officer to AOO Senior Project Development Manager is to postpone the monthly meeting being held on 2024 March 12 due to March Break. CNL noted focusing on the draft Project Specific Contribution Agreement and workplan for the AOO in the meantime. AOO confirmed the cancellation.										√

AOO - Mapping of Key Interests and Concerns

Table C-2 presents a mapping of how the key interests and concerns relate to detailed feedback and input from the AOO, up to March 2024.

Table C-2 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-2 Mapping of AOO Key Interests and Concerns

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(a) Algonquin traditional knowledge should be collected and incorporated into the EIS. It is important to the AOO that CNL solicit and use the AOO's community-specific knowledge in order to properly characterize current site conditions, develop scenarios that accurately represent potential future uses of the site, and ensure that species and traditional uses are properly considered by the project. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO identified the need for traditional knowledge to be incorporated into the EIS. Through the Contribution Agreement between the AOO and CNL, the AOO requested funding for an Algonquin Knowledge and Land Use Study (AKLUS). The AKLUS report identified the recommendations and concerns with respect to traditional land and resource use and cultural impacts, including a request for funding of an Algonquin Country foods survey and monitoring program designed to monitor species harvested and gathered by Algonquins.
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(b) Impact on ability to practice traditional activities. As stewards of the lands and waters, it is important to the AOO that the environment around the site of the NPD Closure Project, including flora and fauna, are protected, and that the rights and interests of AOO members are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO raised concerns about residual nuisance effects that could impact land use access for traditional practices and lack of mitigation measures. With respect to traditional land and resource use and cultural impacts, the AKLUS report identified the following concerns: • Loss of connection to and use of lands and water; • Safety of harvesting and consuming harvested foods; • Changes, past and present, in access to important Algonquin cultural sites. The AKLUS report identified recommendations and concerns with respect to traditional land and resource use and cultural impacts, including a request for funding of an Algonquin Country foods survey and monitoring program designed to monitor species harvested and gathered by Algonquins.
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(c) Safety of harvested and gathered foods. It is important to the AOO that the environment, including the flora and fauna, is protected, and to ensure that the rights and interests of AOO members are upheld. This is both a site-wide and project-specific concern.	Within the AKLUS report, participants identified concerns about the safety of harvesting and gathering, and of consuming harvested and gathered foods. The AKLUS recommendations also included a request for funding of an Algonquin Country foods survey and monitoring program designed to monitor species harvested and gathered by Algonquins.
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(d) Lack of AOO-specific mitigation measures, monitoring program, accommodation and compensation measures. It is important to the AOO that species of importance are monitored and protected in a way that recognizes the interdependencies between ecological, socio-economic, community and cultural health. It is also important to the AOO to accommodate and/or compensate those who may experience adverse impacts from the project. This is both a site-wide and project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. These comments included concerns about: • Lack of AOO-specific mitigation measures for cultural resources, harvesting locations, and areas of traditional ecological knowledge of significance; • Lack of AOO-specific environmental effects monitoring plan and program for protecting and mitigating potential impacts on areas of traditional land use areas of cultural significance; • Concern regarding accommodation and compensation of trapline holders within the Regional Study Area. The AKLUS report identified the following concerns with respect to traditional land and resource use and cultural impacts:

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
		• Request that species of importance to Algonquins are monitored, protected and that recommendations from the AKLUS are adhered to for each (a list of species of importance is provided in the AKLUS); • Proposal for a holistic, Algonquin-specific follow-up program approach to monitoring that recognizes the interdependencies between ecological, socio-economic, community and cultural health. The AKLUS report also outlined mitigation measures for Algonquin land use and occupancy values that were identified to address concerns regarding potential impacts of the NPD Closure Project.
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(e) Concern about balancing the need for long-term nuclear waste storage and the risk of impacts to ancestral or Algonquin values. It is important to the AOO that CNL provide information and commitments that will encourage further engagement and address community members' perception of risk to ancestral values, including particular species and traditional knowledge and land use activities. This is a project-specific concern.	The AKLUS report identified concerns about the balance between the need for long-term nuclear waste storage and the risk of the project activities impacting ancestral values. Note: the risk of the project impacts on ancestral values is discussed in Row 4(a) below.
2. Unceded Algonquin traditional territory	(a) The AOO would like recognition in the EA that the NPD site is within the unceded Algonquin traditional territory. This is important to the AOO because this area is part of ongoing land claim negotiations. This is both a site-wide and project-specific concern.	In its comments on the 2016 Project Description, the AOO requested that a statement be included in the Project Description acknowledging that the NPD site is in the unceded Algonquin traditional territory.
3. Alternatives	(a) Concern about the suitability of In-situ disposal (ISD). It is important to the AOO that future users of land on the NPD site are protected. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO raised a concern about the suitability of ISD as an alternative.
3. Alternatives	(b) Concern that the EIS does not provide enough information on the alternatives to ISD. It is important to the AOO that they have enough information to be able to evaluate the alternatives**.** This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Some were related to provision of information on alternative means: • The AOO expressed the opinion that CNL has provided insufficient discussion of alternatives to in-situ disposal in its 2017 draft EIS; • It is AOO's position that CNL has failed to adequately address the requirements of *CEAA,* 2012; • The AOO has requested that CNL provide a quantitative assessment of the impacts of each alternative means on VCs.
4. Archaeology and Cultural Heritage	(a) Concerns about the impact of the project on features of cultural importance. It is important to the AOO to that its members are aware of any remaining Algonquin cultural heritage resources on the NPD site, and these resources be preserved. It is also important that the AOO be given the opportunity to be involved in any future archaeological activities at the site. This is a project-specific concern.	In its comments on the NPD Project Description, the AOO stated the significance of archaeological resources within their claim area. The AOO submitted formal comments on the 2017 draft EIS. Several were related to archaeology: • AOO indicated it was not provided adequate notice to participate in the Stage 1 Archaeological Assessment field visit and requested notice and capacity to participate in future archaeological activities; • The AOO expressed interest in a long-term archaeological agreement with CNL, which would involve additional field research to be conducted in collaboration with the AOO; • The AOO note that Algonquins used the area prior to European contact, and therefore, there may be areas of significance to AOO; • The AOO have requested an archaeological monitor for oversight activities at the NPD site.

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
		The AKLUS report identified the following concerns with respect to traditional land and resource use and cultural impacts: • Changes, past and present, to accessing important Algonquin cultural sites; • Access to a historic family village site near the NPD site; • Balancing the need for long-term nuclear waste storage and risk of the project activity impacts to ancestral values. Note: the need for long-term nuclear waste storage is discussed in Row 1(d) above. In the recommendations of the AKLUS report, the AOO propose: • CNL funding to conduct further archaeological assessments across the NPD site; • Protection of areas of archaeological potential during decommissioning activities; • Development of a stop-work process; • Development of a sustainable archaeological research program.
5. Accidents & Malfunctions	(a) Contingency plans for extreme weather and natural hazards that may impact or damage the NPD facility. It is important to the AOO that CNL demonstrate that it has planned for the potential impacts of flooding and other extreme weather events, because the frequency and intensity of such events is expected to increase due to climate change. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO expressed concern about extreme weather and natural hazard contingency planning.
6. Engagement	(a) Continued meaningful engagement using best practices. It is important to the AOO that its members be meaningfully engaged on the project, because the project is located within the unceded Algonquin traditional territory. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO requested continued engagement using best practices. In addition, at the start of the project, the AOO communicated that it wanted to ensure that engagement occurred with all 10 communities that are included under the umbrella of the AOO, not just AOPFN.
6. Engagement	(b) Establishment of an AOO-specific Aboriginal Engagement plan and a Long-Term Relationship Agreement (LTRA). It is important to the AOO that formal plans and agreements are in place with CNL because they provide opportunities for the AOO to discuss all the issues that are important to them related to CNL operations. This is a site-wide concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to communication, engagement and engagement, including: • The AOO request an AOO-specific Aboriginal Engagement Plan that includes establishing a clear communication protocol between CNL and the AOO, provides a schedule for engagement opportunities, and identifies what opportunities will be provided for further input on the project; • The AOO request that AECL/CNL enter into negotiations with the AOO to establish a LTRA; • The AOO has requested that future consultation, engagement, accommodations, monitoring and oversight, and communications be included as part of LTRA discussions; this refers to engagement beyond that in support of current projects; • The AOO has requested that as part of LTRA discussions employment, training, contracting, and other economic interests be included as part of LTRA discussions; this includes NPD.
7. EA Process and Methodology	(a) Concern about the process for identifying potential project-environment interactions: technical decisions should be explained clearly and peer-reviewed. It is important to the AOO that the decisions taken by technical staff are transparent and traceable. The AOO feel that the use of peer review would ensure that technical decisions are supported by evidence and correct interpretations. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO sought additional technical detail and explanation on how CNL had identified potential project-environment interactions.

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
7. EA Process and Methodology	(b) Interest in additional cumulative effects analysis: • Releases from NPD, CRL and other sources along the Ottawa River; • Overall NPD site, including all sources of contamination. Information about cumulative effects is important to the AOO because the AOO is interested in the overall protection of the Kichi-Sìbì and the NPD site, not just the impacts of a single project. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO requested that an analysis of cumulative effects be conducted for the releases from the NPD site and those from CRL and other industries and cities on the Ottawa River. The AOO also requested an assessment of cumulative effects of the overall NPD site, including all sources of contamination (landfills, wetlands, stored materials, etc.). The AKLUS report included a recommendation requesting an Algonquin led cumulative effects assessment.
7. EA Process and Methodology	(c) Concerns about the methodology for determination of significance of adverse residual effects. It is important to the AOO that events with the potential for a high level of effects are carried through the assessment as far as is reasonable. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO expressed a concern about the methodology used for determination of significance of adverse residual effects. The AOO requests that CNL employs a lower threshold for the determination of significant adverse residual effects.
8. End State, Site Restoration and Future Use of the Land	(a) Engagement/consultation on end state, site restoration and future land use of the site. It is important to AOO that its members be engaged/consulted meaningfully, not just informed, on end state, site restoration and future land use. Additionally, it is important to the AOO that the end state of the NPD site is safe for future land users. This is both a site-wide and a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to end state, site restoration and future use of the land; topics of concern and interest included: • Request for consultation and engagement on the site restoration plan and involvement of Algonquin community members in associated activities; • Recommendation that CNL/AECL enter formal discussion with AOO regarding potential land transfer arrangements. In the AKLUS report, the AOO request that CNL and AECL commit to discussing future use and ownership of the NPD property and obtaining a Record of Site condition under O. Reg. 153/04 to initiate the land transfer process. In addition, the AOO has reviewed and provided comments on the Environmental Site Assessments (ESA) as they relate to future use of the land.
8. End State, Site Restoration and Future Use of the Land	(b) Participation in activities related to end state, site restoration and future land use of the site. Involvement is important to the AOO, to ensure transparency and promote confidence in these activities. This is both a site-wide and project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to end state, site restoration and future use of the land; topics of concern and interest included: • Interest in having Algonquin community members participate in revegetation activities and long-term environmental monitoring; • Request for consultation and engagement on the site restoration plan and involvement of Algonquin community members in its associated activities; • In the AKLUS report, the AOO request that Algonquin community members are provided opportunities to participate in follow-up monitoring and restoration work.
8. End State, Site Restoration and Future Use of the Land	(c) Impact of future socio-political changes on land use. It is important to the AOO that CNL fully consider and assess the impacts of potential future socio-political conditions. This is both a site-wide and project-specific concern.	In their comments on the 2017 draft EIS, the AOO expressed concern over how CNL considered future socio-political changes that might impact land use.
8. End State, Site Restoration and Future Use of the Land	(d) Long-term liability of the site beyond decommissioning. The AOO have concerns about the long-term integrity of the concrete vault, facility exterior walls and foundations. The AOO considers activities using the seven generation lens and thus is concerned about who will be responsible if environmental events (such as earthquakes) affect the facility over the long term. It is important to the AOO that the end state of the NPD site is safe for future land users. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to end state, site restoration and future use of the land. One topic of concern was the long-term liability of the site beyond decommissioning.

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
9. Environmental Effects and Mitigation Measures	(a) Potential impacts to Ottawa River shoreline and to fish, wildlife and plants. This is of interest to the AOO because the Kichi-Sibì and these species are of particular importance to the AOO. This is a project-specific concern.	In their comments on the 2017 draft EIS, the AOO expressed concern about restoration of the Ottawa River shoreline. The AKLUS report identified concerns and interests related to end state, site restoration and future use of the land, including: • Concern about potential impacts to fish, wildlife and plant species of importance to Algonquins; • Request that fish, wildlife and plant species of importance to Algonquins be protected and monitored, and that recommendations from the AKLUS are adhered to for each species. Impacts to the shoreline, and appropriate mitigation or accommodation.
10. Indigenous Health	(a) Postclosure Safety Assessment and Indigenous Health. It is important to AOO that the Algonquin lifestyle is accurately reflected when predicting radiation doses to AOO citizens. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. The incorporation of the Algonquin lifestyle in CNL's Postclosure Safety Assessment (PostSA) technical supporting document (TSD) and the assessment of Indigenous health were technical aspects identified by the AOO. The AOO was seeking verification that models of AOO citizen exposure and doses are representative and accurate for use in the development of critical group scenarios and resource use.
11. Monitoring	(a) Participation in activities related to environmental and cultural heritage stewardship and monitoring. Involvement is important to AOO to ensure transparency and promote confidence in these activities. This is both a site-wide and project-specific concern.	The AOO has requested more generally that it wants a role in future environmental and cultural heritage stewardship and monitoring for the CRL and NPD sites. The AOO submitted formal comments on the 2017 draft EIS. Several were related to monitoring, and topics of interest and concern included: • Request that CNL provide opportunities for direct involvement in CNL's EnvP program for the AOO, as the AOO are stewards of the lands and waters. Transparency in the monitoring process and inclusion of Algonquin community members to build confidence in the monitoring program; • Request that CNL provide opportunities for the AOO and Algonquin community members to play an active role in all monitoring of the NPD site, as the AOO are stewards of the lands and waters; • Request that CNL create an Environmental Review Board to promote the effective participation of AOO within the environmental management and monitoring programs for the NPD Closure Project.
11. Monitoring	(b) Review of the CNL's draft follow-up monitoring plans. It is important to the AOO that it has an opportunity to provide input into monitoring details (e.g., frequency, location, parameters). This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to monitoring, and topics of interest and concern included: • Request that CNL provide the following monitoring plans to the AOO for their review and comment: surface water, groundwater, terrestrial environment, restoration, archaeological and AOO-specific environmental effects; • Monitoring of the terrestrial environment; • Monitoring of effects on traditional land and resource use; • Request for the installation of a monitoring well and collections system downgradient of the NPD site. The AOO submitted technical comments on the draft follow-up monitoring plans. Concerns and interests identified in this review included: • Interest in better understanding the post-closure modelling; • Concerns about the groundwater sampling frequency.
11. Monitoring	(c) AOO recommendations and requests for additional monitoring. Implementing these requests would provide additional assurances to AOO community members, and others, who may resume using the site for a range of uses in the future. This is a project-specific concern.	In their comments on the 2017 draft EIS, the AOO expressed concern regarding the lack of baseline monitoring for benthic invertebrates, water quality, and contaminants in fish tissues. The AOO submitted technical comments on the draft follow-up monitoring plans. Concerns and interests identified in this review included: • Concerns related to mercury in groundwater;

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
		• Request for funding of an Algonquin Country foods survey and monitoring program designed to monitor species harvested and gathered by Algonquins; • Request for funding to expand the Kichi-Sìbì Guardians environmental monitoring program; • Request that CNL undertake annual monitoring of sediment and benthic macroinvertebrates with active participation by AOO Kichi-Sìbì Guardians; • Request for vegetation monitoring once every five years during the Institutional Controls Phase; • Inclusion of effectiveness monitoring of SAR mitigation measures in the draft Follow-up Environmental Monitoring Plan; • Recommendation that CNL maintain at least five monitoring wells downgradient of each landfill. The AKLUS report identified the following concerns and interests and made several requests and recommendations related to monitoring: • Safety of harvesting and gathering and consuming harvested and gathered foods; • Request that species of importance to Algonquins are monitored, protected and that recommendations from the AKLUS are adhered to for each (a list of species of importance is provided in the AKLUS); • Proposal for a holistic, Algonquin-specific follow-up program approach to monitoring that recognizes the interdependencies between ecological, socio-economic, community and cultural health; • Request for funding of an Algonquin Country foods survey and monitoring program designed to monitor species harvested and gathered by Algonquins.
11. Monitoring	(d) Monitoring Plan design and implementation and communication of changes. As long-term stewards and users of the land, itis important to the AOO to be actively involved in oversight of the NPD area. This is a project-specific concern.	The AOO submitted technical comments on the draft follow-up monitoring plans. Concerns and interests identified in this review included: • Concern about how the derived release level (DRL) report is used in the development of the draft Follow-up Effluent Monitoring Plan; • Recommendation to include monitoring metrics that evaluate cumulative impacts from multiple stressors; • Interest in reviewing annually the follow-up monitoring reporting, which would provide an important opportunity for the AOO to understand and evaluate the monitoring activities and environmental performance of the project; • Concern that the draft follow-up monitoring plans lack clarity on how exceedances are addressed and how the AOO will be informed of an exceedance; • Concern about adaptive management of the draft follow-up monitoring plans, specifically changes that would reduce frequency of sampling and how these changes would be communicated.
12. Protection of the Ottawa River	(a) Contamination in the Ottawa River and the environment. As stewards of the lands and waters, it is important to the AOO that the environment, including flora and fauna are protected. AOO expressed that the protection of the Ottawa River is of extremely high priority to AOO. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several comments were related to protection of the Ottawa River; topics of interest included: • Washout pit (an engineered catchment that collect surface water from equipment washout); • Historic water discharges; • Protection of the Ottawa River with a specific interest in drainage systems. The AOO's technical comments on the draft follow-up monitoring plans included concern about release of radionuclides to the environment. The AKLUS report identified the following concerns related to monitoring: • Proximity of the project to the Kichi-Sìbì; • Potential for contamination to waterways, plants, fish and wildlife. The AKLUS report identified a concern that there is a lack of modelling to understand how contamination from groundwater reaches the Kichi-Sìbì.

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
13. Protection of Flora and Fauna	(a) Potential impacts to habitat and biota, and related follow-up program elements. As stewards of the lands and waters, it is important to the AOO that the environment around the site of the NPD Closure Project including flora and fauna, are protected, and that the rights and interests of AOO members are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	The AOO's technical comments on the draft follow-up monitoring plans included concern about release of radionuclides to the environment. The AOO submitted formal comments on the 2017 draft EIS. Several were related to protection of flora and fauna: • Potential impacts to migratory birds and their habitat; • Potential impacts to wetland ecosystems by dust from demolition activities; • Lack of details regarding the exact locations of project activities that could impact terrestrial vegetation and wetlands; • Concern about potential exposure of contaminants to fish; • Ecological Risk Assessment. The AKLUS report identified the following concerns and interests related to the protection of flora and fauna, and requests for monitoring: • Potential for contamination of waterways, plants, fish and wildlife; • Bioaccumulation of contaminants in fish species; • Potential impacts to fish, wildlife and plant species of importance to Algonquins (a list of species of importance is provided in the AKLUS); • Request that species of importance to Algonquins are monitored and protected, and that recommendations from the AKLUS are adhered to for each (a list of species of importance is provided in the AKLUS.
13. Protection of Flora and Fauna	(b) Species at Risk. AOO expressed the importance of flora and fauna to their communities, culture and Aboriginal Rights and Title. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several comments were related to protection of flora and fauna: • Impacts to SAR including American eel and lake sturgeon; • Potential impacts to Chimney Swifts and avian species at risk (SAR); • Potential impacts to reptilian SAR and the use of exclusion fencing. The AKLUS report identified a concern about impacts to SAR.
14. Socio-economic	(a) Lack of assessment of Indigenous socio-economic conditions and effects. The AOO consider this information and assessment necessary in order to understand the extent of the socio-economic conditions of AOO communities' socio-economic and how those may be influenced by NPD Closure Project activities. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to socio-economic interests; concerns include: • Lack of an assessment of the socio-economic conditions and effects the project will have on Algonquin community members interacting with the NPD Closure Project; • Concern regarding residual nuisance effects that could impact economic livelihood opportunities of Algonquin community members and lack of mitigation measures for these effects; • In particular, the AOO indicated an interest in CNL including a description of the socio-economic conditions for Indigenous Nations, communities and organizations that CNL is interacting with, a description of socio-economic interactions and their effects, a complete assessment including socio-economic indicators, and a description of planned monitoring and mitigating for socio-economic effects.
14. Socio-economic	(b) The EIS is missing some key Indigenous socio-economic and well-being components (VCs) and interactions. It is important to the AOO that all potential interactions and impacts be considered in order to fully evaluate the effects of the project on AOO citizens. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to socio-economic interests, including: • Concern regarding the limited list of socio-economic VCs; • Concern regarding the adequacy of the effects assessment, specifically the lack of key socio-economic and community well-being components in the assessment.

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
14. Socio-economic	(c) Lack of plans for monitoring of socio-economic effects, accommodations and compensation. It is important to the AOO that CNL work with its members to develop a plan for monitoring socio-economic effects of the project, to ensure that potential negative effects are minimized and that positive effects are fully realized. AOO believes that plans are needed for AOO citizens to be adequately accommodated and compensated for any impacts experienced as a result of the project. This is both a site-wide and a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to socio-economic interests, including: • Concern about the absence of a socio-economic effects monitoring plan; • Lack of accommodations and compensation to address impacts to the Kichi-Sìbì. The AKLUS report included a recommendation requesting that a socio-economic accommodation plan be developed to address concerns about cumulative effects and unavoidable impacts.
14. Socio-economic	(d) The EIS does not discuss employment or procurement opportunities for the AOO. It is important to the AOO to understand the way in which CNL plans to engage the AOO in developing employment and procurement opportunities for the proposed project. This is both a site-wide and project-specific concern.	In their comments on the 2017 draft EIS, the AOO expressed concern about a lack of information on how CNL will engage the AOO in developing employment and procurement opportunities.
15. Technical	(a) Derived Release Limits (DRLs). It is important to AOO to review the DRLs to ensure they comply with relevant standards and that the critical group reflects the Algonquin lifestyle. This is a site-wide concern.	The AOO submitted formal comments on the 2017 draft EIS, including a technical comment related to derived release limits (DRLs). The AOO provided specific comments on DRLs in July 2020. The following interests and concerns were identified: • A request for additional information on how CNL has grouped radionuclides and a request to establish DRLs for all nuclides known to be in the reactor vault; • The need to include groundwater as a transport pathway for the derivation of DRLs; • Adoption of a model that has an adequate sample size and considers the Algonquin lifestyle in its calculation of exposure/dose to the critical group; • Concerns about exclusion of certain foods from the ingestion modelling; • A recommendation to model a critical group with exposure pathways dominated by resources from hunting, trapping, fishing and gathering of berries and medicinal plants; • A concern about the maximum atmospheric deposition in relation to the location of the critical group; • A concern about the quality of the data used for NPD DRLs.
15. Technical	(b) Emissions and discharges. It is important to the AOO that emissions in the atmospheric environment of contaminants are properly assessed and are mitigated and monitored as appropriate. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. The comments involved several technical topics, including: • Emissions - noise, dust, air; • Lack of dispersion modelling for discharges from the wells area sump and for groundwater seepage.
15. Technical	(c) Technical suitability of cement and batch plant construction details. It is important to the AOO that the cement used for the project is appropriate and scientifically defensible. It is also important to understand the locations of project activities so that potential effects on terrestrial vegetation and wetlands are properly assessed. This is a project-specific concern.	The AOO comments on the 2017 draft EIS, included comments related to the technical suitability of cement (and natural analogues) and the batch plant construction details.
15. Technical	(d) Ecological Risk Assessment methodology and revisions. As stewards of lands and waters, it is important to the AOO that the environment, wildlife, and plants are protected. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were technical comments on the Ecological Risk Assessment, including: • A request to amend the EcoRA to incorporate second iteration of models and re-interpretation of results; • A concern that the screening process of exclusion of radionuclides in the EcoRA based on the lack of a dose coefficient is unfounded; • A lack of reporting on doses to non-human species in **Table 2.16** of the EcoRA.

Topic	Key Interests and Concerns	Specific feedback provided by the AOO on this interest/concern
15. Technical	(e) Terrestrial Study Area Rationale. It is important to the AOO that the rationale for selecting the terrestrial Regional Study Area is clearly provided, as the baseline description of the terrestrial environment is critical for understanding the current state of VCs and evaluating the project-related effects. This is a project-specific concern.	The AOO submitted formal comments on the 2017 draft EIS. Several were related to protection of flora and fauna: • Concern about the lack of rationale for establishing the terrestrial environment Regional Study Area.
16. Valued Components	(a) Engagement, input and participation in VC selection. It is important to the AOO that CNL provide opportunities for meaningful engagement on VCs to ensure that the VCs incorporate species important to traditional users of the land. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO expressed concern about the lack of clear engagement of Indigenous peoples on the selection of candidate VCs for the NPD Closure Project. The AKLUS recommendations identified an interest in conducting a collaborative CNL-AOO VC gap analysis between the findings of the AKLUS and the draft EIS.
16. Valued Components	(b) Concerns regarding the limited VCs selected for the NPD Closure Project and recommendations for VCs to be included. This topic is of interest to the AOO because these species are features of particular importance to the AOO. This is a project-specific concern.	In its comments on the 2017 draft EIS, the AOO expressed interests and concerns related to VCs selected for the NPD Closure Project. Concerns included: • Concern about the narrow list of species on the list of VCs, including species under Traditional Land Use, and Terrestrial Environment and fish species (particularly, piscivorous fish species and species of importance to the AOO); • Concern about the limited list of socio-economic VCs. Throughout engagement activities and correspondence between the AOO and CNL, the AOO indicated interest in specific VCs. In a July 2020 letter to CNL, the AOO requested that CNL include the following VCs in the draft EIS and IER: • Fish: lake trout. sauger, muskellunge (fishing); • Mammals: beaver, marten, mink, otter, rabbit/hare, fox (trapping); elk (hunting); • Vegetation: key berry species including cranberries, blueberries. raspberries and service berries (gathering); • Mammals: muskrat, (trapping); black bear (hunting); • Birds: bald eagle (cultural significance); waterfowl and grouse (hunting). The AKLUS report identified a number of features within proximity to the NPD Closure Project, including: • Habitat for wildlife (e.g., moose, white-tailed deer, bear, fox, wolf, five-lined skink and wild turkey); • Habitat for plants (e.g., oak, pine, birch, many other medicines); • Cultural sites (e.g., burial sites, historically significant sites, spiritual sites); • Commercial trapping; • Spawning habitat; • Wildlife and harvesting and fishing areas; • Plant and natural materials gathering areas; • SAR habitat; • Travel routes; • Overnight locations; • Boat launches or landings.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Algonquins of Ontario (AOO) – Summary of Interests and Concerns

Table C-3 below summarizes the interests and concerns that the AOO have raised on the NPD Closure Project up to March 2024, through comments submitted on the Project Description (June 2016), comments submitted on the 2017 draft EIS to the CNSC, comments submitted directly to CNL or through direct discussion and engagement between AOO and CNL.

The submission by the AOO on the Project Description can be found online: Comments on the project description for NPD from Algonquins of Ontario

The full submission of AOO comments on the 2017 draft EIS can also be found online: Comments on the 2017 draft EIS for NPD from Algonquins of Ontario. These comments were summarized by CNSC and included as part of the CNL Table: Consolidated Public and Indigenous Groups' Comments on the Nuclear Power Demonstration Closure Project Draft EIS: IAA - NPD - Consolidated Public and Indigenous Comments (April 2018).

Table C-3 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern.
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS, this is also discussed.
- Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

The Summary of *AOO Key Interests and Concerns* are the result of collaborative development through the Working Group, with validation of the status and next steps occurring at the AOO Working Group level through focused discussions in June and July of 2023. Note that validation of the interests and concerns was already achieved with the AOO in May 2022. Regular Algonquin Negotiation Representatives (ANR) meetings have not been occurring since March of 2023 and therefore the updates have not been reviewed and vetted by the ANRs. As soon as regular ANR meetings resume, taking into consideration the priorities and availability of the ANRs, the Working Group will bring the updates to the ANR Table for validation.

Table C-3 AOO Key Interests and Concerns

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(a) Algonquin traditional knowledge should be collected and incorporated into the EIS. It is important to the AOO that CNL solicit and use the AOO's community-specific knowledge in order to properly characterize current site conditions, develop scenarios that accurately represent potential future uses of the site, and ensure that species and traditional uses are properly considered by the project. This is a project-specific concern.	CNL sent two letters asking specific questions of AOO to align with the requirements of *CEAA* (2012) Section 5(1)(c). These questions included: • Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects? • Does [the AOO], or any members, have sites of ceremonial significance in close proximity [of NPD], or more generally, any cultural activities near [the NPD site]? The CNSC and CNL have contributed funds for the AOO to undertake an AKLUS, which was completed in December 2020. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. CNL met twice with the AOO in 2023 to discuss the AKLUS recommendations and the parties are working to translate these to project commitments where appropriate. CNL incorporated the description of traditional land and resource use, and Indigenous valued components from the AKLUS into the EIS. This revised content was shared with AOO in May 2021, and CNL indicated to AOO that the revised content would be included in the 2021 draft EIS. AOO, AECL and CNL have signed a tri-partite Memorandum of Understanding (MOU) since these comments were received. One of the areas of mutual interest and concern is further discussion on incorporating	Where is this topic discussed in the EIS? **Section 8.9** of the EIS presents information about traditional land and resource use, including specific information about the AOO (**Section 8.9.2.2.3**). **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs. **Section 9.1.1.1** of the EIS presents the future exposure scenarios and groups that are considered in the PostSA. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that in the future there is an interest to re-establish traditional use activities on the NPD site. What changes have been made (and where)? CNL has integrated the AKLUS findings and concerns into the EIS. Specifically, CNL expanded the description of traditional uses in **Section 8.9** of the EIS and added and evaluated new traditional land and resource use VCs in **Sections 6.3 and 9.9** of the EIS to ensure that AOO traditional knowledge becomes an integral component of the EIS and in CNL's consideration of potential effects.	Status: Resolved. CNL believes that this concern has been addressed through its support of the AKLUS and incorporation of results into the EIS. Next steps: CNL and AOO will continue refining project commitments. A final issues resolution meeting validating the close-out of this interest and confirming commitments is expected to occur later in 2023.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		AOO traditional land uses and resource values into the EA processes going forward. To this end, CNL has made improvements to the EIS that reflect further consideration and incorporation of the AOO traditional land and resource use values. The EIS includes information obtained from the AKLUS report. CNL sees opportunities in upcoming meetings within the MOU framework to discuss and endeavour to resolve these issues. CNL Response: In discussions with AOO, CNL agreed that traditional knowledge from the AOO and other Indigenous Nations, communities and organizations should be integrated into the EIS. CNL has contributed funding to the preparation of an AKLUS by the AOO and has integrated the findings and concerns into the EIS. CNL is supportive of the proposal for a comprehensive Country Foods survey to better understand and quantify Algonquins' consumption of wildlife, fish and plants near the NPD site. CNL recognizes how such a study can support long-term monitoring programs. The NSDF and NPD Projects have already provided capacity to the Algonquin community closest to the NPD site (the AOPFN (AOPFN)) in order to execute an AOPFN Harvest and Diet study. CNL has added an Indigenous receptor group to the Postclosure Safety Assessment (PostSA) Technical Supporting Document (TSD). The predicted peak dose to an Indigenous receptor (from the 3rd iteration PostSA) is 0.0004 mSv/yr which is 500 times less than the dose criterion. The analysis demonstrates that the impact on the public, Indigenous and the environment is negligible.	CNL added content from the AKLUS report to **Sections 6.3 and 8.9** of the EIS**.** The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project.	
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(b) Impact on ability to practice traditional activities. As stewards of the lands and waters, it is important to the AOO that the environment around the site of the NPD Closure Project, including flora and fauna, are protected, and that the rights and interests of AOO members are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of a Long-Term Relationship Agreement (LTRA). One of the areas of mutual interest and concern is environmental and cultural heritage monitoring programs, including joint monitoring, to ensure that the environment is adequately protected and the rights and interests of the AOO are upheld. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. CNL met twice with the AOO in 2023 to discuss the AKLUS recommendations and the parties are working to translate these to project commitments where appropriate. CNL and the AOO are exploring site access, including the perception of barriers to site access and nearby important cultural sites for the AOO members, to determine an approach for culturally appropriate risk communications. CNL Response: CNL acknowledges AOO's concerns about the long-term safety of the NPD site and the potential impacts on the rights of the AOO, and other Indigenous Nations, communities and organizations, to practice traditional activities around the NPD site. CNL has assessed potential nuisance effects related to dust and noise, loss of connection to the land, safety of harvesting and consuming local foods, and changes to access to the land; no significant	Where is this topic discussed in the EIS? The EIS discusses concerns about potential loss of connection to land and water (e.g., feeling of discomfort or concern), and loss of land and water use in **Section 9.9.5** of the EIS. Nuisance effects during construction activities are assessed in the Decommissioning Safety Assessment (DecomSA) TSD and summarized in **Section 9.2** (atmospheric environment), **Section 9.9** (traditional land and resource use) and **Section 9.10** (Indigenous socio-economic conditions) of the EIS. Monitoring of nuisance effects is discussed in **Section 12** of the EIS**.** General plans for restoration and end state, including access considerations, are described in **Section 4.3.1.9** of the EIS. **Section 8.9** of the EIS presents information about traditional land and resource use, including specific information about the AOO (**Section 8.9.2.2.3**). **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs. **Section 9.1.1.1** of the EIS presents the future exposure scenarios and groups that are considered in the PostSA TSD.	Status: Ongoing. See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been addressed through its commitment to involving the AOO in the long-term monitoring for the NPD Closure Project. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-4 – Site Visit and Survey Work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		adverse effects were identified in the assessment. CNL notes that the final end state is the only time when changes to access will occur; the final end state of the NPD site will be an improvement from current conditions. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the AOO and other Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm whether the EIS predications around potential effects are accurate and to develop mitigation measures as needed. The PostSA TSD addresses the potential for concerns about loss of connection to land and water, and about food safety. The PostSA and EIS (and other supporting studies) have demonstrated that in the long-term, there are not scientifically based data concerns about the accessibility or safety of the NPD site, based on several different future use scenarios, including self-sufficient Indigenous receptors. The proposed activities will result in an enhancement of the NPD site from current conditions and may lead to an increase of wildlife and therefore improve the ability to practice traditional activities at the NPD site. These findings, which will be confirmed by monitoring, are anticipated to reduce concerns about loss of connection to land and water, and about food safety. Involvement of the AOO in monitoring (discussed in row 9(a)) will help to ensure transparency and lend confidence to monitoring activities and results, and in turn, the findings of the EIS. CNL's Public Information Program aims to enhance engagement with Indigenous peoples and address any potential feelings of loss of connection to and use of lands and water. With respect to monitoring species harvested and gathered by Algonquins: CNL has ensured that these species are captured in our valued components (VCs) and considered for monitoring as appropriate. In discussions with AOO, CNL agreed that traditional knowledge from the AOO and other Indigenous Nations, communities and organizations should be integrated into the EIS. CNL has contributed funding to the preparation of an AKLUS by the AOO and has integrated the findings and concerns into the EIS. CNL is supportive of the proposal for a comprehensive Country Foods survey to better understand and quantify Algonquins' consumption of wildlife, fish and plants near the NPD site. CNL recognizes how such a study can support long-term monitoring programs. The NSDF and NPD Projects have already provided capacity to the Algonquin community closest to the NPD site (the AOPFN (AOPFN)) in order to execute an AOPFN Harvest and Diet study.	The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that in the future there is an interest to re-establish traditional use activities on the NPD site. <u>What changes have been made (and where)?</u> CNL added discussion of loss of connection to and use of lands and water to **Section 6.3** (interests and concerns related to VCs) and **Sections 9.3.1.1, 9.6.1.1, and 9.9.1.1** within the EIS**.** CNL has integrated the AKLUS findings and concerns into the EIS. Specifically, CNL expanded the description of traditional uses in **Section 8.9** of the EIS, and added and evaluated new traditional land and resource use VCs in **Sections 6.3 and 9.9** within the EIS to ensure that AOO traditional knowledge becomes an integral component of the EIS and in CNL's consideration of potential effects. CNL added content from the AKLUS report to **Sections 6.3 and 8.9** within the EIS**.** The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project.	On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional control period. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized. AOO-10 – Ongoing Collaboration CNL is committed to continuing the working group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(c) Safety of harvested and gathered foods. It is important to the AOO that the environment, including the flora and fauna, is protected, and to ensure that the rights and interests of AOO members are upheld. This is both a site-wide and project-specific concern.	CNL gained a better understanding of the reasons for AOO's desire for funding for an Algonquin Country foods survey from a January 2022 follow-up discussion between AOO and CNL on AKLUS recommendations. The AOO wants to ensure that the lifestyle of the broader Algonquin Community is accurately represented and considered in CNL's PostSA TSD. CNL and AOO are working to develop project commitments to address outstanding concerns. AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. One of the areas of mutual interest and concern is environmental and cultural heritage monitoring programs, including joint	<u>Where is this topic discussed in the EIS?</u> Mitigation measures for the protection of flora and fauna are primarily outlined in **Sections 9.6.3.2**. <u>What changes have been made (and where)?</u> **Table 5.2-2** of the EIS has been revised. Any reference to contaminants being screened out because they are due to past NPD operations has been removed. The table has been updated to reflect the more comprehensive	<u>Status:</u> Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been partially addressed through sharing information about the Indigenous receptor. CNL has assessed potential effects related to the safety of harvesting and

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		monitoring, to ensure that the environment is adequately protected and the rights and interests of the AOO are upheld. CNL has responded in writing to recommendations from the AOO AKLUS and has discussed the AKLUS recommendations as part of the January 2022 working group meeting and additional meetings early in 2023. The parties are working to translate the AKLUS recommendations to project commitments where appropriate. In April 2023, CNL also provided an overview of the Indigenous receptor evaluated as part of the environmental assessment for the project. <u>CNL Response:</u> CNL is supportive of the proposal for a comprehensive Country Foods survey to better understand and quantify Algonquins' consumption of wildlife, fish and plants near the NPD site. CNL recognizes how such a study can support long-term monitoring programs. The NSDF and NPD Projects have already provided capacity to the Algonquin community closest to the NPD site (the AOPFN (AOPFN)) in order to execute an AOPFN Harvest and Diet study. CNL has assessed potential effects related to the safety of harvesting and consuming local foods, and no significant adverse effects were identified in the assessment.	Environmental Site Assessment results that include consideration of contaminants from past activities. Changes have been made to **Section 8.5.3.1** to include a summary of how the discrete areas of contamination identified in the Environmental Site Assessment were handled. Changes have been made to **Section 9.6.3.2** to include additional mitigations related to milkweed (important habitat for monarch butterflies), migratory birds, bats, chimney swifts and milksnakes. The revised EcoRA TSD is now a standalone report and includes a clearer description of the method (in response to AOO formal comments on 2017 draft EIS). The EcoRA TSD continues to predict no undue effects on biota.	consuming local foods, and no significant adverse effects were identified in the assessment. <u>Next Steps</u> CNL and AOO have established the following commitments which will help to address this concern: AOO-4 – Site Visit and Survey Work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional control period. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized. AOO-10 – Ongoing Collaboration CNL is committed to continuing the working group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(d) Lack of AOO-specific mitigation measures, monitoring program, accommodation and compensation measures. It is important to the AOO that species of importance are monitored and protected in a way that recognizes the interdependencies between ecological, socio-economic, community and cultural health. It is also important to the AOO to accommodate and/or compensate those who may experience adverse impacts from the project. This is both a site-wide and project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. CNL presented a brief overview of the draft follow-up monitoring plans to the AOO Planning and Environment Working Group in September 2019, and AOO provided comments on these plans in 2020 July. CNL and the AOO are holding a workshop to further discuss the draft follow-up monitoring plans for the NPD Closure Project in 2022. CNL and the AOO will discuss the AOO's interests in developing an AOO specific environmental effects monitoring plan. CNL and the AOO will also discuss protection and mitigation efforts to help ensure that AOO traditional land and resource use and areas of cultural significance are respected. AOO, AECL and CNL have signed a tri-partite MOU since these comments were received. One of the areas of mutual interest and concern is further discussion on incorporating AOO traditional land uses and resource values into the EA processes going forward. To this end, CNL has made improvements to the EIS that reflect further consideration and incorporation of the AOO traditional land and resource use values. The EIS includes information obtained from the AKLUS report. CNL sees opportunities in upcoming meetings within the MOU framework to discuss and endeavour to resolve these issues. CNL Response: CNL has added and assessed additional Indigenous land and resource use VCs in the EIS, including those identified by the AOO. The EIS considers potential effects on trapping and notes that trapping does not occur on the NPD site. As such, CNL does not anticipate any impacts to trapline holders, and consequently, accommodation or compensation is not needed. However, CNL is open to discussing the NPD project with trapline holders within the Regional Study Area, and to further discussion with AOO about AOO-specific mitigation measures and follow-up programs.	Where is this topic discussed in the EIS? **Tables 6.3-1 and 6.3-2** of the EIS highlight how VCs identified by AOO are reflected in the species that are evaluated in the NPD EIS. **Section 8.9** of the EIS presents information about traditional land and resource use, including specific information about the AOO obtained from the AKLUS report (**Section 8.9.2.2.3**). **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs. Mitigation and monitoring are discussed in **Sections 10 and 12** of the EIS. What changes have been made (and where)? CNL expanded the description of traditional uses in **Section 8.9** of the EIS and added and assessed additional traditional land and resource use VCs in **Sections 6.3 and 9.9** of the EIS. CNL added content from the AKLUS report to **Sections 6.3 and 8.9** of the EIS. The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been addressed by revisions to the EIS and through its commitment to involving the AOO in the long-term monitoring for the NPD Closure Project. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional control period. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized. AOO-10 – Ongoing Collaboration CNL is committed to continuing the working group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
1. Algonquin Knowledge, Land and Resource Use and Cultural Impacts	(e) Concern about balancing the need for long-term nuclear waste storage and the risk of impacts to ancestral or Algonquin values. It is important to the AOO that CNL provide information and commitments that will encourage further engagement and address community members' perception of risk to ancestral values, including particular species and traditional knowledge and land use activities. This is a project-specific concern.	CNL has responded in writing to AOO recommendations from the AKLUS. CNL met with the AOO and gave 5 presentations from 2016 to 2019, providing information and seeking input related to Alternative Means and/or In-Situ Disposal. CNL met again with the AOO in 2023 and provided a summary of the alternatives considered. CNL Response: CNL acknowledges that some AOO community members have concerns about the perceived tradeoff between the need for a solution to legacy waste and the risk of impacts from the NPD project as the proposed solution. Although waste at the NPD site is currently in safe storage, over time, the risk associated with this interim solution increases. That is why CNL is committed to addressing AECL's nuclear legacy liabilities through permanent solutions. CNL believes that dealing with the waste now, rather than passing the problem on to future generations, is the responsible approach. CNL has assessed the suitability of in-situ disposal (ISD) for NPD, and the resulting EIS shows that such disposal is safe for human health and the environment in the short term and long term. Design features make it conducive to disposing of the material in place. The proposed activities will result in an enhancement of the NPD site from current conditions. The waste is already at the site, and the proposed project will make the site safer. The assessment findings do not show impacts to ancestral values.	Where is this topic discussed in the EIS? **Section 4.1** of the EIS discusses the purpose and rationale of the NPD Closure project. Effects during the Post-Institutional Controls phase are assessed in the PostSA, and the EIS discusses effects to traditional land and resource use in **Section 9.9.3**. The EIS concludes that there are adverse residual effects on traditional land and resource use. What changes have been made (and where)? No changes to the EIS have been made in response to this concern.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been addressed through regular sharing of information about project alternatives. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the working group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional control period.
2. Unceded Algonquin Traditional Territory	(a) The AOO would like recognition in the EA that the NPD site is within unceded Algonquin traditional territory. This is important to the AOO because this area is part of ongoing land claim negotiations. This is both a site-wide and project-specific concern.	CNL has updated language throughout the EIS to reflect this information (see details in previous column). Subsequent to its comments on the Project Description, the AOO submitted formal comments on the 2017 draft EIS. The AOO did not repeat concerns expressed in the 2016 Project Description with respect to acknowledgement of the unceded Algonquin traditional territory. CNL shared the draft EIS (Rev. 1) with the AOO in May 2020, which included content in **Section 6.2.4.2** for AOO asserted rights and title for the unceded Algonquin traditional territory, including NPD. CNL Response: CNL fully acknowledges that NPD is located in the unceded Algonquin traditional territory.	Where is this topic discussed in the EIS? The NPD site is identified as unceded Algonquin traditional territory throughout the EIS. What changes have been made (and where)? **Section 6.2.4.2** now includes the following text: "The NPD site is located within the unceded Algonquin traditional territory. The Algonquins of Ontario have asserted existing Indigenous rights and title throughout the unceded Algonquin traditional territory, including the NPD site." Changes have been made to **Section 6.2, Section 8.9 and Appendix C** to identify that the NPD site is located within the unceded Algonquin Territory.	Status: Resolved. CNL believes that this concern has been addressed by revisions to the EIS. Next steps: A final issues resolution meeting validating the close-out of this interest is expected to occur later in 2023.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
3. Alternatives	(a) Concern about the suitability of In-situ disposal (ISD). It is important to the AOO that future users of land on the NPD site are protected. This is a project-specific concern.	To address these concerns, CNL added additional assessment to the Alternative Means TSD (details in next column). At a meeting with the AOO ANRs in September 2019, a summary of the Alternative Means for the project was presented and there was an opportunity for questions and discussion on this topic. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL met with the AOO Infrastructure Working Group (including several ANRs) in 2023 to provide a summary of the alternatives considered and engaged in active discussions with the ANRs. This group also received a third party summary review on CNL's Alternative Means Assessment (AMA). CNL has received no follow-up questions/concerns on this topic. CNL Response: In discussions with the AOO, CNL agreed that protection of future land users is an important concern and has addressed it. CNL has assessed the suitability of ISD for NPD, and the EIS demonstrates that such disposal is safe for human health and the environment in the short term and long term. CNL has considered national and international standards and guidelines and continues to believe that the NPD facility has characteristics that support ISD. CNL acknowledges the expressed interest by AOO for future unrestricted land use. Should the preferred alternative of ISD be approved, it is important to note that the land subject to restricted access is less than 1% of the total area of the NPD site (2.53 of 385 hectares). Furthermore, after the Institutional Control period (during which CNL will monitor the site), there will be no land restrictions.	Where is this topic discussed in the EIS? Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? CNL enhanced the assessment of alternatives in the AMA TSD; for example, the projected radiological dose and Industrial Safety risk to workers for each alternative means was presented. This assessment has shown that ISD is safer than the removal alternative means. The revised Alternative Means TSD continues to identify ISD as the preferred means for decommissioning the NPD reactor.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has begun to be addressed through regular sharing of information about project alternatives. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the working group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).
	(b) Concern that the EIS does not provide enough information on the alternatives to ISD. It is important to the AOO that they have enough information to be able to evaluate the alternatives**.** This is a project-specific concern.	In response to this concern, CNL added additional assessment to the Alternative Means TSD and expanded the discussion in the EIS (details in next column). At a meeting with the AOO ANRs in September 2019, a summary of the Alternative Means for the project was presented and there was an opportunity for questions and discussion on this topic. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. The AOO indicated in November 2021 that they still require time to review the AMA. CNL met with the AOO Infrastructure Working Group (including several ANRs) in 2023 and provided a summary of the alternatives considered. This group also received a third party summary review on CNL's AMA. CNL has received no follow-up questions/concerns on this topic. CNL Response: CNL prepared the AMA following the framework laid out in the Canadian Environmental Assessment Agency (CEAA) Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2015). CNL acknowledges that the AOO has requested more details on the strengths and weaknesses of each alternative.	Where is this topic discussed in the EIS? Alternative means are discussed in the **AMA TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? CNL has included additional information from the AMA TSD in **Section 4.2** of the EIS to provide greater clarity on how the alternative means assessment was completed and what the results mean. In addition, both the AMA TSD and **Section 4.2** of the EIS were updated to assess the projected radiological dose and industrial safety risk to workers for each option.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been addressed by revisions to the EIS and through regular sharing of information about project alternatives. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the working group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
4. Archaeology and Cultural Heritage	(a) Concerns about the impact of the project on features of cultural importance. It is important to the AOO to that its members are aware of any remaining Algonquin cultural heritage resources on the NPD site, and these resources be preserved. It is also important that the AOO be given the opportunity to be involved in any future archaeological activities at the site. This is a project-specific concern.	CNL's archaeology consultant determined that there was no potential for archaeological discoveries on the Site Study Area (where project activities will take place), because that area was completely disturbed during site construction. However, in response to concerns expressed by the AOO, CNL did conduct a Stage 1 Archaeological Assessment of the remainder of the NPD site. CNL shared the results of the Stage 1 Archaeological Assessment with the AOO and provided a summary and overview presentation of the archaeology work. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. A January 2022 follow-up discussion between AOO and CNL on AKLUS recommendations gave CNL a better understanding of AOO's concerns on this topic, including the possibility of the project impeding access to a nearby historic cultural site. AOO requested a stop-work process; CNL and AOO are working to develop project commitments to address this concern. AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. One of the areas of mutual interest and concern is environmental and cultural heritage monitoring programs, including joint monitoring, to ensure that the environment is adequately protected and the rights and interests of the AOO are upheld. CNL Response: CNL has conducted a Stage 1 archaeological assessment and shared the results with the AOO. No further archaeological work is planned for NPD.	Where is this topic discussed in the EIS? Indigenous cultural resources and ceremonies, including the presence of Algonquin Cultural Sites and features, are discussed in in **Section 8.9.3** of the EIS. **Section 8.11.4** of the EIS summarizes the **Archaeology TSD,** including the findings of the Stage 1 archaeological assessment. What changes have been made (and where)? CNL updated several sections of the EIS in response to AOO comments and to include information from the AKLUS Report (**Sections 6.2, 6.3, 8.9, 9.9** of the EIS). Changes have been made to **Section 6.2.4.2** of the EIS to include information on CNL and AOO's work to progress towards an LTRA. Changes have been made to **Section 9.9.3.2** of the EIS to include proposed mitigation measures that will be employed if undocumented archaeological resources are discovered during the project. The EIS does not predict any adverse residual effects from the project on the Indigenous socio-economic environment (**Section 9.10.1.6**) or traditional land and resource use (**Section 9.9.3.3**), including access to cultural sites. As such, no changes to these sections were required.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that these have been addressed through AOO's closure of this item in its letter of May 2019 and CNLs responses to AKLUS recommendations. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-3 – Cultural Protection CNL is committed to joint review by CNL, AOO and mutually respected 3rd party SMEs of company and project specific cultural protection procedures/activities with AOO against best practice and consideration of Indigenous Knowledge. If needed a project specific cultural protection plan is developed to address any gaps identified. This topic may also be addressed through a future LTRA, to ensure adequate future engagement around archaeological resources at the NPD site.
5. Accidents & Malfunctions	(a) Contingency plans for extreme weather and natural hazards that may impact or damage the NPD facility. It is important to the AOO that CNL demonstrate that it has planned for the potential impacts of flooding and other extreme weather events, because the frequency and intensity of such events is expected to increase due to climate change. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change, and has concluded that these events will have no undue effects on people or the environment around the site. The NPD site has an Emergency Procedure that will remain in place and be updated as required throughout the Decommissioning Execution and Institutional Controls phases of this project. This procedure focuses on the prevention, mitigation of, preparedness for, response to, and recovery from a wide range of abnormal and emergency conditions including fires, floods, hazardous spills, loss of power, earthquakes, and tornados. The Emergency Procedure also defines the actions of specific staff/roles in such events. Following any of these emergency events, as soon as it is safe for staff to do so, site and facility condition are evaluated, and any necessary actions will be taken to make repairs. The NPD Emergency Procedure is developed and maintained in accordance with CNL's company-wide Emergency Preparedness Program that has been accepted to meet the CNSC's	Where is this topic discussed in the EIS? **Section 8.12** of the EIS discusses the relevant natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River. Additional details and a range of scenarios that encompass the potential impacts from extreme weather and natural hazards are examined in the DecomSA TSD and the PostSA TSD. What changes have been made (and where)? No changes have been made to the EIS in response to this concern.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been substantially addressed through its response to specific comments on this topic received from AOO. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the working group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		requirements (under RegDoc 2.10.1 - *Nuclear Emergency Preparedness and Response).* Further, throughout all project phases (Decommissioning Execution, Institutional Controls and Post-Institutional Controls) CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change, and has concluded that these events will have no undue effects on people or the environment around the site.		This topic may also be addressed through a future LTRA, to ensure adequate sharing of emergency response planning at the community level.
6. Engagement	(a) Continued meaningful engagement using best practices. It is important to the AOO that its members be meaningfully engaged on the project, because the project is located within the unceded Algonquin traditional territory. This is a project-specific concern.	CNL heard AOO's request for ongoing engagement and, since 2016, has carried out extensive engagement with the AOO, and has implemented a MOU to progress towards an LTRA. For CNL, meaningful engagement involves listening to the community's concerns and making real changes as appropriate, for example: • Addition of VC to the project's VC list; • Changes to monitoring plan (see row later in this table); • Commitments to participation of Indigenous Nations, communities and organizations in future monitoring activities (see row later in this table); • Commitments to involving Indigenous Nations, communities and organizations in the site restoration plan. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: CNL has committed to open, transparent and continuing engagement with the AOO. The AOO leadership takes responsibility for communicating with all 10 communities under the AOO umbrella. By directing all its communications through the AOO, CNL ensures that all 10 AOO communities are included. Engagement Highlights: In June 2017, CNL held an AOO-specific open house to which the AOO invited its entire membership. AOO issues and concerns topics covered at the open house included: monitoring (current and proposed follow-up monitoring), future land use, protection of the Ottawa River, and EA methodology. Approximately 15 AOO members attended. In 2019 and into 2020 CNL responded in writing to the AOO's specific comments on the EIS and shared correspondence that tracked resolved and outstanding issues on topics of interest and concern to AOO. During the latter part of 2020 and the first half of 2021, AOO capacity and priorities precluded regular engagement on the NPD Closure Project. In May 2021, CNL offered further support to the AOO to ensure capacity was not a barrier to meaningful participation in the EA for the NPD Closure Project. The 2022 work plan developed collaboratively between AOO and CNL includes capacity to support continued meaningful participation in the EA for the NPD Closure Project.	Where is this topic discussed in the EIS? All 10 AOO communities are identified in **Section 6.2.2** of the EIS (Antoine Algonquin First Nation; AOPFN; Algonquin Nation Kijicho-Manito Madaouskarini; Bonnechere Algonquin First Nation; Algonquins of Greater Golden Lake First Nation; Mattawa/North Bay Algonquin First Nation; Ottawa Algonquin First Nation; Shabot Obaadjiwan First Nation; Snimikobi (Ardoch) (Beaver Creek) Algonquin First Nation; and Whitney Area Algonquins. These communities are described in greater detail in Section 3 of the IER. **Section 6.2.4.2** of the EIS summarizes CNL engagement with AOO to date and describes the collaborative work of CNL and AOO to progress towards an LTRA. What changes have been made (and where)? Changes have been made to **Section 6.2.4.2.1** to reflect new and planned engagement activities to support the AOO's meaningful participation in the EA process.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that these concerns are substantially addressed through AOO's closure of this item in its letter of May 2019 and regular ongoing engagement. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). This topic may also be addressed through a future LTRA to enable continued meaningful engagement between the AOO and CNL on the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		In the fall of 2021, CNL shared with and sought input from AOO on the summary list of interests and concerns and overall support for CNL's 2021 EIS submission. To allow AOO time to respond and provide feedback, CNL delayed its EIS submission. In October 2021, the AOO and CNL met to discuss the prioritization of engagement on the NSDF Project and the NPD Closure Project to facilitate the AOO's desired "one-window" approach for engagement with CNL on the projects. A consolidated draft schedule was prepared by CNL in November 2021 and shared with AOO for review. At the January 25, 2022, meeting the two parties reviewed the schedule together, made edits and discussed the timeline for engagement activities during the first half of 2022. Capacity challenges at the AOO prevented progress on the work plan during most of 2022. However, in November 2022 in response to reach out by CNL and improved resource availability the AOO re-engaged on the NPD Project. Since that time the two parties have been meeting on a monthly (or more frequent) basis – total of 9 meetings between November 2022 and the end of April 2023. Thus far CNL and AOO have discussed the following outstanding concerns: Alternative Means, Valued Components, the AKLUS results and Indigenous Health. Additional meetings are planned for the remainder of 2023 to discuss the remaining outstanding interests: socio-economics, monitoring and end-state. The May 2023 Working Group meeting transitioned to formulating commitments for outstanding areas of concern. CNL expects to close-out all remaining concerns at a final issues resolution meeting in late 2023.		
6. Engagement	(b) Establishment of an AOO-specific Aboriginal Engagement plan and a Long-Term Relationship Agreement (LTRA). It is important to the AOO that formal plans and agreements are in place with CNL because they provide opportunities for the AOO to discuss all the issues that are important to them related to CNL operations. This is a site-wide concern.	In 2018, the AOO, AECL and CNL signed a tri-partite MOU to guide dialogue between the parties on matters of mutual interest. More specifically, the MOU was intended to be a vehicle to work towards the development of an LTRA amongst the parties. The MOU identified the need for both a Technical Group to deal with the NPD Closure Project and an LTRA Working Group that would advance an LTRA amongst the parties. The MOU broadly identified potential topic areas for the LTRA. Over 2019 and 2020, a Terms of Reference and work plan was developed for the LTRA. The LTRA intended to cover such topics as: AOO involvement in environmental and cultural monitoring and stewardship; employment / training; contracting; communications; consultation; etc. The LTRA also intended to cover the interests of all three parties with respect to both the CRL and NPD sites as well as other further projects and/or initiatives across the unceded Algonquin traditional territory. The LTRA discussions are relevant to NPD as it is expected that certain project specific initiatives and commitments will be implemented or realized through this agreement. Since 2020, discussion on the LTRA have not progressed. The parties are still working together on the NPD Closure Project and other projects, but LTRA discussions have not been prioritized. CNL Response: CNL acknowledges AOO's request for formal, AOO-specific engagement plans and agreements. CNL supports a "one-window" approach to all engagement activities (encompassing all projects, not just NPD) (work continues within the AOO/CNL Monthly Working Group for the NPD Closure	Where is this topic discussed in the EIS? **Section 6.2.4.2** of the EIS summarizes CNL engagement with AOO to date and describes the collaborative work of CNL and AOO to progress towards an LTRA. What changes have been made (and where)? Changes have been made to **Sections 6.2, 6.3, 8.9, 9.9, 12** in response to AOO comments and to reflect developments in the relationship between AOO and CNL.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes the concern about AOO's involvement is partially addressed with development of the LTRA. It is noted that the establishment of community-specific Engagement plans and LTRAs extend beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). The parties are continuing discussion on an LTRA.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		Project, which includes a six-month look-ahead schedule and prioritization schedule). CNL believes that building a long-term relationship with the AOO can enable future consultation, engagement, accommodations, monitoring and oversight, communications, employment, training, contracting, and other economic interests. <u>Engagement Highlights</u> In 2018, AECL, CNL, and the AOO signed a tripartite MOU. The parties have agreed to work together on items of mutual interest related to CNL operations and projects. It has been agreed by all parties that a future LTRA may include provisions on future consultation, engagement, and communications. It has been agreed by all parties that a future LTRA may include provisions on employment, training, contracting, and other economic opportunities. It has been agreed by all parties that an LTRA would not be project-specific but intended to cover CNL operations in the unceded Algonquin traditional territory. LTRA topics of consideration could include consultation and engagement, economic opportunities, future land uses, and environmental and cultural heritage stewardship and monitoring. CNL has provided funding to AOO to assist in progression towards an LTRA. CNL has discussed contracting opportunities and provided connections to CNL Procurement staff. The 2022 work plan developed collaboratively between AOO and CNL includes capacity to support continued meaningful participation in the EA for the NPD Closure Project. In October 2021, the AOO and CNL met to discuss the prioritization of engagement on the NSDF Project and the NPD Closure Project to facilitate the AOO's desired "one-window" approach for engagement with CNL on the projects. A consolidated draft schedule was prepared by CNL in November 2021 and shared with AOO for review. At the January 25, 2022 meeting the two parties reviewed the schedule together, made edits and discussed the timeline for engagement activities during the first half of 2022. Capacity challenges at the AOO prevented progress on the work plan during most of 2022. However, in November 2022 in response to reach out by CNL and improved resource availability the AOO re-engaged on the NPD Project. Since that time the two parties have been meeting on a monthly (or more frequent) basis – total of 9 meetings between November 2022 and the end of April 2023. Thus far CNL and AOO have discussed the following outstanding concerns: Alternative Means, Valued Components, the AKLUS results and Indigenous Health. Additional meetings are planned for the remainder of 2023 to discuss the remaining outstanding interests: socio-economics, monitoring and end-state. The May 2023 Working Group meeting transitioned to formulating commitments for outstanding areas of concern.		

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
7. EA Process and Methodology	(a) Concern about the process for identifying potential project-environment interactions: technical decisions should be explained clearly and peer-reviewed. It is important to the AOO that the decisions taken by technical staff are transparent and traceable. The AOO feel that the use of peer review would ensure that technical decisions are supported by evidence and correct interpretations. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: CNL understands the AOO concerns about the subjectiveness of the development of the project-environment interactions matrix. The project-environment interactions matrix follows EA guidance and was developed with input from the technical experts involved in the preparation of TSDs. CNL's approach to identifying interactions for the matrix was to include all potential interactions, even those that may be considered "borderline." For each of the potential interactions identified, CNL is required to provide rationale in the EIS if it is not carried forward into later steps of the effects assessment. The interactions matrix is subject to review and comment from internal and external experts, and through public, stakeholder, and Indigenous engagement efforts. The 2017 EIS was reviewed by a Federal-Provincial Technical Review Team (consisting of the Canadian Nuclear Safety Commission, Environment and Climate Change Canada, Health Canada, Ontario Ministry of Environment, Conservation and Parks, Government of Quebec), members of the public and Indigenous Nations, communities and organizations. CNL addressed these comments and updated the EIS.	Where is this topic discussed in the EIS? **Section 5.2.2** of the EIS discusses the development of the project-environment interactions matrix. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been substantially addressed through its response to specific comments on this topic received from AOO. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.
	(b) Interest in additional cumulative effects analysis: • Releases from NPD, CRL and other sources along the Ottawa River • Overall NPD site, including all sources of contamination Information about cumulative effects is important to the AOO because the AOO is interested in the overall protection of the Kichi-Sìbì and the NPD site, not just the impacts of a single project. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: CNL acknowledges AOO's concern about the effects on the Kichi-Sìbì and NPD site from various activities in the past, present and future. *CEAA* (2012) requires that a cumulative effects assessment be carried out for any residual adverse effects identified in the EIS. Since it was determined that no adverse residual effects are expected to occur from the NPD project (such as to Kichi-Sìbì water quality), there is no potential for the occurrence of cumulative effects, including no potential for synergistic and / or additive effects. These other requested analyses extend beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project.	Where is this topic discussed in the EIS? **Section 9.13** of the EIS describes the process for evaluating cumulative effects and presents CNL's assessment of cumulative effects for the NPD Closure Project. What changes have been made (and where)? No changes have been made to the EIS in response to this concern.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been substantially addressed through its response to specific comments on this topic received from AOO. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-2 – Restoration Planning CNL will collaborate with AOO to ensure that the site restoration plan incorporates in its design traditional values, habitat protection and replanting species of cultural significance (e.g., medicines) as appropriate. CNL to coordinate a tri-party discussion (AOO, AECL, and CNL) about future access to the NPD site including the exclusion zone (undisturbed forested lands that surround the facility). CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
7. EA Process and Methodology	(c) Concerns about the methodology for determination of significance of adverse residual effects. It is important to the AOO that events with the potential for a high level of effects are carried through the assessment as far as is reasonable. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. In response to AOO's request that CNL employ a lower threshold for determination of significant adverse residual effects, CNL has offered to present all environmental effects of the project to AOO and explain the process and thresholds for determination of significance of adverse residual effects. CNL Response: CNL acknowledges the AOO's concerns about the methodology of determining significance of residual effects. The criteria used for the evaluation of significance are from CNSC REGDOC 2.9.1 (2020), Environmental Protection: Environmental Principles, Assessments and Protection Measures. CNL has offered to present to AOO its findings on the environmental effects of the project and explain the process and thresholds for determination of significance of adverse residual effects.	Where is this topic discussed in the EIS? **Section 9.1.2** of the EIS explains the methodology used for the determination of significance of residual effects. It also presents the criteria used for the evaluation of significance, which are from CNSC REGDOC 2.9.1 (2020), Environmental Protection: Environmental Principles, Assessments and Protection Measures. **Section 11** of the EIS, Conclusion on Significance, discusses the assessment findings. What changes have been made (and where)? No changes have been made to the EIS in response to this concern.	Status: Resolved. CNL believes that this concern has been substantially addressed through its response to specific comments on this topic received from AOO. Next Steps CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.
8. End State, Site Restoration and Future Use of the Land	(a) Engagement/consultation on end state, site restoration and future land use of the site. It is important to AOO that its members be engaged/consulted meaningfully, not just informed, on end state, site restoration and future land use. Additionally, it is important to the AOO that the end state of the NPD site is safe for future land users. This is both a site-wide and a project-specific concern.	CNL acknowledges AOO's request for ongoing engagement and consultation related to site restoration and future land use. AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. One of the areas of mutual interest and concern is land – rehabilitation and remediation programs. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS and comments on the ESA studies. CNL will be engaging the AOO in the process to develop a Draft Restoration Plan with AOO. CNL Response: CNL has completed a Phase II Environmental Site Assessment (ESA) to characterize soil, groundwater and sediment for chemicals of potential concern and has provided an evaluation against federal and provincial environmental standards for residential/parkland and commercial/industrial land uses. The Phase 2 ESA is consistent with the requirements defined in O. Reg. 153/04 and is sufficient for the purposes of due diligence. A Record of Site Condition (RSC) is not required as part of this work. In the event of a sale or transfer of lands, any outstanding documentation needed to move this forward (e.g., RSC, as required) would be prepared at that time. CNL has indicated its commitment to continued meaningful engagement with AOO about site restoration, end state and future land use of the site.	Where is this topic discussed in the EIS? General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. **Section 6.2.4.2** of the EIS discusses CNL's engagements efforts to date and path forward for continued meaningful engagement and describes the collaborative work to progress towards an LTRA. What changes have been made (and where) CNL provided additional detail related to restoration of the site following decommissioning in **Section 4.3.1.9.** Additionally, changes have been made to **Sections 6.2** to include the current status of engagement with the AOO related to this concern As the topic of potential land transfer agreements involves AECL and is focused on activities that extend beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project, the EIS is not expected to change as a result of this concern.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been partially addressed through its response to specific comments on this topic received from AOO. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-2 – Restoration Planning CNL will collaborate with AOO to ensure that the site restoration plan incorporates in its design traditional values, habitat protection and replanting species of cultural significance (e.g., medicines) as appropriate. CNL to coordinate a tri-party discussion (AOO, AECL, and CNL) about future access to the NPD site including the exclusion zone (undisturbed forested lands that surround the facility). AOO-4 – Site Visit and Survey Work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. This topic may also be addressed through a future LTRA to ensure adequate future engagement with the AOO in longer-term environmental stewardship and monitoring activities.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
8. End State, Site Restoration and Future Use of the Land	(b) Participation in activities related to end state, site restoration and future land use of the site. Involvement is important to the AOO, to ensure transparency and promote confidence in these activities. This is both a site-wide and project-specific concern.	CNL acknowledges AOO's interest in participating in revegetation activities and environmental monitoring, and in ongoing consultation related to site restoration and future land use. The AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. One of the areas of mutual interest and concern is land – rehabilitation and remediation programs. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. CNL will share the Draft Restoration Plan with AOO for review once it is developed. CNL Response: CNL is committed to providing opportunities for AOO community members to participate in activities related to site restoration, end state and future land use of the site, including monitoring programs. At the project level, follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to the AOO.	Where is this topic discussed in the EIS? General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. **Section 6.2.4.2** of the EIS discusses involvement of the AOO in the monitoring program and describes the collaborative work to progress towards an LTRA. **Section 12** of the EIS discusses how feedback from Indigenous Nations, communities and organizations has been incorporated into the draft follow-up monitoring plans and will continue to be used in the refinement of the plans. What changes have been made (and where)? Changes have been made to **Sections 6.2, 6.3, 8.9 and 9.9** of the EIS in response to AOO comments and to include new information from the AKLUS Report. No changes have been made to the EIS regarding participation in these activities.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been partially addressed through its response to specific comments on this topic received from AOO. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-2 – Restoration Planning CNL will collaborate with AOO to ensure that the site restoration plan incorporates in its design traditional values, habitat protection and replanting species of cultural significance (e.g., medicines) as appropriate. CNL to coordinate a tri-party discussion (AOO, AECL, and CNL) about future access to the NPD site including the exclusion zone (undisturbed forested lands that surround the facility). AOO-4 – Site Visit and Survey Work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. This topic may also be addressed through a future LTRA, to enable AOO involvement in longer-term environmental stewardship and monitoring activities.
	(c) Impact of future socio-political changes on land use. It is important to the AOO that CNL fully consider and assess the impacts of potential future socio-political conditions. This is both a site-wide and project-specific concern.	CNL heard AOO's concern about the impact of future socio-political changes on land use and addressed it in the responses to AOO comments. CNL Response: As shown in the PostSA TSD, CNL's development of scenarios includes consideration of relevant future changes in land use. These could arise from various future situations including changes to socio-political conditions. Specifically, hypothetical future presence of a full-time self-sufficient Indigenous potential exposure group (PEG) at the NPD site has been assessed. The analysis demonstrates that under all scenarios, the impact on the public, Indigenous and the environment is negligible.	Where is this topic discussed in the EIS? The evaluation of FEPs in the PostSA TSD considers relevant future changes in land use, for example, under FEP 1.4 Future Human Actions and FEP 1.4.2 Social and Institutional Developments. FEP 1.4.2 looks at the changes in social patterns and degree of local government, planning and regulation. Potentially significant social and institutional developments include: changes in planning controls and environmental legislation; demographic change and urban development; changes in land use; and loss of records or societal memory of the facility location and hazards. What changes have been made (and where)? In response to AOO comments, a full-time self-sufficient Indigenous potential exposure group has been added to the PostSA TSD and EIS. The analysis demonstrates that under all scenarios, impact on the public, Indigenous and the environment is negligible.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes this concern has been addressed by revisions to the EIS. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-2 – Restoration Planning CNL will collaborate with AOO to ensure that the site restoration plan incorporates in its design traditional values, habitat protection and replanting species of cultural significance (e.g., medicines) as appropriate. CNL to coordinate a tri-party discussion (AOO, AECL, and CNL) about future access to the NPD site including the exclusion zone (undisturbed forested lands that surround the facility). This topic may also be addressed through a future LTRA.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
8. End State, Site Restoration and Future Use of the Land	(d) Long-term liability of the site beyond decommissioning. The AOO have concerns about the long-term integrity of the concrete vault, facility exterior walls and foundations. The AOO considers activities using the seven generation lens and thus is concerned about who will be responsible if environmental events (such as earthquakes) affect the facility over the long term. It is important to the AOO that the end state of the NPD site is safe for future land users. This is a project-specific concern.	CNL heard AOO's concern about long-term liability of the site and addressed it in its responses to AOO comments. CNL has developed monitoring programs that extend into the Institutional Controls period, to ensure that the public, Indigenous and the environment are protected. CNL Response: CNL, as the licensee, is responsible for conducting ongoing monitoring and maintenance of the site during the Institutional Controls period. The PostSA TSD demonstrates that the impact on the public, Indigenous and the environment is negligible, under all scenarios, beyond the Institutional Controls period.	Where is this topic discussed in the EIS? This topic will be discussed as part of the LTRA with the participation of AECL as the owner of the NPD site. However, the long-term liability of the site extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. Therefore, it is not discussed in the EIS. What changes have been made (and where)? No changes were made in the EIS related to long-term liability.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been partially addressed through its response to specific comments on this topic received from AOO. It is noted that this topic extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. This topic may also be addressed through a future LTRA, to ensure adequate sharing of emergency response planning at the community level.
9. Environmental Effects and Mitigation Measures	(a) Potential impacts to Ottawa River shoreline and to fish, wildlife and plants. This is of interest to the AOO because the Kichi-Sibì and these species are of particular importance to the AOO. This is a project-specific concern.	CNL acknowledges AOO's concern about impacts to species of importance and has responded in writing to AOO comments and AKLUS recommendations. The NPD Closure Project is not expected to adversely impact the shoreline. CNL Response: In discussions with AOO, CNL agreed that protection of the Ottawa River shoreline and fish, wildlife, and plants is important. The EIS demonstrated there are no predicted adverse impacts from the project on the Ottawa River shoreline or on any fish, wildlife or plants.	Where is this topic discussed in the EIS? Effects to the shoreline are evaluated in the EIS as part of the Surface Water Environment discussion. There will not be any changes to or disturbance of the Ottawa river shoreline from NPD Closure Project activities. The EIS does not predict any adverse residual effects on the Surface Water Environment (**Section 9.3.3.5**). The EIS does not predict any adverse residual effects on the aquatic environment (**Section 9.4.3.3**) or the terrestrial environment (**Section 9.6.3.3**) resulting from potential emissions during the NPD Closure project.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes this concern has been addressed by revisions to the EIS. Next steps: CNL and AOO have established the following commitments which will help to address this concern:

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		Follow-up monitoring for the NPD Closure Project will include monitoring of environmental components that the AOO has identified as important.	CNL has developed mitigation measures and draft follow-up monitoring plans for the protection of the Kichi-Sibì (**Sections 9.3.3.2 and 12.3** of the EIS) and for the protection of flora and fauna (**Sections 9.4.3.2 and 9.6.3.2 and 12.3** within the EIS**).** What changes have been made (and where)? Changes have been made to **Sections 6.2, 6.3, 8.9, 9.6 and 9.9** of the EIS in response to AOO comments and to include new information from the AKLUS Report. Specific mitigation measures that were added in response to comments include activities to exclude bats from accessing the facility, and activities to protect monarch butterflies (such as sweeping of work areas, avoiding vegetation removal during periods of monarch presence, and reseeding with milkweed). These are outlined in **Sections 9.6.3.2 and 9.6.3.3** of the EIS. Changes have been made to **Section 9.3.3.2** to update and expand mitigation measures for the protection of surface water, including the Kichi-Sibì. In response to AOO comments, CNL also revised the draft Follow-up Environmental Monitoring Plan to address the specific interests and concerns expressed by the AOO: annual sediment monitoring and monitoring of SAR mitigation measures (**Section 12.3** of the EIS).	AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. AOO-4 – Site Visit and Survey Work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. AOO-10 - Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). AOO-2 – Restoration Planning. CNL will collaborate with AOO to ensure that the site restoration plan incorporates in its design traditional values, habitat protection and replanting species of cultural significance (e.g., medicines) as appropriate.
10. Indigenous Health	(a) Postclosure Safety Assessment and Indigenous Health. It is important to AOO that the Algonquin lifestyle is accurately reflected when predicting radiation doses to AOO citizens. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. In the 3rd iteration of the PostSA TSD issued in March 2020, CNL included a Potential Exposure Group consisting of a family of self-sufficient Indigenous receptors in the NPD Area. The exposure profile in the postclosure period was developed based on a traditional Indigenous lifestyle, pre-European contact (SENES 2014). This lifestyle results in a more cautious dose estimate than that based on current-day lifestyle, where some food is store-bought and likely not from the contaminated area. In April 2023, CNL made a presentation to the AOO Working Group summarizing how the Indigenous lifestyle is evaluated through the PostSA TSD looking specifically at how an Indigenous person might interact with the land and biota at and surrounding the NPD site. CNL Response: CNL has added an Indigenous receptor group to the PostSA TSD (see below).	Where is this topic discussed in the EIS? The EIS presents the PostSA results for the Indigenous receptor group in **Section 9.10.2**. What changes have been made (and where)? An Indigenous receptor was added to the human health assessment in the PostSA TSD and EIS.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern, with revisions to the EIS and technical discussion on this topic. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		The predicted peak dose to an Indigenous receptor (from the 3rd iteration PostSA) is 0.0004 mSv/yr which is 500 times less than the dose criterion. The analysis demonstrates that the impact on the public, Indigenous and the environment is negligible. AOO involvement in monitoring activities will help to promote confidence in verifying EIS predictions. SENES Consultants. 2014. *Aboriginal Lifestyle Characterization*. NWMO TR-2014-13. June.		and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). This topic may also be addressed through a future LTRA, to enable AOO's involvement in longer-term environmental stewardship and monitoring activities at the NPD site.
11. Monitoring	(a) Participation in activities related to environmental and cultural heritage stewardship and monitoring. Involvement is important to AOO to ensure transparency and promote confidence in these activities. This is both a site-wide and project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS, and the AOO comments on draft follow-up monitoring plans. CNL has committed to involving Indigenous Nations, communities and organizations in its environmental monitoring programs. The AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. One of the areas of mutual interest and concern is environmental and cultural heritage monitoring programs, including joint monitoring, to ensure that the environment is adequately protected and the rights and interests of the AOO are upheld. CNL Response: CNL is committed to providing opportunities for AOO community members to participate in monitoring activities. At the project level, follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to the AOO such as monitoring of surface water, groundwater and air quality. CNL is committed to a country foods study involving the AOO, as requested by the AOO, to verify project assumptions, and to build confidence/trust in the project's activities and the long-term performance of the closed facility. CNL is committed to co-developing a project specific cultural and heritage protection plan (CHPP) with the AOO.	Where is this topic discussed in the EIS? CNL has indicated in **Section 6.2.4.2.3** that it is willing to involve the AOO in its monitoring programs. What changes have been made (and where)? No changes have been made to the EIS regarding participation in these activities. However, the shared activities are a topic of the LTRA.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern in its response to EIS comments and by initial commitment discussions. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-4 – Site Visit and Survey Work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
				interdependencies between ecological, socio-economic, community and cultural health are recognized. AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).
11. Monitoring	(b) Review of the CNL's draft follow-up monitoring plans. It is important to the AOO that it has an opportunity to provide input into monitoring details (e.g., frequency, location, parameters) This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to AOO comments on draft follow-up monitoring plans. CNL has committed to involving Indigenous Nations, communities and organizations in its environmental monitoring programs Working Group discussion is planned for summer 2023 to hear additional feedback on the draft follow-up monitoring plans. CNL Response: CNL shared the draft follow-up monitoring plans with AOO for comment in August 2019. The planned monitoring proposed in the draft follow-up monitoring programs includes SAR and SAR habitat monitoring, as well as potential vegetation monitoring only if there is an unexpected result in groundwater monitoring.	Where is this topic discussed in the EIS? The follow up monitoring program is described at a high level in **Section 12** of the EIS. What changes have been made (and where)? Changes have been made to **Section 12** to include significant details from the 3 draft follow-up monitoring plans for effluent, environment and groundwater developed since the 2017 EIS.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern is addressed. AOO has provided review comments on the draft follow-up monitoring plans and CNL has provided responses. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
11. Monitoring	(c) AOO recommendations and requests for additional monitoring. Implementing these requests would provide additional assurances to AOO community members, and others, who may resume using the site for a range of uses in the future. This is a project-specific concern.	AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. One of the areas of mutual interest and concern is environmental and cultural heritage monitoring programs, including joint monitoring, to ensure that the environment is adequately protected and the rights and interests of the AOO are upheld. As part of the LTRA the AOO will have the opportunity to make recommendations on environmental and cultural monitoring that would address ecological-community health inter-dependencies of importance to the AOO. CNL Response: Follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to the AOO. To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020, and the report was provided to the AOO. The study determined that the Ottawa River benthic invertebrate community near NPD is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. This study can be repeated when decommissioning is complete, to verify if the project has had an impact. CNL is planning to regularly monitor the Ottawa River water quality before the project begins. CNL is willing to discuss fish tissue sampling with the AOO and review past studies of fish tissue in the NPD area. A very small amount of mercury remains in the NPD facility (estimated to be less than 0.01 kg from past leaks of instruments like thermometers). Because mercury is detected in the facility sump liquid, it is one of the parameters that will be monitored in groundwater and surface water. Regarding AOO's requests for annual vegetation monitoring to confirm the contamination pathway around the grouted facility, and annual monitoring of sediment and benthic macroinvertebrates immediately offshore of NPD, CNL believes that the planned monitoring is sufficient, i.e. monitoring vegetation around groundwater monitoring wells only if there is an unexpected result in groundwater monitoring, and undertaking sediment monitoring if there is an unexpected result in either groundwater or surface water monitoring. CNL has committed to involving Indigenous Nations, communities and organizations in its environmental monitoring programs and to hosting workshops in spring 2022 to further discuss draft follow-up monitoring plans.	Where is this topic discussed in the EIS? The follow up monitoring program is described at a high level in **Section 12** of the EIS. What changes have been made (and where)? Changes have been made to **Section 12** of the EIS to include significant details from the three draft follow-up monitoring plans for effluent, environment and groundwater developed since the 2017 EIS. The benthos and fish habitat survey is important baseline data for the follow-up monitoring program. The results of this study have been incorporated into **Section 8.3** and **Section 8.4** of the EIS. The results reinforce the baseline presented for both the surface water and aquatic environments.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have substantially addressed this concern in their response to EIS comments and by revisions to the EIS. Next Steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized. CNL is committed to continuing the Working Group with AOO. It is understood that work progressed through the Working Group may lead to refinements of commitments in the future.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
11. Monitoring	(d) Monitoring Plan design and implementation and communication of changes. As long-term stewards and users of the land, itis important to the AOO to be actively involved in oversight of the NPD area. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS, and the AOO comments on draft follow-up monitoring plans. CNL has committed to involving Indigenous Nations, communities and organizations in its environmental monitoring programs and Working Group discussion is planned for summer 2023 to hear additional feedback on the draft follow-up monitoring plans. CNL is open to discussing with the AOO the preferred ways of AOO involvement in monitoring plan design, implementation and communication of changes. CNL Response: Follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to the AOO. There is no long-term effluent monitoring at NPD that will require the use of DRLs. Once the project enters the Institutional Controls phase, the only effluents are minor releases from maintenance activities, and DRLs are no longer used. Doses to receptors during the Post-Institutional Controls phase are assessed in the PostSA TSD. The PostSA TSD also assesses dose to an Indigenous receptor group. The assessment demonstrates that the impact on the public, Indigenous and the environment is negligible. CNL is committed to sharing the results of annual follow up monitoring with the AOO and communicating the changes to the program resulting from adaptive management throughout the monitoring period.	Where is this topic discussed in the EIS? The follow up monitoring program is described at a high level in **Section 12** of the EIS. What changes have been made (and where)? • CNL has committed to updating the draft follow-up monitoring plans based on AOO feedback to provide clarity that mitigation measures will be implemented in the event of an exceedance. • The draft follow-up monitoring plans remain draft and CNL is seeking feedback from all Indigenous Nations, communities and organizations and the public. These plans will not be finalized until the CNSC renders a decision for the project.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that this concern has been partially addressed through its response to specific comments on this topic received from AOO. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized. CNL is committed to continuing the Working Group with AOO. It is understood that work progressed through the Working Group may lead to refinements of commitments in the future.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
12. Protection of the Ottawa River	(a) Contamination in the Ottawa River and the environment. As stewards of the lands and waters, it is important to the AOO that the environment, including flora and fauna are protected. AOO expressed that the protection of the Ottawa River is of extremely high priority to AOO. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS, and the AOO comments on draft follow-up monitoring plans. In 2018, CNL ceased the practice of discharging liquid effluent from the facility sumps to the Ottawa River in response to public and Indigenous concerns and arranged instead for water to be sent to the Waste Treatment Centre at the CRL site. CNL has committed to involving Indigenous Nations, communities and organizations in its environmental monitoring programs and to hosting workshops in spring 2022 to gather feedback on the draft follow-up monitoring plans. CNL Response: The potential for contamination to reach the Ottawa river is assessed in the EIS and is supported by long term modelling and detailed groundwater modelling. The EIS predicts no effects to surface water (including the Ottawa river) and follow up monitoring will be implemented to confirm these predictions. CNL has added information to the EIS about the washout pit and historic water discharges from the wells area sump. Monitoring results capture the effects of historic activities. Groundwater modelling was conducted for the NPD site. The PostSA TSD incorporates the results of groundwater modelling and, where necessary, uses conservative assumptions, (e.g., the tile drains remain functional and serve as a faster pathway to the Ottawa River), and considers the tile drains to have failed (so that the facility resaturates more quickly). The PostSA TSD concludes that no residual effects are expected from potential contaminant migration in groundwater. The tile drain system is expected to fail at some point during the Institutional Controls phase.	Where is this topic discussed in the EIS? The follow-up monitoring program is described at a high level in **Section 12** of the EIS. **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the Ottawa River. The EIS does not predict any adverse residual effects on the surface water environment (encompassing the Ottawa River) (**Section 9.3.3.5**). Groundwater modelling has been conducted in the Groundwater Modelling TSD. What changes have been made (and where)? Changes have been made to **Section 12** to include significant details from the 3 draft follow-up monitoring plans for effluent, environment and groundwater developed since the 2017 EIS. Mitigation measures for the protection of surface water, including the Ottawa River, in **Section 9.3.3.2** have been updated and expanded. Based on AOO feedback, the project scope (**Section 4.3.1.3**) has been clarified with improved definition of requirements for the washout pit. CNL has also provided additional explanation in **Section 8.3.3** to clarify the history and basis for monitoring of the wells area sump. CNL will review data from facility characterization activities that were completed after the draft Follow-up Effluent Monitoring Plan was prepared. CNL will ensure that the draft Follow-up Effluent Monitoring Plan takes into consideration all radionuclides that may be released from demolition of the reactor building.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern in their response to EIS comments and by revisions to the EIS. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). Future dialogue may include dedicated discussions with SMEs on the importance of water. AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized.
13. Protection of Flora and Fauna	(a) Potential impacts to habitat and biota, and related follow-up program elements. As stewards of the lands and waters, it is important to the AOO that the environment around the site of the NPD Closure Project including flora and fauna, are protected, and that the rights and interests of AOO members are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	CNL has completed additional site characterization since issuing the 2017 draft EIS. CNL undertook baseline studies of benthic macroinvertebrate, sediment quality and water quality in the Ottawa River in the summer of 2020. Samples were taken upstream, downstream and adjacent to the NPD facility. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS, and the AOO comments on draft follow-up monitoring plans. CNL has included the AOO VC species in the EIS	Where is this topic discussed in the EIS? The follow up monitoring program is described at a high level in **Section 12** of the EIS. CNL has indicated that it is willing to involve the AOO in its monitoring programs (**Section 6.2.4.2.3**). **Section 6.3** of the EIS discusses VCs identified by Indigenous Nations, communities and organizations and shows how they are included or represented in the EIS.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern in their response to EIS comments and by revisions to the EIS. Next Steps CNL and AOO have established the following commitments which will help to address this concern:

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		CNL Response: As shown in the EIS, there are no adverse impacts from the project on the Ottawa River or to any fish, birds, wildlife or plants within the terrestrial, riparian and aquatic ecosystems. Monitoring results capture the effects of historic release of radionuclides. CNL will follow Environment and Climate Change Canada guidance for the protection of migratory birds and their habitat. CNL will undertake continuous air monitoring to ensure that the wetlands are protected. The EIS demonstrates that there are no predicted adverse impacts from the project on the Ottawa River shoreline or onto any fish, wildlife or plants. Follow-up monitoring for the NPD Closure Project will include monitoring of environmental components that the AOO has identified as important. At the project level, follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to the AOO.	What changes have been made (and where)? The EIS was updated with significant details developed compared to the 2017 draft EIS. These details come through the development of the 3 draft follow-up monitoring plans for effluent, environment and groundwater. Changes have been made to **Section 4.3.1.2** to include the preferred location for the batch plant, which is not predicted to have any effect on terrestrial vegetation or wetland areas, as the area was previously disturbed and is well away from wetlands.	AOO-4 – Site visit ad survey work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program. On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).
13. Protection of Flora and Fauna	(b) Species at Risk. AOO expressed the importance of flora and fauna to their communities, culture and Aboriginal Rights and Title. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. In 2019, 2020, 2021 and 2023, Indigenous Nations, communities and organizations and the public were invited to participate in the National Chimney Swift Roost Counts. CNL Response: Impacts to Species at Risk (SAR) are assessed using the SAR VCs selected. Lake sturgeon, listed as Threatened under COSEWIC, is included as a VC and is assessed in Section 9.4.3. The American eel is represented as a benthic fish receptor in the Ecological Risk Assessment (EcoRA) TSD. In the EcoRA TSD, additional protective measures were applied, such as adding an extra safety factor to the radiological benchmarks for SAR species and selecting chemical benchmarks protective at the individual level. CNL has developed a number of mitigation measures to ensure the protection of biota, including SARs. Some of the planned measures are specific to the protection of specific SARs, such as chimney swifts and bald eagles.	Where is this topic discussed in the EIS? Potential impacts to SAR are assessed using the SAR VCs selected in the EIS, which include the bald eagle (**Section 9.6.3**). Lake sturgeon, listed as Threatened under COSEWIC, is included as a VC and is assessed in **Section 9.4.3**. What changes have been made (and where)? CNL has included additional mitigation measures related to migratory birds and avian and herpetofauna species at risk in **Section 9.6.3.2** of the EIS	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern in their response to EIS comments and by revisions to the EIS. Next Steps CNL and AOO have established the following commitments which will help to address this concern: AOO-4 – Site visit ad survey work Provide an opportunity to and support pre-decommissioning site visit(s). Provide capacity for a baseline plant inventory survey. AOO-5 – Participation in monitoring and sharing of results CNL is committed to involve all interested Indigenous Nations, communities and organizations in the NPD Closure Project Follow-up Monitoring Program.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
				On an annual basis, CNL and AOO will review together environmental monitoring results from the NPD site. CNL can share results with the AOO annually through to the end of the Institutional Control period. AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).
14. Socio-economic	(a) Lack of assessment of Indigenous socio-economic conditions and effects. The AOO consider this information and assessment necessary in order to understand the extent of the socio-economic conditions of AOO communities' socio-economic and how those may be influenced by NPD Closure Project activities. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment. CNL has revised the EIS to include Indigenous socio-economic and well-being receptors, assess project interactions, describe current Indigenous socio-economic and well-being conditions (based on information provided by the AOO and other Indigenous Nations, communities and organizations) and assess the potential impacts of the project on Indigenous socio-economics and health, including nuisance effects. Mitigation measures, monitoring and follow-up activities are also discussed. CNL provided AOO with digital access to the EIS, which includes a new section on Aboriginal health and socio-economic factors. CNL has also offered support to the AOO to complete a socio-economic study. Results to be available late in 2023. <u>CNL Response:</u> CNL has acknowledged this gap and revised the EIS and Indigenous Engagement Report (IER) to include sections on Indigenous socio-economics and health. These sections aim to include the interests of Indigenous Nations, communities and organizations, such as the AOO, in the consideration of the potential impacts of the NPD Closure Project. The EIS and IER conclude that there are no adverse residual effects predicted to the Indigenous Socio-economic environment.	<u>Where is this topic discussed in the EIS?</u> **Sections 8.10 and 9.10** of have been added to the EIS to focus on Indigenous Socio-economic and Health and introduce specific Indigenous receptors. **Section 8.10** summarizes current conditions, and **Section 9.10** assesses potential effects. **Section 10.3** of the EIS describes mitigation measures to minimize effects to Indigenous socio-economic conditions and health, including outlining the process to be followed in the event of discovering previously undocumented archaeological resources, limiting off-site transportation to Highway 17 and site roads, limiting construction activities to between 7 a.m. and 7 p.m. wherever possible, etc. <u>What changes have been made (and where)?</u> CNL added **Sections 8.10 and 9.10** (discussed above) to the EIS as a result of these comments. Changes have been made to **Section 5.2.4** (Valued Components) to reflect the new environmental components, sub-categories and receptors. Changes have been made to **Section 10.3** to include mitigation measures for the new Indigenous socio-economic and health receptors. CNL also added new sections to the IER to cover Indigenous socio-economic and health factors and to include the new Indigenous receptors.	<u>Status:</u> Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes this concern will be substantially addressed by completion of the socio-economic study and review of study results as they pertain to potential impacts from the project. <u>Next steps:</u> CNL and AOO have established the following commitments which will help to address this concern: AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized.
14. Socio-economic	(b) The EIS is missing some key Indigenous socio-economic and well-being components (VCs) and interactions. It is important to the AOO that all potential interactions and impacts be considered in order to fully evaluate the effects of the project on AOO citizens.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL has revised the EIS to include consideration of potential interactions of the project with numerous Indigenous well-being and health components, such as population and demographics, economy and employment, housing	<u>Where is this topic discussed in the EIS?</u> **Section 5.2.2** of the EIS shows the revised Interactions Matrix, which includes the new Indigenous socio-economic and well-being receptors. **Section 5.2.4** of the EIS describes the new Indigenous socio-economic and well-being compartments and VCs.	<u>Status:</u> Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes this concern will be substantially addressed by completion of the socio-economic study

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
	This is a project-specific concern.	and infrastructure, Indigenous resident use and enjoyment of property, decision-making, the health of members of the public, and worker receptors. With the addition of these new interactions, CNL can assess the effects of the project on components that are important to AOO and other Indigenous Nations, communities and organizations. CNL provided AOO with digital access to the EIS, which includes a new section on Aboriginal health and socio-economic factors. CNL has also offered support to the AOO to complete a socio-economic study. Results to be available late in 2023. CNL Response: CNL has acknowledged this gap and revised the EIS and IER to include specific consideration of project interactions with Indigenous socio-economics and health. To address the gap, CNL has now included Indigenous socio-economic and Indigenous health environmental compartments and carrying them through the interactions matrix, description of current conditions, and evaluation of effects.	**Sections 8.10 and 9.10** of the EIS have been added to focus on Indigenous socio-economic and Health, including introduction of specific Indigenous receptors. **Section 8.10** summarizes current conditions, and **Section 9.10** assesses potential effects. **Section 10.3** of the EIS presents mitigation measures to minimize effects to Indigenous socio-economic conditions and health. What changes have been made (and where)? CNL revised the interactions matrix (**Section 5.2.2 of the EIS**) to include the new Indigenous socio-economic and well-being receptors. Changes have been made to **Section 5.2.4** (Valued Components) to reflect the new environmental components, sub-categories and receptors. CNL added **Sections 8.10 and 9.10** (discussed above) to the EIS as a result of these comments. Changes have been made to **Section 10.3** to include mitigation measures for the new Indigenous socio-economic and health receptors. CNL also added new sections to the IER to cover Indigenous socio-economic and health factors and include the new Indigenous receptors.	and review of study results to assess gaps in the VCs selected to assess impacts to socio-economics. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-1 – Socio-Economic Considerations, Monitoring and Mitigations Provide capacity to the AOO to undertake a socio-economic study with results captured in a subsequent revision of the Indigenous Engagement Report. Study recommendations will be implemented in CNL's project plans after collaborative review by CNL and the AOO. CNL and AOO will identify opportunities to improve CNL's monitoring and mitigations to ensure traditional knowledge is incorporated and that interdependencies between ecological, socio-economic, community and cultural health are recognized.
14. Socio-economic	(c) Lack of plans for monitoring of socio-economic effects, accommodations and compensation. It is important to the AOO that CNL work with its members to develop a plan for monitoring socio-economic effects of the project, to ensure that potential negative effects are minimized and that positive effects are fully realized. AOO believes that plans are needed for AOO citizens to be adequately accommodated and compensated for any impacts experienced as a result of the project. This is both a site-wide and a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. One of the areas of mutual interest and concern is environmental and cultural heritage monitoring programs, including joint monitoring, to ensure that the environment is adequately protected and the rights and interests of the AOO are upheld. CNL Response: CNL is of the opinion it has assessed accurately all of the pathways associated with the NPD Closure Project, compliant with *CEAA* (2012). The EIS did not predict effects to socio-economic VCs. Therefore, no specific Indigenous socio-economic monitoring activities, compensation, or accommodations have been identified. Monitoring in other environmental components will confirm the EIS predictions (i.e., that no effects are expected in the Indigenous socio-economic environment). CNL is open to discussing socio-economic monitoring measures during construction activities with the AOO and other Indigenous Nations, communities and organizations. CNL is committed to working with the AOO to identify barriers for accessing economic opportunities from the project, mitigation of those barriers and ways	Where is this topic discussed in the EIS? **Section 6.2.4.2** of the EIS presents information on the work to progress developing an LTRA. **Sections 8.10 and 9.10** of the EIS have been added to focus on Indigenous socio-economic conditions, including economy and employment. **Section 8.10** summarizes current economic and employment conditions, and **Section 9.10** assesses potential effects and discusses CNL's plan to fully realize the potential for economic and employment benefits to Indigenous Nations, communities and organizations. What changes have been made (and where)? No changes were made to the EIS in response to this concern.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-9 – Economic Participation and Benefit CNL is committed to improved economic participation and benefits for Indigenous Peoples from its projects. CNL recognizes that there is an opportunity to improve in this area. CNL will continue working with the AO to improve systems that support economic participation and benefits. CNL will review together with AOO the scope and activities for the NPD project and share contracting and employment opportunities. AOO-10 – Ongoing Collaboration

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
		to monitor the degree to which Algonquins are able to take advantage of benefits of the project.		CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). This topic may also be addressed through a future LTRA to enable AOO's involvement in employment and procurement opportunities.
14. Socio-economic	(d) The EIS does not discuss employment or procurement opportunities for the AOO. It is important to the AOO to understand the way in which CNL plans to engage the AOO in developing employment and procurement opportunities for the proposed project. This is both a site-wide and project-specific concern.	CNL has revised the EIS to include consideration of Indigenous economic and employment opportunities as part of the new assessment of Indigenous socio-economics. AOO, AECL and CNL have signed a tri-partite MOU to support the negotiation of an LTRA. The areas of mutual interest and concern include: contracting opportunities, employment considerations and economic impact awareness. CNL has been working with Indigenous Nations, communities and organizations on facilitating such economic and contracting opportunities. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: CNL has provided information to AOO on the processes involved in Indigenous employment and procurement for the project. CNL is committed to improved economic participation and benefits for Indigenous Peoples from its projects. CNL recognizes that there is an opportunity to improve in this area and has developed an Indigenous Procurement Strategy.	Where is this topic discussed in the EIS? **Section 5.2.4** of the EIS describes the new Indigenous socio-economic VCs, which include Indigenous economy and employment. **Section 6.2.4.2** of the EIS describes the work to progress towards an LTRA. **Sections 8.10 and 9.10** of the EIS have been added to focus on Indigenous socio-economic conditions, including economy and employment. **Section 8.10** summarizes current economic and employment conditions, and **Section 9.10** assesses potential effects and discusses CNL's plan to fully realize the potential for economic and employment benefits to Indigenous Nations, communities and organizations. CNL will proactively seek, engage, and support discussion on issues and opportunities. What changes have been made (and where)? Changes have been made to **Section 5.2.4** (Valued Components) to include economy and employment as a VC under the new Indigenous socio-economic compartment. CNL added **Sections 8.10 and 9.10** (discussed above) to the EIS as a result of these comments.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern, with revisions to the EIS and recent work to develop an Indigenous Relations Procurement Strategy. It is noted that employment or procurement opportunities extend beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-9 – Economic Participation and Benefit CNL is committed to improved economic participation and benefits for Indigenous Peoples from its projects. CNL recognizes that there is an opportunity to improve in this area. CNL will continue working with the AO to improve systems that support economic participation and benefits. CNL will review together with AOO the scope and activities for the NPD project and share contracting and employment opportunities. AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities). This topic may also be addressed through a future LTRA to enable AOO's involvement in employment and procurement opportunities.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
15. Technical	(a) Derived Release Limits (DRLs). It is important to AOO to review the DRLs to ensure they comply with relevant standards and that the critical group reflects the Algonquin lifestyle. This is a site-wide concern.	CNL has responded in writing to AOO comments on the topic of DRLs. <u>CNL Response:</u> There is no long-term effluent monitoring at NPD that will require the use of DRLs. Once the project enters the Institutional Controls phase, the only effluents are minor releases from maintenance activities, and DRLs are no longer used. Doses to receptors during the Post-Institutional Controls phase are assessed in the PostSA TSD. The PostSA TSD also assesses dose to an Indigenous receptor group. The assessment demonstrates that the impact on the public, Indigenous and the environment is negligible.	<u>Where is this topic discussed in the EIS?</u> The DRL report is beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. <u>What changes have been made (and where)?</u> The DRL report is not part of the scope of the EA submission, and no changes were made.	<u>Status:</u> Resolved. Although the DRL Report extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. CNL is following up on this issue with the AOO. <u>Next Steps</u> CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.
	(b) Emissions and discharges. It is important to the AOO that emissions in the atmospheric environment of contaminants are properly assessed and are mitigated and monitored as appropriate. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. In 2018, CNL ceased the practice of discharging liquid effluent from the facility sumps to the Ottawa River in response to public and Indigenous concerns and arranged instead for water to be sent to the Waste Treatment Centre at the CRL site. <u>CNL Response:</u> The EIS describes noise and dust mitigation measures, and monitoring is planned as part of the EA follow-up monitoring. Air releases of substances that will not be removed from the facility prior to decommissioning are assessed in the DecomSA TSD and are below relevant criteria. The EIS does not predict any adverse residual effects on the aquatic or terrestrial environment as a result of potential emissions during the NPD Closure Project.	<u>Where is this topic discussed in the EIS?</u> **Section 9.2.3** of the EIS provides the mitigation measures and monitoring for dust and noise; the draft follow-up monitoring plans provide details for monitoring of hazardous substances during decommissioning activities that may make them airborne. **Section 4.3.1.2** of the EIS includes the preferred location for the batch plant, which is not predicted to have any effect on terrestrial vegetation or wetland areas, as the area was previously disturbed and is well away from wetlands. Air releases are assessed in **Sections 8.5.2.1** and **8.6.1** of the DecomSA TSD. **Section 9.2.3** of the EIS provides the mitigation measures and monitoring for dust and noise. The EIS does not predict any adverse residual effects on the aquatic (**Section 9.4.3.3**) or terrestrial environment (**Section 9.6.3.3**) as a result of potential emissions during the NPD Closure Project. The PostSA TSD includes dispersion modelling for groundwater discharge in the Ottawa River <u>What changes have been made (and where)?</u> The EIS was updated to include additional information about PCBs removal. Changes have been made to **Section 12** to include significant details from the 3 draft follow-up monitoring plans for effluent, environment and groundwater developed since the 2017 EIS, including monitoring of hazardous substances.	<u>Status:</u> Resolved. CNL believes that they have addressed this concern, with revisions to the EIS. <u>Next steps:</u> CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
15. Technical	(c) Technical suitability of cement and batch plant construction details. It is important to the AOO that the cement used for the project is appropriate and scientifically defensible. It is also important to understand the locations of project activities so that potential effects on terrestrial vegetation and wetlands are properly assessed. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: Comparing Roman concrete and the grout to be used in the NPD facility (a mixture of blast furnace slag, Portland cement, and sand), shows the similarities between both materials. The NPD grout fill will be 90% blast furnace slag, which is a pozzolanic material similar to the volcanic ash used in Roman cements. Due to the depth below surface, the grouted facility will also not experience freeze-thaw cycles and will be at a relatively constant ground temperature. The natural cements have also been exposed to a wide range of climate conditions over millions of years, which encompasses multiple periods of climate change and the effects of continental drift. The project has prepared a Cementitious Materials Synthesis Report that provides additional technical information and research supporting the performance of the concrete to understand how it will behave. The PostSA accounts for the degradation of concrete over time, and the PostSA results show that doses to receptors are below regulatory criteria, and that the NPD Closure Project is safe in the short-term and the long-term. The preferred location for the batch plant is not predicted to have any effect on terrestrial vegetation or wetland areas, as the area was previously disturbed and is well away from wetlands.	Where is this topic discussed in the EIS? Natural analogues are discussed in **Section 4.1.2** of the EIS. Batch plant construction details are discussed in **Section 4.3.1.2** of the EIS. What changes have been made (and where)? In response to comments from the AOO and others, the EIS now includes an updated discussion of natural analogues (**Section 4.1.2**), including cement, and their relevance to the project. The preferred location for the batch plant was added to **Section 4.3.1.2** of the EIS. This location is not predicted to have any effect on terrestrial vegetation or wetland areas, as the area was previously disturbed and is well away from wetlands.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern, with revisions to the EIS. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-7 – Details of the Batch Plant CNL is committed to providing the construction details for the batch plant wash-out pit to the AOO once they are available and will review together with AOO to understand any concerns. CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.
	(d) Ecological Risk Assessment methodology and revisions. As stewards of lands and waters, it is important to the AOO that the environment, wildlife, and plants are protected. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: The EcoRA has been revised to incorporate the latest results from the safety assessments and to report doses to non-human biota. To compensate for the lack of dose coefficients for these radionuclides, a conservative approach was taken in the revised EcoRA TSD where the lowest No Effect Concentrations were used as the screening criteria. The concentrations of these radionuclides in all environmental media for all credible PostSA scenarios were below the No Effect Concentrations.	Where is this topic discussed in the EIS? The EIS uses the results of the EcoRA in the assessment of exposure-related effects (both radiological and non-radiological) to biota in the aquatic and terrestrial environmental components (**Sections 9.4** and **9.6**) What changes have been made (and where)? The EcoRA has been revised to directly incorporate the latest results from the safety assessments and to report doses to non-human biota in the main EcoRA report. Table 2.16 has been removed from the EcoRA, however, the risk to non-human biota from a flood is still discussed.	Status: Resolved. CNL believes that they have addressed this concern, with revisions to the EIS. Next steps: CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
15. Technical	(e) Terrestrial Study Area Rationale It is important to the AOO that the rationale for selecting the terrestrial Regional Study Area is clearly provided, as the baseline description of the terrestrial environment is critical for understanding the current state of VCs and evaluating the project-related effects. This is a project-specific concern.	CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS, and the AOO comments on draft follow-up monitoring plans. CNL Response: The intent of the Regional Study Area is to capture the area within which the potential effects of the NPD Closure Project may interact with the effects of other projects, resulting in the potential for cumulative effects. Specifically, the terrestrial Regional Study Area was established to capture areas where other projects may take place (e.g., the des Joachims dam at Rolphton Ontario and the Chalk River Laboratories site), in order to assess any cumulative effects from projects at those sites.	Where is this topic discussed in the EIS? **Section 8.6.1** presents the spatial boundaries selected by CNL to assess potential effects to the terrestrial environment. What changes have been made (and where)? Changes have been made to **Section 8.6.1** to include additional rationale for the selection of the terrestrial Regional Study Area.	Status: Resolved. CNL believes that they have addressed this concern, with revisions to the EIS. Next steps: CNL and AOO will review together the technical topic responses and identify any remaining gaps. Resolution of any gaps identified will be a topic of a dedicated discussion at the Working Group level.
16. Valued Components	(a) Engagement, input and participation in VC selection. It is important to the AOO that CNL provide opportunities for meaningful engagement on VCs to ensure that the VCs incorporate species important to traditional users of the land. This is a project-specific concern.	CNL has engaged with the AOO by seeking input on VCs, providing funds to support the AKLUS, incorporating additional VCs in the EIS, sharing the update with the AOO and requesting feedback on it. CNL has sent two targeted letters asking specific questions of the AOO to align with the requirements of *CEAA* (2012) Section 5(1)(c). These questions included: • Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects? • Does [the AOO], or any members, have sites of ceremonial significance in close proximity [of NPD], or more generally, any cultural activities near [the NPD site]? CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. At the request of AOO, CNL has prepared a summary table that maps AOO VCs to those VCs used in CNL's assessment. This table also shows how the project is protective of each VC, whether any potential impacts have been identified and how CNL will monitor to confirm those VCs remain protected. CNL Response: The EIS outlines how Indigenous engagement and input has influenced the VCs used in the assessment. CNL added VCs to the EIS in response to AOO feedback (see row below). CNL has and continues to engage with the AOO on resolving interests and concerns related to VCs and on developing project commitments.	Where is this topic discussed in the EIS? The EIS now includes a section on Indigenous engagement related to VC selection (**Section 6.3.1.1**) What changes have been made (and where)? The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern, with revisions to the EIS and the VC mapping exercise. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-6 – Valued Components CNL will continue to engage with the AOO on the topic of Valued Components (VCs) as long as there is interest from the AOO. At the AOO's request, CNL has shared a VC mapping table that provides the intersection of VCs identified through the AOO AKLUS with the VC's used in CNL's assessment. AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA Process	Status of the Concern
16. Valued Components	(b) Concerns regarding the limited VCs selected for the NPD Closure Project and recommendations for VCs to be included. This topic is of interest to the AOO because these species are features of particular importance to the AOO. This is a project-specific concern.	CNL has sent two targeted letters asking specific questions of the AOO to align with the requirements of *CEAA* (2012) Section 5(1)(c). These questions included: • Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects? • Does [the AOO], or any members, have sites of ceremonial significance in close proximity [of NPD], or more generally, any cultural activities near [the NPD site]? CNL has included VCs from Indigenous feedback in **Section 6.3.2** of the EIS – specifically in **Tables 6.3-1(a) and 6.3-2**; VCs identified by AOO through the AKLUS are listed and where necessary mapped to representative species to show how they are considered in CNL's assessment. CNL has responded in writing to AOO comments on this topic, citing relevant sections of the EIS as part of the comment responses and has also responded in writing to recommendations from the AKLUS. At the request of AOO, CNL has prepared a summary table that maps AOO VCs to those VCs used in CNL's assessment. This table also shows how the project is protective of each VC, whether any potential impacts have been identified and how CNL will monitor to confirm those VCs remain protected. CNL Response: CNL considers all of the VCs identified by AOO. Some VCs are considered directly (i.e., either added to, or already in, the EIS), and some are considered via representative species. CNL also considers the features identified by AOO in their AKLUS. The EIS assesses effects to these VCs and no impacts are predicted.	Where is this topic discussed in the EIS? The EIS includes expanded description of traditional uses in **Section 8.9**. **Section 9.9** describes the VCs related to Traditional Land Use. **Section 9.6.3.2** describes the mitigation, monitoring and follow up activities for the Terrestrial Environment VCs. **Tables 6.3-1** and **6.3-2** of the EIS highlight how VCs identified by AOO are represented by the species that are evaluated in the NPD EIS. What changes have been made (and where)? The EIS was updated to show how the VCs identified by the AOO are included or represented by species that are evaluated in the NPD EIS. Some VCs are considered directly (i.e., either added to or already in the EIS), and some are considered via representative species. The EIS was updated to include an expanded description of traditional uses and to describe the VCs related to Traditional Land Use, including the rationale, mitigation, monitoring and follow-up activities related to the Traditional Land Use VCs. CNL added new sections and VCs for the Indigenous socio-economic environment.	Status: Ongoing See Note at the top of this table – the Working Group want this to be recognized as a positive descriptor of status. CNL believes that they have addressed this concern, with revisions to the EIS and VC mapping exercise. Next steps: CNL and AOO have established the following commitments which will help to address this concern: AOO-6 – Valued Components CNL will continue to engage with the AOO on the topic of Valued Components (VCs) as long as there is interest from the AOO. At the AOO's request, CNL has shared a VC mapping table that provides the intersection of VCs identified through the AOO AKLUS with the VC's used in CNL's assessment. AOO-10 – Ongoing Collaboration CNL is committed to continuing the Working Group with AOO to promote continued open communication, information sharing and education including collaborating on the development of communications and engagement material for various audiences (e.g., AOO staff, ANRs and specific communities).

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Appendix C.2 – Record of Engagement and Tables of Interests and Concerns for the Algonquins of Pikwàkanagàn First Nation (AOPFN)

This Appendix provides a complete record of all engagement between CNL and AOPFN from June 2015 to March 2024 (Table C-4). Table C-4 includes the date and method of the communication/engagement, the topics discussed and participants. The table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement is a mapping of how the summary of interests and concerns were compiled (Table C-5), as well as a summary of interests and concerns raised by AOPFN (Table C-6).

Section 6.2.4.3.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and the AOPFN.

Table C-4 Record of Engagement with Algonquins of Pikwàkanagàn First Nation (AOPFN)

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
December 01, 2015 Meeting	This meeting between AOPFN representatives (including the Chief, five councillors and AOPFN staff members) and CNL representatives (including the CEO, the Vice-President of Human Resources, the General Manager of Health, Safety, Security and Environment, the Vice President of Corporate Affairs, the Vice President of Decommissioning and Waste Management, the Director of the proposed NSDF, and Corporate Communications staff) was held at the CRL site and the NPD Closure Project was introduced within the context of a larger vision of the new contractor company. The meeting agenda included: • Welcome and Introductions; • CNL Vision 2026; • AOPFN Overview; • CNL Human Resources Overview; • Site tour.										√
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the AOPFN Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
December 22, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the AOPFN Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of AOPFN's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Does the AOPFN have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of the AOPFN using the areas around the two projects?* • *Do you have any members of the AOPFN that currently live in close or reasonable proximity to either of the projects?* • *Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does the AOPFN, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interest in learning more about the AOPFN and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	√
January 10, 2017 Incoming letter	This letter from the AOPFN Chief to CNL's Director of Corporate Communications was advising CNL that the AOPFN were engaged in discussions with the federal government and advised CNL not to finalize any plans at this point.					√					√
November 15, 2017 Outgoing email	This email from a CNL communications officer to the AOPFN Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and the environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a CNL communications officer to the AOPFN Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: "CNL would be pleased to update information in this current draft with input from your community."	√	√	√	√	√	√	√	√	√	√
May 16, 2019 Outgoing email	This email from a CNL communications officer to the AOPFN Chief was an invitation to participate in the National Roost Monitoring Program at the NPD site for evening bird counts, on May 22, May 26, May 30, May 30 and June 03, to help monitor and understand Chimney Swift spring migration.										√
May 2019 Outgoing correspondence	This correspondence between the AOPFN representative on the ESC and a communications officer with CNL included the details of the June 20, 2019 ESC meeting.										√
June 12, 2019 Outgoing email	This email from a CNL communications officer to the AOPFN Chief was an invitation to an online webinar discussion on June 17, 2019 that focuses on how IAEA guidance is applied to the NPD Closure Project. A Q&A discussion followed.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
June 18, 2019 Outgoing email	This email from a CNL communications officer to the AOPFN Chief was an invitation to a bi-monthly breakfast briefing on June 26, 2019. The topic of discussion was Protecting the Chimney Swifts at NPD. A Q&A discussion followed.										√
July 25, 2019 Outgoing email	This email from a CNL communications officer to the AOPFN Chief was an invitation to NPD public open houses on August 1 and 8, 2019. These included the option of a chimney swift roost count viewing. The open houses provided an opportunity to talk about the project with CNL subject matter experts and access information on all aspects of the project and the environmental assessment.										√
July 2019 Outgoing correspondence	This correspondence between the AOPFN representative on the ESC and a communications officer with CNL included the details and invitation to the NPD Open Houses held at the facility on held on August 01, 2019 and August 08, 2019, which incorporated an Indigenous cultural ceremony led by an Indigenous CNL staff member.										√
September 11, 2019 Outgoing email	This email from a CNL communications officer to the AOPFN Chief was an invitation to the third Breakfast Briefing on September 18, 2019. The topic of discussion was NPD Engineering Challenges. A Q&A discussion followed.										√
September 24, 2019 Outgoing email	This email from a CNL communications officer to the AOPFN Chief was an invitation to an online webinar discussion on September 30, 2019. The topic was engineering challenges of the NPD Closure Project. A Q&A discussion followed.										√
September 2019 Outgoing correspondence	This correspondence between the AOPFN representative on the ESC and a communications officer with CNL included the details of the October 24, 2019 ESC meeting.										√
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
March 06, 2020 Incoming letter	This letter from the AOPFN's Consultation Coordinator to CNL's Director of Corporate Communications was to invite the NPD Closure Project and NSDF Project staff to a community meeting on 2020 April 07 to provide a project overview/update followed by a question period.										√
March 13, 2020 Incoming email	This email from the AOPFN's Consultation Coordinator to a CNL Communications Officer was to postpone the 2020 April 07 community meeting due to COVID-19.										√
April 23, 2020 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Communications Officer was to request six documents related to the NPD Closure Project's draft EIS.	√	√	√	√	√	√	√	√	√	
April 29, 2020 Outgoing email	This email from CNL communications staff to the AOPFN Consultation Coordinator was enclosing the requested six documents on the NPD Closure Project as well as a preliminary version of the revised draft EIS for review.	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the AOPFN Chief enclosed a preliminary version of the 2020 EIS and an updated IER and indicated an interest in meeting with the AOO. This letter included a list of topics of interest the AOO had brought forward and the status of each. These included: • Technical issues; • Traditional knowledge; • Future land use (site restoration); • Socio-economic interests; • Monitoring; • Alternative means; • Indigenous health; • Archaeology. The letter also asked for feedback on the following seven questions: • *Do the Algonquin of Pikwàkanagàn First Nation have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Do the Algonquin of Pikwàkanagàn First Nation have any members who currently live close or in reasonable proximity to the NPD site?* • *Do the Algonquin of Pikwàkanagàn First Nation have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Do the Algonquin of Pikwàkanagàn First Nation have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to the Algonquin of Pikwàkanagàn First Nation near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.*	√	√		√	√	√	√	√	√	
May 11, 2020 Outgoing email	This email from a CNL communications officer to the AOPFN Consultation Coordinator was to follow-up to see if the AOPFN had any questions on the material to support their review of the revised draft EIS.										√
May 11, 2020 Incoming email	This email from the AOPFN's Consultation Coordinator to a CNL communications officer was in response to the previous email and stated that at this time there was no further information needed.										√
May 13, 2020 Incoming letter	This letter from AOPFN's Chief to CNL's Manager of Stakeholder Relations was confirming interest in direct AOPFN-CNL engagement and an LTRA for the NSDF Project and the NPD Closure Project.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
June 03, 2020 Virtual meeting	This meeting was an initial meeting between AOPFN representatives, including the Consultation Coordinator and consultants, and CNL representatives, from the NPD Closure Project team (including the Director and Manager of Regulatory Approvals) and ERM Stakeholder Relations (including the Manager of Stakeholder Relations and two communications officers), to discuss the development of a project-specific contribution agreement between AOPFN and CNL. Actions were recorded and next dates were suggested.									√	√
June 24, 2020 Virtual meeting	This meeting was the second meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) to discuss the development of a contribution agreement between AOPFN and CNL. Actions were updated and new ones recorded, next dates were suggested.									√	
July 09, 2020 Virtual meeting	This meeting was the third meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) to discuss the development of a contribution agreement between AOPFN and CNL. Actions were updated and new ones recorded, next dates were suggested.										√
July 17, 2020 Incoming letter	This letter from the Chief of AOPFN to the Project Director for the NPD Closure Project enclosed the AOPFN comments on a preliminary version of the 2020 EIS. Key interests and concerns from these comments focused on the following: • Alternative Means Assessment and In-situ Disposal; • Baseline characterization; • Consultation, Engagement and Communications; • EA process and methodology; • End state and future land use; • Environmental monitoring; • Indigenous content within EIS; • Effects on Indigenous rights; • Traditional Knowledge, Land and Resource Use and Cultural Impacts; • Valued Components.		√		√	√			√	√	
July 23, 2020 Virtual meeting	This meeting was the fourth meeting between CNL staff CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) to discuss the development of a contribution agreement between AOPFN and CNL. Actions were updated and new ones recorded, next dates were suggested.									√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
August 13, 2020 Virtual meeting	This meeting was the fifth meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) to discuss the development of a contribution agreement between AOPFN and CNL. Actions were updated and new ones recorded, next dates were suggested.										√
August 26, 2020 Virtual meeting	This meeting was the sixth meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) to discuss the development of a contribution agreement between AOPFN and CNL. Actions were updated and new ones recorded, next dates were suggested.									√	
September 10, 2020 Contribution agreement	The contribution agreement between CNL and the AOPFN, focused on supporting AOPFN to participate in the environmental assessment process for the NPD Closure Project (as well as the NSDF Project), was finalized and signed.										√
September 23, 2020 Virtual meeting	This meeting was the first working group meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants). This meeting established working group guidelines and determined topics for 2020 October and November.					√				√	√
October 02, 2020 Incoming letter	This letter from the AOPFN Chief to the Director of the NPD Closure Project enclosed the AOPFN AKLUS Final Report on the NPD Closure Project.					√				√	√
October 09, 2020 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL communications officer sharing copies of the Requests for Proposals (RFP) for Culture and Rights and Diet and Harvest studies. CNL acknowledged receipt of the RFPs.									√	√
October 23, 2020 Virtual meeting	This meeting was an introductory meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) and the AOPFN Advisory Committee (made up of AOPFN community members). This meeting focused on an introduction to CNL as a corporation.									√	√
November 23, 2020 Outgoing email	This email from a CNL communications officer to the AOPFN Consultation Coordinator enclosed a letter detailing how the AKLUS, Harvest and Diet study and Culture and Rights study would be used in the IER and enclosing an excerpt of the NPD Closure Project's draft EIS that incorporated aspects of the AKLUS into the revised draft EIS to be submitted in December 2020.				√	√				√	√

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 27, 2020 Virtual meeting	This meeting between (CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) and the AOPFN Advisory Committee (made up of AOPFN community members) was focused on an overview of the NPD Closure Project. The presentation focused on the following: • Overview of in-situ disposal; • NPD waste inventory; • Project timeline; • Current monitoring; • VC; • Effects on humans; • Follow-up monitoring. Questions from the AAC included the following: • How can we as a nation know that it is Low Level Waste (LLW) stored at NPD? • Better understanding needed of the difference between the NPD site and the CRL site. • What is relatively safe to CNL? • Is there any other facility using this system (in-situ)? • How old are the disposal sites that are using in-situ? • What is the contingency plan if the in-situ bursts? • Is this the only waste on the site (for this project)? • Are there ground water wells onsite? • Has any other site been considered for the waste (e.g. other provinces)? • Is there permanent below ground monitoring? • Valued Components are so broad and complicated, curious to how CNL evaluated those? • How does CNL look at the historical use of land by the First Nations people? • How does CNL evaluate what AOPFN needs will be in the future (20, 50, 100 years)? • Is the stack producing heat? Is that why the Chimney Shifts are using it in their migration? • Will lead shielding be a part of the construction of the facility? • Any consideration been given to an impact benefit agreement with AOPFN?	√		√	√	√			√	√	

Environmental Impact Statement - NPD Closure Project

		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 30, 2020 Virtual meeting	This meeting was the first working group meeting CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) that was focused on the NPD Closure Project; the focus of discussion was the revised draft EIS comments and draft dispositions. The following actions arose from the discussion on the comments and dispositions: • CNL to send the AOPFN the NPD document that specifies what baselines were conducted, where the sites are and what has been done in each area. • The Project to verify any remaining baseline monitoring that needs to be completed and will update AOPFN. • The Project to provide clarification of additional baseline studies for migratory water fowls. • CNL to provide AOPFN with the online link to the NPD Closure Project documents. • CNL to provide AOPFN with the three draft follow-up monitoring plans. • CNL to share draft restoration plan with the AOPFN upon completion.	√	√	√	√	√			√	√	
December 14, 2020 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Communications Officer included revised comments/responses on (NPD) draft EIS from the 2020 November 30 working group meeting.										√
December 17, 2020 Virtual meeting	This meeting was the second working group meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) that was focused on the NPD Closure Project; the focus of discussion was the revised draft EIS comments and draft dispositions. The following actions arose from the discussion on the comments and dispositions: • CNL to send Valued Components table from the revised draft EIS as well as the introductory text that references the new species added. • AOPFN to provide example of a Chance Find Procedure. • AOPFN to review the scope of the three AOPFN studies and identify which gaps will be addressed. Identify remaining socio-economic impacts to re-assess based on input from AOPFN. • AOPFN to identify status of cultural training and is it available to CNL. • AOPFN to identify potential elements of monitoring and risk communication; what could that look like. • AOPFN to provide CNL with examples of existing guardian programs.				√				√	√	√
January 05, 2021 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL communications officer requested that the 2021 January 21 working group meeting agenda change and focus on the NSDF Project as AOPFN has a strict timeline with the CNSC on the NSDF Project. AOPFN will forward an agenda. CNL acknowledged working group meeting topic change. Note that the next few meetings were focused on the NSDF Project.										√

May 05, 2021 Virtual meeting	This virtual meeting between CNL (including the Manager of Stakeholder Relations and the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the AOPFN (including the Consultation Coordinator and two consultants) involved discussions on developing an LTRA.										√
May 11, 2021 Outgoing email	This email from CNL's Communications Officer to the AOPFN's consultation coordinator enclosed draft sections of the NPD Closure Project's latest revision of draft EIS (8.9 and 9.9) for verification of CNL's incorporation of the AOPFN's AKLUS as well as a preliminary list of commitments and indicated interest in meeting to discuss.									√	√
May 12, 2021 Virtual meeting	This virtual meeting between CNL (including the Manager of Stakeholder Relations and the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the AOPFN (including the Consultation Coordinator and two consultants) involved discussions on developing an LTRA.									√	√
May 20, 2021 Virtual meeting	This virtual meeting between CNL (including the Manager of Stakeholder Relations and the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the AOPFN (including the Consultation Coordinator and two consultants) involved discussions on developing an LTRA.									√	√
May 26, 2021 Virtual meeting	This virtual meeting between CNL (including the Manager of Stakeholder Relations and the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the AOPFN (including the Consultation Coordinator and two consultants) involved discussions on developing an LTRA.									√	√
June 1, 2021 Incoming email	This email from the AOPFN's consultation coordinator was to request an NPD Closure Project meeting focus for the last week in June.									√	√
June 21, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the AOPFN Chief enclosed a draft summary of the AOPFN's interests and concerns for the NPD Closure Project for the AOPFN's review and verification.									√	√
June 29, 2021 Virtual meeting	This meeting between CNL staff (including the Manager of Regulatory Approvals for the NPD Closure Project and the ERM Stakeholder Relations Manager and communications officers) and the AOPFN consultation coordinator and consultants included discussion on a work plan for the project, the preliminary draft commitments and the summary of interests and concerns. Actions brought forward at this meeting included: • CNL to forward sections of interest of EIS to AOPFN for review and feedback. • CNL to set up meeting in mid-July with AOPFN to discuss submission of implications letter for the three studies and feedback on AKLUS content in the traditional use section. • AOPFN to draft a list of commitments sought for the project, similar to what was done for NSDF.									√	√
July 6, 2021 Outgoing email	This email from a CNL Communications Officer to the Consultation Coordinator for the AOPFN enclosed the updated subsections that had incorporated the AKLUS information (8.9 and 9.9) for the AOPFN's review.	√			√			√		√	√
July 8, 2021 Emails	This email correspondence between a CNL communications officer and the Consultation Coordinator for the AOPFN involved meeting coordination for the Algonquin Advisory Committee meeting.										√

		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
September 9, 2021 Incoming email	This email from the AOPFN Consultation Coordinator to CNL's Communications Officer enclosed a document of advice from AOPFN on what type of things CNL should be prepared to discuss and present at the AAC meeting in September 2021.		√								√
September 13, 2021 Virtual Meeting	This virtual meeting between CNL (including the Manager of Stakeholder Relations and the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the AOPFN (including the Consultation Coordinator and two consultants) involved discussions on developing an LTRA.										√
September 17, 2021 Outgoing email	This email from the CNL Manager of Regulatory Approvals for the NPD Closure Project to the AOPFN Consultation Coordinator enclosed the Alternatives slide deck for the September 21, 2021 AAC Meeting. CNL committed to sending a second deck covering 'What-Ifs". The AOPFN acknowledged receipt.		√								
September 17, 2021 Outgoing email	This email from a CNL Communications Officer to the Consultation Coordinator for the AOPFN to follow-up on the working group meeting of September 2, 2021. The email enclosed the most current versions of key sections from the EIS, for the AOPFN's review and verification of sufficiency of CNL's incorporation of information from the AKLUS, Diet and Harvest Study, and the Culture and Rights Study. The key sections sent included the revised *Table of Interests and Concerns*, EIS Section 6.0 *Indigenous Engagement* (excerpt), EIS Sections 8.9 *Description of the Existing Environment, Traditional Land and Resource Use* and 9.9 *Assessment & Mitigation of Environmental Effects, Traditional Land and Resource Use* and the EIS Appendix (excerpt). CNL requested feedback by October 6, 2021.					√					√
September 20, 2021 Outgoing email	This email from a CNL Communications Officer to the Consultation Coordinator for the AOPFN enclosed the 'What-Ifs" slide deck for the September 21, 2021 Algonquin Advisory Committee (AAC) meeting									√	
September 21, 2021 Virtual Meeting	This meeting between CNL representatives (including the Manager of Regulatory Approvals for the NPD Closure Project and the ERM Stakeholder Relations Manager and communications officers), AOPFN representatives (including the consultation coordinator, project administrator and consultants) and the AOPFN Advisory Committee (made up of AOPFN community members) involved discussions of the four alternative means included in the alternative means assessment. The AAC had several questions, which were discussed at the meeting, including the following: • With the removal of certain components on a percentage basis, how much is left? • What is the risk potential for contamination on the grounds during removal? • What is the importance of keeping a stack? • Has anything changed in the EIS since 2020? • Can this land be used for traditional use after clean up?		√	√	√	√				√	
September 22, 2021 Outgoing email	This email from a CNL Communications Officer to the Project Administrator and the Consultation Coordinator with the AOPFN was to coordinate next steps following the AAC meeting.										√

September 24, 2021 Incoming email	This email from the AOPFN Project Administrator to a CNL Communications Officer was in follow-up to the AAC meeting on Alternative Means and stated that, “AOPFN's position remained that any aspects of the EIS that deals with potential impacts on AOPFN rights or the resources they rely upon, including the alternative means assessment, should both integrate those study findings - in ways verified by AOPFN - and reflect AOPFN perspectives.” The email also stated that it was, “AOPFN's strong preference, as stated previously, is that those discussions, reviews and revisions occur prior to refiling of the EIS, not afterward.”		√	√		√				√	
September 24, 2021 Outgoing email	This email from a CNL Communications Officer to the AOPFN Project Administrator was to confirm a meeting date and the delay of the commitments that were to be shared in advance of the next meeting.									√	√
September 27, 2021 Virtual Meeting	This meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the Consultation Coordinator and consultants) that was focused on the NPD Closure Project; the focus of discussion was developing project commitments. Specific actions that came forward were: • CNL to provide project timeline of activities; • CNL to add additional resourcing aspects to timing column; • AOPFN provides descriptions for priority scale 'priority level'.			√	√					√	√
September 28, 2021 Outgoing email	This email from a CNL Communications Officer to the AOPFN Project Administrator was to confirm a meeting date.										√
October 4, 2021 Emails	These emails between the Project Administrator for the AOPFN and a Senior Communications Officer with CNL were to coordinate a meeting on October 5.										√
October 5, 2021 Virtual Meeting	This meeting between CNL representatives (including the Manager of Regulatory Approvals for the NPD Closure Project and the ERM Stakeholder Relations Manager and communications officers) and AOPFN representatives (including the consultation coordinator and consultants) and the AOPFN Advisory Committee (made up of AOPFN community members) provided an overview of What-ifs and effects of the environment on the project. Actions recorded at the meeting included: • CNL to share the newest version (2019) of the Annual Dose Report with the AOPFN. • CNL will flag more Indigenous participation in future studies as a topic for future discussion. • CNL to share air monitor and off-site reading information from previous ACC meeting with members. • CNL to share information on dose rate from NPD presently and in the future in addition to comparison to the dose rate over time for the other options. • CNL to share a copy of the Annual Dose Report of animals with AOPFN. • CNL to share information on the past post-closure safety assessment & current environmental monitoring (to cover off-site and downstream topics). • CNL to share a copy of the slide deck to members of the AOPFN.		√	√	√				√	√

October 5, 2021 Emails	These emails between the Consultation Coordinator for the AOPFN and a Senior Communications Officer with CNL were to confirm upcoming receipt of the AOPFN review of NPD EIS content.										√
October 6, 2021 Incoming email	This email from the Consultation Coordinator for the AOPFN to a Senior Communications Officer with CNL enclosed the AOPFN comments on the revised draft EIS documents CNL provided on September 17, 2021 (Section 8.9, 9.9 and 6, as well as the record of engagement and *Table of Interests and Concerns*). As well, the AOPFN indicated that CNL's plan to resubmit the draft EIS in October was not agreeable to the AOPFN, highlighting several areas of work that the AOPFN would like to see progressed, prior to resubmission.	√	√	√	√	√				√	√
October 6, 2021 Outgoing email	This email was sent from a CNL Communications Officer to the AOPFN's Consultation Coordinator was to confirm receipt of the previous email.										√
October 7, 2021 Virtual Meeting	This meeting between CNL staff (including ERM Stakeholder Relations manager and communications officers and NPD Closure Project staff, including the Director and Manager of Regulatory Approvals) and AOPFN representatives (including the consultation coordinator and consultants) that was focused on the NPD Closure Project; this was the second meeting to discuss project commitments.									√	
October 13, 2021 Outgoing Email	This email was sent from a CNL Communications Officer in response to an email sent on October 6, 2021 enclosing revisions, including new interests to the *Table of Interests and Concerns*. This email reiterated the ongoing committal to address and resolve these concerns; this email enclosed the revised *Table of Interests and Concerns* and requested that AOPFN Consultation confirm the addition of two columns that encapsulate two added interests of AOPFN in the *Table of Interests and Concerns*.									√	
October 14, 2021 Virtual Meeting	This virtual meeting between CNL (including the Manager of Stakeholder Relations and the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the AOPFN (including the Consultation Coordinator and two consultants) was to discuss the AOPFN's cultural protection program.										√
October 14, 2021 Incoming Email	This email from AOPFN Consultation to the ERM Stakeholder Relations team contained a memo and identified support on the approach that the AOPFN proposed to address their perspective on the Alternative Means identified by CNL.		√							√	
October 19, 2021 Outgoing Email	This email from a CNL Senior Communications Staff was to arrange a phone call to consult with AOPFN Consultation Coordinator pertaining to the NPD Closure Project EIS Submission before the Working Group Meeting on October 20, 2021.										√
October 20, 2021 Virtual Meeting	This meeting between CNL representatives (including the Manager of Regulatory Approvals for the NPD Closure Project and the ERM Stakeholder Relations Manager and Communications Officers) was to discuss the delay of the NPD Closure Project EIS Submission to December 2021 and map out a mutually agreeable path forward for the inclusion of complimentary material from the AOPFN in the revised draft EIS. Discussion on the NPD Closure Project commitments also continued.			√						√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
October 22, 2021 Outgoing Email	This email from Senior Communications Staff to AOPFN was to follow-up from the NPD Closure Project Commitments meeting on October 20, 2021 to draft the path forward on EIS submission, specifically to address AOPFN concerns on language and content of the Draft EIS. The email enclosed an action plan, the most recently revised *Table of Interests and Concerns* for the AOPFN and the most recently updated list of VCs.		√	√	√					√	
October 29, 2021 Incoming Email	This email from the AOPFN Consultation Coordinator to CNL asked for CNL's response to AOPFN's request for funds for an AOPFN Alternative Means Assessment and whether CNL was willing to revisit the Contribution Agreement for aspects of the proposed work that exceed the originally envisioned scope of engagement.		√	√						√	
October 29, 2021 Outgoing Email	This email from the NPD Manager of Regulatory Approvals to the AOPFN Consultation Coordinator responded CNL was committed to funding the AOPFN Alternative Means Assessment (AMA), including the AOPFN words as is, and to amending the contribution agreement as necessary.									√	
November 2, 2021 Incoming Email	This email from AOPFN's Consultation to NPD's Manager of Regulatory Approvals responded to CNL's questions regarding the first point in the previous email. AOPFN Consultation directed CNL to an email that was sent on October 14, 2021 that included a Statement of Work (SOW) and the costs for an AOPFN AMA approach.										√
November 2, 2021 Outgoing Email	This email from NPD's Manager of Regulatory Approvals informed AOPFN Consultation of CNL's commitment to provide requested funds for an AOPFN Alternative Means Assessment perspective gathering process as outlined in the SOW shared on October 14, 2021.										√
November 2, 2021 Incoming Email	This email from AOPFN's Consultation Coordinator to a Communication Officer at CNL responded to CNL's October 22, 2021 email for Attachment 1 associated with additional tasks CNL hopes to accomplish during November 2021. AOPFN's response included timelines by which AOPFN would need documents and meetings with CNL, as well as costs over and above the existing Contribution Agreement for particular activities. AOPFN requested CNL to send AOPFN an email confirming the additional requested funding to be built into a CA amendment so that AOPFN's work could start effective immediately. AOPFN noted that the field work would not be conducted until Spring 2022 and that costs were not included in the attachment.										√
November 4, 2021 Outgoing Email	This email from a Communications Officer at CNL to AOPFN's Consultation Coordinator was regarding the current addition of funds to the contribution agreement for NPD Closure Project activities.										√
November 4, 2021 Incoming Email	This email from AOPFN's Consultation Coordinator to a CNL Communications Officer approved CNL to add a new schedule to the Contribution Agreement Amendment.										√
November 4, 2021 Outgoing Email	This email from a Communications Officer at CNL to AOPFN's Consultation Coordinator was in response to AOPFN's November 2 email to confirm that the requested additional funding would be built into a Contribution Amendment Agreement. This email was also to coordinate the meetings identified in AOPFN's November 2 email in addition to arranging another meeting to discuss the clarification of language in the summary of interests and concerns table. Meeting dates were proposed for both meetings. CNL also confirmed that they would send the sections of the EIS that were identified in the November 2 email by the end of the week.										√

February 13, 2022 Incoming email	This email from the AOPFN consultant to a CNL Senior Communications ask for the below information for the February 22, 2022 AOPFN Advisory Committee meeting. 1. Can CNL provide a plain language information package on how ISD has been implemented at other sites in the past and what effects have been encountered during subsequent monitoring? 2. CNL is requested to provide exact information about how large the overall NPD site is (the whole AECL owned area, in hectares), and how large in hectares is the area shown in the images provided previously (the impacted area that will be subject to the Decommissioning). 3. CNL is requested to provide an estimation, for each of Alternatives 2, 3 and 4, of how long fencing will likely be kept around the decommissioned facility. And, if the fenced in area (in hectares) will differ between any of these alternatives, please provide that information as well. 4. CNL is requested to provide an estimation, for each of Alternatives 2, 3 and 4, of how long monitoring of the site will continue into the future. If there are differences in the type and intensity of monitoring required, this should be identified as well. 5. CNL is requested to provide an estimation, for each of Alternatives 2, 3 and 4, how long in months or years the active decommissioning stage would take (i.e., how long it would take to complete everything up to the end state (minus removal of the stack, which is a longer-term activity). 6. CNL is requested to provide an estimation of how many a. truckloads and b. mass of radioactive materials are still in the NPD site, and how much of that (broken down if possible to low level vs. intermediate level waste) will be removed in Alternative 2 (the only active Alternative that neither takes all the materials out or leaves all the materials in situ).		√								
February 15, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Consultation Coordinator was to clarify and propose new agenda items for the next meeting on February 23, 2022.										√

March 17, 2022 Working Group Meeting	This meeting was between the AOPFN (Project Administrator and Consultants) and CNL representatives (including the Manager of Regulatory Approvals for the NPD Closure Project and the ERM Stakeholder Relations Manager and Communications Officers). At this meeting focus was on the AOPFN's feedback on the Table of Interests and Concerns was, CNL edited language and flagged outstanding issues.									√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
March 17, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Consultation Coordinator discussed the new summary table of interests and concerns for the NPD Closure Project. CNL was under the impression that AOPFN was not going to review the tables, this is different than recent communication with the Canadian Nuclear Safety Commission (CNSC). CNL asked AOPFN to confirm if they would like to review the tables, what the timeline would be for that review and if capacity is needed.									√	
March 29, 2022 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Senior Communications Officer clarified that when the AOPFN met with the CNSC March 23, 2022 that AOPFN gave the same response to them as CNL on March 09, 2022. AOPFN noted that would clarify with the CNSC.									√	
April 08, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Consultation Coordinator attached the repackaged summary table of interests and concerns. The updates to the table are based on feedback from the CNSC on the December 2021 draft EIS submission package. CNL noted AOPFN's comments about resourcing issues and offered to assist in any way.									√	
April 19, 2022 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Senior Communications Officer provided CNL the estimated costs in relation to the CNL/AOPFN 2022 Master Engagement Schedule. CNL confirmed receipt.										√
April 26, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Consultation Coordinator attached the updated master engagement schedule based on the last working group meeting.										√
April 28, 2022 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Senior Communications Officer attached the final version of the Nuclear Power Demonstration Project Decommission Alternative Means Assessment report on behalf of the AOPFN. CNL confirmed receipt.		√								
May 06, 2022 Outgoing email	Email invitation to the AOPFN to the CNL Industry Day at the Chalk River Laboratories on Thursday, June, 2, 2022 to promote the broader engagement between CNL's nuclear industry partners and our local supply chain. AOPFN confirmed that a member would be attending.										√
May 11, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Consultation Coordinator requested AOPFN to confirm if they would be reviewing the "repackaged" table of interests and concerns before the NPD Closure Project resubmits their revised draft Environmental Impact Statement (EIS). CNL offered a meeting in June 2022 to review and discuss the table.									√	
May 11, 2022 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Senior Communications Officer attached the master engagement schedule for review.										√

Environmental Impact Statement - NPD Closure Project

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 11, 2022 Incoming email	This email from the AOPFN consultant to a CNL Senior Communications Officer was in response to CNL's May 11, 2022 email regarding a review of the table of interests and concerns. AOPFN confirmed that they could review the table and provide comments by June 24, 2022 and that CNL provide capacity. AOPFN requested the table be sent again.									√	
June 01, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN consultant confirmed AOPFN's review plan for the interest and concerns table. CNL offered a meeting June 27, 2022 to review the AOPFN comments as a group.									√	
June 01, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN consultant attached the most recent summary table of interests and concerns. CNL also sent a table (labeled "IC mapping") that shows how the interests and concerns that the AOPFN reviewed and revised in late 2021 are represented in the "repackaged" table.									√	
June 14, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN working group cancel the June 16, 2022 meeting.									√	
June 14, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN working group proposed a working group meeting on June 27, 2022. CNL proposed the following agenda: 1. AOPFN Alternative Means Assessment for the NPD Closure Project; 2. AOPFN review of the NPD Closure Project Interests and Concerns Table; 3. Master Engagement Schedule and Budget for 2022 (CNL to provide update to this schedule tomorrow). CNL would also be able to discuss any relevant updates on the LTRA. CNL sent a meeting invitation.		√							√	√
June 27, 2022 Working group meeting	This meeting was between the AOPFN (Project Administrator and Consultants) and CNL representatives (including the Manager of Regulatory Approvals for the NPD Closure Project and the ERM Stakeholder Relations Manager and Communications Officers). CNL and the AOPFN discussed the AOPFN AMA, the AOPFN's review of the NPD Closure Project Interests and Concerns Table and updates to the engagement schedule.		√							√	√
June 27, 2022 Outgoing email	This email from the Manager of Regulatory Approvals for the NPD Project at CNL to the AOPFN consultant stated that CNL is looking forward to receiving AOPFN's review of the revised summary table of interests and concerns. CNL offered a meeting to discuss the comments.									√	
June 27, 2022 Incoming email	This email from the AOPFN Consultation Coordinator to the Manager of Regulatory Approvals for the NPD Project at CNL attached AOPFN's marginal comments and track changes on the Summary of Interests and Concerns document for review. AOPFN noted that it could not endorse this table as adequate for resubmission purposes until such time as column 2, in particular, is revised. AOPFN stated that column two did not accurately reflect the concerns and that CNL had classified the status of some of the issues.									√	
June 28, 2022 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Senior Communications Officer asked for clarification if CNL is to provide the Master Schedule and budget back to AOPFN.										√

August 12, 2022 Incoming email	This email from the AOPFN Project Lead, Economic Development Department to a CNL Senior Communications Officer requesting CNL supply specific equipment for the AOPFN knowledge keeper visit to the NPD site. CNL acknowledged.										√
August 15, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Project Lead, Economic Development Department ask for confirmation on the participant for the AOPFN knowledge keeper visit to the NPD site. AOPFN acknowledged.										√
August 17, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Consultation Coordinator proposed rescheduling the Working Group NSDF/NPD site tour. AOPNF cancelled the meeting August 11, 2022.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
August 17, 2022 Site inventory	AOPFN knowledge keeper and AOPFN's consultant and CNL representatives (include environmental protection staff, NPD Project staff and ERM Stakeholder Relations) conducted the site inventory. The purpose of these field visits are to support AOPFN in the identification of their cultural and environmental values prior to possibly obtain authorization to proceed by the Canadian Nuclear Safety Commission (CNSC) with the NPD site closure. CNL staff assisted with environmental data collection, supported species identification, and answered questions regarding the NPD closure project and biodiversity monitoring as requested. The day started with a pre inventory meeting to discuss the plan for the day.								√		√
August 23, 2022 Incoming email	This email from the AOPFN Project Administrator to a CNL Senior Communications Officer requested the contact of the NPD team lead. CNL provide the contact for the Manager of Regulatory Approvals for the NPD Project.										√
September 07, 2022 Incoming email	This email from the AOPFN Project Administrator to a CNL Senior Communications Officer requested to move the monthly working group meeting by a week. CNL and AOPFN corresponded about a new meeting date.										√
September 15, 2022 Incoming email	This email from the AOPFN Project Administrator to a CNL Senior Communications Officer requested to plan the working group tour of NPD for October 04, 2022. CNL acknowledged.										√
September 16, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Project Administrator and Consultation Coordinator proposed to discuss the AOPFN's Alternative Means Assessment (AMA) for the NPD Closure Project at the September 21, 2022 working group meeting. CNL followed up on September 20, 2022.		√								
September 16, 2022 Outgoing email	Email invitation to the AOPFN working group tour for the tour of the NPD Facility.										√
September 20, 2022 Incoming email	This email from the AOPFN Consultation Coordinator to a CNL Senior Communications Officer confirmed that the AOPFN would lead the working group meeting discussion on the AMA. CNL acknowledged.		√								
September 21, 2022 Working group meeting	This meeting was between the AOPFN (Consultation Coordinator, Project Administrator, Project Coordinator and Consultants) and CNL representatives (including the Manager of Regulatory Approvals for the NPD Closure Project and the ERM Stakeholder Relations Manager and Communications Officers) and AECL (Including the Director of Decommissioning). The focus of this meeting was the presentation and discussion of the AOPFN's Alternative Means Assessment. AOPFN and CNL discussed how the AMA could be integrated into the EIS.		√								

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
September 21, 2022 Incoming email	This email from the AOPFN Project Administrator to a CNL Senior Communications Officer requested an alternative date for the working group tour of the NPD facility.										√
September 26, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Project Administrator and Consultation Coordinator provided the link to the register for the AOPFN fall inventory on October 4&5, 2022. AOPFN acknowledged.										√
September 27, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Project Administrator and Consultation Coordinator was to follow up from the September 21, 2022 AMA working group meeting. CNL appreciated the opportunity for conversation around the key findings of the AMA. For next steps, CNL proposed: 1. CNL will share a written response to the Alternative Means recommendations by the end of October. 2. AOPFN and CNL to collaborate on how to incorporate the results of the AMA into the Environmental Assessment (EA) / Environmental Impact Statement (EIS). Note that CNL suggests the AOPFN update their EIS subsection on Alternative Means and reference the AMA (by the end of November), which CNL will then include as a technical reference in the EIS submission package to the CNSC. 3. AOPFN and CNL work together to bridge the gap on the opposing results for preferred option through development of related commitments. Related to the third proposed next step and in follow-up to the meeting, CNL attached the most recent version of the commitments.		√								√
September 27, 2022 Incoming email	This email from the AOPFN Project Administrator to a CNL Senior Communications Officer provided the list of participants for the October 5, 2022 NPD site inventory. AOPFN asked for additional logistical details.										√
September 27, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN Project Administrator provided the details requested related to the October 5, 2022 NPD site inventory. CNL requested that each participant for the inventory register online. AOPFN acknowledged.										√
October 01, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AOPFN's consultation attached CNL memo: Summary of AOPFN Field Inventory Taking 2022 August 16 and 17 for the AOPFN-CNL site assessment in support of NSDF commitment AOPFN-21 "Pre-Project inventory work at site" as well as the AOPFN-CNL site assessment for the NPD site.								√		√

February 16, 2023 Outgoing Email	This email from a CNL Senior Communications Officer to the AOPFN Consultation Coordinator with the NPD EIS report Section 4.2.4.6. CNL requested AOPFN's final edits by the end of 2023 April.										√
March 02, 2023 Site Inventory	AOPFN knowledge keeper and AOPFN's consultant and CNL representatives (include environmental protection staff, NPD Project staff and ERM Stakeholder Relations) conducted the site inventory. The purpose of these field visits are to support AOPFN in the identification of their cultural and environmental values prior to possibly obtain authorization to proceed by the Canadian Nuclear Safety Commission (CNSC) with the NPD site closure. CNL staff assisted with environmental data collection, supported species identification, and answered questions regarding the NPD closure project and biodiversity monitoring as requested. The day started with a pre inventory meeting to discuss the plan for the day.								√	√	
March 06, 2023 Emails	This email from a CNL Communications Officer to the AOPFN Coordinator with proposed 2023 monitoring and ecological data collection activities. CNL also requested AOPFN send the NPD commitments table to them so that CNL can review it prior to the in-person meeting on 2023 March 21. AOPFN confirmed CNL will receive their comments prior to the 2023 March 21 meeting. CNL confirmed receipt of the email.								√		
March 06, 2023 Emails	This email from the AOPFN Coordinator to a CNL Communications Officer to discuss attendance at the in-person monthly meeting being held on 2023 March 21 in Pikwàkanagàn First Nation.										√
March 08, 2023 Outgoing Email	This email from CNL Communications Officer to the AOPFN Coordinator thanking them for visiting site on 2023 March 02, and providing AOPFN with additional information for those who were not present at the site visit. CNL also invited AOPFN to a knowledge holder's discussion to give them the opportunity to ask questions and learn more about topics of interest to them. AOPFN confirmed receipt of the email.		√								√
March 09, 2023 Incoming Email	This email from the AOPFN Coordinator to CNL Senior Communications Officer asking to post-pond the NPD topic for the 2023 March Monthly meeting, previously arranged for March 21 in-person, be moved to 2023 April.										√
March 09, 2023 Outgoing Email	This email from CNL Senior Communications Officer to the AOPFN Coordinator in response to AOPFN's email on the 2023 March 09 to confirm if a meeting on 2023 March 21 in person with a different topic is still occurring, and to confirm that the 2023 April 20 meeting is to be scheduled as an in-person meeting.										√
March 09, 2023 Outgoing Email	This email from CNL Senior Communications Officer to the AOPFN Coordinator to confirm the status of the 2023 March 21 in-person meeting in Pikwàkanagàn First Nation.										√
March 14, 2023 Outgoing Email	This email from CNL Communications officer to the AOPFN Coordinator with a follow-up to the AOPFN email sent on 2023 February 16; CNL provided AOPFN with the list of proposed 2023 monitoring and ecological data collection activities for the NPD site.										√
March 14, 2023 Outgoing Email	This email from CNL Senior Communications Officer to the AOPFN Consultation Coordinator with CNL's Indigenous Relations Procurement Strategy.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
March 15, 2023 Emails	This email from CNL Senior Communications Officer to the AOPFN Coordinator following up on an email sent on 2023 March 09 to confirm the 2023 March 21 Monthly meeting and location. AOPFN cancelled the March 21, 2023, in-person meeting- no virtual meeting will be held either.										√
March 27, 2023 Emails	This email from CNL Senior Communications Officer to the AOPFN Coordinator to follow up on an email sent on 2023 March 15 to confirm the status of the 2023 April 20 working group meeting, and the topics to be discussed are NPD related. AOPFN confirmed the meeting for April, however, requested a date change to 2023 April 18. CNL Confirmed the date change of the April meeting to 2023 April 18. The topics to be discussed are NPD EIS comment responses and the AMA EIS insert.										√
April 06, 2023 Incoming Email	This email from the AOPFN Coordinator to CNL Senior Communications Officer with draft revisions to the NPD EIS section on AMA for CNL's review. AOPFN also confirmed that they should be able to provide EIS comments the week of 2023 April 10. CNL confirmed receipt of the email.		√								√
April 12, 2023 Emails	This email from the AOPFN Coordinator to CNL Senior Communications Officer with a request to have the 2023 Spring inventory be held on 2023 May 09 and 2023 on May 10. CNL confirmed the receipt of the request and noted they will confirm the dates as soon as possible. CNL Later confirmed the site visit for 2023 May 09 on 2023 April 14.										√
April 14, 2023 Outgoing Email	This email from CNL Senior Communications Officer to the AOPFN Coordinator with copies of declined meeting invites from AOPFN staff- AOPFN confirmed a glitch in the system and that they would be in attendance on 2023 May 09 and 10.										√
April 17, 2023 Incoming Email	This email from the AOPFN Coordinator to CNL Senior Communications Officer with a draft agenda for the 2023 April Monthly working group being held on 2023 April 18th. AOPFN also asked to confirm the status of the CNL/AOP contribution agreement to amendment #3.										√
April 17, 2023 Incoming email	Email correspondence from the AOPFN Coordinator to CNL Senior Communications Officer requesting to be removed from the monthly meeting invite list due to a role change.										√
April 18, 2023 Virtual Meeting	This meeting was between the AOPFN (including the Project Coordinator, Consultation Coordinator and Consultant), CNL representatives (including the Manager of Regulatory Approvals for the NPD Closure Project, ERM Stakeholder Relations Manager, Communications Officers and Director of NPD & WR-1 Reactor Decommissioning) and AECL. CNL and AOPFN discussed that funding would not be impacted due to the LTRA not being signed yet. CNL noted that it received the AOPFN's AMA edits and committed to accepting the edits and sending a clean version back to AOPFN. AOPFN and CNL created a path forward for the EIS Comment Response table. After CNL response to questions about the monitoring schedule AOPFN committed to indicating areas of interest.		√							√	√
April 19, 2023 Emails	Email correspondence from the AOPFN Project Coordinator to a CNL Communications Officer requesting action items from AOPFN/ CNL meeting. CNL sent AOPFN with action items coming out of the 2023 April 18 working group meeting. CNL also asked if it is appropriate to start planning 2023 inventory days. AOPFN confirmed the desire to start planning site inventory.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
April 21, 2023 Emails	Email correspondence between CNL Communications Officer and the AOPFN Project Coordinator with a copy of the May Site Inventory participants; CNL confirmed the participants and requested they provide information for site access guest pass.										√
April 25, 2023 Outgoing email	Email correspondence from CNL Senior Communications Officer to the AOPFN Project Coordinator with an open invite for AOPFN consultation staff and AOPFN community members to the Chimney Swift Count Night.										√
April 25, 2023 Emails	Email from the CNL Manager, Stakeholder Relations to AOPFN with a follow-up to the 2023 April 19 email concerning the 2023 April NPD working group to inform AOPFN of CNL's commitment to funding associated with AOPFN's continued engagement in the NPD Environmental Impact Statement (EIS). CNL also provided AOPFN with an update on all remaining actions from the AOPFN/CNL 2023 April Monthly working group meeting.										√
April 25, 2023 Incoming email	Email from AOPFN to a CNL Senior Communications Officer requesting a date change for the AOPFN spring NPD Inventory date. AOPFN requested the inventory day be switched to Tuesday, May 9th.										√
May 03, 2023 Emails	Email correspondence between a CNL Communications Officer and AOPFN with site visit instructions for the AOPFN NSDF/NPD spring inventory visit.										√
May 05, 2023 Emails	Email correspondence between CNL Senior Communications Officer and AOPFN with site visit list of attendees for both the NSDF and NPD site inventories.										√
May 10, 2023 Site Inventory	AOPFN knowledge keepers and AOPFN's consultant and CNL representatives (include environmental protection staff, NPD Project staff and ERM Stakeholder Relations) conducted the site spring inventory. The purpose of these field visits are to support AOPFN in the identification of their cultural and environmental values prior to possibly obtain authorization to proceed by the Canadian Nuclear Safety Commission (CNSC) with the NPD site closure. CNL staff assisted with environmental data collection, supported species identification, and answered questions regarding the NPD closure project and biodiversity monitoring as requested. The day started with a pre inventory meeting to discuss the plan for the day.	√								√	
May 10, 2023 Outgoing email	This email from CNL Senior Communications Officer to AOPFN to provide a copy of the radiation dose chart; CNL also printed some and provided them to AOPFN during the NPD site tour. CNL also informed AOPFN that the CNSC website offers additional information if there is more interest in this topic, and attached a link to the CNSC website.										√
May 10, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN to provide links to the video and cutaway that were referenced during the NPD Site tour on 2023 May 10. CNL also provided AOPFN with Nuclear 101 created by the Grand Council of Treaty #3.										√
May 12, 2023 Outgoing email	This email from a CNL Senior Communications Officer to AOPFN is to confirm the ability to attend the 2023 May 26 in-person monthly meeting being held in Pikwàkanagàn First Nation, CNL also asked if they can confirm numbers later. CNL asked AOPFN to confirm the agenda topics for the meeting.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 15, 2023 Incoming email	This email from the AOPFN Manager, Consultation to a CNL Senior Communications Officer is in follow-up to the 2023 May 01 email from CNL outlining action items from the 2023 April Monthly Working Group Meeting. AOPFN had no comments on the AOPFN AMA insert for the EIS. AOPFN provided feedback on the EIS commitment table.		√				√			√	
May 16, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN seeking confirmation that the version of the AMA report attached to AOPFN's email on 2022 April 28 is the version to be included as an appendix in the NPD Revised Draft EIS. CNL also asked AOPFN to confirm that there are no confidentiality issues with including the AMA report as is in the EIS as it will be publicly available.		√								
May 16, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN is to provide AOPFN with the registration link for the NPD Swift Night Count being held on 2023 May 24 and 2023 May 31.										√
May 16, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN provided AOPFN with the updated Interests and Concerns Table. Specifically CNL's response to the interest/concern and the status of the concern. These updates align with the progress on engagement we have made together and AOPFN's recent feedback (April 2023). CNL noted they have marked new language with grey shading. CNL also noted that AOPFN will also see new rows (indicated in pale yellow) which were added to capture concerns that were missing or not stand alone in previous versions of the table. As part of the Environmental Assessment process CNL is seeking verification that AOPFN agrees with the updates and that CNL has accurately captured AOPFN's concerns on the project.									√	
May 18, 2023 Outgoing email	This email from CNL Senior Communications Officer to AOPFN is to confirm the number of CNL Staff attending the in-person 2023 May 26 monthly working group meeting being held in community.										√
May 24, 2023 Outgoing email	This email from a CNL Senior Communications Officer to AOPFN is to provide AOPFN with the proposed agenda for the 2023 May 26 in-person working group meeting. AOPFN confirmed receipt of the meeting agenda.										√
May 26, 2023 Meeting	This meeting was between the AOPFN (Project Administrator, Manager of Consultation and Consultants) and CNL (including Manager, ERM Stakeholder Relations, Manager, NPD Regulatory Approvals, Manager ERM Licensing Support, Senior Communications Officer, and Indigenous Engagement Coordinator, held in-person at Golden Lake. This meeting was to discuss the NSDF and NPD commitments tale, the bears Den Memo and to provide updates.						√			√	
May 30, 2023 Outgoing email	This email from CNL Indigenous Engagement Coordinator to AOPFN is to provide AOPFN with an action list from the 2023 May 26 CNL/AOPFN working group meeting.						√			√	√
May 30, 2023 Signing of the LTRA	CNL, AECL, and AOPFN signed the Long Term Relationship Agreement (LTRA).										√
May 30, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN following up on the email sent on 2023-05-16 concerning the inclusion of the AMA report as it as an appendix in the NPD Revised Draft. AOPFN responded and noted they would respond once the Consultation Manager has returned. CNL confirmed receipt of the email.		√

June 01, 2023 Incoming email	This email from AOPFN Project Coordinator to CNL Manager, NPD Regulatory Approvals provided CNL with AOPFN's NPD Seasonal Surveys Implications Letter and the 4 associated seasonal survey reports. CNL confirmed receipt.	√								√	√
June 06, 2023 Emails	This email from CNL Communications Officer to AOPFN in response to the seasonal inventory Implications Letter and reports. CNL indicated that In CNL's initial review of the NPD Seasonal Surveys Implications Letter CNL was seeking clarification on language indicating a new commitment sought by AOPFN. AOPFN confirmed once AOPFN receives the updated commitments sought document with additional columns from CNL they would be providing feedback on the table. This feedback will include a couple of additional commitments that we drafted, including #22.						√				√
June 07, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN is to provide them with a draft list of commitments for the NPD Closure Project. CNL requested that as AOPFN reviews, please provide AOPFN's agreement/position re public facing or not and AOPFN confirmation of commitments that will be covered under the LTRA.						√				√
June 20, 2023 Incoming email	This email is from AOPFN to a CNL Communications Officer provided CNL with Issues and Concerns Table with AOPFN's comments for review. AOPFN also attached a Question feedback document for further discussion as per the April 2023 EIS Comments Response Table. CNL confirmed receipt of the document.									√	
June 27, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN requesting clarification on when CNL would receive AOPFN's forthcoming "Commitments Sought" update. Referenced in the June 20 I&C Table feedback.						√				√
June 27, 2023 Incoming email	This email from AOPFN to a CNL Communications Officer indicating the "Commitments Sought" update would be shared shortly.										√
June 29, 2023 Incoming email	This email from AOPFN to a CNL Communications Officer proving the Commitments Sought updated document for CNL's review.						√				
June 29, 2023 Outgoing email	This email from a CNL Communications Officer to AOPFN confirming receipt of the Commitments Sought updated document. CNL requested AOPFN provide meeting times to discuss the edits. CNL also asked the AOPFN to confirm version of the AMA report attached in the April 28, 2022 email to CNL is the version to be included as an appendix in the NPD Revised Draft EIS.		√				√				√
June 29, 2023 Incoming email	This email from AOPFN to a CNL Communications Officer confirmed the version of the AMA report to be included as an appendix.		√								
July 04, 2023 Outgoing Email	This email is from CNL Senior Communications Officer to AOPFN communicated some questions related to the NPD Interest and Concerns Table.									√	
July 05, 2023 Telephone Call	Phone call from an AOPFN Project Coordinator to a CNL Communications Officer asking for a timeline for needing responses to the questions.									√	
July 24, 2023 Outgoing Email	This email is from CNL Communications Officer to AOPFN is to provide a status update on the I&C table.									√	

Environmental Impact Statement - NPD Closure Project

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
August 03, 2023 Outgoing Email	This email from CNL Director, Communications and Engagement to the AOPFN Chief is to invite him to the AECL, CNL and Canada's nuclear supply chain leadership for the annual Organization of Canadian Nuclear Industry (OCNI) Suppliers Day Banquet Dinner.										√
August 03, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to AOPFN is to offer AOPFN a complimentary registration to the upcoming Canadian Conference on Waste Management, Decommissioning and Environmental Restoration (NWMDER) to be held August 27 - 31, 2023 in Niagara Falls, ON.										√
August 15, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to AOPFN is to follow-up on the email sent on 2023 August 03, offering AOPFN a complimentary registration to the upcoming Canadian Conference on Waste Management, Decommissioning and Environmental Restoration (NWMDER) to be held August 27 - 31, 2023 in Niagara Falls, ON.										√
August 29, 2023 Outgoing Email	This email from CNL Communications Officer to AOPFN is to inform AOPFN that CNL is interested in meeting with AOPFN to discuss the status of the NPD Closure Project and review the I&C and Commitment tables together. CNL asked that AOPFN provide some date options for next week that would work for AOPFN. Prior to the meeting, CNL noted that they will share the updated I&C Table and the simplified Commitments Table. CNL also noted that they will also provide AOPFN a bilateral response to the Commitments sought. AOPFN confirmed possible dates and CNL sent a meeting invite.						√			√	
August 30, 2023 Outgoing Email	This email from the Manager, NPD Closure Project, to AOPFN is to provide AOPFN the updated Table of Interests and Concerns and a Table of Commitments for the EIS. CNL noted the changes to the I&C Table made from feedback received from AOPFN on June 21. CNL requested a future meeting to include confirming that status is correct and next steps are appropriate. CNL also noted they had utilized the feedback on commitments provided by AOPFN on June 29, using the list in Appendix B as a guide, to develop of Table of Commitments (list) suitable for the EIS.						√			√	
September 06, 2023 Meeting	This meeting between CNL (Including, Manager, NPD Closure Project, Decommissioning and Environmental Specialist, Communications Officer, Indigenous Engagement Coordinator) and AOPFN (including, Project Coordinators, Project Administrators, Communications Specialist and Consultant) is to discuss the AOPFN NPD Interest and Concerns table and Commitments list for the NPD Closure Project. CNL and AOPFN reviewed the language in the I&C Table and mitigation measures. CNL provided a status update on the Commitments list. Following the meeting AOPFN committed to sharing marked up versions of both tables to CNL.						√			√	
September 15, 2023 Incoming Email	This email from AOPFN Project Administrator to CNL Communications Officer is to provide CNL with AOPFNs I&C table with AOPFN's latest comments and track changes. Also, as per the last discussion, AOPFN requested another NPD-focused meeting be scheduled, and provided possible dates for a meeting.						√			√	
September 20, 2023 Incoming Email	This email from the AOPFN Project Coordinator to CNL is to provide a copy of AOPFNs simplified version of the Table of Commitments (list) suitable for the EIS. CNL confirmed receipt.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
September 27, 2023 Incoming Email	This email from the AOPFN Project Coordinator to CNL Communications Officer is to request available dates to discuss NPD Interests and Concerns and Commitments list. CNL confirmed 2023 October 19th from 2:30 pm.									√	
September 29, 2023 Outgoing Email	This email from the CNL Communications Officer to AOPFN Project Coordinator is to propose a draft agenda for the 2023 October 19 AOPFN-CNL NPD-focused meeting. AOPFN confirmed the draft agenda on 2023 October 03.									√	√
October 13, 2023 Emails	These email between the CNL Communications Officer and AOPFN Project Coordinator is to inform AOPFN that CNL will be sending the updated I&C table and commitments the following day. CNL also looked to add some time next week to work together on the wording of the EIS commitment list. AOPFN confirmed the delay in the updated I&C and confirmed the draft agenda. AOPFN looked for an update on the table and CNL sent it over. AOPFN confirmed receipt on 2023 October 16.									√	
October 17, 2023 Incoming Email	This email from AOPFN to CNL Communications Officer is to inform CNL that upon receipt of NPD Issues and Concern documents on October 16, it has been determined that appropriate time is not available for a proper evaluation. AOPFN requested to postpone the upcoming meeting on October 19th to ensure adequate reviews from the AOPFN team. CNL proposed alternative dates.									√	√
October 19, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to AOPFN is to propose converting the NSDF weekly meeting on 2023 November 2 to the NPD Closure Project discussion (I&C and Commitment Tables). CNL noted that CNL will be providing updated NPD Issues and Concern documents by 2023 October 20 for review. APOFN confirmed the meeting subject change.						√			√	
October 26, 2023 Outgoing Email	This email from CNL Communications Officer to AOPFN shared the updated Commitments table. CNL noted the updates made to align with the NSDF Project March 29, 2021 letter specifically Attachment B.						√				
November 02, 2023 Incoming Email	This email from AOPFN to a CNL Communications Officer provided the updated Interest and Concerns List.									√	
November 02, 2023 Meeting	This meeting between CNL (including the CNL Director NPD Closure Project, Director, Communications and Engagement, Environmental and Decommissioning Specialist, and Indigenous Engagement Coordinator) and AOPFN (Including, Project Coordinators, Project Administrator, Communications Specialist, and Consultant) was to discuss the I&C and EIS Commitments tables. CNL and AOPFN reviewed the comments provided by AOPFN on November 02. During the discussion on the commitments AOPFN provided guidance to CNL on how to revise the public facing list for the EIS. CNL and AOPFN also discussed a project specific agreement and the purpose it would serve.						√			√	
November 07, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to AOPFN is to provide the actions captured at the 2023 November 02 AOPFN-CNL NPD Closure Project working group meeting (Interests and Concerns and Commitments List).										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
December 14, 2023 Outgoing Email	This email from CNL Communications Officer to AOPFN Project Administrator is to provide the updated Summary of AOPFN Key Interests and Concerns and the Commitments working table along with forward facing list for the EIS. Both documents have been updated with edits suggested by AOPFN in writing and at the November 2, 2023, meeting. The I&C table has track changes showing only the most recent edits. CNL noted that unless AOPFN has any significant concerns about the changes to the I&C table, these are now ready for the EIS submission. CNL would appreciate confirmation from AOPFN by 2024 January 26.						√			√	√
January 25, 2024 Incoming Email	This email from AOPFN Project Coordinator to CNL Communications Officer informed CNL that AOPFN is not going to provide further comments on the public facing I&C and Commitments Tables at this time. AOPFN noted sharing thoughts and recommended edits, and while there may be sections that we don't agree on, AOPFN won't be holding you up from filing the EIS but do want it noted that the submission should not be labelled as approved by or otherwise endorsed by AOPFN. AOPFN reserves the right to further comment during the FPIRT process.						√			√	
January 29, 2024 Outgoing Email	This email from CNL to AOPFN Project Coordinator confirmed that AOPFN is not providing further comments on the updated Key Interests and Concerns and the Commitments Tables and provided an update on the outstanding responses.						√			√	
February 08, 2024 Telephone Call	This telephone call between CNL Communications Officer and AOPFN Project Coordinator is to discuss the outstanding responses to the 2023 EIS questions which CNL did not provide on the agreed date. CNL noted planning to provide the responses by the end of the month, and as a reminder we have committed to providing the responses prior to submitting the revised draft EIS.										√
February 08, 2024 Outgoing Email	This email from a CNL Communications Officer to AOPFN Project Coordinator is to apologize for not provided the outstanding responses to the 2023 questions by the date indicted in a previous email. CNL noted the extra time is being used to ensure the responses are in alignment with all the work being done at the working group level and with AECL. CNL is planning to provide the responses by the end of the month, and as a reminder CNL have committed to providing the responses prior to submitting the revised draft EIS. AOPFN Project Coordinator confirmed receipt of the update from CNL.										√

AOPFN - Mapping of Key Interests and Concerns

Table C-5 presents a mapping of how the key interests and concerns relate to detailed feedback and input from the AOPFN, up to March 2024.

Table C-5 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-5 Mapping of AOPFN Key Interests and Concerns

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
1. Accidents and Malfunctions	(a) Concerns about potential effects of malfunctions and accidents (e.g., due to natural hazards) and concern about overall deterioration of the disposal facility over time. It is important to the AOPFN that there are no health or environmental impacts from the facility, in the long term because of the project's proximity to the Kichi-Sìbì, which has great importance to AOPFN culture, heritage and ways of life. As well, the AOPFN is concerned that contamination leads to further alienation and loss of access to traditional land use. This is a project-specific concern.	In July 2020, the AOPFN submitted formal comments on the 2020 EIS. AOPFN raised concerns about potential accidents and malfunctions. In addition, participants at the Algonquin Advisory Committee (AAC) meeting in 2021 July also expressed significant concerns about what-if scenarios related to both accidents and malfunctions caused by effects of the environment on the project and from other sources. In their letter dated August 13, 2021 that outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN highlighted member concerns over the potential for contaminants leaking into waterways. Further the Aug 13th letter indicated concerns about the integrity of the site in the event of natural disasters, such as earthquakes, and impacts of climate change, including changing precipitation patterns and alterations to the bank of the Kichi-Sìbì that may expose the grouted monolith to increased erosion. Similarly, concerns were expressed over the cracking, breaking or general deterioration of the concrete barriers over time. In April 2023, AOPFN also identified that CNL should be required to provide substantive evidence that it has contingency plans in place in case the facility fails to contain the radioactive materials adequately, including a scenario where the materials need to be removed. Further, AOPFN is concerned because the placement of the grout and cap will make it more difficult to access the facility in the future, and therefore any such remedial action may be difficult to activate. AOPFN highlights that proximity is only one factor in assessing the potential risks to health. While workers will be geographically closer and have potentially longer exposure periods to both radiological and non-radiological contaminants, workers will also have access to protective equipment, emergency procedures, and early warning of accidents and malfunctions. AOPFN is seeking meaningful participation in compliance monitoring and emergency response planning as part of any AOPFN-specific risk communication program.
2. Alternatives	(a) Technical suitability of the In-Situ Disposal concept AOPFN is seeking for the NPD site to be decommissioned in a manner that is safe, acceptable and preferable to Algonquin peoples, when considering environmental, rights, and other values. This is a project-specific concern.	AOPFN is concerned that ISD is not a preferred alternative means to decommission the NPD site, technically or from an Algonquin perspective. AOPFN is concerned about the reversibility of the ISD technique, consistency of ISD with international best practice and that the hazard will outlive the design life of the closure strategy and contamination will be dispersed. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several were related to the in-situ disposal concept, including: • The reversibility of the in-situ disposal technique and mitigation strategies; • Consistency of in-situ disposal with International best practice; • The design life of the disposal facility in relation to the hazard duration of the waste; The effectiveness of retrofitting the current NPD facility as opposed to constructing a purpose built facility. In April 2023, AOPFN reiterated its concern that the hazard will outlive the design life of the closure strategy and contamination will be dispersed. While the severity of any associated impacts may be low from a technical perspective, some form of contamination risk and the associated psycho-social impact will persist. AOPFN is also concerned that CNL considers material within the facility to be 'existing wastes' given that the decommissioning work has not yet occurred.
	(b) Process for Assessment of Alternatives It is important to the AOPFN that the process of the assessment of alternatives is accepted by and includes AOPFN. This is a project-specific concern.	AOPFN highlights that joint assessment of alternatives is considered best practice and are commonly implemented for projects that are of high concern to Indigenous peoples. AOPFN has indicated that the alternative means assessment (AMA) should be following the more rigorous IAA 2019 legislation. In July 2020, the AOPFN submitted formal comments on the 2020 EIS. Several were related to the alternatives assessment process and the in-situ disposal concept, including: • The principle of willing host and the precedent for future disposal facilities. • The need for a detailed quantitative assessment of each alternative against the ALARA principle. • A lack of consultation on the design alternatives assessment methodology. • No participation of AOPFN in the alternatives assessment.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
		• No opportunity for AOPFN to engage on the criteria and weightings used in the assessment and concerns about specific criteria weightings. • The need for a robust environmental effects assessment for each alternative. • A lack of evidence supporting significant incremental risks related to off-site disposal. • An AOPFN request for a multi-party reconsideration of alternatives. In their letter dated August 13, 2021, which outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN reiterated their concern with the way in which CNL undertook the AMA for the project and highlighted that the Diet and Harvest Study found a clear majority of AOPFN respondents prefer the full removal option. In April 2023, AOPFN reiterated its concerns related to CNL's process for assessment of alternatives including that the willing host principle has not been followed for this permanent radioactive waste disposal facility. AOPFN remains concerned that doses from ISD are not ALARA, that a quantitative comparison of dose risks from all technically and economically feasible alternatives has not been provided, that ISD would defer risks to future generations, that ISD would create an unnecessary permanent radioactive waste disposal facility in AOPFN territory, that ISD has heightened long-term impacts on AOPFN traditional land and resource use, culture, and health and well-being compared to other alternatives, that the risks of a contaminant plume impacting on the Ottawa River are not justified, that ISD is not amenable to easy contingency adaptive management in case the technology does not contain the radiological risk, that ISD is not considered a preferred means of decommissioning a reactor versus a geological repository, and that occupational risks have been weighted too heavily in CNL's assessment. AOPFN has also indicated a continued desire for a multi-party forum for selection and evaluation of alternatives.
2. Alternatives	(c) Integration of AOPFN AMA results into CNL's overall assessment of alternatives It is important to AOPFN that CNL meaningfully consider the results of the AOPFN Alternative Means Assessment. Further, AOPFN expected CNL to reconsider its original alternatives assessment and directly integrate the AOPFN results. This is a project-specific concern.	It is important to AOPFN that CNL meaningfully consider the results of the AOPFN AMA. Further, AOPFN expected CNL to reconsider its original alternatives assessment and directly integrate the AOPFN results. In a meeting on September 27, 2021, AOPFN representatives reiterated concerns that AOPFN members feel like their perspectives on preferred alternative means had not been integrated into CNL's EIS. AOPFN is appreciative that CNL funded AOPFN's AMA however remain concerned that CNL has not meaningfully considered AOPFN's AMA or conducted a reconsideration of CNL's original AMA as a result of AOPFN's AMA. AOPFN expressed disappointment that AOPFN material was only recognized and not integrated into CNL's decision-making process.
	(d) Emphasis on financial costs in determining preferred alternative means. AOPFN is concerned that CNL may be incentivized to choose the single fastest and cheapest decommissioning option (ISD) versus the two "removal" options. This is both a CNL-wide and a project-specific concern.	AOPFN is concerned that CNL prefers the option that has the lowest potential risks of short-term (i.e., plan implementation) safety, security or environmental incidents, at the expense of that option transferring longer-term risks to the immediate receiving environment. In July 2020, AOPFN submitted formal comments on the 2020 EIS including questions related to the contractual relationships between CNEA, AECL and CNL. In December 2020, AOPFN expressed concern that CNL was financially incentivized to find the fastest and cheapest ways to decommission NPD. In April 2023, AOPFN reiterated its concerns that the fastest, cheapest option has been selected.
3. Archaeology and Cultural Heritage	(a) Involvement in culture and heritage matters at the NPD site It is important for the AOPFN to be involved in any future archaeological activities at the site, to ensure that artefacts with cultural value and significance are identified and protected as archaeological sites and artifacts have deep cultural value and significance for the Algonquins. This is both a CNL-wide and project-specific concern.	The AOPFN AKLUS highlights the potential for deposited artefacts in the area of the NPD property related to pre-contact transportation corridors. As these archaeological sites and artefacts have deep cultural value and significance, AOPFN requires further involvement in culture and heritage matters at the NPD site. In addition, the AKLUS and the Culture and Rights Studies discuss the significant cultural and historical importance of the Kichi-Sìbì, and the AOPFN's concerns about impacts to current and future values and use of the Kichi-Sìbì. Protection of the Kichi-Sìbì is discussed in row #16 (a) below.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
4. Baseline Characterization	(a) Characterization of aquatic and terrestrial biota baseline It is important to AOPFN that the baseline environmental conditions around the site of the NPD Closure Project including aquatic and terrestrial biota are well understood and are protected in order to adequately assess potential impacts to AOPFN rights and traditional land and resource uses. This is a project-specific concern.	AOPFN has identified concerns in particular with the absence of an Algonquin Knowledge baseline for the NPD site and its surroundings, due to an absence of prior engagement by CNL and AECL of AOPFN in Algonquin Knowledge studies in and around this 400-hectare site. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several were related to baseline characterization: • A lack of data for benthic invertebrates abundance/diversity and no studies of fish tissues. • A reliance on background information and not on targeted field studies when defining the baseline for the terrestrial environment. • Species presence, abundance and potential nesting areas for migratory birds.
	(b) Use of a current, damaged baseline as the starting point for the assessment AOPFN has raised consistent concerns about the temporal comparison chosen by CNL for the NPD decommissioning assessment, which is to compare the future against today, rather than against a pre-NPD site condition (i.e., the early 1960s). This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	AOPFN has argued that any decommissioning project needs to be tied to the ability to reach an agreed upon desired future state, not against an already damaged current state. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several comments were related to EA methodology and process. In their letter dated August 13, 2021, which outlined the implications of the AOPFN studies for the NPD Closure Project, one of the concerns reiterated by AOPFN was the lack of consideration of effects against a pre-NPD baseline. AOPFN reiterated to CNL in its feedback from April 2023 that it disagrees with the use of the current – damaged, baseline in CNL's assessment.
	(c) Technical suitability of the site. AOPFN is concerned that the site was not designed to be a permanent radioactive waste disposal facility. This is a project-specific concern.	AOPFN wants to ensure that AOPFN lands and the Kichi-Sìbì are protected and to reduce the radiological burden placed on AOPFN by Canada in the future. In July 2020, AOPFN submitted formal comments on the 2020 EIS. AOPFN expressed concern that CNL had not completed a siting study that demonstrated the site is technically superior and publicly acceptable. In April 2023, AOPFN repeated their concern that CNL had not performed a comprehensive exercise to determine the suitability of the site.
5. Engagement	(a) Interest in establishing a Long-Term Relationship Agreement (LTRA) It is important that a mechanism be in place for AOPFN to express its community members' needs and concerns with respect to CNL activities, including those beyond the NPD Closure Project, to CNL and AECL, and to be able to work with CNL and AECL towards understanding and resolution with respect to CNL activities and AECL-owned sites within the Algonquin Settlement Area where AOPFN members harvest food, medicines, and other natural materials. This is a CNL-wide interest.	In July 2020, AOPFN submitted formal comments on the 2020 EIS. In these comments, the AOPFN expressed interest in developing a LTRA with CNL. In April 2023, AOPFN clarified that there are only some mechanisms from the proposed LTRA which are applicable to NPD (i.e., the Guardian Program and Risk Communication Program). AOPFN has indicated that further collaborative assessment and negotiation of a Project-Specific Agreement will be required for NPD as part of a consent seeking process between the parties, at the end of which AOPFN may or may not provide its free, prior and informed consent to the proposed in-situ project at NPD.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
5. Engagement	(b) Interest in more direct and collaborative engagement on the NPD Closure Project It is important to the AOPFN that engagement involve two-way communication and active collaboration through all phases of the project as there are potential impact to current and future AOPFN members' rights and ability to practice traditional activities on the land / water. This is a project-specific interest.	AOPFN was not engaged collaboratively during the early stages of the EA e.g., the AMA and has identified their desire to be involved in all phases of the EA. Key areas for collaboration include: • Integration of the Traditional Use Study into project planning, design, mitigation and accommodation both during and post-EIS. • Development of mitigations that will be considered in assessments for valued components today – so AOPFN is involved in all phases of the EA and project life-cycle. • co-development and co-approval for development and implementation of the EA follow-up and monitoring program for the project, including adaptive management objectives, indicators, thresholds, and responses for terrestrial wildlife, fish and fish habitat, traditional land and resource use, and water quality at minimum. • co-development and co-management of end-state land use planning for the entire AECL site at NPD. In July 2020, AOPFN submitted formal comments on the 2020 EIS. In these comments AOPFN requested a work plan for direct EA engagement. AOPFN highlighted the need for more collaborative engagement and two-way dialogue.
6. EA Process and Methodology	(a) Concern about the methodology for conducting the effects assessment and determination of significance It is important to the AOPFN that events with the potential for an adverse effects on the environment and/or AOPFN rights are carried through the assessment process as far as is reasonable as the project may have impact to current and future AOPFN members' rights and ability to practice traditional activities on the land / water. This is a project-specific concern.	AOPFN is concerned that CNL's assessment does not integrate into its effects characterization any of the impact pathways identified by AOPFN that results in both direct and indirect effects on Traditional Land and Resource Use: quality and accessibility of the land, consideration against a pre-NPD baseline, Project-related activities would exacerbate the issue of alienation and further limitation of members' access to the area, perpetuating the difficulty of exercising their Aboriginal rights, long-term continuation of an avoidable location-specific effect in the form of fencing off and not allowing the NPD site to return to a natural condition, and the permanent cementing in place of radioactive materials very close to the Kichi-Sìbì the radioactive materials that cause fear, stigma, alienation and concerns about the quality of country foods and medicines, and whether they are harvestable. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several were related to EA methodology and process. In their letter dated August 13, 2021, which outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN reiterated their concerns related to EA methodology and process. The following items were highlighted related to EA methodology and process: • Concerns with the methodology to determine significance of adverse residual effects; • Concerns related to the determination of effects (impacts) and on the adequacy of evaluation of cumulative effects. • Concerns about how the quality and accessibility of land were considered in the effects assessment; this is discussed in row #17(b) below. • Consideration of effects against a pre-NPD baseline. The findings of the three AOPFN studies suggest there are residual adverse effects potential across a larger number of VCs, including Indigenous land and resource use, and the EIS has not been updated to properly reflect AOPFN's understandings of impacts on AOPFN members from the project. AOPFN reiterated to CNL in its feedback from April 2023 that it disagrees with the use of the current – damaged, baseline in CNL's assessment.
	(b) Concern about the methodology of the cumulative effects assessment It is important to AOPFN that the project assessment is properly informed by cumulative effects assessment in order to protect AOPFN values and rights. This is both a project-specific and CNL-wide concern.	AOPFN is concerned that despite AOPFN finding adverse effects there has been inadequate consideration of trend-over-time impacts on VCs found at and around the NPD site (adoption of a damaged current baseline), no cumulative effects assessment on AOPFN culture, traditional land and resource use, or health and well-being. AOPFN has provided evidence through four studies of risks in the Project Case to longer-term continuation of alienation and loss of use effects on traditional land users as a result of converting the NPD site to a permanent radioactive waste disposal facility. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several were related the adequacy of evaluation of cumulative effects.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
6. EA Process and Methodology	(c) Relevant legislation AOPFN expressed concern on continued use of *CEAA, 2012* rather than the more recent *Impact Assessment Act*. It is important to AOPFN that the NPD Closure Project Environmental Assessment (EA) is carried out using up-to-date legislation that includes best practice decision-making through a collaborative process. This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	The impacts that AOPFN has identified are impacts within the federal jurisdiction under *IAA* (2019) and is disappointed that CNL, AECL and CNSC are continuing this assessment under the less rigorous expectations of CEAA 2012. In April 2023, AOPFN reiterated its disappointment that CNL, AECL, and CNSC, have chosen to continue the NPD Closure Project EA under the less rigorous expectations of *CEAA* (2012).
	(d) AOPFN participation in the assessment AOPFN is seeking good impact assessment practice that include Indigenous groups as part of the assessment early and throughout the process. This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	The traditional users themselves, through the four AOPFN studies, have concluded that the proposed project will have impact on traditional use. AOPFN is concerned that the inputs from Indigenous Land users themselves has not been integrated into the actual effects characterization and significance determination process. AOPFN – and AOPFN's evidence in the traditional land use and occupancy study, the Diet and Harvest Study, and AOPFN's AMA, and culture and rights study, all of which have been made available to CNL, do not support CNL's conclusion that "the project will not interfere with traditional activities. AOPFN has and will continue to provide evidence that CNLs estimation of no adverse impacts on TLRU in the Project Case are incorrect, not supported by the traditional users themselves, In April 2023, AOPFN highlighted that their involvement in the assessment has been from the outside looking in and that AOPFN perspectives have had little to no influence on CNL's assessment findings. Further AOPFN highlights that there is an important distinction between putting an Indigenous group's perspective into a portion of the EIS and actually involving that Indigenous group in the assessment process.
7. End State, Site Restoration and Future Use of the Land	(a) Collaborative end land use planning It is important to AOPFN that it receives reassurance that the land around the facility will be renaturalized over time, so that AOPFN community members can reconnect with the site and be able to practice traditional land use activities. This is both a CNL-wide and project-specific concern.	AOPFN is a governance and stewardship entity with a right to be directly and deeply involved in collaborative end state planning. AOPFN is seeking an active, decision making, co-management role in the end state planning for NPD including early involvement in the development of the plan (not simply an opportunity to provide feedback on the plan after CNL has already drafted). AOPFN is also concerned that restoration of these ecosystems strive to bring back conditions similar to a pre-disturbance baseline (or intact reference baseline) and that more detailed restoration plans be included in the EIS. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several were related to end land use and restoration such as: • A request from AOPFN for commitment from CNL and AECL on collaborative end land use planning; • A lack of detail in the EIS to determine the cultural and ecological effectiveness of the lands following completion of the project; • A request for clarification on terminology ("renaturalization"). In their letter dated August 13, 2021, which outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN reiterated their request for collaboration on end-land use planning for the NPD site. In April 2023, AOPFN repeated its desire for collaborative end-land use planning for the full NPD site and indicated their preference to see the restoration activities further developed in the EIS before final submission. AOPFN's requested commitments would require CNL and AECL to fund and collaborate with AOPFN to undertake end-land use planning for the larger AECL-controlled NPD site, including plans for compensation if end-land use goals that have been agreed to are not met. CNL and AECL have not yet adequately demonstrated that they are ready to meet this requirement.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
7. End State, Site Restoration and Future Use of the Land	(b) Preparation of on-site landfills for the post-closure period Closure plans for the on-site landfills are important to AOPFN because it wants to ensure that the environment around the site of the NPD Closure Project is protected as these landfills were located on the NPD site within unceded Algonquin traditional territory where AOPFN members harvest food, medicines, and other natural materials. This is a project-specific interest.	In July 2020, AOPFN submitted formal comments on the 2020 EIS. AOPFN requested additional details on how the landfills onsite will be prepared for the post-closure period.
	(c) Project timeframe AOPFN is concerned that the site will require an indefinite period (>100 years) of institutional care. This is both a CNL-wide and project-specific interest.	AOPFN is concerned that the site will require an indefinite period (>100 years) of institutional care to monitor and maintain the infrastructure necessary to prevent potential impacts including continuation of active controls. AOPFN is also concerned that long-term funding for these institutional controls is uncertain. AOPFN is concerned that the NPD site and surrounding lands are safe for traditional land and resource use activities in the future. In July 2020, AOPFN submitted formal comments on the 2020 EIS. One comment requested details on the length of Institutional Control period and the Crown's commitment of long-term funds
	(d) Long-term liability of the site beyond decommissioning. It is important to AOPFN that the end state of the NPD site is safe for future land users and that a guarantee and long-term funding is in place for Institutional Controls for as long as necessary. This is a project--specific concern.	AOPFN is concerned that the Institutional Controls period will need to be significantly longer than 100 years. Further AOPFN is concerned that contingency plans in case the facility fails to contain the radioactive materials adequately, including a scenario where the materials need to be removed are not sufficiently developed. For both of these aspects AOPFN does not have confidence that government funding will continue or be in place. It is important to AOPFN that radioactive risks will not be passed on as a burden to future generations and it is important to AOPFN that radioactive materials are not abandoned and forgotten in Algonquin territory. It is important to AOPFN that they have safe and trusted access and use of the NPD site and its surroundings for present and future generations. AOPFN prefers an alternative that allows the land to heal the quickest from harms i.e., a removal option that does not perpetuate the current state of contamination. In a future with in-situ disposal, the underground conditions will be unnatural, and on the surface, portions of the site will be unnaturally fenced off, covered with a concrete cap and unable to return to a forested condition. AOPFN is concerned that project-related activities would exacerbate the issue of alienation and further limit members' access to the area. In April 2023, CNL heard that AOPFN remains concerned about a guarantee for funding of Institutional Controls and the lack of clarity on the length of the Institutional Controls period.
8. Environmental Effects and Mitigation Measures	(a) Invasive species management AOPFN is unclear how invasive species will be managed at the NPD site if introduced by vectors other than heavy equipment (e.g., by smaller vehicles, hand-held equipment, or people). This is a project-specific concern.	It is unclear what measures will be implemented to manage invasive species, should they be accidentally introduced or already present at the site. In July 2020, AOPFN submitted formal comments on the 2020 EIS seeking additional information on how invasive species will be managed. In December 2020 and April 2023 AOPFN continued to seek clarity on what measures would be implemented to manage invasive species if they are accidently introduced or already present at the NPD site.
9. Free Prior and Informed Consent (FPIC)	(a) Principle of consent It is important to AOPFN that the right to give consent to be a willing host be respected as the NPD site and facility is in unceded AOPFN traditional territory. This is both a CNL-wide and project-specific concern.	AOPFN is concerned that it did not consent to the original NPD construction and operation and that now, potentially without their consent, are expected to host the radioactivity in perpetuity. AOPFN has noted that the United Nations Declaration on the Rights of Indigenous Peoples, section 29.2, is not being adhered to by CNL and AECL in relation to the NPD Project. AOPFN has identified in writing, including in a letter shared in 2022 March, that it expects CNL and AECL to respect AOPFN's right to be a Willing Host for any transition of this site from a nuclear reactor site to a permanent hazardous waste disposal facility, and to respect AOPFN's right to Free, Prior and Informed Consent (FPIC) to any such proposal, as per the United Nations Declaration on the Rights of Indigenous Peoples. In April 2023, AOPFN highlighted that it did not consent to the NPD construction/operation and that now, without consent, AOPFN is expected to host the radioactive waste in perpetuity. AOPFN continued to highlight its position that FPIC is mandatory in relation to hazardous waste disposal facilities which this project has proposed the NPD facility become.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
10. Impacts on Rights	(a) Concerns about completeness of assessment of impacts on rights It is important to the AOPFN that all potential effects of concern have been assessed, including the potential alienation of AOPFN members from land use due to distrust in the safety of the land and water as this may impact AOPFN members ability to practice traditional activities on the land. This is a project-specific concern.	AOPFN has raised concerns that the implications of the findings of AOPFN's Culture and Rights Study, along with the Algonquin Knowledge and Land Use Study, the Diet and Harvest Study, and the AMA, which point to measurable adverse effects from the proposed In-Situ Decommissioning on AOPFN rights and related valued components, have not been adequately integrated into the EIS' effects characterization and significance estimation process. In particular, AOPFN has stated on multiple occasions and through the AMA process, that In-Situ Decommissioning is the least preferable decommissioning option from a rights protection perspective, given the area would not see the radiological hazard fully removed and as such the area cannot return to a natural and trusted condition in a reasonable time frame. In July 2020, AOPFN submitted formal comments on the 2020 EIS. One comment raised concern about potential Impacts on Rights and a desire for adoption of the new requirements as per the *IAA* (2019). In their letter in August 2021 that outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN's position was that measurable impacts on long-term ability to harvest in the NPD area will result from the project as proposed. Additionally, the August 2021 letter repeated AOPFN's concern that CNL has underestimated the project's impacts on traditional land and resource use, as well as culture and heritage resources, and impacts on AOPFN rights. In April 2023, identified the need for recognition of truth. The legacy of the NPD facility and larger surrounding site, including ongoing effects, are a fact that must be considered during the assessment and consultation phase for this proposed Project. AOPFN's position remains that there are measurable impacts on the rights of AOPFN to practice traditional activities around the NPD site. Psychosocial effects are discussed further in row 11 (b) below.
11. Indigenous Health	(a) Indigenous health assessment, receptors and diet AOPFN is concerned that health is primarily focused on biophysical health rather than full scope Indigenous determinants of health. This is a project-specific concern.	The assessment of Indigenous health should look beyond radiation dose thresholds and include consideration of the more difficult to measure, but equally important, perceptual and real impacts on AOPFN determinants of health including education status, economic status, and diet, among other factors. Diet is of critical importance given the likelihood that negative perceptions of the safety of the Project may diminish AOPFN member's consumption of traditional foods. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several identified concerns with the health assessment and requested a dietary study involving AOPFN. The concerns are: • Changes in diet from perceived contamination and effects on overall health. • The definition of the Indigenous receptor and alignment of that profile with the harvest and diet practices of the local population. • A request to update the spatial boundaries for the Indigenous Health assessment. AOPFN has highlighted that the Diet and Harvest Study implications do not end at modelling of the human health risks and factors related to Indigenous determinants of health have not been demonstrably integrated into the EIS materials that assess Indigenous health.
	(b) Psychosocial effects AOPFN is concerned that in relation to human health, CNL has adopted a relatively narrow perspective on human health that is focused on biophysical impacts to human health, with little or no emphasis on other factors that influence Indigenous population health. This is a both a CNL-wide and project-specific concern.	This is particularly concerning to AOPFN because of the fear, stigma, and alienation felt by AOPFN members associated with the nuclear industry in general. The impacts resulting from the perception of environmental effects must be recognized. These include but are not limited to continued – now potentially permanent - fear and stigma associated with the radiological legacy at the site, and communal health and wellness issues associated with the inability to connect to the site and protect and heal it which is characterized by AOPFN as both a right and a responsibility. Pooled together, these concerns are often labeled as psychosocial impacts, and they are major contributors to poor health and wellness outcomes among Indigenous peoples. AOPFN has raised consistent concerns that CNL is not considering psychosocial impacts as legitimate impacts. AOPFN disagrees with CNL's assessment that there are no effects from the NPD Closure Project. AOPFN continues to have concerns about the safety of the NPD site and the potential impacts on the rights of AOPFN to practice traditional activities around the NPD site. AOPFN has highlighted in its feedback in April 2023 that CNL does not consider perceived risk, fear, stigma and their combined impacts on traditional use and rights practices as a legitimate impact pathway in this assessment. AOPFN is concerned that CNL is making this assessment/characterization instead of allowing AOPFN to decide whether it will be impacted. AOPFN is interested in better characterization of the factors that have led to alienation and loss of land use, and better understanding of the implications of psychosocial impacts on AOPFN socio-cultural health and well-being. AOPFN has indicated that this will be an important issue for focus on a move forward basis.
12. Long-term Safety	(a) Concern about overall deterioration of the disposal facility over time. The AOPFN identified the long-term site integrity as important because of the site's location within unceded Algonquin traditional territory and the potential of the project / site to impact people living or fishing nearby (exercising rights to fish), as well as wildlife, vegetation, and all elements of the natural environment at and in the vicinity of the Project. This is a project-specific concern.	AOPFN has raised concerns about whether future safety will be properly monitored, given the life of some of the contaminants exceeds the predicted Institutional Control period for the facility in the Project Case. Within the AKLUS report, participants identified concern about long-term site integrity and monitoring. The Culture and Rights Study also identified concern about site integrity and the need for monitoring based on Algonquin principles. In their letter dated August 13, 2021, which outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN highlighted member concerns over the potential for contaminants leaking into waterways. Further the Aug 13th letter indicated concerns about the integrity of the site in the long-term resulting from cracking, breaking or general deterioration of the concrete barriers over time.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
13. Monitoring	(a) AOPFN involvement in monitoring Involvement in monitoring is important to the AOPFN to ensure the Kichi-Sìbì is taken care of as it has great importance to AOPFN culture, heritage and ways of life. This is both a CNL-wide and project-specific interest.	It is important to AOPFN that it has a co-development and co-approval role in the development and implementation of the EA follow-up and monitoring program for the project, including adaptive management objectives, indicators, thresholds, and responses for terrestrial wildlife, fish and fish habitat, traditional land and resource use, and water quality at minimum. AOPFN is concerned that follow-up monitoring lacks a health component that would evaluate aspects of TLRU, culture and Indigenous health/well-being. AOPFN is seeking meaningful participation in compliance monitoring and emergency response planning as part of any AOPFN-specific risk communication program. AOPFN's position is that an independent Indigenous Guardian-style program is critical in relation to the NPD site and its surroundings. This will allow for Indigenous Knowledge to be integrated into project monitoring for the first time, restore AOPFN stewardship responsibilities in keeping with Canada's commitment to reconciliation and UNDRIP, increase AOPFN capacity to understand and monitor changes to the environment our members rely upon, and is an important link into a required Indigenous-driven risk communication strategy for the Project. In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several indicated AOPFNs desire for involvement in monitoring. In their letter dated August 2021 that outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN reiterated their expectation of a meaningful AOPFN role in site (and surroundings) monitoring for the life of the project, and support for the collection of both technical and Indigenous Knowledge monitoring data. To facilitate this meaningful role, AOPFN is seeking support for the Neya Wabun Guardian Program to be applied in relation to monitoring the NPD site. Specifically, the Culture and Rights Study requested long-term monitoring of the site, including a site inventory by AOPFN members to know what resources are within the fenced site location (the entirety of the AECL-owned property, not just the NPD reactor location within it), and the current conditions of those resources.
14. National Policy	(a) Canadian strategy for waste management is lacking AOPFN is concerned that the Government of Canada does not yet have a modern nuclear waste management policy in place and that a lack of coordinated planning in past to develop permanent facilities has resulted in a proposed facility in AOPFN territory that it has not consented to, and which is contrary to IAEA guidance and the principle of consolidation of waste into the smallest feasible number of permanent waste disposal facilities. This is not a project-specific concern; however it has implications on this project.	In April 2023, AOPFN highlighted that Canada lacked a coordinated strategy to develop permanent disposal facilities. As an outcome of this failing by Canada, not only did AOPFN not consent to the NPD construction/operation, they are now, without their consent, expected to host the radioactivity in perpetuity.
	(b) Canadian strategy for waste management is not timely AOPFN's view is that Canada failed to act in a timely manner to implement an acceptable permanent waste management alternative. This is not a project-specific concern; however it has implications on this project.	AOPFN is concerned that it did not consent to the NPD construction/operation and that now, without consent, AOPFN is expected to host the radioactive waste in perpetuity. In April 2023, AOPFN highlighted that Canada failed to act in a timely manner to implement an acceptable permanent waste management alternative.
15. Protection of Flora and Fauna	(a) Habitat (including Species at Risk) and road mortality impacts As stewards of lands and waters, it is important to the AOPFN that the environment, wildlife, and plants, including Species at Risk and their habitat areas, are taken care of now and for future generations. This is a project-specific concern.	In July 2020, AOPFN submitted formal comments on the 2020 EIS. One comment sought additional information about potential road mortality impacts for important VCs such as Blanding's turtles and milk snake. Within the AKLUS report, participants identified the following concerns related to species at risk: • Species at risk including lake sturgeon, eel, and bald eagles, including habitat concerns; • Concerns about loss of habitat.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
16. Protection of the Ottawa River	(a) The Ottawa River, and shoreline and riparian ecosystems AOPFN is concerned that the disturbed riparian habitat was excluded from CNL's Ecological Land Classification on the basis that it was considered an anthropogenic site. This is both a CNL-wide and project-specific concern.	AOPFN is concerned that the Project will contribute impacts to riparian ecosystems as a result of decommissioning activities, batch plant operation, traffic on adjacent roadways, dust, and ongoing legacy effects as a result of liabilities remaining after decommissioning that are likely to influence groundwater and adjacent riparian areas. The restoration of these ecosystems should strive to bring back conditions similar to a pre-disturbance baseline (or intact reference baseline). In July 2020, AOPFN submitted formal comments on the 2020 EIS. One comment expressed concern about the impacts to the riparian ecosystem as a result of decommissioning activities and the liability remaining after decommissioning. Within the AKLUS report, participants identified concerns related to the Kichi-Síbí, fish, fish habitat and bioaccumulation. A letter from the AOPFN, received in August 2021 highlighted concern about the proximity of the proposed project to the Kichi-Sìbì, considering its importance to AOPFN culture, heritage and ways of life. In April 2023, AOPFN identified the need for restoration activities to re-establish a more natural riparian habitat in the NPD Project- affected area.
17. Socio-Economic	(a) The absence of primary socio-economic baseline data for AOPFN The AOPFN have indicated that having primary socio-economic baseline data is important to the AOPFN because Indigenous Nations, communities and organizations often conceptualize socio-economic wellbeing in ways that cannot be adequately captured with census data. And, potential effects to Indigenous socio-economic conditions cannot be adequately assessed without this baseline. This is a project-specific concern.	AOPFN is concerned that the Indigenous socio-economic assessment is extremely narrow, focusing primarily on nuisance effects from Project activities and traffic safety. This assessment does not contain an appropriate social component, which may include (but not be limited to) considerations such as social relations, family, intergenerational relations, food security, sharing relationships, and psychosocial factors, as well as standard socio-economic considerations such as (but not limited to) education and training, employment and income, job readiness, housing, and community services. In addition, AOPFN commercial activities (e.g. guiding and outfitting) should be assessed. The socio-economic effects assessment should consider direct, indirect, induced, and cumulative socio-economic impacts. In addition, appropriate mitigation and monitoring measures should be adopted. In July 2020, AOPFN submitted formal comments on the 2020 EIS. AOPFN raised concerns on the narrow spectrum of socio-economic issues discussed in the EIS.
18. Technical	(a) Emissions and Discharges It is important to AOPFN that emissions to the environment are properly assessed and are mitigated and monitored as appropriate to ensure that the rights and interests of AOPFN members are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several were technical such as: • Plans for dust mitigation. • Effluent discharges to the aquatic environment.
19. Traditional Land and Resource Use and Cultural Impacts	(a) Algonquin traditional knowledge should be collected and incorporated into the EIS. It is important to AOPFN that community-specific knowledge be obtained and used to properly characterize current conditions and develop scenarios that accurately represent potential future uses of the site to enable future AOPFN members to practice traditional activities in the region. This is a project-specific concern.	In July 2020, AOPFN submitted formal comments on the 2020 EIS. Two of these comments focused on the incorporation of AKLUS information into the EIS. AOPFN also requested capacity for disaggregation of AOO AKLUS results.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
19. Traditional Land and Resource Use and Cultural Impacts	(b) Impact on ability to practice traditional activities. AOPFN is concerned about continued ability to harvest and consume wildlife and natural materials from the area, including hunting, plant harvesting and fishing. This is a project-specific concern.	AOPFN is concerned that harvesting sites could become compromised in the future, leading to concerns over safety that would impact members' abilities to pass on AOPFN knowledge on harvesting to children. This would in turn affect the ability of future generations to use the area; and that project-related activities would exacerbate the issue of alienation and further limit members' access to the area, and perpetuate the difficulty of exercising their Aboriginal rights. AOPFN disagrees with CNL's conclusion of no impacts on traditional land use. AOPFN's four studies, supported by evidence from traditional land users themselves identify the following existing impact pathways: • Lack of access to the NPD site since 1962; • Diminished quality and quantity of game species in preferred hunting areas; • Lack of confidence in the health of animals, fish, medicines, and waters, and in their safety for human consumption. In July 2020, AOPFN submitted formal comments on the 2020 EIS. One comment included AOPFN perceptions of safety and quality of experience on the land. Through its recent engagement with AOPFN, CNL has also heard interest on the topics of Traditional Use (aesthetics and visual), perceived and sensory effects that may result in alienation from lands and impact on cultural landscapes. Within the AKLUS report, participants identified the following concerns with respect to traditional land and resource use and cultural impacts: • Concerns about impacts to harvesting; • Concerns about the Kichi-Síbí, fish and bioaccumulation; • Concerns about future generations' ability to use the area; • Concerns about the protection of and access to sites of cultural and spiritual significance; • Concerns about loss of access. In their letter dated 2021 August that outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN's position is that measurable impacts on long-term ability to harvest in the NPD area will result from the proposed project. This letter repeated AOPFN's concern that CNL has underestimated the project's impacts on traditional land and resource use, as well as culture and heritage resources, and impacts on AOPFN rights. The 2021 August letter highlighted: • concern over the potential for leaks from the facility affecting people and wildlife that rely on them; • Perception of contamination, leading to further alienation and loss of access to traditional land use; AOPFN is interested in better characterization of the factors that have led to alienation and loss of land use, and better understanding of the implications of psychosocial impacts on AOPFN socio-cultural health and well-being. In April 2023, AOPFN reiterated its position that CNL's estimation of no adverse impacts on TLRU in the Project Case are incorrect and not supported by the traditional users themselves.
	(c) Preservation of cultural resources, and mitigation of impacts to cultural resources It is important to the AOPFN that traditional land use and cultural resources are protected and potential effects are mitigated and monitored in a way that recognizes the interdependencies between ecological, socio-economic, community and cultural health. This is a project-specific concern.	AOPFN is concerned that the EIS has only considered the presence of ceremonies and access to physical archaeological resources, neglecting other cultural values of importance to AOPFN such as transmission of traditional knowledge, cultural landscapes as well as trails and travel-ways such as the Ottawa river. Further mitigations for impacts to traditional use are limited to construction timing, dust suppression, and communication/notification. AOPFN is seeking a collaborative process to identify culturally appropriate ways to mitigate potential impacts and concerns of AOPFN and AOPFN Knowledge Keepers. In 2020 July, AOPFN submitted formal comments on the 2020 EIS. Several were related to traditional land and resource use: • Preservation of cultural resources. • Culturally appropriate mitigations. In April 2023, AOPFN identified that commitments to collaborative development of mitigation measures and monitoring activities remain too vague. Further AOPFN is looking to a see health follow-up monitoring activities that integrate aspects of TLRU, culture and Indigenous health and well-being.

Topic	Key Interests and Concerns	Specific feedback provided by the AOPFN on this interest/concern (Validated)
19. Traditional Land and Resource Use and Cultural Impacts	(d) Concern about the size of the study areas for the assessment of effects on traditional land use. It is important to the AOPFN that all potential effects on traditional land use are considered by identifying study areas that encompass not just biophysical and physical effects, but also changes to the environment that would affect the values and sense of safety of AOPFN members. This is a project-specific concern.	AOPFN is concerned that CNL has not adopted the larger Local and Regional Study Areas used by AOPFN in their studies. This highlights the continued lack of understanding of just how large the impact zone on Traditional Land and Resource Use is around the NPD site. AOPFN has flagged that the study areas selected for traditional use VCs by CNL in the EIS differ from the study areas used by AOPFN in the AKLUS. AOPFN highlighted in its text within Section 9.9 of the EIS that CNL has chosen to ignore the larger Local Study Area and Regional Study Area used by AOPFN peoples in three studies, thus rejecting AOPFN Algonquin Knowledge. The result is Local Study Areas and Regional Study Areas that are 25 times smaller than those chosen by the AOPFN Algonquin knowledge holders themselves. This contributes to the continued lack of understanding of just how large the impact zone on Traditional Land and Resource Use is around the NPD site, which remains an open question in this EA.
	(e) Participation of knowledge holders in the assessment of effects to TLRU. AOPFN is concerned about the lack of integration of AOPFN knowledge and AOPFN members into the assessment of effects on traditional land and resource use, culture, and Indigenous health and well being This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	AOPFN holds that it is a principle of meaningful assessment of effects on Indigenous land use, culture, and health and well-being that not only must Indigenous inputs be provided into the process, but the Indigenous Knowledge holders, with their unique expertise as the actual land users and culture holders, must be involved in effects characterization and significance estimation. In their April 2023 comments to CNL, AOPFN highlighted that the traditional users themselves, through the four AOPFN studies, have concluded that the proposed project will have impact on traditional use. AOPFN is concerned that the inputs from Indigenous land users themselves has not been integrated into the actual effects characterization and significance determination process. AOPFN has and will continue to provide evidence that CNLs estimation of no adverse impacts on TLRU in the Project Case are incorrect, not supported by the traditional users themselves.
20. Valued Components	(a) Inclusion of VCs identified by AOPFN AOPFN is concerned that the specific species they have identified are sometimes assessed using a representative species. Further, AOPFN is concerned that the final decisions on what VCs to include was made by CNL, and was not verified as appropriate by AOPFN, which suggests that Algonquin Knowledge is still not treated as of equivalent value to western science in CNL's EA. This is a project-specific concern.	The decision to use a receptor species and the appropriateness of that species was not informed by Algonquin Knowledge. For example AOPFN is concerned that the many fish species are evaluated using only two generic categories – pelagic and benthic and that vegetation is represented by a single VC – terrestrial vegetation. AOPFN also suggests additional work to understand the values, distribution, abundance, and risks to impacts of specific aquatic and terrestrial vegetation is required. In their letter dated August 2021 that outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN expressed their concern that several VCs identified by AOPFN Knowledge Keepers in the AKLUS were not covered in the draft EIS: • Culturally important plants (including cattails and muskrat root/sweet flag); • Furbearers of cultural importance (including Amik (Beaver), Pashkwajàsh (Coyote), Odjìg (Fisher), Wàbisheshi (Marten), Nigig (Otter), Wàbòz (Rabbit), Esiban (Raccoon), Wàgosh (Fox), Adjidimò (Squirrel),and Shingosi (Weasel)); • Mónz and Mónz Habitat; • Wawáshkeshi Habitat; • Partridge; • AOPFN preferred harvesting sites; • AOPFN preferred fishing sites; • Kichi-Sìbì as a cultural landscape. • AOPFN member cultural continuity and way of life. Further, late in 2021 AOPFN provided text directly for the EIS that highlighted several concerns about the comprehensiveness and representativeness of some of the VCs chosen by CNL for this EA.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

AOPFN (AOPFN) – Summary of Interests and Concerns

Table C-6 below summarizes the key interests and concerns that the AOPFN have raised up to March 2024 on the NPD Closure Project, through comments submitted on the 2020 EIS to the CNSC and CNL, subsequent filings of material by AOPFN to CNL or through direct discussion and engagement between AOPFN and CNL.

Table C-6 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, and why it is important to the Indigenous Nation, community or organization. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern.
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS, this is also discussed.
- Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

Table C-6 AOPFN Interests and Concerns

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
1. Accidents and Malfunctions	(a) Concerns about potential effects of malfunctions and accidents (e.g., due to natural hazards) It is important to the AOPFN that there are no health or environmental impacts from the facility, in the long term because of the project's proximity to the Kichi-Sìbì, which has great importance to AOPFN culture, heritage and ways of life. As well, the AOPFN is concerned that contamination leads to further alienation and loss of access to traditional land use. This is a project-specific concern.	CNL has responded in writing to AOPFN comments on accidents and malfunctions citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL updated its dispositions to AOPFN comments on the EIS and responded to AOPFN in December 2022. AOPFN provided additional feedback to CNL in April 2023. CNL delivered a presentation to the Algonquin Advisory Committee (AAC) in 2021 September on how the project considers what-if scenarios, including accidents, leaks, or malfunctions. CNL Response: CNL's Emergency Procedure for the NPD site includes actions for specific staff roles in the event of a wide range of emergency conditions including fires, floods, hazardous spills, loss of power, earthquakes, and tornados. This procedure was developed and is updated in accordance with CNL's company-wide Emergency Preparedness Program, which has been accepted by the CNSC and meets the requirements of REGDOC 2.10.1 Nuclear Emergency Preparedness and Response. It will remain in place and be updated as required throughout the Decommissioning Execution and Institutional Controls phases of this project. Per the plan, as soon as it is safe to do so following an emergency event, CNL staff will evaluate site and facility conditions and arrange for any necessary repairs to be made. Further, CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change through all project phases (Decommissioning Execution, Institutional Controls and Post-Institutional Controls) and has concluded that these events will have no undue effects on people or the environment around the site.	Where is this topic discussed in the EIS? **Section 8.12** of the EIS discusses the natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River. Additional details and a range of scenarios that encompass the potential impacts from extreme weather and natural hazards are examined in the Decommissioning Safety Assessment (DecomSA) TSD and the PostSA TSD. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Further alignment on this concern is unlikely. CNL's technical assessment shows that accidents and natural hazards which could affect the facility will not result in undue effects on people and the environment around the site. CNL understands that this concern is outstanding from AOPFN's perspective based on AOPFN feedback in April 2023. A contributing factor to this outstanding concern is AOPFN's concern that the proposed closure of the facility (grout, cap etc.) will make it very difficult to access the facility in the future to intervene with remedial action if the facility does not perform as expected. Next steps: CNL and AOPFN have agreed to the following commitments: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Risk Communication Program at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL models several scenarios in its Postclosure Safety Assessment (PostSA) technical supporting document (TSD) which take into account how accidents and natural hazards could affect the facility. These scenarios are called disruptive events. One such case models severe erosion (flood) while another models extreme degradation of the facility (the concrete structure and the grout). In both of these cases the predicted doses to receptors are still well below the dose criterion of 0.25 mSv/yr; 0.009 mSv/yr and 0.0009 mSv/yr, respectively. To verify that the engineered barriers as a whole are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River.		
2. Alternatives	(a) Technical suitability of the In-Situ Disposal concept AOPFN is seeking for the NPD site to be decommissioned in a manner that is safe, acceptable and preferable to Algonquin Peoples, when considering environmental, rights, and other values. AOPFN is concerned that ISD is not a preferred alternative means to decommission the NPD site, technically or from an Algonquin perspective. AOPFN is concerned about the reversibility of the ISD technique, consistency of ISD with international best practice and that the hazard will outlive the design life of the closure strategy and contamination will be dispersed. This is a project-specific concern.	CNL has responded in writing to AOPFN comments on the in-situ disposal concept citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020. CNL updated its dispositions to AOPFN comments on the EIS and responded to AOPFN in December 2022. AOPFN provided additional feedback to CNL in April 2023. At the November 2020 meeting with the AAC, CNL provided an overview of the in-situ disposal concept. CNL presented to the AAC on how it conducted the alternative means assessment (AMA) and why in-situ disposal is the preferred approach in October 2021. AOPFN recommended to CNL in 2021 September that further revisions be made to the EIS section on Alternative Means, including a meaningful effort to integrate AOPFN perspectives from the three studies and through the AAC on in-situ disposal compared to other alternative means. CNL funded an AOPFN AMA and a report was completed in April 2022. The report includes AOPFN community perspectives and concerns about the alternatives to decommission the site. The report also identifies full removal as AOPFN's preferred decommissioning strategy. CNL Response: CNL agrees that protection of future land users is an important concern and has addressed this subject. CNL has assessed the suitability of in-situ disposal for the NPD site, and the EIS shows that such a disposal is safe for human health and the environment in the short term and long term. The NPD reactor has a low radionuclide inventory. Tritium is the major radionuclide and will decay to low levels during the Institutional Control period (~100 years). The proposed waste disposal facility barriers have a design life consistent with that timeframe. The longer-lived Intermediate Level Waste (ILW) consists of small quantities of low energy beta emitters. The beta emitters have low radiotoxicity. The main barrier to containing the radioactivity on long timescales is that 83% of the initial inventory (mostly activation products) is embedded within steels and zircaloy which corrode very slowly, particularly in an alkaline environment. The metals used in the	Where is this topic discussed in the EIS? The in-situ disposal approach is described in **Section 3.2** of the EIS. Alternative means are discussed in the **AMA TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? CNL has included within the EIS a sub-section **Section 4.2 (**Alternative Means), written by the AOPFN, that provides a summary of the results of the AOPFN AMA. The AOPFN AMA has also been included as an appendix to the EIS (Appendix D). The 2020 EIS reviewed by AOPFN already included the following improvements: • CNL incorporated additional information from the AMA TSD in the EIS (**Section 4.2**) to provide greater clarity on how the alternative means was completed and what the results mean. • CNL enhanced the assessment of alternatives in the AMA TSD; for example, the projected radiological dose and industrial safety risk to workers for each alternative means was presented. Though all alternatives can be performed safely, there is an increased risk to workers from industrial hazards and radiological dose for the removal alternative means compared to in-situ disposal.	Status: Further alignment on this concern not possible CNL's technical assessment shows that the in-situ design is appropriate for the hazardous timeframe of the contaminants and is consistent with national and international standards. CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN's position is that full removal is the preferred option. AOPFN is concerned that the hazard will outlive the design life of the strategy and that contamination will be dispersed over time, possibly after Institutional Controls have been removed, thus exposing future generations to this risk. AOPFN is also concerned that ISD would defer risks to future generations, that ISD would create an unnecessary permanent radioactive waste disposal facility in AOPFN territory, that ISD is not amenable to easy contingency adaptive management in case the technology does not contain the radiological risk and that ISD is not considered a preferred means of decommissioning a reactor versus a geological repository, AOPFN acknowledges that, from a technical perspective, the severity of the impacts may be low, some form of contamination risk and the associated psycho-social impact will persist. Next steps: AOPFN and CNL disagree on the preferred option to decommission the NPD site. Through continued engagement at the Working Group and with the AAC CNL hopes that the parties are able to find common ground on this topic.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		reactor vault are corrosion-resistant alloys, with stainless steel taking approximately 30,000 years to fully corrode and zircaloy up to 300,000 years to fully corrode. The low corrosion rates allow the radioactivity to decay before it is released into the reactor vault. Once in the reactor vault the radioactive contaminants sorb onto the grout which further delays its diffusion out of the facility. Based on its consideration of national and international standards and guidelines, CNL continues to believe that the NPD facility has characteristics that support in-situ disposal.		CNL and AOPFN have agreed to the following commitment: AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. This commitment has the potential to build confidence and trust in the in-situ disposal concept.
2. Alternatives	(b) Process for Assessment of Alternatives It is important to the AOPFN that the process of the assessment of alternatives is accepted by and includes AOPFN. AOPFN highlights that joint assessment of alternatives is considered best practice and are commonly implemented for projects that are of high concern to Indigenous Peoples. AOPFN has indicated that the alternative means assessment should be following the more rigorous IAA 2019 legislation. This is a project-specific concern.	CNL has responded in writing to AOPFN comments on alternatives citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020. CNL updated its dispositions to AOPFN comments on the EIS and responded to AOPFN in December 2022. AOPFN provided additional feedback to CNL in April 2023. As per direction from the CNSC and the transitional provisions of the Impact Assessment Act, CNL is continuing its EA for the NPD Closure Project under *CEAA* (2012). Letter to CNL - Changes to Federal Legislation. CNL recognizes that what AOPFN is requesting is consistent with the new provisions and commitments under the *Impact Assessment Act* (*IAA*) but is beyond the scope of *CEAA* (2012) and this EA, and therefore is not required to be considered. The final NPD EIS will meet the requirements of *CEAA* (2012) but will also incorporate good practices consistent with the *IAA*. CNL held a workshop with the AAC in October 2021 that explained how CNL conducted the AMA and why in-situ disposal is the preferred approach. This was also an opportunity for AAC members to ask questions about the alternatives assessment and voice concerns directly with the project team. To address AOPFN's concerns about participation in the study design and assessment, CNL funded an AOPFN AMA and a report was completed in April 2022. The report includes AOPFN community perspectives and concerns about the alternatives to decommission the site. The report also identifies full removal as AOPFN's preferred decommissioning strategy. CNL Response: When conducting the AMA, CNL followed the regulatory framework laid out in the Canadian Environmental Assessment Agency (CEAA) Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2015) for the evaluation of alternatives. The level of analysis conducted for each alternative is consistent with these requirements. The waste at NPD has been there for over 55 years. CNL is reducing the waste liability by converting the waste into a form that provides safe, permanent waste disposal. However, in order to ensure that AOPFN's perspective on this subject has been recorded, CNL has added a sub-	Where is this topic discussed in the EIS? The in-situ disposal approach is described in **Section 3.2** of the EIS. Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? CNL has included within the EIS a sub-section to **Section 4.2 (**Alternative Means), written by AOPFN, that provides AOPFN perspectives on in- situ disposal compared to other alternative means developed thus far, based on study findings and community perspectives. The AOPFN AMA has also been included as an appendix to the EIS (Appendix D). The 2020 EIS reviewed by AOPFN already included the following improvements: • CNL incorporated additional information from the AMA TSD in the EIS (**Section 4.2**) to provide greater clarity on how the alternative means was completed and what the results mean. • CNL enhanced the assessment of alternatives in the AMA TSD; for example, the projected radiological dose and industrial safety risk to workers for each alternative means was presented. This assessment has shown that in-situ disposal is safer than the removal alternative means. The results and conclusions of the AOPFN AMA have been integrated into the EIS to demonstrate the inclusion of valuable input into the EA process. However, the results of the AOPFN AMA do not replace or supersede CNL's conclusions.	Status: Further alignment on this concern not possible CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012) and concludes that ISD is the preferred means to execute the NPD Closure Project. CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN has identified that the willing host principle has not been followed for this permanent radioactive waste disposal facility. Further AOPFN remains concerned that doses from ISD are not ALARA, that a quantitative comparison of dose risks from all technically and economically feasible alternatives has not been provided, that ISD would defer risks to future generations, that ISD has heightened long-term impacts on AOPFN traditional land and resource use, culture, and health and well-being compared to other alternatives, that the risks of a contaminant plume impacting on the Ottawa River are not justified and that occupational risks have been weighted too heavily is CNL's assessment. AOPFN has also indicated a desire for a multi-party forum for selection and evaluation of alternatives. Next steps: AOPFN and CNL disagree on the process for assessing alternatives and on the preferred option to decommission the NPD site. Through continued engagement at the Working Group and with the AAC CNL hopes that the parties are able to find common ground on this topic.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		section to the EIS Alternative Means section (Section 4.2) written by the AOPFN. CNL has provided support for the AOPFN to conduct its own AMA and through this assessment, CNL has been able to better understand AOPFN's views on the proposed NPD disposal facility.		
2. Alternatives	(c) Integration of AOPFN AMA results into CNL's overall assessment of alternatives It is important to AOPFN that CNL meaningfully consider the results of the AOPFN Alternative Means Assessment. Further, AOPFN expected CNL to reconsider its original alternatives assessment and directly integrate the AOPFN results. This is a project-specific concern.	CNL has responded in writing to AOPFN comments on alternatives citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020. CNL updated its dispositions to AOPFN comments on the EIS and responded to AOPFN in December 2022. AOPFN provided additional feedback to CNL in April 2023. CNL held a workshop with the AAC in October 2021 that explained how CNL conducted the AMA and why in-situ disposal is the preferred approach. This was also an opportunity for AAC members to ask questions about the alternatives assessment and voice concerns directly with the project team. CNL funded an AOPFN AMA and a report was completed in April 2022. The report includes AOPFN community perspectives and concerns about the alternatives to decommission the site. The report also identifies full removal as AOPFN's preferred decommissioning strategy. <u>CNL Response:</u> When conducting the AMA, CNL followed the regulatory framework laid out in the Canadian Environmental Assessment Agency (CEAA) Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2015) for the evaluation of alternatives. The level of analysis conducted for each alternative is consistent with these requirements.	<u>Where is this topic discussed in the EIS?</u> Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. <u>What changes have been made (and where)?</u> CNL has included within the EIS a sub-section to **Section 4.2 (**Alternative Means), written by AOPFN, that provides AOPFN perspectives on in- situ compared to other alternative means developed thus far, based on study findings and community perspectives. The AOPFN AMA has also been included as an appendix to the EIS (Appendix D). The results and conclusions of the AOPFN AMA have been integrated into the EIS to demonstrate the inclusion of valuable input into the EA process. However, the results of the AOPFN AMA do not replace or supersede CNL's conclusions.	<u>Status:</u> Further alignment on this concern not possible. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN appreciated CNL's support to complete the AMA however they remain disappointed that CNL has not meaningfully considered the results or reconsidered its own assessment. AOPFN has stated that CNL's AMA fundamentally ignores AOPFN inputs, which include a finding that ISD is clearly the least preferred option when considering AOPFN values, criteria, and weighting. <u>Next steps:</u> AOPFN and CNL disagree on the preferred option to decommission the NPD site. Through continued engagement at the Working Group and with the AAC CNL hopes that the parties are able to find common ground on this topic. CNL and AOPFN have agreed to the following commitment: AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. This commitment has the potential to build confidence and trust in the in-situ disposal concept.
2. Alternatives	(d) Emphasis on financial costs in determining preferred alternative means. AOPFN is concerned that CNL may be incentivized to choose the single fastest and cheapest decommissioning option. AOPFN is concerned that CNL prefers the option that has the lowest potential risks of short-term (i.e., plan implementation) safety, security or	CNL has responded in writing to AOPFN comments on alternatives. AOPFN provided feedback on these dispositions in December 2020. CNL updated its dispositions to AOPFN comments on the EIS and responded to AOPFN in December 2022. AOPFN provided additional feedback to CNL in April 2023. <u>CNL Response:</u> The NPD Closure Project is managed under a specific target-cost agreement. CNEA earns a fee based on its cost performance against a target cost over the entire project. The contract includes provisions for fee	<u>Where is this topic discussed in the EIS?</u> The in-situ disposal approach is described in **Section 3.2** of the EIS. Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS.	<u>Status:</u> Further alignment on this concern is unlikely. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012), and concludes that ISD is the preferred means to execute the NPD Closure Project based on a number of factors, one of which was are options within the financial guarantee committed by NRCan. CNL understands that this concern is outstanding from AOPFN's perspective based on AOPFN feedback in

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	environmental incidents, at the expense of that option transferring longer-term risks to the immediate receiving environment. AOPFN is significantly concerned that this implies that Canada and its agents are not willing to pay the financial price necessary to comply with the best practices of willing host, DGR and not willing to pay the financial price to comply with their commitments (e.g., UNDRIP, FPIC, reconciliation), nor AOPFN's preferences, which should be a critical consideration in determining what is an "acceptable design". This is both a CNL-wide and a project-specific concern.	reductions where there are safety, security or environmental incidents. Overall, the contract is set up to incentivize effective performance without compromise to health and safety. AECL provides oversight with a view to obtaining value for Canada under the contract. Moreover, CNL has obligations as a licensee to maintain safe operations, and the CNSC, as the independent federal regulator, oversees safety of CNL's operations and protection of the environment. The specific financial terms between Canada and the CNEA (incentives/penalties) cannot be disclosed as they are confidential. CNL will not be receiving greater compensation for implementing in-situ disposal versus other alternative means. Through its target cost contract, CNL (the contractor) was asked to ensure the strategy selected reduced nuclear liabilities at the NPD site in a timely manner rather than deferring the waste management decision for NPD. CNL's role is to determine the most effective method to safely and securely manage the nuclear liabilities at the NPD site. In alignment with the CEAA Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *CEAA* (2012), an AMA was completed. The purpose of the AMA is to provide a qualitative analysis of the environmental risks (including health) of alternative decommissioning techniques to allow for the selection of a preferred method for carrying out the project. The AMA informed the decision to proceed with in-situ disposal through the EA process. The use of a robust AMA process demonstrates that the NPD Closure Project is not solely motivated by cost savings or profit. In CNL's AMA, all options proposed were shown to meet the financial guarantee from NRCan for the nuclear liability at NPD, after which point there was no further consideration/weighting of the cost in the assessment. While cost was one factor in CNL's assessment of alternatives, it was not the decision-making factor in the AMA for NPD.	What changes have been made (and where)? CNL has included within the EIS a sub-section to **Section 4.2 (**Alternative Means), written by the AOPFN, that provides the results of the AOPFN AMA. The AOPFN AMA has also been included as an appendix to the EIS (Appendix D).	April 2023. AOPFN remains concerned that ISD would defer risks to future generations, that ISD has heightened long-term impacts on AOPFN traditional land and resource use, culture, and health and well-being compared to other alternatives and that the risks of a contaminant plume impacting on the Ottawa River are not justified. Next steps: AOPFN and CNL disagree on the preferred option to decommission the NPD site. Through continued engagement at the Working Group and with the AAC CNL hopes that the parties are able to find common ground on this topic. CNL and AOPFN have agreed to the following commitment: AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. This commitment has the potential to build confidence and trust in the in-situ disposal concept.
3. Archaeology and Cultural Heritage	(a) Involvement in culture and heritage matters at the NPD site It is important for the AOPFN to be involved in any future archaeological activities at the site, to ensure that artefacts with cultural value and significance are identified and protected as archaeological sites and artefacts have deep cultural value and significance for the Algonquins. This is both a CNL-wide and project-specific concern.	CNL has responded in writing to the AOPFN's specific comments on the EIS and recommendations from the AKLUS. CNL and the AOPFN have worked together to establish a project-specific Contribution Agreement that includes capacity, schedule, studies and engagement activities. In addition, CNL, AECL and the AOPFN finalized a Long-Term Relationship Agreement (LTRA) in June 2023 that includes, as matters of mutual interest, cultural protection, promotion, education, recognition and reconciliation and AOPFN's role in archaeological programs. Note: The LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. CNL Response: CNL's archaeology consultant determined that there was no archeological potential for the Site Study Area (where project activities will take place), because that area has already been completely disturbed during site construction. However, in response to concerns expressed by Indigenous Nations, communities and organizations, CNL did conduct a Stage 1 archaeological assessment of the remainder of the NPD site. CNL shared	Where is this topic discussed in the EIS? Indigenous cultural resources and ceremonies, including the presence of Algonquin Cultural Sites and features, are discussed in in **Section 8.9.3 of** the EIS. The EIS references the AOPFN AKLUS report. **Section 8.11.4** of the EIS summarizes the **Archaeology TSD,** including the findings of the Stage 1 archaeological assessment. The EIS does not predict any adverse residual effects from the project on the Indigenous socio-economic environment (**Section 9.10.1.6**) or on traditional land and resource use (**Section 9.9.3.3**), including access to cultural sites. No changes to these sections were required.	Status: Resolution is in progress. CNL understands that this concern is partially resolved from AOPFN's perspective. Continued engagement may result in additional commitments which will enhance confidence and trust in CNL's assessment. Involvement of the AOPFN in culture and heritage matters is not expected to affect the outcome of CNL's assessment. Next steps: CNL and AOPFN have agreed to the following commitments: AOPFN-2: CNL will support a Cultural Protection and Commemoration Plan in relation to the NPD site and CNL commits to involve AOPFN in any future archaeological programs at or around the NPD site.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		the results of this assessment with the AOPFN and provided a summary and overview presentation on the archaeological work conducted on the site. No further archaeological work is planned for NPD.	**Section 9.9.3.2** of the EIS, includes the proposed mitigation measures that will be employed if undocumented archaeological resources are discovered during the project. What changes have been made (and where)? CNL updated several sections of the EIS, in response to AOPFN comments and to include information from the AOPFN AKLUS Report (**Sections 6.2, 6.3, 8.9, 9.9**). In particular, CNL expanded its description of cultural aspects in **Section 8.9** of the EIS. CNL has added more information on the engagement activities to date between CNL and the AOPFN in **Section 6.2.4.3** of the EIS.	AOPFN-15: CNL is committed to work jointly with AOPFN to develop a NPD site specific chance find procedure and TLRU discovery plan.
4. Baseline Characterization	(a) Characterization of aquatic and terrestrial biota baseline It is important to AOPFN that the baseline environmental conditions around the site of the NPD Closure Project including aquatic and terrestrial biota are well understood and are protected in order to adequately assess potential impacts to AOPFN rights and traditional land and resource uses. AOPFN has identified concerns in particular with the absence of an Algonquin Knowledge baseline for the NPD site and its surroundings, due to an absence of prior engagement by CNL and AECL of AOPFN in Algonquin Knowledge studies in and around this 400 hectare site. This is a project-specific concern.	In response to comments from Indigenous Nations, communities and organizations, CNL completed sediment and benthic invertebrate sampling and fish habitat surveys to establish the baseline for follow-up monitoring. CNL has responded in writing to AOPFN comments on baseline characterization citing relevant section of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in 2020 December, and two meetings to discuss responses were held in 2020. CNL also shared the baseline survey data for migratory birds in November 2020. CNL is continuing its water bird species identification and nest survey that began in 2021 and will share the results with AOPFN. Through the contribution agreement, AOPFN and CNL have worked together to conduct site-wide Algonquin Knowledge Inventories at the NPD site in 2022 and 2023. CNL has committed to include Algonquin Knowledge, collected independently by Indigenous guardians, in all future ecological data collection programs at the NPD site. CNL Response: To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020, and the report was provided to the AOPFN. The study determined that the Ottawa River benthic invertebrate community near the NPD site is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. This study can be repeated when decommissioning is complete, to verify if the project has had an impact. CNL is planning to regularly monitor the Ottawa River water quality before the project begins. CNL is willing to discuss fish tissue sampling with the AOPFN and review past studies of fish tissue in the NPD area.	Where is this topic discussed in the EIS? **Appendix B** and **Section 8.6** of the EIS indicate which species have been observed on the NPD site. What changes have been made (and where)? The benthos and fish habitat survey is important baseline data for the follow-up monitoring program. The results of this study which are now summarized in **Section 8.4** do not alter the aquatic environment baseline for the project.	Status: Resolution in Progress CNL understands that this concern is partially resolved from AOPFN's perspective as the parties completed four one-day field studies at the NPD site. AOPFN is seeking a site-wide and more comprehensive Algonquin knowledge inventory. Next Steps: CNL and the AOPFN are continuing engagement through the framework of the contribution agreement. Using the findings and recommendations from AOPFN's initial four days of investigations and a more comprehensive and site-wide inventory, as committed below, CNL looks forward to working with AOPFN to ensure that mitigations are in place to protect terrestrial and aquatic biota that are important to AOPFN. CNL and AOPFN have agreed to the following commitments: AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL has undertaken several site-specific surveys for the terrestrial environment, such as surveys of songbirds, bats and chimney swifts. Species detected as part of baseline biodiversity surveys within a 200m area beyond the perimeter of the project footprint have been included as Valued Components for the NPD Closure Project, and mitigation measures, including buffers, have been developed for protection.		AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-13: CNL is committed to engaging with the AOPFN in the NPD Closure Project Environmental Assessment Follow-up Monitoring Program (EAFMP) development. CNL recognizes that our plans would benefit from incorporation of Indigenous knowledge and welcomes AOPFN comments on the plans. AOPFN-15: CNL is committed to work jointly with AOPFN to develop a NPD site specific chance find procedure, TLRU discovery plan, Eagle Feather Protocol and cultural protection plan. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.
4. Baseline Characterization	(b) Use of a current, damaged baseline as the starting point for the assessment. AOPFN has raised consistent concerns about the temporal comparison chosen by CNL for the NPD decommissioning assessment, which is to compare the future against today, rather than against a pre-NPD site condition (i.e., the early 1960s). AOPFN has argued that any decommissioning project needs to be tied to the ability to reach an agreed upon desired future state, not against an already damaged current state. This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	<u>CNL Response:</u> CNL acknowledges that AOPFN disagrees with the use of the current baseline in its assessment of impacts on Traditional Land and Resource Use. In its assessment, CNL has determined that there are no adverse impacts on Traditional Land and Resource Use resulting from the NPD Closure Project. Indigenous Nations, communities and organizations often prefer a different approach, consider different factors, and evaluate against a different baseline than CNL and, subsequently, the findings of the Indigenous Nations, communities and organizations, and CNL, differ. The methodology for assessing the significance of residual effects used in the EIS for the NPD Closure Project is an established methodology which used the criteria in CNSC REGDOC 2.9.1 (2020), Environmental Protection: Environmental Principles, Assessments and Protection Measures. The baseline used in the EIS reflects current-day conditions, in accordance with *CEAA* (2012) requirements. CNL maintains the view that past disturbances, i.e., those that occurred during the pre-construction of the NPD facility, are not in scope. CNL notes that the proposed NPD Closure Project will improve the long-term environmental conditions and safety of the NPD site and surroundings, which will be confirmed by Indigenous-led monitoring programs.	<u>Where is this topic discussed in the EIS?</u> The EIS does not predict any adverse residual effects on traditional land and resource use (as described in **Sections 8.9** and **9.9**). CNL invited the AOPFN to share their perspective within the EIS (**Sections 9.9.6** and **Section 11.1**). <u>What changes have been made (and where)?</u> EIS changes as a result of this comment: - **Table 6.3-1(b)** AOPFN Concerns recorded alongside CNL's conclusions (third column of this table) - Text throughout **Section 6.2.4.3.3** was updated based on specific mark-ups provided by AOPFN - A dedicated section added (**Section 9.9.6** – AOPFN Perspective on Effects to Traditional Land and Resource Use) this includes AOPFN concerns with CNL's assessment approach and details AOPFN findings in relation to traditional land and resource use	<u>Status:</u> Further alignment on this concern is unlikely. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL has performed baseline characterization to ensure that the site conditions support the proposed facility. CNL understands that this concern is outstanding from AOPFN's perspective based on feedback in April 2023, that AOPFN disagree with the use of a damaged current baseline in the assessment. <u>Next steps:</u> AOPFN and CNL disagree on the baseline for the effects assessment. Through continued engagement at the Working Group CNL hopes that the parties are able to find common ground on this topic. CNL and AOPFN have agreed to the following commitment: AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
			- A dedicated section added (**Section 11.1.1** – AOPFN Perspective on Assessment Findings) highlighting the AOPFN's desire for the assessment to use pre-NPD construction as the baseline for comparison and for fear, stigma and alienation to be recognized as valid impact pathways.	knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary.
4. Baseline Characterization	(c) Technical suitability of the site AOPFN is concerned that the site was not designed to be a permanent radioactive waste disposal facility. AOPFN wants to ensure that AOPFN lands and the Kichi-Sìbì (Ottawa River) are protected and to reduce the radiological burden placed on AOPFN by Canada in the future. This is a project-specific concern.	CNL has responded in writing to AOPFN concerns that the NPD facility was not originally designed to be a permanent waste disposal facility. AOPFN provided feedback on these dispositions in December 2020. CNL updated its dispositions to AOPFN comments on the EIS and responded to AOPFN in December 2022. AOPFN provided additional feedback to CNL in April 2023. CNL Response: CNL does not intend to conduct a siting study for the waste that is currently at the NPD site. Such siting studies are done for new waste disposal facilities. The waste at NPD has been there for over 55 years. CNL has however completed geoscientific characterization work to understand the local geology and hydrogeology. The Geoscientific Characterization Report was used to revise the Geosynthesis for the site, Local and Regional Study Areas. The site investigation work found that the general site conditions are 5-10 m of overburden comprised of fluvial sands and gravels and silt to cobble till underlain by a granitic gneiss bedrock. Through CNL's site investigation work the properties of the overburden and bedrock are well understood such that CNL can evaluate the possible movement of contaminants in the geosphere. The site information is used in various models (i.e., Groundwater Modelling, Resaturation Modelling). The results of the models feed into CNL's PostSA TSD, enabling CNL to assess potential effects to valued components (VC). The geosphere is one of multiple barriers identified in CNL's Safety Case that helps to contain and isolate the waste within the NPD facility.	Where is this topic discussed in the EIS? **Section 8.5** of the EIS presents information on geological and hydrogeological conditions around the NPD site and study areas. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Further alignment on this concern is unlikely. CNL has performed characterization to ensure that the site conditions support the proposed facility. CNL's assessment has shown that the proposed facility will safely contain and isolate wastes using multiple barriers, one of which is the bedrock surrounding the facility. CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN remains concerned that CNL has not performed a comprehensive exercise to determine the suitability of the site and that without their consent, AOPFN is expected to host the radioactivity in perpetuity. Next steps: Through continued engagement at the Working Group CNL hopes that the parties are able to find common ground on this topic. CNL is also committed to begin discussions with AOPFN on a project-specific agreement for NPD. AOPFN and CNL have agreed to the following commitments: AOPFN-1: CNL is committed to providing the funding to continue the Working Group and AOPFN Advisory Committee (AAC) for 10 years.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
5. Engagement	(a) Interest in establishing a Long-Term Relationship Agreement (LTRA) It is important that a mechanism be in place for AOPFN to express its community members' needs and concerns with respect to CNL activities, including those beyond the NPD Closure Project, to CNL and AECL, and to be able to work with CNL and AECL towards understanding and resolution with respect to CNL activities and AECL-owned sites within unceded AOPFN traditional territory where AOPFN members harvest food, medicines, and other natural materials. This is a CNL-wide interest.	CNL has responded in writing to AOPFN comments on requesting the establishment of an LTRA. Since 2020, CNL has undertaken extensive engagement with AOPFN, implemented a Memorandum of Understanding (MOU) and carried out engagement activities and LTRA discussions with the AOPFN in the form that AOPFN has requested. In 2021, AECL, CNL, and AOPFN signed a tripartite MOU. The parties have agreed to work together on items of mutual interest related to CNL operations and projects. LTRA topics of consideration include: • communication and engagement, • environmental baseline data collection, • risk communication, • a role in site level and project planning activities for major projects, • cultural protection, promotion, education, recognition and reconciliation, • economic development opportunities, • cumulative effects assessment, and • environmental stewardship and monitoring. CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as matters of mutual interest, (1) Engagement and communications on items of note related to ongoing operations and activities, as well as changes in scope to existing major projects, at CRL and NPD and (2) an AOPFN role in site level and project planning activities for major projects, including as part of their life-cycle (where practicable). (3) logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL-operated sites; (4) risk communication re: the health of country foods, medicines and waters at, and in the vicinity of, CNL-operated sites in the territory that AOPFN asserts is its unceded traditional territory and (5) opportunities for meaningful engagement to recognize, characterize and as necessary accommodate for potential historic harms The LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. AOPFN has identified that there are only some mechanisms from the proposed LTRA which are applicable to NPD (i.e., the Guardian Program and Risk Communication Program, characterization of historic harms). AOPFN has indicated that further collaborative assessment and negotiation of a project-specific agreement will be required for NPD as part of a consent seeking process between the parties, at the end of which AOPFN may or may not provide its free, prior and informed consent to the proposed in-situ project at NPD. CNL Response: CNL heard AOPFN's request to establish an LTRA and signed a MOU in 2020 to support the development, in addition to the project-specific Contribution Agreement. CNL, AECL and the AOPFN finalized an LTRA in June 2023 to facilitate a response to this concern.	Where is this topic discussed in the EIS? **Section 6.2.4.3** of the EIS summarizes CNL engagement with the AOPFN to date and presents information on the collaborative work by CNL and to develop a project-specific contribution agreement and an LTRA. What changes have been made (and where)? CNL has updated **Section 6.2.4.3** of the EIS to include the recent engagement-related activities and to describe progress in the relationship between the AOPFN and CNL, including development of the LTRA.	Status: Resolved Next steps: Make progress on agreed commitments. Begin discussions on a project-specific agreement for NPD.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
5. Engagement	(b) Interest in more direct and collaborative engagement on the NPD Closure Project It is important to the AOPFN that engagement involve two-way communication and active collaboration through all phases of the project as there are potential impacts to current and future AOPFN members' rights and ability to practice traditional activities on the land / water. AOPFN was not engaged collaboratively during the early stages of the EA e.g., the AMA and has identified their desire to be involved in all phases of the EA. Key areas for collaboration include: • Integration of the Traditional Use Study into project planning, design, mitigation and accommodation both during and post-EIS. • Development of mitigations that will be considered in assessments for valued components <u>today</u> – so AOPFN is involved in all phases of the EA and project lifecycle. • co-development and co-approval for development and implementation of the EA follow-up and monitoring program for the project, including adaptive management objectives, indicators, thresholds, and responses for terrestrial wildlife, fish and fish habitat, traditional land and resource use, and water quality at minimum. • co-development and co-management of end-state land use planning for the entire AECL site at NPD, This is a project-specific interest.	CNL has responded in writing to AOPFN comments on direct and collaborative engagement on the NPD Closure Project. A project contribution agreement was established in 2020 and has been updated to accommodate the evolving relationship and engagement activities between CNL and AOPFN and the addition of new scope. Working Group meetings are held on a monthly basis to understand each other's concerns and move forward to address them together. CNL has committed to continued funding for the Working Group and AOPFN Algonquin Advisory Committee (AAC) until closure is achieved for the NPD Closure Project. Through the contribution agreement, AOPFN and CNL have worked together to conduct site-wide Algonquin Knowledge Seasonal Inventories at the NPD site in 2022 and 2023. AOPFN members generously shared their time and interest in biodiversity, and in turn CNL was able to share information on the nuclear industry and environmental monitoring. The time spent together in the field has proven to be very valuable to improve the relationship <u>CNL Response:</u> CNL is committed to collaborative, two-way engagement with the AOPFN on the NPD Closure Project. CNL has much to learn and hopes to build trust and seek guidance from AOPFN. CNL heard AOPFN's request for direct and collaborative engagement. In response to this request, CNL and the AOPFN have worked together to establish a Contribution Agreement that includes capacity, schedule, studies and engagement activities for the NPD Closure Project. Through this Contribution Agreement, CNL has funded four technical studies related to the project. A number of other meaningful engagement activities, as requested by AOPFN, are also identified, funded and planned for the next two years.	<u>Where is this topic discussed in the EIS?</u> **Section 6.2.4.3** of the EIS summarizes CNL engagement with the AOPFN to date and presents information on CNL and AOPFN's work towards developing a project-specific Contribution Agreement and a LTRA. <u>What changes have been made (and where)?</u> CNL has updated **Section 6.2.4.3.1** of the EIS to include the recent engagement-related activities and relationship progress between the AOPFN and CNL.	<u>Status:</u> Resolution is in progress. CNL understands that this concern is well on its way to resolution from AOPFN's perspective. CNL has taken meaningful interim measures to improve its engagement with AOPFN. CNL understands that the AOPFN is seeking for this funding to extend well into the Institutional Control period and given that the NPD is not consented to through the LTRA, that a project specific agreement must be sought for the NPD that would fuel future engagement, should the decommissioning project proceed. <u>Next steps:</u> CNL and AOPFN have agreed to the following commitments: AOPFN-1: CNL is committed to providing the funding to continue the Working Group and AOPFN Advisory Committee (AAC) for 10 years. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-13: CNL is committed to engaging with the AOPFN in the NPD Closure Project Environmental Assessment Follow-up Monitoring Program (EAFMP) development. CNL recognizes that our plans would benefit from incorporation of Indigenous knowledge and welcomes AOPFN comments on the plans. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
6. EA Process and Methodology	(a) Concern about the methodology for conducting the effects assessment and determination of significance It is important to the AOPFN that events with the potential for an adverse effect on the environment and/or AOPFN rights are carried through the assessment process as far as is reasonable as the project may have impact to current and future AOPFN members' rights and ability to practice traditional activities on the land / water. AOPFN is concerned that CNL's assessment does not integrate into its effects characterization any of the impact pathways identified by AOPFN that results in both direct and indirect effects on Traditional Land and Resource Use: quality and accessibility of the land, consideration against a pre-NPD baseline, Project-related activities would exacerbation of alienation and further limitation of members' access to the area, perpetuating the difficulty of exercising their Aboriginal rights, long-term continuation of an avoidable location-specific effect in the form of fencing off and not allowing the NPD site to return to a natural condition, and the permanent cementing in place of radioactive materials very close to the Kichi-Sìbì the radioactive materials that cause fear, stigma, alienation and concerns about the quality of country foods and medicines, and whether they are harvestable. This is a project-specific concern.	CNL has responded in writing to AOPFN comments on EA methodology and significance of adverse residual effects citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL has offered to present all environmental effects of the project to AOPFN and to explain the process and thresholds for determining the significance of adverse residual effects. CNL is continuing its efforts to address these concerns by: (i) Involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL-operated properties and build confidence that the decommissioning strategy and mitigation measures are effective (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). <u>CNL Response:</u> CNL has acknowledged that AOPFN and CNL have differing perspectives on impacts to traditional land and resource use Valued Components (VC)**.** The methodology used in the EIS for assessing the significance of residual effects for the NPD Closure Project is an established methodology that was used in the EA for the Darlington New Nuclear Project, which currently has an approved License to Prepare Site. The criteria for the evaluation of significance are from the CNSC REGDOC 2.9.1(2020), Environmental Protection: Environmental Principles, Assessments and Protection Measures. The baseline used in the EIS reflects current-day conditions, in accordance with *CEAA* (2012) requirements. CNL notes that the proposed NPD Closure Project will improve the long-term environmental conditions and safety of the NPD site and surroundings, which will be confirmed by Indigenous-led monitoring programs. The participation of AOPFN in monitoring work for the NPD Closure Project ensures consideration of Indigenous knowledge, collaboration, mutual respect, ongoing participation and relationship building for the future. • CNL is willing to conduct a workshop with AOPFN to review all environmental effects of the project and present the methodology for determining significance of adverse residual effects.	<u>Where is this topic discussed in the EIS?</u> **Section 9.1.2** of the EIS explains the methodology used for determining the significance of residual effects. It also presents the criteria used to evaluate significance, which are from CNSC REGDOC 2.9.1 (2020), Environmental Protection: Environmental Principles, Assessments and Protection Measures. **Section 11** of the EIS, Conclusion on Significance, discusses the assessment findings. <u>What changes have been made (and where)?</u> CNL has provided AOPFN an opportunity to directly integrate the following into the EIS: a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9**) and on overall assessment findings (**Section 11.1**).	Status: Further alignment on this concern is unlikely. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN remains concerned that the project is evaluated against the current baseline site conditions and does not consider the damage caused by the historic siting and operation of the site. In addition, AOPFN has raised concerns about the fact that CNL has chosen to ignore AOPFN's studies' findings of adverse effects from the proposed decommissioning project on traditional land and resource use, culture, and well-being. <u>Next Steps:</u> AOPFN and CNL disagree on the baseline for the effects assessment. Through continued engagement at the Working Group CNL hopes that the parties are able to find common ground on this topic. CNL wishes to continue discussions with AOPFN to better understand the community's perspective and values and any fears, or concerns associated with the NPD site and traditional use near the site. CNL and AOPFN have agreed to the following commitment: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
				within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected. These commitments have the potential to build confidence and trust in the in-situ disposal concept and may help to alleviate fear, stigma, alienation and concerns about the quality of country foods and medicines.
6. EA Process and Methodology	(b) Concern about the methodology of the cumulative effects assessment It is important to AOPFN that the project assessment is properly informed by cumulative effects assessment in order to protect AOPFN values and rights. AOPFN is concerned that despite AOPFN finding adverse effects there has been inadequate consideration of trend-over-time impacts on VCs found at and around the NPD site (adoption of a damaged current baseline), no cumulative effects assessment on AOPFN culture, traditional land and resource use, or health and well-being. This is both a project-specific and CNL-wide concern.	CNL responded to this concern by summarizing the cumulative effects assessment methodology applied in the EIS, which is consistent with *CEAA* (2012). CNL also provided additional background information in its responses. CNL, AECL and the AOPFN have established an LTRA that can support the parties work together to alleviate this concern. <u>CNL Response:</u> CNL is in agreement with AOPFN's comment that a cumulative effects assessment is required only where adverse residual effects have been identified, a position consistent with *CEAA* (2012). For all VCs in all environmental components, it was determined that no adverse residual effects are expected to occur from the NPD Closure Project: the proposed mitigation measures are expected to eliminate, reduce or control possible effects, resulting in no or negligible effects. According to *CEAA* (2012), cumulative effects assessment is not required for negligible potential effects. Therefore, conducting a cumulative effects assessment would be beyond the scope of *CEAA* (2012) scope and this EA.	<u>Where is this topic discussed in the EIS?</u> **Section 9.13** of the EIS provides the process for evaluating cumulative effects and the assessment of cumulative effects for the NPD Closure Project. <u>What changes have been made (and where)?</u> CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9.6**) and overall assessment findings (**Section 11.1),** into the EIS.	<u>Status:</u> Efforts at resolution in progress; further alignment is possible but uncertain. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL understands that this concern is outstanding from AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN remains concerned that their involvement in the assessment has been from the outside looking in, that AOPFN and Algonquin Knowledge holders had no role in the effects characterization or significance estimation process, and that AOPFN perspectives have had little to no influence on CNL's assessment findings. AOPFN has indicated that changes to the effects characterization to include cumulative effects assessments for additional VCs is required. <u>Next Steps:</u> AOPFN and CNL disagree on the assessment methodology for cumulative effects and on the assessment of impacts to TLRU. Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. CNL and AOPFN have agreed to the following commitment: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
				AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.
6. EA Process and Methodology	(c) Relevant legislation AOPFN expressed concern on continued use of *CEAA, 2012* rather than the more recent *Impact Assessment Act*. It is important to AOPFN that the NPD Closure Project Environmental Assessment is carried out using up-to-date legislation that includes best practice decision-making through a collaborative process. The impacts that AOPFN has identified are impacts within the federal jurisdiction under IAA 2019 and is disappointed the CNL, AECL and CNSC are continuing this assessment under the less rigorous expectations of CEAA 2012. This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	CNL Response This interest is generally beyond the scope of the project. As per direction from the CNSC and the transitional provisions of the *Impact Assessment Act*, CNL is continuing its EA for the NPD Closure Project under *CEAA* (2012). Letter to CNL - Changes to Federal Legislation. CNL recognizes that what AOPFN is requesting is consistent with the new provisions and commitments under the *Impact Assessment Act* (*IAA*) but is beyond the scope of *CEAA* (2012) and this EA, and therefore is not required to be considered. The final NPD EIS will meet the requirements of *CEAA* (2012) but will also incorporate good practices consistent with the *IAA*.	Where is this topic discussed in the EIS? **Section 3.5** of the EIS discusses the regulatory framework of the project. What changes have been made (and where)? CNL added text to **Section 3.5** of the EIS, providing clarification on this issue. A reference was added to a letter received from the CNSC, which indicates that the NPD Closure Project will continue under *CEAA* (2012).	Status: Further alignment on this concern not possible CNL will continue the NPD Closure Project EA under *CEAA* (2012). CNL will endeavour to work towards meeting the more rigorous expectations of *IAA* where possible. CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN remains concerned that CNL has chosen to disregard the new *IAA* (2019) legislation, instead opting for the less rigorous expectations of *CEAA* (2012). Next steps: Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. AOPFN and CNL have agreed to the following commitments: AOPFN-1: CNL is committed to providing the funding to continue the Working Group and AOPFN Advisory Committee (AAC) for 10 years. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
6. EA Process and Methodology	(d) AOPFN participation in the assessment AOPFN is seeking good impact assessment practice that include Indigenous groups as part of the assessment early and throughout the process. The traditional users themselves, through the four AOPFN studies, have concluded that the proposed project will have impact on traditional use. AOPFN is concerned that the inputs from Indigenous Land users themselves has not been integrated into the actual effects characterization and significance determination process. This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	<u>CNL Response:</u> See responses above regarding impact assessment practices. CNL has included a summary of AOPFN traditional knowledge and land use, incorporated the valued species identified by AOPFN, and recorded main concerns about the project in the EIS.	<u>Where is this topic discussed in the EIS?</u> AOPFN input appears in **Section 4.2, Section 6.3, Section 8.9, Section 9.9,** and **Section 11.1** of the EIS. <u>What changes have been made (and where)?</u> CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspectives in **Section 4.2, Section 6.3, Section 8.9, Section 9.9,** and **Section 11.1.**	<u>Status:</u> Further alignment on this concern unlikely CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN remains concerned that their involvement in the assessment has been from the outside looking in, that AOPFN and Algonquin Knowledge holders had no role in the effects characterization or significance estimation process, and that AOPFN perspectives have had little to no influence on CNL's assessment findings. AOPFN has indicated that this approach seriously undermines the quality and likely accuracy of the CNL impact assessment. <u>Next steps:</u> AOPFN and CNL disagree on the assessment methodology and on the assessment of impacts to TLRU. Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. CNL and AOPFN have agreed to the following commitment: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
7. End State, Site Restoration and Future Use of the Land	(a) Collaborative end land use planning It is important to AOPFN that it receives reassurance that the land around the facility will be renaturalized over time, so that AOPFN community members can reconnect with the site and be able to practice traditional land use activities. AOPFN is a governance and stewardship entity with a right to be directly and deeply involved in collaborative end state planning. AOPFN is seeking an active, decision making, co-management role in the end state planning for NPD including early involvement in the development of the plan (not simply an opportunity to provide feedback on the plan after CNL has already drafted). AOPFN is also concerned that restoration of these ecosystems strive to bring back conditions similar to a pre-disturbance baseline (or intact reference baseline) and that more detailed restoration plans be included in the EIS. This is both a CNL-wide and project-specific concern.	CNL has responded in writing to AOPFN comments on collaborative end land use planning citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL has committed to sharing the draft restoration plan with AOPFN once it is developed. CNL Response CNL acknowledges the AOPFN's request for collaboration on end-use planning and has a similar vision for the future use of the land. CNL has used the terms renaturalize/renaturalization to mean: return to natural. As the majority of the site is forested, disturbed areas outside the final licensed area will be left to return to natural via natural succession. Renaturalization will have a positive impact on terrestrial biodiversity because vegetation will provide habitat for nests and dens, cover for animals as they roam, and will promote movement of animals by increasing connectivity (reducing habitat fragmentation). Future land use is a discussion topic that requires the participation of AECL as the owner of the NPD site, in consultation with Indigenous Nations, communities, and organizations, the public, as well as industry and government. As the licensee, CNL is committed to engagement and consultation with AOPFN on future end state and land use. The potential land options will not be fully determined until the NPD Closure Project EA and license amendment process proceeds further. In the meantime, CNL is preparing a plan for site restoration after decommissioning is complete, which CNL is committed to sharing with the AOPFN.	Where is this topic discussed in the EIS? General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. What changes have been made (and where)? CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on renaturalization into the EIS (**Section 9.9.6.1**).	Status: Resolution is in progress. CNL understands that this concern is outstanding from AOPFN's perspective, pending the establishment of end-state planning commitments that reflect AOPFN's expectation for collaborative governance and stewardship for the whole NPD site. Next Steps: CNL recognizes that AOPFN remains concerned that CNL is developing a draft restoration plan before engaging AOPFN on this topic. CNL will engage with AOPFN through targeted discussions to seek input prior to and during restoration plan development. The restoration and end state plan draft will be shared with AOPFN to verify that input has been adequately recorded, and/or justification given for why information could not be included. AOPFN and CNL have agreed to the following commitment: AOPFN-21: CNL is committed to seeking input from the AOPFN on the proposed ISD project end state, including AOPFN input on lands restoration of the disturbed areas. Tri-party discussion including AECL/CNL/AOPFN will be required for site-wide end state planning.
	(b) Preparation of on-site landfills for the post-closure period Closure plans for the on-site landfills are important to AOPFN because it wants to ensure that the environment around the site of the NPD Closure Project is protected as these landfills were located on the NPD site within unceded AOPFN traditional territory where AOPFN members harvest food, medicines, and other natural materials. This is a project-specific interest.	CNL Response CNL has responded in writing to AOPFN comments related to the on-site landfills citing relevant section of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and indicated that CNL's response was adequate.	Where is this topic discussed in the EIS? The former landfills are introduced in **Section 3.3.1** of the EIS (Structures at the NPD Site). General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. **Section 8.5** describes the geology and baseline characterization near the former landfills. Landfill monitoring activities are discussed in **Section 12** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
7. End State, Site Restoration and Future Use of the Land	(c) Project timeframe AOPFN is concerned that the site will require an indefinite period (>100 years) of institutional care to monitor and maintain the infrastructure necessary to prevent potential impacts including continuation of active controls. AOPFN is also concerned that long-term funding for these Institutional Controls is uncertain. AOPFN is concerned that the NPD site and surrounding lands are safe for traditional land and resource use activities in the future. This is both a CNL-wide and project-specific interest.	CNL has responded in writing to AOPFN comments on the project timeframe. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL Response CNL acknowledges AOPFN's concerns about the long-term safety of the NPD site and the potential impacts on the rights of the AOPFN and other Indigenous Nations, communities and organizations to practice traditional activities around the NPD site. Ongoing monitoring and maintenance of the site will occur during the Institutional Controls period, which will last a minimum of 100 years and will be extended as long as is necessary to ensure protection of people and the environment. The PostSA TSD demonstrates that the impact beyond the Institutional Controls period on the public, Indigenous peoples and the environment is negligible under all scenarios. CNL notes that the final end state is the only time when changes to access will occur; the final end state of the NPD site will be an improvement from current conditions. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the AOPFN and other Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm the predictions of the EIS.	Where is this topic discussed in the EIS? General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Efforts at resolution in progress; further alignment is possible but uncertain. CNL understands that this concern is outstanding from AOPFN's perspective due to a lack of confidence in long-term funding commitments. Next Steps: Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. AOPFN and CNL have agreed to the following commitment: AOPFN-1: CNL is committed to providing the funding to continue the Working Group and AOPFN Advisory Committee (AAC) for 10 years.
	(d) Long-term liability of the site beyond decommissioning. It is important to AOPFN that the end state of the NPD site is safe for future land users and that a guarantee and long-term funding is in place for Institutional Controls for as long as necessary. AOPFN is concerned that the Institutional Control period will need to be significantly longer than 100 years. Further AOPFN is concerned that contingency plans in case the facility fails to contain the radioactive materials adequately, including a scenario where the materials need to be removed are not sufficiently developed. For both of these aspects AOPFN does not have confidence that government funding will continue or be in place. It is important to AOPFN that radioactive risks will not be passed on as a burden to future generations and it is important to AOPFN that radioactive materials are not	CNL heard AOPFN's concern about long-term liability of the site and addressed it in its responses to AOPFN comments. CNL has developed monitoring programs that extend into the Institutional Controls period, to ensure that the public, Indigenous and the environment are protected. CNL Response: CNL acknowledges that, as the licensee, it is responsible for ongoing monitoring and maintenance of the site during the Institutional Controls period. The financial guarantee for Atomic Energy of Canada Limited's (AECL's) sites, including Nuclear Power Demonstration (NPD), has been provided by the Government of Canada. AECL has committed to enforcing land-use restrictions (Institutional Controls) on the NPD site – into the future, for as long as possible during the post-closure phase of the NPD. At the appropriate time CNL or its successor will apply to the CNSC for a Licence to Abandon – cease active Institutional Controls - following the requirements of applicable laws in effect at such time. The PostSA TSD demonstrates that the impact on the public, Indigenous and the environment is negligible, under all scenarios, beyond the Institutional Controls period.	Where is this topic discussed in the EIS? This topic will be discussed as part of the LTRA with the participation of AECL as the owner of the NPD site. However, the long-term liability of the site extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. Therefore, it is not discussed in the EIS. What changes have been made (and where)? No changes were made in the EIS related to long-term liability.	Status: Efforts at resolution in progress; further alignment is possible but uncertain. It is noted that this topic extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. CNL understands that this concern remains unresolved from AOPFN's perspective based on feedback in April 2023. AOPFN is concerned about the lack of clarity on the likely length of the Institutional Control period and the commitment for long-term funding. Next Steps: Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. CNL wishes to continue discussions with AOPFN to better understand the community's perspective and values and any fears, or concerns associated with the NPD site and traditional use near the site.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	abandoned and forgotten in Algonquin territory. It is important to AOPFN that they have safe and trusted access and use of the NPD site and its surroundings for present and future generations. AOPFN prefers an alternative that allows the land to heal the quickest from harms i.e., a removal option that does not perpetuate the current state of contamination. In a future with in-situ disposal, the underground conditions will be unnatural, and on the surface, portions of the site will be unnaturally fenced off, covered with a concrete cap and unable to return to a forested condition. AOPFN is concerned that project-related activities would exacerbate the issue of alienation and further limit members' access to the area. This is a project--specific concern.			CNL and AOPFN have agreed to the following commitment: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected. These commitments have the potential to build confidence and trust in the in-situ disposal concept and the long-term safety of the NPD site.
8. Environmental Effects and Mitigation Measures	(a) Invasive species management AOPFN is unclear how invasive species will be managed at the NPD site if introduced by vectors other than heavy equipment (e.g., by smaller vehicles, hand-held equipment, or people). It is also unclear what measures will be implemented to manage invasive species, should they be accidentally introduced or already present at the site. This is a project-specific concern.	<u>CNL's Response:</u> In response to the AOPFN's follow-up question on how invasive species (non-native plants, animals, aquatic life and micro-organisms that, when introduced outside of their natural environment, out-compete native species) will be managed at the NPD site, the CNL standard Management of Land, Habitat and Wildlife (900-509200-STD-006) will be followed. CNL recognizes that when invasive species become established in a new habitat, they can disrupt the existing balance of the ecosystem. In some cases, the new species takes over, causing radical and irreversible changes to its new environment. Aquatic invasive species are managed through prohibitions on import, transport, possession and/or release of aquatic invasive species as per the Aquatic Invasive Species Regulations. Activities conducted on different water bodies shall take into consideration the potential to spread aquatic invasive species. In order to prevent the spread of invasive species or noxious weeds on-to the NPD Closure Project site, heavy equipment entering the site will be	<u>Where is this topic discussed in the EIS?</u> General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS **Section 9.6.3.2** and **Table 10.3-1** within the EIS describes the proposed mitigation measures for invasive species. <u>What changes have been made (and where)?</u> No changes to these sections of the EIS have been made since the AOPFN review.	<u>Status:</u> Resolution is in progress. CNL will engage with AOPFN to seek input prior to and during restoration plan development. CNL understands that this concern is outstanding from AOPFN's perspective, pending the establishment of end state planning commitments for the NPD site. AOPFN has requested to be involved at a decision-making level in both immediate-term restoration planning and end-state planning for the entire NPD site. AOPFN's general position is that restoration plans should be included in the EIS after discussions with AOPFN. <u>Next Steps:</u> CNL will engage with AOPFN through targeted discussions to seek input prior to and during

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		inspected to ensure they are free of dirt clogs coming from outside of the site. This will prevent the spread via seeds. Other methods used by CNL to manage and prevent the spread of invasive species include: • Washing and disinfecting equipment used to conduct work in a waterbody before leaving or returning to a CNL site (e.g., sampling equipment, boats, motors, and trailers) • Washing equipment used on land before leaving or returning to a CNL site Other methods used by CNL to minimize and manage the risks of invasive species spread and protect our Canadian ecosystems can be found through the Canadian Food Inspection Agency (CFIA) as per the *Plant Protection Act*. CNL is open to working collaboratively with the AOPFN to develop proposed mitigation measures to eliminate, reduce or control possible effects from invasive species. CNL looks forward to seeking input and feedback from Indigenous Peoples, such as the AOPFN, on specific restoration activities for the NPD site.		restoration plan development. The restoration and end state plan draft will be shared with AOPFN to verify that input has been adequately recorded, and/or justification given for why information could not be included. AOPFN and CNL have agreed to the following commitments: AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected. AOPFN-21: CNL is committed to seeking input from the AOPFN on the proposed ISD project end state, including AOPFN input on lands restoration of the disturbed areas.
9. Free Prior and Informed Consent (FPIC)	(a) Principle of consent It is important to AOPFN that the right to give consent to be a willing host be respected as the NPD site and facility is in unceded AOPFN traditional territory. AOPFN is concerned that it did not consent to the original NPD construction and operation and that now, potentially without their consent, are expected to host the radioactivity in perpetuity. AOPFN has noted that the United Nations Declaration on the Rights of Indigenous Peoples, section 29.2, is not being adhered to by CNL and AECL in relation to the NPD Project. This is both a CNL-wide and project-specific concern.	CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as matters of mutual interest, (1) Engagement and communications on items of note related to ongoing operations and activities, as well as changes in scope to existing major projects, at CRL and NPD, (2) an AOPFN role in site level and project planning activities for major projects, including as part of their life-cycle (where practicable) and (3) opportunities for meaningful engagement to recognize, characterize and as necessary accommodate for potential historic harms. The LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. AOPFN has identified that there are only some mechanisms from the proposed LTRA which are applicable to NPD (i.e., the Guardian Program and Risk Communication Program). AOPFN has indicated that further collaborative assessment and negotiation of a project-specific agreement will be required for NPD as part of a consent seeking process between the parties, at the end of which AOPFN may or may not provide its free, prior and informed consent to the proposed in-situ project at NPD. CNL and AECL have met with the AOPFN council and shared correspondence related to this issue. In correspondence CNL and AECL have stated: "AECL and CNL are fully aligned with the Government of Canada on the principle of FPIC and committed to advancing Canada's policy and objectives in this regard." CNL responded to each of the AOPFN Principles and Requirements related to Nuclear Sector Projects as outlined in Appendix 3 of the August 2021 Implications Letter to indicate how the proposed NPD Closure Project can satisfy or meet the intent of these principles/requirements, including through project commitments as appropriate. CNL Response:	Where is this topic discussed in the EIS? **Section 4.2.4.7.3** of the EIS. What changes have been made (and where)? CNL has included a summary prepared by AOPFN describing the importance of Indigenous consent for the NPD disposal facility per UNDRIP within **Section 4.2.4.7.3** of the EIS.	Status: Further alignment on this concern is unlikely. CNL remains committed to on-going discussions on this topic. CNL understands that this concern is outstanding from AOPFN's perspective as consent has not been given for this permanent hazardous waste disposal facility. As of 2023 April, CNL has not committed to respect AOPFN's consent decision in relation to the NPD Project decommissioning. Next Steps: CNL and the AOPFN continue engagement through the framework of the contribution agreement working to satisfy or meet the intent of AOPFN nuclear sector principles/requirements, including through project commitments as appropriate. Begin discussions on a project-specific agreement for NPD.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		It is understood by AOPFN that an Indigenous Nation, community or organizations' consent is required for the creation of a permanent hazardous waste disposal facility in its traditional territory, per Section 29.2 of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP). CNL is committed to work towards consensus and consent, with an understanding that UNDRIP does not necessitate a veto in decision-making. CNL is committed to ensuring meaningful participation of Indigenous peoples in decisions that affect their nations, communities and territories. This is a key topic for future discussions between AOPFN, AECL and CNL.		
10. Impacts on Rights	(a) Concerns about completeness of assessment of impacts on rights It is important to the AOPFN that all potential effects of concern have been assessed, including the potential alienation of AOPFN members from land use due to distrust in the safety of the land and water as this may impact AOPFN members ability to practice traditional activities on the land. AOPFN has raised concerns that the implications of the findings of AOPFN's Culture and Rights Study, along with the Algonquin Knowledge and Land Use Study, the Diet and Harvest Study, and the Alternative Means Assessment, which point to measurable adverse effects from the proposed In-Situ Decommissioning on AOPFN rights and related valued components, have not been adequately integrated into the EIS' effects characterization and significance estimation process. In particular, AOPFN has stated on multiple occasions and through the Alternative Means Assessment process, that in-situ decommissioning is the least preferable decommissioning option from a rights protection perspective, given the area would not see the radiological hazard fully removed and as such the area cannot return to a natural and trusted condition in a reasonable time frame. This is a project-specific concern.	CNL shared that perception of an effect could not be considered a primary pathway under the *CEAA* (2012) because it is not tied to a biophysical effect to the environment. CNL has responded in writing to AOPFN comments related to assessment of impacts on rights citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL has also contributed funds for AOPFN to undertake a Culture and Rights Study, which were completed in August 2021. CNL seeks to develop a mutual understanding of the perceived effects of NPD Closure Project activities on the environment and any potential negative impacts on Aboriginal and/or treaty rights. This includes, but is not limited to, rights to trap, hunt, fish, gather, or harvest as well as the continuation and uninterrupted access to cultural and spiritual activities on the lands and waters. CNL is continuing its efforts to address this concern by committing to: (i) Involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL managed properties and build confidence that the decommissioning strategy and mitigation measures are effective (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as matters of mutual interest, (1) logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL operated sites and (2) risk communication re: the health of country foods, medicines and waters at, and in the vicinity of, CNL operated sites in the territory that AOPFN asserts unceded traditional	Where is this topic discussed in the EIS? The EIS notes in **Table 6.2-2** that the NPD site is located within the vicinity of known traditional territory. The EIS does not predict any adverse residual effects to traditional land and resource use (**Section 9.9.3.5**). What changes have been made (and where)? CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9.6.1**) and overall assessment findings (**Section 11.1),** into the EIS.	Status: Further alignment on this concern unlikely. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. CNL acknowledges that the findings of the ongoing AOPFN-CNSC rights impact assessment may require additional engagement and a mutually agreed upon resolution of any found impacts on rights. CNL understands that this concern is outstanding from AOPFN's perspective as the EIS findings in relation to traditional land and resource use (which are closely related to impacts on rights) do not correlate to those from AOPFN's studies, and the related concerns that: a. AOPFN was not directly involved in the effects characterization or significance estimation process, and b. CNL has not provided evidence that its consultants working on effects characterization or significance estimation for traditional land and resource use, Indigenous culture, and Indigenous health and well-being, have expertise on these topics. Next steps: AOPFN and CNL disagree on the assessment methodology, the assessment of impacts to TLRU and on the preferred decommissioning alternative. Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. CNL and AOPFN have agreed to the following commitments: AOPFN-3: CNL is committed to collaborative development of risk-informed communication

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		territory and (3) opportunities for meaningful engagement to recognize, characterize and as necessary accommodate for potential historic harms. Note: the LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. <u>CNL Response:</u> CNL acknowledges AOPFN's concerns about assessment of impacts to rights and traditional land and resource use, driven by concerns about contamination of and distrust in the safety of the land and water. CNL is open to increased engagement, education and participatory involvement in monitoring activities at its sites to address these concerns. Through the contribution agreement with AOPFN, CNL provided funding for a Culture and Rights Study. CNL has provided evidence in the EIS to support the conduct of a rights impact assessment between the CNSC and AOPFN. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. This solution has the potential to result in additional lands being freed up for traditional harvest or other uses by Indigenous peoples or the public. CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. Ultimately, the decision of impacts to rights rests with the CNSC. If the CNSC finds any potential impacts to AOPFN's Indigenous and/or treaty rights, CNL remains committed to understanding these rights and working collaboratively to ensure that they are appropriately mitigated to the greatest extent possible.		materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program and Risk Communication Program at the NPD Site. AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.
11. Indigenous Health	(a) Indigenous health assessment, receptors and diet AOPFN is concerned that health is primarily focused on biophysical health rather than full scope Indigenous determinants of health. The assessment of Indigenous health should look beyond radiation dose thresholds and include consideration of the more difficult to measure, but equally important, perceptual and real impacts on AOPFN determinants of health including education status, economic status, and diet, among other factors. Diet is of critical importance given the likelihood that negative perceptions of the safety of the Project may diminish AOPFN member's consumption of traditional foods.	CNL shared that perception of an effect could not be considered a primary pathway under the *CEAA* (2012) because it is not tied to a biophysical effect to the environment. CNL has responded in writing to AOPFN comments related to Indigenous health, receptors and diet citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL is continuing its efforts to address these concerns by committing to: (i) Involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL managed properties and build confidence that the decommissioning strategy and mitigation measures are effective.	<u>Where is this topic discussed in the EIS?</u> The EIS presents the PostSA results for the Indigenous receptor group in **Section 9.10.2.** <u>What changes have been made (and where)?</u> CNL's has updated its PostSA. This update includes an Indigenous receptor whose characteristics have been based on the results of the AOPFN Harvest and Diet Study. Two additional medicinal pathways have been added in addition to ingestion (inhalation and skin application). The human health assessment in the PostSA also includes an even more conservative scenario where an Indigenous receptor where characteristics match a pre-European contact lifestyle. The results of the PostSA have been integrated into the EIS.	<u>Status:</u> Efforts at resolution in progress; further alignment is possible but uncertain. CNL's technical assessment shows that there are no predicted impacts to Indigenous biophysical health resulting from the NPD Closure Project. CNL understands that this concern is outstanding from AOPFN's perspective because to date, CNL has not revised its assessment of Indigenous health in relation to the NPD Closure Project to adopt a more holistic evaluation of health. <u>Next Steps:</u> CNL is committed to working with AOPFN to incorporate Harvest and Diet Study results as they relate to Indigenous health and overall community wellness in a subsequent revision of the IER.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	This is a project-specific concern.	(ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as matters of mutual interest, (1) logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL operated sites (2) risk communication re: the health of country foods, medicines and waters at, and in the vicinity of, CNL operated sites in the territory that AOPFN asserts is its unceded traditional territory(3) logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of CNL operated sites; (4) risk communication re: the health of country foods, medicines and waters at, and in the vicinity of, CNL operated sites in the territory that AOPFN asserts is its unceded traditional territory and (5) opportunities for meaningful engagement to recognize, characterize and as necessary accommodate for potential historic harms. The LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. AOPFN has identified that there are only some mechanisms from the proposed LTRA which are applicable to NPD (i.e., the Guardian Program and Risk Communication Program, characterization of historic harms). AOPFN has indicated that further collaborative assessment and negotiation of a Project-Specific Agreement will be required for NPD as part of a consent seeking process between the parties. <u>CNL Response:</u> CNL acknowledges AOPFN's concerns about perceived contamination and health effects from the NPD site. CNL has added an Indigenous receptor group to the PostSA TSD. In the third iteration of the PostSA TSD issued in March 2020, CNL included a Potential Exposure Group consisting of a family of self-sufficient Indigenous receptors in the NPD area. The exposure profile in the postclosure period was developed based on a traditional Indigenous lifestyle pre-European contact (SENES 2014). This lifestyle results in a more cautious dose estimate than that based on current-day lifestyle, where some food is store-bought. The predicted peak dose to an Indigenous receptor (from the 3rd iteration PostSA) is 0.0004 mSv/yr, which is 500 times less than the dose criterion. The analysis demonstrates that the impact on the public, Indigenous peoples and the environment is negligible under all scenarios. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the AOPFN and other Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm the predictions of the EIS.	CNL has also provided AOPFN an opportunity to directly integrate a summary of its differing perspective on overall assessment findings into the EIS (**Section 11.1)**.	Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. CNL wishes to continue discussions with AOPFN to better understand the community's perspective and values and any fears, or concerns associated with the NPD site and traditional use near the site. CNL and AOPFN have agreed to the following commitments: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food and Risk Communication Programs at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL acknowledges that each Indigenous Nation, community and organization and, each individual study may establish different study area boundaries. CNL respects that AOPFN's evaluation identifies potential effects. CNL maintains that human health has been conservatively assessed for Indigenous Nations, communities and organizations within the EIS. CNL acknowledges that AOPFN disagrees on the basis that there are other determinants of health important to AOPFN including the avoidance of consuming traditional foods.		
11. Indigenous Health	(b) Psychosocial effects AOPFN is concerned that in relation to human health, CNL has adopted a relatively narrow perspective on human health that is focused on biophysical impacts to human health, with little or no emphasis on other factors that influence Indigenous population health. This is particularly concerning to AOPFN because of the fear, stigma, and alienation felt by AOPFN members associated with the nuclear industry in general, The impacts resulting from the perception of environmental effects must be recognized. These include but are not limited to continued – now potentially permanent - fear and stigma associated with the radiological legacy at the site, and communal health and wellness issues associated with the inability to connect to the site and protect and heal it which is characterized by AOPFN as both a right and a responsibility. Pooled together, these concerns are often labeled as psychosocial impacts, and they are major contributors to poor health and wellness outcomes among Indigenous peoples. AOPFN has raised consistent concerns that CNL is not considering psychosocial impacts as legitimate impacts. This is a both a CNL-wide and project-specific concern.	CNL shared that perception of an effect could not be considered a primary pathway under the *CEAA* (2012) because it is not tied to a biophysical effect to the environment. CNL recognizes AOPFN's interest in better characterization of the factors that have led to alienation and loss of land use, and better understanding of the implications of psychosocial impacts on AOPFN socio-cultural health and well-being. CNL seeks to develop a mutual understanding of the perceived effects of the NPD Closure Project activities on the environment and any potential negative impacts on Aboriginal and/or treaty rights. CNL remains committed to finding alternative ways to address AOPFN's concern. CNL is attempting to address these concerns by committing to: (i) Involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL managed properties and build confidence that the decommissioning strategy and mitigation measures are effective (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL Response: CNL acknowledges AOPFN's concerns about the safety of the NPD site and the potential impacts on the rights of the AOPFN and other Indigenous Nations, communities and organizations to practice traditional activities around the NPD site. CNL has assessed potential effects related to dust and noise nuisance, loss of connection, safety of harvesting and consuming local foods, and changes to access and identified no significant adverse effects. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the AOPFN and other Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm the predictions of the EIS.	Where is this topic discussed in the EIS? The EIS discusses concerns about potential loss of connection to land and water (e.g., feeling of discomfort or concern), and loss of land and water use in **Section 9.9.5**. What changes have been made (and where)? CNL added discussion of loss of connection to and use of lands and water to **Section 6.3** (interests and concerns related to VCs) and in new **Sections 9.3.1.1, 9.6.1.1, and 9.9.1.1** within the EIS**.** CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9.6.1**) and overall assessment findings (**Section 11.1),** into the EIS.	Status: Further alignment on this concern unlikely. It is CNL's position that this topic extends beyond the scope of *CEAA* (2012) and this EA. CNL recognizes that AOPFN's position is that the EIS does not adequately consider Indigenous health and wellness impacts beyond biophysical parameters, and that AOPFN's studies find adverse effects on other key Indigenous determinants of health in the Project Case. Next Steps: Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic. CNL wishes to continue discussions with AOPFN to better understand the community's perspective and values and any fears, or concerns associated with the NPD site and traditional use near the site. CNL and AOPFN have agreed to the following commitment: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
12. Long-term Safety	(a) Concern about overall deterioration of the disposal facility over time. The AOPFN identified the long-term site integrity as important because of the site's location within unceded Algonquin traditional territory and the potential of the project / site to impact people living or fishing nearby (exercising rights to fish), as well as wildlife, vegetation, and all elements of the natural environment at and in the vicinity of the Project. AOPFN has also raised concerns about whether future safety will be properly monitored, given the life of some of the contaminants exceeds the predicted Institutional Control period for the facility in the Project Case. This is a project-specific concern.	CNL is attempting to address these concerns by committing to: (iii) Involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL managed properties and build confidence that the decommissioning strategy and mitigation measures are effective. (iv) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as matters of mutual interest, (1) logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL operated sites and (2) risk communication re: the health of country foods, medicines and waters at, and in the vicinity of, the CNL operated sites in the territory that AOPFN asserts is its unceded traditional territory. Note: the LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. CNL Response: CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change on the integrity of the grouted facility and concluded that these events will have no undue short-term or long-term effects on people or the environment around the site. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS.	Where is this topic discussed in the EIS? **Section 8.12** of the EIS discusses the relevant natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Efforts at resolution in progress; further alignment is possible but uncertain. CNL's technical assessment predicts no long-term environmental effects resulting from the NPD Closure Project. CNL understands that this concern is outstanding from AOPFN's perspective as the duration of the hazard exceeds the length of the Institutional Control period. Next Steps: CNL will plan workshops to gather feedback on the draft follow-up monitoring plans. CNL and AOPFN have agreed to the following commitments: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program and Risk Communication Program at the NPD Site. AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected.
13. Monitoring	(a) AOPFN involvement in monitoring Involvement in monitoring is important to the AOPFN to ensure the Kichi-Sìbì is taken care of as it has great importance to AOPFN culture, heritage and ways of life. It is important to AOPFN that it has a co-development and co-approval role in the development and implementation of the EA follow-up and monitoring program for the project, including adaptive management objectives, indicators, thresholds, and responses for terrestrial wildlife, fish and fish	CNL has responded in writing to AOPFN comments requesting involvement in monitoring citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL committed to share the draft follow-up monitoring plans with AOPFN for comment and did so in November 2020. CNL is continuing its efforts to address these concerns by involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help build confidence that the decommissioning strategy and mitigation measures are effective. CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as a matter of mutual interest logistical support for the development of an	Where is this topic discussed in the EIS? CNL has indicated that it is willing to involve the AOPFN in its monitoring programs (**Section 6.2.4.2.3**). The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. What changes have been made (and where)? No change to the EIS has been made since the AOPFN review.	Status: Resolution is in progress CNL understands that this concern is outstanding from AOPFN's perspective until such time as there is a dedicated long-term. Indigenous-led, Indigenous Knowledge driven component integrated into the site monitoring at NPD. AOPFN's position remains that an independent Indigenous Guardian-style program is critical in relation to the NPD site and its surroundings. This will allow for Indigenous Knowledge to be integrated into project monitoring for the first time, restore AOPFN stewardship responsibilities in keeping with Canada's

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	habitat, traditional land and resource use, and water quality at minimum. AOPFN is concerned that follow-up monitoring lacks a health component that would evaluate aspects of TLRU, culture and Indigenous health/well-being. AOPFN is seeking meaningful participation in compliance monitoring and emergency response planning as part of any AOPFN-specific risk communication program. This is both a CNL-wide and project-specific interest.	AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL operated sites. Note: the LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. CNL Response: CNL is committed to involving the AOPFN in its monitoring programs. The participation of AOPFN in monitoring work for the NPD Closure Project ensures consideration of Indigenous knowledge, collaboration, mutual respect, ongoing participation and relationship building for the future.		commitment to reconciliation and UNDRIP, increase AOPFN capacity to understand and monitor changes to the environment our members rely upon, and is an important link into a required Indigenous-driven risk communication strategy for the project. Next Steps: CNL will plan workshops to gather feedback on the draft follow-up monitoring plans and here feedback from the AOPFN site-wide inventory to ensure that monitoring and mitigations are in place for AOPFN values of importance. CNL and AOPFN have agreed to the following commitments: AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected. AOPFN-13: CNL is committed to engaging with the AOPFN in the NPD Closure Project Environmental Assessment Follow-up Monitoring Program (EAFMP) development. CNL recognizes that our plans would benefit from incorporation of Indigenous knowledge and welcomes AOPFN comments on the plans.
14. National Policy	(a) Canadian strategy for waste management is lacking AOPFN is concerned that the Government of Canada does not yet have a modern nuclear waste management policy in place and that a lack of coordinated planning in past to develop permanent facilities has resulted in a proposed facility in AOPFN territory that it has not consented to, and which is contrary to IAEA guidance and the principle of consolidation of waste into the smallest feasible number of permanent waste disposal facilities.	CNL Response: This interest is generally beyond the scope of the project. The proposal to create a disposal facility on the NPD reactor site through in-situ decommissioning has been chosen as a safe and immediate decommissioning option for the NPD reactor with respect to the environment, workers and the public. It is important to highlight that this closure will reduce historic nuclear liabilities for Canada and, at the same time, reduce the footprint of the NPD site.	Where is this topic discussed in the EIS? **Section 3.5** of the EIS summarizes the regulatory framework for the NPD Closure Project. What changes have been made (and where)? This concern is recorded in **Section 6.2.4.3**.	Status: From CNL's perspective, this concern is out of scope of the NPD Closure Project. CNL understands that AOPFN is concerned about why in the Project Case this waste is not proposed to be consolidated with other sources of waste, and why the intermediate-level waste is not being removed and stored for the purpose of ultimate deep geological disposal, as per AOPFN's understanding of nuclear waste management and disposal principles. Next Steps: Through continued engagement at the Working Group, CNL hopes that the parties are able to find

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	This is not a project-specific concern; however it has implications on this project.			common ground on this topic, even though it is out of scope for the project. AOPFN and CNL have agreed to the following commitments: AOPFN-1: CNL is committed to providing the funding to continue the Working Group and AOPFN Advisory Committee (AAC) for 10 years.
14. National Policy	(b) Canadian strategy for waste management is not timely AOPFN's view is that Canada failed to act in a timely manner to implement an acceptable permanent waste management alternative. AOPFN is concerned that it did not consent to the NPD construction/operation and that now, without consent, AOPFN is expected to host the radioactive waste in perpetuity. This is not a project-specific concern; however it has implications on this project.	<u>CNL's Response:</u> Approaches for the management of radioactive waste have evolved over time, and strategies must be adjusted based on best available solutions and international best practices. It should be noted that the availability of a disposal facility for ILW is not the only factor that is taken into account when considering options for the decommissioning of the NPD reactor. The AMA considers the alternatives for technical feasibility (proven technology and compliance with regulatory requirements), financial feasibility and effects on the people and the environment. The current version of the Alternative Means report (prepared for March 2020) does include that a disposal facility will be available for ILW within the 100-year Institutional Control Period. There are activities underway to identify options for the disposal of intermediate-level radioactive waste, including characterization work that has already led to a better understanding of the exact volumes. AECL also asked CNL to evaluate the various options based on an analysis not only of the technical possibilities, but also of their costs in order to lead to a decision that is in the best interest of Canada. CNL, as the licensee, is committed to protecting the environment and reducing risk. Completing the decommissioning of the NPD site is part of that commitment. The proposal to create a disposal facility on the NPD reactor site, using a method called in-situ decommissioning has been chosen as a safe and immediate decommissioning option for the NPD reactor with respect to the environment, workers and the public. It is important to highlight that this closure will reduce historic nuclear liabilities for Canada and, at the same time, reduce the footprint of the site. The fundamental objective of the in-situ decommissioning strategy is to contain and isolate contaminants in the NPD facility for a sufficiently long time to ensure that post closure doses and concentrations are safe for people and the environment. A long-term safety analysis completed by CNL shows that the proposed decommissioned facility can achieve this result. In-situ decommissioning is a proven technology. It has been in successful use for over six decades in the United States. CNL has completed a Review of In-Situ Disposal and has summarized in a report (Aikens, 2019). At the present time, there are no suitable repositories in Canada for the disposal of radioactive waste generated during the decommissioning of nuclear reactors. Therefore, the only alternatives are to continue with SWS or to remove the Facility and store it within an existing waste storage facility or build a new waste storage facility. Of these two options, only SWS is	<u>Where is this topic discussed in the EIS?</u> AOPFN's view is that Canada failed to act in a timely manner to implement an acceptable permanent waste management alternative extends beyond the scope of *CEAA* (2012) and the NPD Closure Project. Therefore, it is not discussed in the EIS. <u>What changes have been made (and where)?</u> This concern is recorded in Section **6.2.4.3**.	<u>Status:</u> This concern extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project. CNL understands that this concern remains unresolved from AOPFN's perspective based on feedback in April 2023. <u>Next Steps:</u> Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		currently practical as there is not a waste storage facility of sufficient capacity to accept this volume of waste. To transfer this waste to an existing waste storage facility would require capital construction of a new facility with a resultant increase of national liability and waste facility surveillance costs. The relatively small size of the NPD Facility means that it can be effectively grouted in place at a significantly lower cost than the construction of a new disposal facility. In the case of NPD, the characteristics of the Facility and its location mean that in-situ disposal can be considered as a viable option for decommissioning and that in-situ disposal reduces Canada's nuclear liability.		
15. Protection of Flora and Fauna	(a) Habitat (including Species at Risk) and road mortality impacts As stewards of lands and waters, it is important to the AOPFN that the environment, wildlife, and plants, including Species at Risk and their habitat areas, are taken care of now and for future generations. This is a project-specific concern.	CNL has responded in writing to AOPFN comments about habitat and species at risk citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL committed to share the draft follow-up monitoring plans with AOPFN for comment, and did so in November 2020. CNL is continuing its efforts to address these concerns by involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help build confidence that the decommissioning strategy and mitigation measures are effective. CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as a matter of mutual interest logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL managed sites. Note: the LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. CNL Response: As the bald eagle's nest is located approximately 875 m away from the facility where work will be occurring, and the EIS notes that project activities are limited to the vicinity of the facility (Morin and Carr 2015), no impacts are expected to the bald eagle's nest. As shown in the EIS, there are no predicted adverse impacts from the project on the Ottawa River shoreline or on any fish, wildlife or plants (see row 4(a) for more details) The speed limit on roads at the NPD site will be reduced to no more than 20 km/h, and frequent inspection for wildlife presence will be conducted by the environmental personnel in the field. Following Ontario Ministry of Natural Resources and Forestry, Best Management Practices for Mitigating the Effects of Road on Amphibians and Reptiles (https://arc-solutions.org/wp-content/uploads/2017/02/mnrf_herp_road-mitigation_bmp_2016.pdf), CNL will be implementing mitigation measures to influence driver behaviour at the NPD site. If approved, the NPD Closure Project reduces the overall disturbed habitat compared to the present-day conditions, and thus will increase available habitat for vegetation and wildlife.	Where is this topic discussed in the EIS? Mitigation measures related to migratory birds, avian and herpetofauna species at risk and road mortality are discussed in **Section 9.6.3.2** of the EIS. Impacts to the surface water environment (including the Ottawa River) are discussed in **Section 9.3.3** of the EIS, and impacts to aquatic species at risk are discussed in **Section 9.4.3** of the EIS. What changes have been made (and where)? CNL has included additional mitigation measures related to migratory birds and avian and herpetofauna species at risk.	Status: Resolution is in progress CNL understands that this concern is outstanding from AOPFN's perspective until such time as there is a dedicated Indigenous-led, Indigenous Knowledge driven component integrated into the site monitoring at NPD. The participation of AOPFN in monitoring work for the NPD Closure Project ensures consideration of Indigenous knowledge, collaboration, mutual respect, ongoing participation and relationship building for the future. Next Steps: CNL and AOPFN have agreed to the following commitments: AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-15: CNL is committed to work jointly with AOPFN to develop a NPD site specific chance find procedure, TLRU discovery plan, Eagle Feather Protocol and cultural protection plan.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
16. Protection of the Ottawa River	(a) The Ottawa River, and shoreline and riparian ecosystems AOPFN is concerned that the disturbed riparian habitat was excluded from CNL's Ecological Land Classification on the basis that it was considered an anthropogenic site. AOPFN is concerned that the Project will contribute impacts to riparian ecosystems as a result of decommissioning activities, batch plant operation, traffic on adjacent roadways, dust, and ongoing legacy effects as a result of liabilities remaining after decommissioning that are likely to influence groundwater and adjacent riparian areas. The restoration of these ecosystems should strive to bring back conditions similar to a pre-disturbance baseline (or intact reference baseline). This is both a CNL-wide and project-specific concern.	CNL has responded in writing to AOPFN comments about the Ottawa River shoreline and riparian ecosystem citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL committed to share the draft follow-up monitoring plans with AOPFN for comment and did so in November 2020. CNL is continuing its efforts to address these concerns by involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help build confidence that the decommissioning strategy and mitigation measures are effective. CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as a matter of mutual interest, logistical support for the development of an AOPFN Guardian Program to enable stewardship and monitoring at and in the vicinity of the CNL managed sites. Note: the LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. CNL Response: The EIS estimates no adverse impacts from the project on the Ottawa River shoreline or on any fish, wildlife or plants within the riparian and aquatic ecosystems (see row 4(a) for more details). A small area of the shoreline at the NPD site is maintained in a cleared state, with riprap on the shoreline, to enable access to the dry hydrant near the shoreline (which was installed to draw water from the Ottawa River if needed for fire suppression). The NPD Closure Project decommissioning activities will not impact the currently disturbed riparian area. For this reason, no impact assessment has been conducted for this habitat. Past disturbances, i.e., those that occurred during the construction of the NPD facility, are not in scope. To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020, and the report was provided to the AOPFN. The study determined that the Ottawa River benthic invertebrate community near NPD is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. This study can be repeated when decommissioning is complete, to verify if the project has had an impact. CNL is planning to regularly monitor the Ottawa River water quality before the project begins. CNL is willing to discuss fish tissue sampling with the AOPFN and review past studies of fish tissue in the NPD area. Follow-up monitoring for the NPD Closure Project will include monitoring of the Ottawa River to verify that there are no effects.	Where is this topic discussed in the EIS? The EIS does not predict any adverse residual effects on the surface water environment, which encompasses the Ottawa River (**Section 9.3.3.5**). What changes have been made (and where)? **Section 9.3.3.2** of the EIS expands on the mitigation measures for the protection of surface water, including the Kichi-Sibì.	Status: Resolution is in progress. CNL understands that this concern is outstanding from AOPFN's perspective until such time as there is a dedicated Indigenous-led, Indigenous Knowledge driven component integrated into the site monitoring at NPD. AOPFN would also like to see re-establishment of a more natural riparian habitat along the shore near the facility as part of site restoration activities. AOPFN has requested to be involved at a decision-making level in both immediate-term restoration planning and end-state planning for the entire NPD site. Next Steps: CNL and AOPFN have agreed to the following commitments: AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-21: CNL is committed to seeking input from the AOPFN on the proposed ISD project end state, including AOPFN input on lands restoration of the disturbed areas. Tri-party discussion including AECL/CNL/AOPFN will be required for site-wide end state planning.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
17. Socio-Economic	(a) The absence of primary socio-economic baseline data for AOPFN The AOPFN have indicated that having primary socio-economic baseline data is important to the AOPFN because Indigenous Nations, communities and organizations often conceptualize socio-economic wellbeing in ways that cannot be adequately captured with census data. Potential effects to Indigenous socio-economic conditions cannot be adequately assessed without this baseline. AOPFN is concerned that the Indigenous socio-economic assessment is extremely narrow, focusing primarily on nuisance effects from Project activities and traffic safety. This assessment does not contain an appropriate social component, which may include (but not be limited to) considerations such as social relations, family, intergenerational relations, food security, sharing relationships, and psychosocial factors, as well as standard socio-economic considerations such as (but not limited to) education and training, employment and income, job readiness, housing, and community services. In addition, AOPFN commercial activities (e.g. guiding and outfitting) should be assessed. The socio-economic effects assessment should consider direct, indirect, induced, and cumulative socio-economic impacts. In addition, appropriate mitigation and monitoring measures should be adopted. This is a project-specific concern.	CNL has responded in writing to AOPFN comments on socio-economic baseline data citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL Response: CNL's socio-economic analysis does focus on secondary census data for AOPFN; however, the recently established AOPFN AAC, formed as part of the contribution agreement, provides an opportunity for primary collection of socio-economic data. CNL would be pleased to participate in a focused discussion with AOPFN on this topic and would welcome any "gray literature" that might be available. Further, CNL acknowledges that Indigenous Nations, communities and organizations may conceptualize socio-economic wellbeing in ways that cannot be adequately captured with census data.	Where is this topic discussed in the EIS? **Section 9.10.1.2** of the EIS describes the interactions of the Indigenous Socio-Economic environment and the project as well as proposed mitigations. The EIS does not predict any adverse residual effects on the Indigenous socioeconomic and health (**Sections 9.10.1.4** and **9.10.2.4**). What changes have been made (and where)? No changes to these sections of the EIS have been made since the AOPFN review.	Status Outstanding CNL understands that this concern is outstanding from AOPFN's perspective as no further engagement on this topic has occurred since AOPFN reviewed the 2020 draft EIS. Next Steps: CNL is committed to working with AOPFN to incorporate material related to Indigenous Socio-economics in a subsequent revision to the IER. AOPFN and CNL have agreed to the following commitment: AOPFN-1: CNL is committed to providing the funding to continue the Working Group and AOPFN Advisory Committee (AAC) for 10 years.
18. Technical	(a) Emissions and Discharges It is important to AOPFN that emissions to the environment are properly assessed and are mitigated and monitored as appropriate to ensure that the rights and interests of AOPFN members are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	CNL has responded in writing to AOPFN comments on effluent and effluent mitigation measures citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. CNL Response: The EcoRA evaluates potential impacts to biota, including those in the Kichi-Sìbì, from chemical and radiological releases during all phases of the project. The EcoRA found that no potential exposure-related effects to aquatic biota are expected during the Decommissioning Execution phase.	Where is this topic discussed in the EIS? **Section 9.2.3** of the EIS provides the mitigation measures and monitoring for dust. **Section 9.4.3** of the EIS summarizes the EcoRA findings related to potential impacts to biota, including those in the Kichi-Sìbì, from chemical and radiological releases during all phases of the project.	Status: Resolved Next Steps: AOPFN's review of the draft responses to comments on the EIS indicated that CNL's response on dust was adequate, and that they would need to review the PostSA to assess the adequacy of the response related to effluent discharges to the aquatic environment.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		The EcoRA also determined that no adverse residual effects to aquatic biota are anticipated during the Institutional Controls or Post-Institutional Controls phases. The EIS describes noise and dust mitigation measures, and monitoring is planned as part of the EA follow-up monitoring.	What changes have been made (and where)? No changes to the EIS have been made in response to this concern.	CNL and the AOPFN are continuing engagement through the framework of the contribution agreement.
19. Traditional Land and Resource Use and Cultural Impacts	(a) Algonquin traditional knowledge should be collected and incorporated into the EIS. It is important to AOPFN that community-specific knowledge be obtained and used to properly characterize current conditions and develop scenarios that accurately represent potential future uses of the site to enable future AOPFN members to practice traditional activities in the region. This is a project-specific concern.	CNL sent two letters asking specific questions of AOPFN to align with the requirements of *CEAA* (2012) Section 5(1)(c). These questions included: • Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects? • Does [AOPFN], or any members, have sites of ceremonial significance in close proximity [of NPD], or more generally, any cultural activities near [the NPD site]? The CNSC and CNL have contributed funds for AOPFN to disaggregate the AOO AKLUS results, which was completed in November 2020. CNL has also contributed funds for AOPFN to undertake a Harvest and Diet Study and Culture and Rights Study, which were completed in August 2021. CNL has responded in writing to AOPFN comments on incorporation of AKLUS information in the EIS citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. Also, in November 2020, CNL sent by letter to AOPFN the content from the AKLUS that it intended to include in the December 2020 EIS. Revised content was shared again with AOPFN in May 2021. In August 2021, AOPFN shared the Harvest and Diet Study and Culture and Rights Study along with a presentation and letter summarizing the findings and implications of these two studies and the AKLUS. Leading up to the December 2021 EIS submission CNL shared revised Sections of the EIS (Section 8.9 and 9.9) and sought and incorporated AOPFN feedback. CNL Response: CNL agrees that traditional knowledge from the AOPFN and other Indigenous Nations, communities and organizations should be integrated into the EIS. CNL has contributed funding to the preparation of an AOPFN AKLUS, Harvest and Diet Study and Culture and Rights Study and has integrated findings and concerns into the EIS. CNL includes an Indigenous receptor group in its PostSA TSD. CNL has completed an initial comparison of the AOPFN study results with the characteristics of the Indigenous receptor used in the PostSA and found that its assumptions in almost all cases are conservative for the Indigenous receptor profile. The predicted peak dose to an Indigenous receptor is 0.0004 mSv/yr which is 500 times less than the dose criterion. The analysis demonstrates that the impact on Indigenous Peoples and the environment is negligible.	Where is this topic discussed in the EIS? **Section 8.9** of the EIS presents information about traditional land and resource use, including specific information about the AOPFN (**Section 8.9.2.2.3**). **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs, including new VCs (**Sections 6.3 and 9.9** of the EIS). **Section 9.1.1.1** of the EIS presents the future exposure scenarios and groups that are considered in the PostSA TSD. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that there will be future interest in re-establishing traditional use activities on the NPD site. What changes have been made (and where)? CNL expanded the description of traditional uses and added and evaluated new traditional land and resource use VCs (**Sections 6.3 and 9.9** of the EIS). Content from the AKLUS, Harvest and Diet Study and Culture and Rights Study has been added to the EIS (**Section 8.9)**. The EIS update includes additional detail on the VC-related engagement process (**Section 6.3**) and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project. CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9.6.1**) and overall assessment findings (**Section 11.1),** into the EIS.	Status: Efforts at resolution in progress; resolution possible but uncertain at this time. CNL understands that this concern is outstanding from AOPFN's perspective as the findings of CNL in the EIS do not correlate with the findings from the three AOPFN-related studies, in relation to impacts on traditional land and resource use, culture, and Indigenous health and well-being. Next steps: CNL and AOPFN have agreed to the following commitments: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program and Risk Communication Program at the NPD Site. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
19. Traditional Land and Resource Use and Cultural Impacts	(b) Impact on ability to practice traditional activities. AOPFN is concerned about continued ability to harvest and consume wildlife and natural materials from the area, including hunting, plant harvesting and fishing. AOPFN is concerned that harvesting sites could become compromised in the future, leading to concerns over safety that would impact members' abilities to pass on AOPFN knowledge on harvesting to children. This would in turn affect the ability of future generations to use the area; and that project-related activities would exacerbate the issue of alienation and further limit members' access to the area, and perpetuate the difficulty of exercising their Aboriginal rights. AOPFN disagrees with CNL's conclusion of no impacts on traditional land use. AOPFN's four studies, supported by evidence from traditional land users themselves identify the following existing impact pathways: • Lack of access to the NPD site since 1962; • Diminished quality and quantity of game species in preferred hunting areas; • Lack of confidence in the health of animals, fish, medicines, and waters, and in their safety for human consumption. This is a project-specific concern.	CNL has sent two targeted letters asking specific questions of AOPFN to align with the requirements of *CEAA* (2012) Section 5(1)(c). CNL has responded in writing to AOPFN comments on safety and quality of experience on the land citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in 2020 December, and two meetings to discuss responses were held in 2020. CNL is continuing its efforts to address these concerns by committing to: (i) Involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL managed properties and build confidence that the decommissioning strategy and mitigation measures are effective (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as matters of mutual interest, (1) logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL operated sites and (2) risk communication re: the health of country foods, medicines and waters at, and in the vicinity of, CNL operated sites in the territory that AOPFN asserts is its unceded traditional territory. Note: the LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. CNL seeks to develop a mutual understanding of the perceived effects of the NPD Closure Project activities on the environment and any potential negative impacts on Aboriginal and/or treaty rights. This includes, but is not limited to, rights to trap, hunt, fish, gather, or harvest as well as the continuation and uninterrupted access to cultural and spiritual activities on the lands and waters. CNL Response: CNL acknowledges AOPFN's concerns about the safety of the NPD site and the potential impacts on the rights of the AOPFN and other Indigenous Nations, communities and organizations to practice traditional activities around the NPD site. CNL has assessed potential effects related to dust and noise nuisance, loss of connection, safety of harvesting and consuming local foods, and changes to access and identified no significant adverse effects. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the AOPFN and other Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm the predictions of the EIS.	Where is this topic discussed in the EIS? The EIS discusses concerns about potential loss of connection to land and water (e.g., feeling of discomfort or concern), and loss of land and water use in **Section 9.9.5**. General plans for restoration and end state, including access considerations, are described in **Section 4.3.1.9** of the EIS. What changes have been made (and where)? CNL added discussion of loss of connection to and use of lands and water to **Section 6.3** in the EIS (interests and concerns related to VCs) and in new **Sections 9.3.1.1, 9.6.1.1, and 9.9.1.1** in the EIS**.** CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9.6.1**) and overall assessment findings (**Section 11.1),** into the EIS.	Status: Further alignment on this concern not possible CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL's conclusion is that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. CNL understands that this concern is outstanding from AOPFN's perspective based on AOPFN feedback in April 2023. The findings of CNL are not supported by the traditional users themselves and CNL has chosen not to update the results of its effects assessment with this information. Next steps: CNL and the AOPFN are continuing engagement through the framework of the contribution agreement. CNL wishes to continue discussions with AOPFN to better understand the community's perspective and values and any fears, or concerns associated with the NPD site and traditional use near the site. CNL has proposed a workshop with AOPFN focused on effects to traditional land and resource use, and on commitments to mitigate this concern. CNL and AOPFN have agreed to the following commitment: AOPFN-2: CNL will support a Cultural Protection and Commemoration Plan in relation to the NPD site. AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program and Risk Communication Program at the NPD Site. AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL notes that the final end state is the only time when changes to access will occur; the final end state of the NPD site will be an improvement from current conditions. The PostSA TSD addresses the potential for concerns about loss of connection to land and water, and about food safety. The PostSA and EIS (and other supporting studies) have demonstrated that, there are no concerns about the accessibility or safety of the NPD site in the long term based on several different future use scenarios, including self-sufficient Indigenous receptors. The proposed activities will result in an enhancement of current conditions at the NPD site and will improve the ability to practice traditional activities in the area surrounding the NPD site. These findings, which will be confirmed by monitoring, may reduce concerns about loss of connection to land and water, and about food safety.		AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-15: CNL is committed to work jointly with AOPFN to develop a NPD site specific TLRU discovery plan. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.
19. Traditional Land and Resource Use and Cultural Impacts	(c) Preservation of cultural resources, and mitigation of impacts to cultural resources It is important to the AOPFN that traditional land use and cultural resources are protected and potential effects are mitigated and monitored in a way that recognizes the interdependencies between ecological, socio-economic, community and cultural health. AOPFN is concerned that the EIS has only considered the presence of ceremonies and access to physical archaeological resources, neglecting other cultural values of importance to AOPFN such as transmission of traditional knowledge, cultural landscapes as well as trails and travel-ways such as the Ottawa river. Further mitigations for impacts to traditional use are limited to construction timing, dust suppression, and communication/notification. AOPFN is seeking a collaborative process to identify culturally appropriate ways to mitigate potential impacts and concerns of AOPFN and AOPFN Knowledge Keepers. This is a project-specific concern.	CNL has responded in writing to AOPFN comments on preservation of cultural resources citing relevant sections of the EIS as part of the comment response. AOPFN provided feedback on these dispositions in December 2020, and two meetings to discuss responses were held in 2020. Also, in November 2020, CNL sent by letter to AOPFN the content from the AKLUS that it intended to include in the December 2020 EIS. Revised content was shared again with AOPFN in May 2021. In August 2021, AOPFN shared the Harvest and Diet Study and Culture and Rights Study along with a presentation and letter summarizing the findings and implications of these two studies and the AKLUS. Leading up to the December 2021 EIS submission CNL shared revised Sections of the EIS (Section 8.9 and 9.9) and sought and incorporated AOPFN feedback. CNL is attempting to further address concerns on this topic through project commitments related to involvement in the monitoring and key protocols and procedures that will be co-developed for the NPD site (see Next Steps). CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as a matter of mutual interest, cultural protection, promotion, education, recognition and reconciliation. The LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. AOPFN has identified that there are only some mechanisms from the proposed LTRA which are applicable to NPD (i.e., the Guardian Program and Risk Communication Program, characterization of historic harms). AOPFN has indicated that project specific commitments in this area are required. <u>CNL Response:</u> CNL has included a summary of AOPFN traditional knowledge and land use, incorporated the valued species identified by AOPFN, and recorded main concerns about the project in the EIS, which also includes new VCs as	<u>Where is this topic discussed in the EIS?</u> • CNL added content from the AKLUS report to the EIS. The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project. • Content from the AKLUS, Harvest and Diet Study and Culture and Rights Study has been added to **Sections 8.9 and 9.9** of the EIS**.** • Mitigation measures for Indigenous Land and Resource Use are presented in **Section 9.9.3.2** and for Indigenous Socio-Economic and Health in **Section 9.10.1.3.2**. <u>What changes have been made (and where)?</u> Mitigation measures have been updated in the EIS, and the Cultural Resource Management Procedure has been referenced as a mitigation.	<u>Status:</u> Efforts at resolution in progress; resolution possible but uncertain at this time. CNL understands that this concern is outstanding from AOPFN's perspective as the findings of CNL do not correlate with the findings from the three AOPFN studies, in relation to impacts on traditional land and resource use and culture. AOPFN is also concerned that commitments related to collaborative development of mitigations and monitoring activities remain too vague. <u>Next steps:</u> CNL and the AOPFN are continuing engagement through the framework of the contribution agreement. CNL wishes to continue discussions with AOPFN to better understand the community's perspective and values, as well as any fears or concerns associated with the NPD site and traditional use near the site. CNL proposes a workshop with AOPFN focused on effects to traditional land and resource use and on future commitments to mitigate this concern. CNL and AOPFN have agreed to the following commitment: AOPFN-2: CNL will support a Cultural Protection and Commemoration Plan in relation to the NPD site and CNL commits to involve AOPFN in any future archaeological programs at or around the NPD site. AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		well as updated mitigation measures related to the assessment of traditional land and resource use. CNL would be willing and pleased to work with AOPFN on identifying culturally appropriate mitigation measures to deal with effects associated with the proposed project. CNL invites AOPFN to identify timing and methodology to perform this work.		community members and application of the AOPFN Algonquin Risk Communication Program at the NPD Site. AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-15: CNL is committed to work jointly with AOPFN to develop a NPD site specific chance find procedure, TLRU discovery plan, Eagle Feather Protocol and cultural protection plan. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.
19. Traditional Land and Resource Use and Cultural Impacts	(d) Concern about the size of the study areas for the assessment of effects on traditional land use. It is important to the AOPFN that all potential effects on traditional land use are considered by identifying study areas that encompass not just biophysical and physical effects, but also changes to the environment that would affect the values and sense of safety of AOPFN members. AOPFN is concerned that CNL has not adopted the larger Local and Regional Study Areas used by AOPFN in their studies. This highlights the continued lack of understanding of just how large the impact	CNL is attempting to address these concerns by committing to: (i) Involving the Indigenous Nations, communities and organizations, including AOPFN, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL properties and build confidence that the decommissioning strategy and mitigation measures are effective (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS).	<u>Where is this topic discussed in the EIS?</u> **Section 8.9.1** of the EIS presents the spatial boundaries selected by CNL to assess potential effects on the Indigenous traditional land and resource use environment. **Section 9.9** of the EIS presents the assessment of effects to traditional land and resource use VCs, including further discussion of the assessment boundaries used (**Section 9.9.2** of the EIS). Note that in its review of these sections, the AOPFN indicated that they continue to disagree with CNL's conclusion that there are no	<u>Status:</u> Further alignment on this concern unlikely. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL understands that this concern is outstanding from AOPFN's perspective because CNL has chosen not to adopt the study area boundaries from the AOPFN studies. <u>Next steps:</u> AOPFN and CNL disagree on the assessment area boundaries and on the assessment of impacts to TLRU. Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	zone on Traditional Land and Resource Use is around the NPD site. This is a project-specific concern.	CNL, AECL and the AOPFN finalized an LTRA in June 2023 that includes, as matters of mutual interest, (1) logistical support for the development of an AOPFN guardian program to enable stewardship and monitoring at and in the vicinity of the CNL operated sites and (2) risk communication re: the health of country foods, medicines and waters at, and in the vicinity of, CNL operated sites in the territory that AOPFN asserts is its unceded traditional territory The LTRA does not provide AOPFN's consent for the proposed ISD decommissioning plan for NPD. AOPFN has identified that there are only some mechanisms from the proposed LTRA which are applicable to NPD (i.e., the Guardian Program and Risk Communication Program, characterization of historic harms). AOPFN has indicated that project specific commitments in this area are required. AOPFN has drafted **Section 9.9.6** of the EIS, identifying remaining concerns AOPFN has with CNL's assessment approach. <u>CNL Response:</u> CNL acknowledges that each Indigenous Nation, community or organization may establish different study area boundaries, and may identify different potential effects of concern. CNL is working with Indigenous Nations, communities and organizations, including AOPFN, to improve risk communications, promote understanding of the EIS results, and involve Indigenous groups in monitoring to build confidence that the land is safe for use (see further discussion below). For the assessment of effects on traditional land and resource use, CNL selected a Local Study Area that extends beyond NPD property boundaries, including Crown land in Ontario and Quebec, and the Ottawa River. If any effects were to be experienced, they would occur in the selected Local Study Area. If required, based on the results of the assessment, the boundaries of the Local Study Area could be extended. In Section 9 of the EIS, the assessment confirmed that there are no measurable effects for any environmental component beyond the Local Study Area. Enlarging the Local Study Area would not change these findings. Similarly, the Regional Study Area boundaries were chosen to include the expected area of possible effects. The assessment, which was conducted per *CEAA* (2012) requirements, found that no measurable effects on traditional land use VCs in the Regional Study Area are expected from the project.	measurable effects to traditional land and resource use. <u>What changes have been made (and where)?</u> No change has been made to the study areas used in the assessment. CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9.6.1**) and overall assessment findings (**Section 11.1),** into the EIS.	CNL and AOPFN have agreed to the following commitment: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Risk Communication Program at the NPD Site. AOPFN-5: CNL is committed to support the AOPFN with NPD Closure Project and NPD site specific Guardian monitoring activities, incorporating traditional knowledge and AOPFN valued components. Until the Guardian Program is stood up, CNL can support AOPFN participation/observation in our current environmental monitoring activities. CNL welcomes recommendations for other monitoring/mitigation activities that should be integrated into our existing program to ensure that environmental and cultural components of value to AOPFN are protected. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.
19. Traditional Land and Resource Use and Cultural Impacts	(e) Participation of knowledge holders in the assessment of effects to TLRU AOPFN is concerned about the lack of integration of AOPFN knowledge and AOPFN members into the assessment of effects on traditional land and resource use,	In July 2020, AOPFN submitted formal comments on the 2020 EIS. Several comments were related to effects on traditional land and resource use, culture, Indigenous health and well-being. In their letter dated August 13, 2021 that outlined the implications of the AOPFN studies for the NPD Closure Project, AOPFN highlighted that best practice considers all potential impact pathways and that for impacts on the	<u>Where is this topic discussed in the EIS?</u> **Section 8.9** of the EIS presents information about traditional land and resource use, including specific information about the AOPFN (**Section 8.9.2.2.3**). **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs, including new VCs (**Sections 6.3 and**	<u>Status:</u> Further alignment on this concern unlikely CNL believes that they have addressed this concern based on the requirements of *CEAA* (2012). CNL understands that this concern is outstanding from the AOPFN's perspective based on AOPFN feedback in April 2023. AOPFN remains concerned that CNL

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	culture, and Indigenous health and well-being. AOPFN holds that it is a principle of meaningful assessment of effects on Indigenous land use, culture, and health and well-being that not only must Indigenous inputs be provided into the process, but the Indigenous Knowledge holders, with their unique expertise as the actual land users and culture holders, must be involved in effects characterization and significance estimation. This is not a project-specific interest; however it has implications for the EA process and methods used in this project-specific assessment.	human environment they should be considered by the people who would be impacted themselves. AOPFN reiterated to CNL in its feedback from April 2023 that Knowledge holders should participate in the effects characterization for traditional land, resource use and culture. <u>CNL Response:</u> CNL acknowledges that AOPFN is concerned that Knowledge holders did not participate in the effects assessment. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that there will be future interest in re-establishing traditional use activities on the NPD site. CNL has determined that there are no adverse impacts on Traditional Land and Resource Use resulting from the NPD Closure Project. Indigenous Nations, communities and organizations often prefer a different approach, consider different factors, and evaluate against a different baseline than CNL and, subsequently, the findings of the Indigenous Nations, communities and organizations, and CNL, differ. CNL has provided AOPFN an opportunity to directly integrate its assessment findings for impacts on traditional land and resource use within the EIS. Through the contribution agreement with AOPFN, CNL provided funding for a Culture and Rights Study. CNL has provided evidence in the EIS to support the conduct of a rights impact assessment between the CNSC and AOPFN. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. This solution has the potential to result in additional lands being freed up for traditional harvest or other uses by Indigenous peoples or the public. CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. Ultimately, the decision of impacts to rights rests with the CNSC. If the CNSC finds any potential impacts to AOPFN's Indigenous and/or treaty rights, CNL remains committed to understanding these rights and working collaboratively to ensure that they are appropriately mitigated to the greatest extent possible.	**9.9**). **Section 9.1.1.1** of the EIS presents the future exposure scenarios and groups that are considered in the PostSA TSD. <u>What changes have been made (and where)?</u> CNL expanded the description of traditional uses and added and evaluated new traditional land and resource use VCs (**Sections 6.3 and 9.9** of the EIS). Content from the AKLUS, Harvest and Diet Study and Culture and Rights Study has been added to the EIS (**Section 8.9)**. The EIS update includes additional detail on the VC-related engagement process (**Section 6.3**) and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project. CNL has provided AOPFN an opportunity to directly integrate a summary of its differing perspective on impacts on traditional land and resource use (**Section 9.9.6.1**) and overall assessment findings (**Section 11.1),** into the EIS.	has not shown expertise in assessing effects on these valued components, has not included Algonquin Knowledge holders in the assessment of effects on these valued components and that AOPFN perspectives have had little to no influence on CNL's assessment findings. <u>Next steps:</u> AOPFN and CNL disagree on the assessment methodology and on the assessment of impacts to TLRU. Through continued engagement at the working group CNL hopes that the parties are able to find common ground on this topic. CNL and AOPFN have agreed to the following commitment: AOPFN-3: CNL is committed to collaborative development of risk-informed communication materials for the NPD Closure Project for AOPFN community members and application of the AOPFN Algonquin Food Program and Risk Communication Program at the NPD Site. AOPFN-5: CNL is committed to develop with AOPFN a meaningful role for AOPFN in the monitoring for the NPD Closure Project in addition to AOPFN participation in current environmental/compliance monitoring. AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary. AOPFN-18: CNL is committed to co-developing with the AOPFN additional mitigation measures to include within the NPD Closure Project Environmental Protection Plan to ensure that items of value to AOPFN are protected.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
20. Valued Components	(a) Inclusion of VCs identified by AOPFN AOPFN is concerned that the specific species they have identified are sometimes assessed using a representative species. The decision to use a receptor species and the appropriateness of that species was not informed by Algonquin Knowledge. For example AOPFN is concerned that the many fish species are evaluated using only two generic categories – pelagic and benthic and that vegetation is represented by a single VC – terrestrial vegetation. AOPFN also suggests additional work to understand the values, distribution, abundance, and risks to impacts of specific aquatic and terrestrial vegetation is required. Further, AOPFN is concerned that the final decisions on what VCs to include was made by CNL, and was not verified as appropriate by AOPFN, which suggests that Algonquin Knowledge is still not treated as of equivalent value to western science in CNL's environmental assessment. This is a project-specific concern.	CNL has updated the draft EIS to include a mapping of Indigenous VCs to the effects assessment. CNL shared the new content in Section 6.3 with AOPFN for review and comment. AOPFN has drafted Section 6.3.2.1 of the EIS, identifying remaining issues AOPFN has with the VCs and how they are used in the CNL assessment. Through the contribution agreement, AOPFN and CNL have worked together to conduct site-wide Algonquin Knowledge Seasonal Inventories at the NPD site in 2022 and 2023 CNL Response: CNL initially created a Master List of Candidate Valued Components by reviewing relevant reference documents and applying EA process and site knowledge. These candidate VCs include biota such as fish or birds, as well as abiotic qualities such as cultural and heritage sites, or socio-economic entities such as fishing. CNL provides rationale for including or not including species as a VC. The VCs selected for the NPD Closure Project reflect a wide range of Indigenous interests. Many of the interests and concerns raised by Indigenous Nations, communities and organizations, correspond directly or indirectly to the VCs selected for the project. Based on Indigenous feedback received during engagement activities, CNL has added several human and non-human VCs that were identified as being of importance to Indigenous Nations, communities and organizations. Berries, mushrooms, mink, river otter, weasel, red fox, moose and monarch butterflies were added as VCs, as well as soil quality, groundwater quality, groundwater flow and several Indigenous socio-economic and Indigenous health VCs. In some cases no new VCs were added, because direct, representative or related VCs that encompass the value or interest of the Indigenous Nation, community or organization were already included in the assessment.	Where is this topic discussed in the EIS? A complete listing of VCs assessed by the project can be found in **Table 5.2-3** of the EIS while **Appendix B** provides a Master List of Candidate Valued Components, providing a rationale for including or not including the species as a VC. **Section 6.3** of the EIS captures VCs identified by Indigenous Nations, communities and organizations. What changes have been made (and where)? CNL has developed a detailed table (**Table 6.3-1 (b)**) for **Section 6.3** of the EIS that captures VCs of Indigenous Nations, communities and organizations and organizations and demonstrates how they are either directly or indirectly assessed in the EIS. CNL shared and incorporated AOPFN feedback into this table in November 2021. CNL has also provided AOPFN an opportunity to directly integrate a summary of its differing perspective on the use of representative species and other VC-related issues (**Section 6.3.2.1**) into the EIS.	Status: Resolution is in Progress CNL's EIS considers a wide range of VCs and where individual species have not been selected CNL provides rationale for the use of representative species. CNL and AOPFN have completed four one-day seasonal field inventories at portions of the NPD site and AOPFN has requested funding and time for a site-wide Algonquin knowledge inventory, which has yet to occur. CNL looks forward to discussing the inventory results and recommendations. CNL understands that this concern is outstanding from AOPFN's perspective, with specific issues raised in the AOPFN-developed **Section 6.3.2.1** of the EIS. Next Steps: CNL and the AOPFN are continuing engagement through the framework of the contribution agreement. Using the findings and recommendations from AOPFN's partial site inventory to date, CNL commits to work with AOPFN to develop specific project and corporate commitments that consider AOPFN valued species and components and mitigations to ensure AOPFN valued species are protected. AOPFN and CNL have agreed to the following commitment: AOPFN-6: CNL is committed to supporting AOPFN-led site inventory work to develop an Algonquin Knowledge baseline for the entire NPD site. Where AOPFN identifies important resources that could be impacted by the project, CNL is committed to evaluate and implement additional mitigation measures if necessary.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Appendix C.3 – Record of Engagement and Tables of Interests and Concerns for the Métis Nation of Ontario (MNO)

This appendix provides a complete record of all engagement between CNL and MNO from June 2016 to March 2024 (Table C-7). Table C-7 includes the date and method of the communication/engagement, the topics discussed and participants. The table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement is a mapping of how the summary of interests and concerns were compiled (Table C-8), as well as a summary of interests and concerns raised by MNO (Table C-9).

Section 6.2.4.4.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and the MNO.

Table C-7 Record of Engagement with the Métis Nation of Ontario (MNO)

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
June 02, 2016 Meeting	This teleconference between CNL staff (including the Director of Corporate Communications) and MNO representatives (including the MNO's Manager of Natural Resources and Consultations) was an introductory overview discussion on the NPD Closure Project to build awareness on the project and on Métis interests.			√						√	
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the President of the MNO introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
July 20, 2016 Meeting	This meeting between MNO (including members of the MNO Mattawa/Lake Nipissing Métis Traditional Territory Consultation Committee and the MNO's Manager of Natural Resources and Consultations) and CNL representatives was an introductory meeting hosted by the MNO in North Bay to share information on the project and learn about the MNO and in particular the MNO Mattawa/Lake Nipissing Métis Traditional Territory Consultation Committee. Six staff members from CNL, from the NPD Closure Project, Corporate Communications and Environmental Protection attended, as well as four members of the MNO Mattawa/Lake Nipissing Métis Traditional Territory Consultation Committee and two MNO staff members. CNL staff shared a presentation on the proposed project, which focussed on: the existing site and its history, alternative means, the project timeline and planned phases for decommissioning, environmental assessments (including its purpose of determining mitigation measures) and Environmental Impact Statement contents, VCs, effluent monitoring and shared North American examples of technique. The MNO identified a number of interests at this meeting. A member of the consultation committee stated that CNL did a good job of identifying the "potential" VCs to their communities and asked if CNL could look into whether berry patches would be affected, sharing that the people in his community did a lot of berry picking along the side of the roads and highways. The same member also inquired on could find out if any historic or current cemeteries that could be affected. Employment opportunities for Métis business owners also came up as a topic of discussion as well as the whether the project would remain on Crown property. Interest in medicinal plants in the region was also identified, as well as an interest in facility tours. This is the first instance where the MNO raised interest in VCs and archaeology and cultural sites.	√	√	√	√					√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 01, 2016 Outgoing telephone call	This telephone call from a CNL communications officer to a member of the Mattawa Métis Council was in follow-up to earlier interest in the Chimney Swifts. CNL had understood there was interest in the Chimney Swifts and left a voicemail offering more information and an opportunity to chat with a subject matter expert.			√						√	
December 22, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Presidents representing the Mattawa Métis Council, the North Bay Métis Council and the Sudbury Métis Council inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of MNO's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Do members have traditional territory near the NSDF and/or NPD Closure Project?* • *What is the history of the Métis using the areas around the two projects?* • *Do you have any members that currently live in close or reasonable proximity to either of the projects?* • *Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Do the Métis have sites of cultural significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the MNO and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
July 19, 2017 Incoming letter	This letter from the MNO Provisional Council to CNL's Director of Corporate Communications shared information to CNL on Métis rights, the need for consultation per the Crown's duty to consult, and confirmation that the MNO Mattawa/Lake Nipissing Traditional Territory Consultation Committee will be the Métis community that CNL should engage with in regards to the proposed project. This is the first instance of the MNO raising the interest of Métis rights and interests and traditional use with respect to the project.					√				√	
July 20, 2017 Outgoing email	This email from CNL's Director of Corporate Communications to the MNO's Manager of Natural Resources and Consultation confirmed receipt of the earlier letter and indicated that CNL would respond and look forward to engagement with the MNO.									√	
August 25, 2017 Outgoing letter	This letter to the MNO Provisional Council from CNL's Director of Communications thanked the MNO for the July letter and shared information on the CNSC as the Crown with respect to the duty to consult. This letter also discussed working on an MOU or Consultation Plan between the MNO and CNL.					√				√	
August 30, 2017 Incoming email	This email from the MNO's Manager of Natural Resources and Consultation to CNL's Director of Corporate Communications indicated that an agreement between the MNO and CNL should be designed to: • Identify Métis-specific values; • Identify Métis land use and traditional knowledge; • Engage the community; • Identify impacts to Métis rights, interests and way of life; • Undertake a thorough technical review of the EIS, its baseline data, assumptions and conclusions; • Mitigate any potential impacts; and • Accommodate those potential impacts that cannot be mitigated.					√				√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
September 26, 2017 Meeting	This meeting between nine MNO representatives (including members of MNO Mattawa/Lake Nipissing Métis Traditional Territory Consultation Committee and the Manager of Natural Resources and Consultation) and six CNL representatives (including the Director of the NPD Closure Project and the Director of Corporate Communications) in North Bay, Ontario was to discuss developing a work plan agreement/ MOU and to discuss the project. Information shared included: • Environmental monitoring; • Environmental assessment; • Traditional use and traditional use effects assessment; • NPD Closure Project timelines; • End state; and • Species at risk.	√		√	√	√				√	
October 2017 Outgoing letter	This letter from CNL's Corporate Communications staff to the MNO representative on the ESC was sent enclosing the agenda from the October 26, 2017 ESC meeting and the notes from the June 22, 2016 ESC meeting. The notes gave the following information about the ESC meeting related to the NPD Closure Project: *Meggan Vickerd – Manager, NPD Operations at CNL presented to the council an update on the NPD Closure Project comprising of an overview on environmental performance which included current and future site monitoring and reporting.* *QUESTIONS:* • *Where is the source of tritium at NPD and what percentage is background?* • *Do you monitor at the top of the stack and do you monitor liquid emissions into the Ottawa River?* • *Does the 2020 completion date reflect all closure activities?* • *ESC Action 170622:05 – NPD project to provide ESC members with the airborne tritium levels at NPD? Kurt Kehler is responsible for this action.*										√
November 15, 2017 Outgoing email	This email from CNL's Corporate Communications staff to MNO representatives enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and the environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	√
November 17, 2017 Outgoing email	This email from CNL's Corporate Communications staff to MNO representatives enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: "*CNL would be pleased to update information in this current draft with input from your community."*	√	√	√	√	√	√	√	√	√	√
December 18, 2017 Incoming email	This email from the MNO's Manager of Lands, Resources and Consultation to the CNL's Director of Corporate Communications requested supporting information to assist in the MNO's review of the NPD Closure Project's draft EIS.										√
December 18, 2017 Outgoing email	This email from CNL's Corporate Communications staff to the MNO's Manager of Lands, Resources and Consultation was to share the complete set of technical support documents to support the MNO's review of the draft EIS. The email also offered a meeting with the MNO to discuss.	√	√	√	√		√	√	√	√	
March 09, 2018 Meeting	This meeting between representatives of the MNO (including the Manager of Natural Resources and Consultation) and CNL (including the Director of Corporate Communications and NPD Closure Project staff) focussed on the development of an MOU. CNL also shared information on past cultural resources management at CNL and the Stage 1 Archaeological Assessment for the NPD Closure Project with the MNO at this meeting.									√	√

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. June 13, 2018 Outgoing email	This email from a CNL communications officer to the MNO's Director of Lands, Resources and Consultation enclosed 13 documents requested by the MNO related to topics of interest with respect to the NPD Closure Project, which included information on the following: • Annual compliance monitoring and reporting; • Derived release limits for the NPD site; • Past groundwater and hydrogeological reports; • Draft follow-up monitoring plans.	√								√	
December 17, 2018	The MOU between the MNO and CNL related to the NPD Closure Project and NSDF Project was signed.	√	√	√	√	√	√	√	√	√	√
January 23, 2019 Incoming email	This email from the MNO's Manager, Nuclear Energy Lands Resources & Consultations to CNL's Director of Corporate Communications attached the MNO's draft hydrogeological and archaeological technical reviews for the NPD Closure Project.	√			√	√	√			√	
February 28, 2019 Incoming email	This email from MNO staff to CNL staff enclosed the MNO's Traditional Knowledge and Land Use Study (TKLUS).				√	√				√	
April 02, 2019 Outgoing email	This email from CNL's Director of Corporate Communications to the MNO's Manager, Nuclear Energy Lands Resources & Consultations and the MNO's Manager of Lands, Resources and Consultations enclosed a partial set of draft responses to the MNO's comments on the NPD Closure Project's draft EIS.		√		√		√	√	√	√	
April 23, 2019 Meeting	This meeting between representatives of the MNO (including members of the Mattawa/Lake Nipissing Traditional Territory Consultation Committee and the Manager of Lands, Resources and Consultation) and CNL (including the Director of Environmental Protection, the Director of Corporate Communications and the Director of the NPD Closure Project) involved an NPD Closure Project update, an overview of environmental monitoring and a presentation on proposed VC for the NPD Closure Project. The update on the NPD Closure Project included an overview of the EIS, which covered the following topics: • Alternative means; • Valued Components (VC); • Baseline environment; • Aboriginal land and resource use; • Groundwater and the Ottawa River; • Effects on the environment; • Project timeline; • EIS conclusion. The VCs presentation included definition and identification, types of VCs, approach and selection of VCs and the MNO VCs addressed in the environmental assessment. This meeting also included a review and discussion of the draft dispositions to the formal EIS comments and draft dispositions to MNO VCs workshop comments. All questions were addressed verbally at the meeting.	√	√	√	√	√	√	√		√

In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
April 02, 2020 Virtual meeting	This virtual meeting between CNL (including the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the MNO (including the Manager, Lands Resources & Consultations) involved preliminary discussions on developing an LTRA.									√	
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the MNO's Manager, Lands Resources & Consultations enclosed a preliminary version of the 2020 EIS and updated IER and indicated an interest in meeting with the MNO. The letter also asked for feedback through the following three questions: • *Any additional information you have regarding traditional use (fishing, hunting, trapping, gathering, practicing cultural ceremonies).* • *Any additional information on important resources, uses, activities, values and interests to your community near the NPD site.* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights. CNL would be pleased to describe its proposed design and mitigation measures and is open to hearing about other mitigation and monitoring measures from your community.*	√	√	√	√	√	√	√	√	√	
June 05, 2020 Outgoing email	This email from CNL's Communications Officer to the MNO's Manager of Lands Resources and Consultation was to follow-up on the 2020 May 06 letter sent from CNL.										√
June 06, 2020 Virtual meeting	This virtual meeting between CNL representatives (including the Director of Corporate Communications) and the MNO (including the Manager of Lands, Resources and Consultation) involved further preliminary discussion on a LTRA.										√
September 09, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the MNO's Manager, Nuclear Energy Lands Resources and Consultations enclosed a full set of CNL's responses to the MNO's comments on the 2017 draft EIS.		√		√		√	√	√	√	
October 01, 2020 Outgoing email	This email CNL's Communications Officer to the MNO's Manager, Nuclear Energy Lands Resources and Consultations was to follow up on the September letter enclosing the full set of CNL's responses to the MNO's comments on the 2017 draft EIS.										√
October 19, 2020 Incoming email	This email from the MNO's Manager, Nuclear Energy Lands Resources and Consultations to a CNL Communications Officer was to clarify that a response to CNL's September letter, which enclosed a full set of dispositions on the MNO comments on the 2017 draft EIS for the NPD Closure Project was in draft and that the consultation committee would need to approve.									√	√
October 30, 2020 Meeting	This meeting was between CNL's Communications Officer and the MNO's Manager of Natural Resources and Consultation was to plan for the wider meeting on NPD Closure Project monitoring scheduled for November 09, 2020.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 09, 2020 Meeting	This meeting between nine representatives of the MNO (including the Manager, Lands, Resources and Consultation, the Nuclear Policy Analyst and members of the consultation committee) and five CNL staff (including the Manager of Stakeholder Relations, Communications Officers, Director of the NPD Closure Project, Manager of NPD Regulatory Approvals and an Environmental Specialist with the NPD Closure Project) focused on monitoring for the NPD Closure Project. The focus was follow-up monitoring and the potential involvement of MNO citizens in monitoring. Some questions were answered verbally and CNL shared further information on the remaining questions following the meeting. Questions and interests that arose included the following: • Is it dry? • If there is a release what is the contingency plan? • How long until we could harvest on the land? • It would be good to have a reference point for background monitoring; example? • Why not sample the dust in all four corners of the footprint? How do we ensure the dust is properly monitoring across the site? • Do you have an idea on how long it takes for groundwater to flow across the site? • Has the Province of Quebec been consulted? • Do you monitor the noise on the Quebec side? • How is water treated at CRL? • Is there an erosion plan? • Will fumes from grout effect Chimney Swifts? • Interest in citizen monitoring?			√					√	√	
November 17, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the MNO's Manager, Nuclear Energy Lands Resources and Consultations enclosed follow-up on a number of questions that arose in the earlier meeting on monitoring for the NPD Closure Project. The information provided covered the following: • Background radiation in the region; • Noise monitoring (the MNO had indicated interest in expanded noise monitoring); • Groundwater flow; • Further information on specific phases of decommissioning; • Examples what MNO involvement in monitoring could look like.	√							√	√	
November 30, 2020 Outgoing email	This email from the Director of Corporate Communications for CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations to attend CNL's virtual industry for the opportunity to learn more about CNL's operations and projects, including the NPD Closure Project.									√	√
January 11, 2021 Outgoing email	This email from CNL's Communications Officer to MNO's Manager, Nuclear Energy Lands Resources and Consultations and Nuclear Policy Analyst enclosed CNL's dispositions of the MNO's comments on the three draft follow-up monitoring plans.					√	√		√	√	
February 03, 2021 Virtual meeting	This meeting between CNL (including the Director of Environmental Protection, the Director of the NPD Closure Project, the Manager of Stakeholder Relations and Communications Officer) and the MNO (including the MNO's Manager, Nuclear Energy Lands Resources and Consultations and Nuclear Policy Analyst) was to discuss CNL's current monitoring program and where the MNO could be involved in the future with respect to the NPD Closure Project.								√	√	

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
April 15, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the MNO's Manager, Nuclear Energy Lands Resources and Consultations enclosed a preliminary list of commitments and indicated interest in meeting to discuss.									√	√
May 05, 2021 Outgoing letter	This letter from a CNL communications officer to the MNO's Manager, Nuclear Energy Lands Resources and Consultations enclosed the 2020 EIS and directed to the sections where the MNO TKLUS had been incorporated (8.9 and 9.9) for verification.									√	√
June 08, 2021 Virtual meeting	This virtual meeting between CNL (including the Manager of Stakeholder Relations and the Director of Corporate Communications), AECL (including the Director of Communications and Government Reporting), and the MNO (including the Manager, Lands Resources & Consultations) involved discussions on developing an LTRA.										√
June 15, 2021 Outgoing email	This email from a communications officer with CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations was to follow-up on the April letter.										√
June 21, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the MNO's Manager, Nuclear Energy Lands Resources and Consultations enclosed a draft summary of the MNO's interests and concerns for the NPD Closure Project for the MNO's review and verification.									√	√
June 22, 2021 Outgoing email	This email from a communications officer with CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations was to share a CNL proposal on MNO involvement in Environmental Monitoring activities.								√		
July 12, 2021 Incoming letter	This email from the MNO's Manager, Nuclear Energy Lands Resources and Consultations to a CNL Communications Officer was to provide MNO's comments on the June 21, 2021 draft summary of the MNO's interests and concerns for the NPD Closure Project letter.									√	
July 15, 2021 Virtual meeting	This meeting between the MNO's Manager, Nuclear Energy Lands Resources and Consultations and CNL (including the Manager of Regulatory Approvals for the NPD Closure Project, the Manager for ERM Stakeholder Relations and communications specialists) discussed the MNO's feedback on CNL's *Table of Interests and Concerns* and confirmed that the general topics were accurate, that commitments were in development, and that the long-term relationship agreement between CNL and the MNO would enact the commitments specific to the NPD Closure Project. It was also confirmed that no further formal response on the 2017 draft EIS comments was necessary.									√	√
August 10, 2021 Incoming email	This email from the MNO's Manager, Nuclear Energy Lands Resources and Consultations to a CNL communications officer was to provide MNO's comments on the June 22 CNL proposal on MNO involvement in environmental monitoring activities.								√		
August 12, 2021 Outgoing email	This email from a Communications Officer with CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations was to share the draft summary table of interests and concerns (attached) that was revised to reflect our conversation at the July 15, 2021 meeting. CNL added commitments to address the remaining interests and concerns of the MNO.									√	
August 19, 2021 Outgoing email	This email from a Communications Officer with CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations was to confirm that the information from the MNO Traditional Knowledge and Land Use Study has been adequately incorporated into the draft Environmental Impact Statement and confirm that CNL has captured the Valued Components (VC), which the MNO have shared with CNL on the NPD Closure Project, to date. CNL included working revisions of **Sections 8.9 and 9.9** of the EIS and Valued Components Identified by Métis Nation of Ontario through the TKLUS.	√			√					√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
August 31, 2021 Outgoing email	This email from a Communications Officer with CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations requested MNO confirmation that CNL has captured accurately the MNO summary of interests and concerns. CNL shared the updated Summary Table of Interest and Concerns, which had been updated following the July 15, 2021 meeting.									√	
September 7, 2021 Outgoing telephone call	This telephone call from a Communications Officer with CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations discussed the MNO's review of the *Table of Interests and Concerns* and how CNL planned on submitting the revised draft EIS in October, and would need feedback on the Table before then. A meeting date to discuss updating the MOU between CNL and the MNO was also discussed.										√
September 7, 2021 Outgoing email	This email from a Communications Officer with CNL to the MNO's Manager, Nuclear Energy Lands Resources and Consultations confirmed the details of the phone call and coordinated the next meeting.										√
October 6, 2021 Virtual meeting	This meeting between the MNO's Manager, Nuclear Energy Lands Resources and Consultations and CNL (including the Manager for ERM Stakeholder Relations and a Senior Communications Officer) discussed a proposed schedule of activities to amend the MOU to cover continued engagement with MNO on the NPD Closure Project and the NSDF Project.										√
October 20, 2021 Outgoing Email	This email from a Senior Communications Officer at CNL to the MNO's Manager of Lands, Resources, and Consultations (LRC) was to follow up on previous correspondence regarding the *Table of Interests and Concerns* stating: "the MNO provided verbal agreement to the interests and concerns shared and discussed (attached) at the 2021 July 15 meeting and CNL has been seeking a formal agreement in writing that these are an accurate portrayal of the MNO's interests and concerns since then." This email also shared an update on CNL's plans to submit the revised draft EIS and requested verification by November 15, 2021.									√	√
November 3, 2021 Outgoing Email	This email from a Senior Communications Officer at CNL was to follow up on an email that was sent on October 20, 2021 that included a summary of the next steps on the NSDF Project as well as the NPD Closure Project. This email was to follow up and ensure that the MNO had received this email.									√	√
December 3, 2021 Virtual Meeting	This virtual meeting between a Senior Communications Officer at CNL and the MNO's Manager of Lands, Resources, and Consultations (LRC) discussed the NSDF Project and the NPD Closure Project. The MNO confirmed knowledge that CNL was submitting the revised draft EIS for the NPD Closure Project in December 2021.										√
December 23, 2021 Letter from CNL to MNO	CNL' Director of Corporate Communications sent a letter to the MNO's Manager of Lands, Resources, and Consultations (LRC) providing MNO the opportunity to participate in future diet and harvest studies. The purpose of the letter was to advise the MNO of the opportunity to participate in a study to support the update of derived release limits for airborne and liquid emissions at the Chalk River Laboratories Site. CNL provided information on derived release limits. CNL proposed engaging MNO community members in a survey during the summer of 2022.										√
February 03, 2022 Outgoing Email	This email from a CNL Senior Communications Officer to MNO was to connect to discuss any of the information that CNL shared about Douglas Point. CNL also informed MNO that they hired a new Director of Indigenous Relations. CNL offered to coordinate a brief introductory meeting to discuss the most recent engagements with the MNO Region 7 prior to (the new member of MNO's) arrival.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
February 03, 2022 Incoming Email	This email from MNO's Manager of Nuclear Lands, Resources, and Consultations agreed to coordinate a future discussion in the next while. MNO informed CNL of a new staff person who will be the Consultation Advisor responsible for connecting with CNL hopefully starting on February 14 and MNO requested to meet at that time.										√
March 03, 2022 Outgoing Email	This email from a CNL Senior Communications Officer to MNO's (Jesse) was to inform MNO that the NPD Closure Project was working on completing all outstanding comments and the response to the MNO's Water and Archaeology Technical review was complete. CNL attached both the original letter from the MNO, dated January 23, 2019, enclosing the review, as well as the CNL's responses to the MNO's review in a word document.										√
March 03, 2022 Incoming Email	This email from MNO's Manager of Nuclear Lands, Resources, and Consultations to a CNL Senior Communications Officer was to thank CNL for the presentation and discussion about the Douglas Point Decommissioning Project on February 9, 2022. MNO noted that they had spoken with the Georgian Bay Traditional Territory Consultation Committee about initiating a long-term contribution agreement with CNL and the Committee had expressed interest and had asked MNO to reach out to CNL to begin discussions.										√
March 08, 2022 Outgoing Email	This email from a CNL Senior Communications Officer to MNO (Jesse) was to inform MNO of the inclusion of a revised column to link each of MNO's interests and concerns to a specific aspect of the project, and/or an Aboriginal and treaty right, where possible. CNL informed MNO that the interest and concerns that MNO previously verified would remain unchanged as part of the Environmental Impact Statement (EIS) and Indigenous Engagement Report that is submitted alongside the EIS. CNL asked for MNO to confirm whether they would like to verify that the revised table still reflects your interests and concerns.										√
March 16, 2022 Incoming Email	MNO (Jesse) confirmed that MNO would like to review the Summary of Interests and Concerns Table before CNL's submission to the CNSC.										√
March 16, 2022 Outgoing Email	This email from a CNL Senior Communications Officer to MNO (Jesse) was to confirm sharing a restructured copy of the table within the next 2 weeks.										√
March 30, 2022 Incoming email	This email from MNO FN to a CNL Senior Communications Officer was to inquire about the radiation protection training.										√
April 11, 2022 Outgoing email	This email from a CNL Senior Communications Officer to MNO was to inform MNO that members of the MNO are welcome to come on site and observe monitoring with CNL personnel. Observing monitoring (e.g. collecting biota, surface or groundwater samples) would provide the MNO with a very good idea of monitoring activities at the CRL site.										√
April 19, 2022 Outgoing email	This email from a CNL Senior Communications Officer to MNO attached the goals document for the GRA with a few minor comments from the ERM team at CNL. CNL offered MNO to give a call or set up a chat if there is clarification needed.										√
April 23, 2022 Outgoing email	This email from a CNL Senior Communications Officer to MNO FN attached the repackaged summary table of interests and concerns. This repackaging is based on feedback from the Canadian Nuclear Safety Commission (CNSC) on CNL's December 2021 draft EIS submission package. CNL requested that MNO review the new table and provide feedback with a potential 4 week turnaround.										√

September 08, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the MNO's Manager of Lands, Resources, and Consultations (LRC) offered a fall tour of NSDF and NPD. MNO confirmed interest and provide CNL the contact of the Consultation Advisor to coordinate with.										√
September 08, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the MNO's Consultation Advisor extended an invitation to the MNO staff and RCC to visit the Chalk River Laboratories (CRL) site and the NPD) site.										√
September 09, 2022 Incoming email	This email from the MNO's Manager of Lands, Resources, and Consultations (LRC) to CNL's Environmental Assessment Section Head confirmed that the MNO would like to offer the Diet and Harvest Study survey virtually.										√
September 09, 2022 Outgoing email	This email from CNL's Environmental Assessment Section Head to the MNO's Manager of Lands, Resources, and Consultations (LRC) confirmed that CNL would assist in the virtual Diet and Harvest Study survey. CNL requested the MNO identify participants in advance and provide them paper copies. MNO confirmed.										√
September 12, 2022 Incoming email	This email from the MNO's Manager of Lands, Resources, and Consultations (LRC) to CNL's Environmental Assessment Section Head asked if there is a deadline to complete the Diet and Harvest Study survey. CNL replied that there is no deadline for completion but CNL was hoping to conduct by the end of November 2022. To meet the deadline CNL offered to conduct the survey virtually.										√
September 22, 2022 Incoming email	This email from the MNO's Manager of Lands, Resources, and Consultations (LRC) to a CNL Senior Communications Officer replied to CNL's September 7, 2022 email regarding Radiation Protection Training. MNO asked about the length of training requested.								√		
September 28, 2022 Outgoing email	This email from CNL's Environmental Assessment Section Head to the MNO's Manager of Lands, Resources, and Consultations (LRC) asked about dates and locations for the Diet and Harvest Study survey.										√
September 22, 2022 Incoming email	This email from the MNO's Manager of Lands, Resources, and Consultations (LRC) to CNL's Environmental Assessment Section Head sharing the mail out that was shared with community members regarding the Diet and Harvest Study survey. MNO requested that CNL provide a short presentation of the NPD and NSDF Projects during the meeting. CNL confirmed.										√
October 01, 2022 Outgoing email	This email from a CNL Senior Communications Officer the MNO's Manager of Lands, Resources, and Consultations (LRC) provided information about Radiation Protection Training, staring that the training could be covered as a one hour pre-job. MNO confirmed.								√		

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
October 01, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the MNO's Consultation Advisor extended an invitation to the MNO staff and RCC to visit the Chalk River Laboratories (CRL) site and the NPD) site.										√
October 03, 2022 Outgoing Letter	This letter addressed to the MNO's Manager of Lands, Resources, and Consultations (LRC) from CNL's Director of Indigenous Relations provided a project update and the engagement status with the MNO, CNL noted that the next step to address comments for the MNO to review the final EIS. CNL believes that the next steps are to establish commitments between the MNO and CNL to ensure that all interests and concerns are addressed and tracked to resolution. CNL enclosed an updated draft set of commitments for the MNO's review. CNL offered additional capacity. CNL also proposed a meeting to establish commitments prior to December 2022. CNL requested that the MNO respond confirming their agreement to proceed with these engagement activities, or modified engagement activities.				√	√				√	
October 05, 2022 Outgoing email	This email from CNL's Environmental Assessment Section Head to the MNO's Manager of Lands, Resources, and Consultations (LRC) sent the MNO the updated Diet and Harvest Study survey. CNL asked that the survey be circulated to those participating by Zoom.										√
October 11, 2022 Incoming email	This email from MNO's Consultation Advisor to CNL's Environmental Assessment Section Head provided the agenda for the October 21, 2022 CNL Diet and Harvest Survey Community Information Session. 15 minutes were allotted for a NPD presentation.										√
October 18, 2022 Outgoing email	This email from a CNL Senior Communications Officer to MNO's Consultation Advisor confirmed receipt of the October 11, 2020 agenda. CNL asked for an idea of the number of participants. CNL also asked if a community member would be willing to speak to their harvesting and /or cultural narratives prior to the survey.										√
October 19, 2022 Incoming email	This email from MNO's Consultation Advisor to a CNL Senior Communications Officer shared that they had received 29 RSVPs for the CNL Diet and Harvest Survey Community Information Session. MNO committed to reaching our tot eh RSVPs to find is any would be interested in speaking. MNO asked CNL to provide the names of the presenters.										√
October 19, 2022 Incoming email	This email from MNO's Manager of Lands, Resources, and Consultations (LRC) to a CNL Senior Communications Officer noted that CNL's request for speakers at the Diet and Harvest Survey Community Information Session may not be possible. This is due to potential time it may take for those interested to share their experiences. CNL confirmed.										√
October 21, 2022 Outgoing email	This email from a CNL Senior Communications Officer to MNO's Consultation Advisor attached CNL's presentation for the Diet and Harvest Survey Community Information Session. CNL sent a PowerPoint version via FTP link.										√

November 15, 2022 Outgoing email	Email invitation from a CNL Senior Communications Officer to the MNO's Consultation Advisor and Manager of Lands, Resources, and Consultations (LRC) to discuss the NPD Project commitments.										√
November 23, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the MNO's Consultation Advisor and Manager of Lands, Resources, and Consultations (LRC) proposed the agenda for the October 30, 2022 meeting on NPD commitments. Proposed agenda: • LTRA status update; • Confirming NPD commitments for the MNO; • Ensure commitments are covered within LTRA.										√
November 28, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the MNO's Consultation Advisor and Manager of Lands, Resources, and Consultations (LRC) advised of the upcoming CNL supply chain event in Pembroke, Ontario. Canadian Nuclear Laboratories in partnership with the AOPFN, County of Renfrew, and Pontiac Regional County Municipality (MRC), will be hosting the "Meet and Greet: CNL Major/Strategic Supply Chain Partners. MNO confirmed receipt.										√
November 28, 2022 Incoming email	The email from a MNO community member to a CNL Senior Communications Officer requested to postpone the tour until the spring of 2023. CNL confirmed receipt.										√
November 30, 2022 Meeting	This meeting between to the MNO's Consultation Advisor and Manager of Lands, Resources, and Consultations (LRC) and CNL (including the Director of Indigenous Relations and NPD Closure Project staff) focussed on reviewing the NPD commitments and the status of the LTRA.										√
December 01, 2022 Outgoing email	This email from a CNL Communications Officer to the MNO's Consultation Advisor and Manager of Lands, Resources, and Consultations (LRC) confirmed the next steps from the 2022 November 30 meeting.										√
January 20, 2023 Outgoing Email	This email from a CNL Communications Officer to the MNO Manager, Nuclear Energy Lands Resources and Consultations to inform of the decision to postpone the submission of the NPD Closure Project's draft Environmental Impact Statement (EIS) until 2023 May to allow for additional Indigenous input. CNL proposed the next steps would be to discuss the MNO's interest and desired involvement in the NPD project.										√
January 26, 2023 Incoming Email	This email from MNO to a CNL Communications Officer with an invitation to the Métis Business Tradeshow (March 18th/19th 2023) in Midland Ontario. CNL acknowledged receipt of the invitation.										√
March 14, 2023 Outgoing Email	This email from a CNL Senior Communications Officer to the MNO Manager, Nuclear Energy Lands Resources and Consultations with CNL's Indigenous Relations Procurement Strategy.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
April 14, 2023 This email from CNL to MNO	This email from CNL Senior Communications Officer to a MNO member following up from a previous conversation from 2023 November to inquire if the MNO is still interested in attending a site visit in late spring 2023.										√
July 04, 2023 Emails	This email from CNL Communications Officer to MNO is to discuss MNO's interest in touring the NPD Site Facility. On 2023-07-06 MNO confirmed their interest in an NPD site tour.										√
July 10, 2023 Emails	This email from CNL Communications Officer to MNO is to discuss MNO's availability for an NPD site tour, and availability to first discuss the NPD Commitments. MNO confirmed some upcoming dates for an NPD commitment meeting in 2023 July.										√
July 13, 2023 Outgoing Email	This email from CNL Communications Officer to MNO is to confirm receipt of available times for the MNO and to inform them that CNL will confirm dates and send a draft agenda.										√
August 22, 2023 Emails	Email from CNL Communications Officer to MNO is to provide the draft agenda and potential tour dates for the MNO NPD and CRL site tours. CNL requested dates for the tour, and MNO noted they will send potential dates. CNL confirmed receipt of email. (5 emails).										√
September 19, 2023 Incoming Email	This email from the MNO to CNL Communications Officer is to inform CNL that there has been a lack of interest shown for a CNL site tour. MNO has asked that CNL reach out again in the spring-summer of 2024. CNL confirmed receipt.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

MNO - Mapping of Key Interests and Concerns

Table C-8 presents a mapping of how the key interests and concerns relate to detailed feedback and input from the MNO, up to March 2024.

Table C-8 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-8 Mapping of MNO Key Interests and Concerns

Topic	MNO Key Interests and Concerns	Specific feedback provided by the MNO on this interest/concern
1. Accidents & Malfunctions	(a) Effects of accidents and malfunctions including as applicable to offsite transportation activities It is important to the MNO that impacts from accidents and malfunctions be assessed, and that procedures are in place to notify and provide information to MNO citizens in the event of an accident or malfunction. This is both a site-wide and project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern about the potential accidents and malfunctions related to the proposed project. The MNO also expressed concern about offsite transportation activities in relation to this topic area.
2. Alternatives	(a) Concern about the suitability of In-situ disposal (ISD). It is important to the MNO that future land users of the NPD site are protected. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern about the suitability of in-situ disposal as an alternative specifically with respect to the ILW inventory.
	(b) Input into the Alternative Means Assessment It is important that the MNO's perspectives be taken into account in the assessment of alternatives, because the approach selected has implications for Métis people's future use of the site. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern that they were not provided an opportunity to provide input into the four proposed alternatives or the preferred approach selected.
3. Archaeology and Cultural Heritage	(a) Métis-specific Archaeology and Cultural Sites The MNO is concerned that without participation of MNO citizens, the project could potentially lack information about Métis-specific heritage resources. This is both a site-wide and project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern about the lack of involvement and lack of Métis history in the archaeology study. The MNO also requested that a Métis history section be included in the background section of future reports, when relevant to the project area.
	(b) Archaeological buffer zone and rating It is important that areas with high archaeological value are identified appropriately and protected from project-related impacts.	The MNO consultant provided supplemental review comments in January 2019, including the following comments on archaeology: • Apply a 100 m high potential buffer to the entire length of the Ottawa River shoreline within NPD property area on the historical potential map. • Change the historical potential rating outside of the project area and high potential lands within the NPD property to 'moderate'.
4. Atmospheric Environment	(a) Atmospheric study area boundaries and data It is important to the MNO that study areas are large enough to encompass intangible effects and that baseline conditions in the study areas are correctly represented. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern about the baseline data used to develop study area boundaries for the atmospheric environment. Further, the MNO expressed concern that the study area boundaries are limited and may not extend to far enough to encompass the area where intangible aspects of Métis way-of-life may be affected and where there is Métis citizens perceive there may be impacts from the project.
	(b) C-14 releases from the stack It is important to the MNO that they understand historic releases from the NPD site and implications of potential releases related to the project so they have confidence that the rights and interests of MNO citizens are upheld in relation to the environment. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern about increases in C-14 releases from the stack in recent years. The MNO also wish to understand any implications of the planned modifications to the stack.

Topic	MNO Key Interests and Concerns	Specific feedback provided by the MNO on this interest/concern
5. Baseline Characterization	(a) Inclusion of Métis-specific socio-economic baseline data and effects This is important to the MNO because the socio-economic characterization and effects assessment should include consideration of Indigenous receptors (including citizens of the Métis Nation), and this can't be done without collecting information from Indigenous Nations, communities and organizations . This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern that Metis-specific socio-economic baseline data was not included and request both collection and presentation of Métis-specific data.
	(b) Baseline soil contamination (near historic landfill) This is a concern for the MNO because it is important that the final state of the NPD site is safe to use, regardless of whether the contamination comes from the NPD Closure Project or earlier activities. This is a project-specific concern.	In their comments on the 2017 draft EIS, the MNO expressed concern about elevated soil concentrations in historic landfills.
	(c) Baseline for the Surface Water and Aquatic Environments This is important to the MNO because an understanding of current contamination in the Ottawa River is necessary in order to assess impacts on aquatic biota. It is also important to confirm that there are currently no discharges to the Ottawa River from NPD activities. This is a project-specific concern.	In their comments on the 2017 draft EIS the MNO identified a number of concerns related to the baseline conditions in both the surface water and aquatic environments including: • applicability of the current effluent monitoring plan, to Métis rights and interests; • discharges to the Ottawa River; • baseline and future chemical levels in surface water; • baseline sediment quality data.
	(d) MNO involvement in baseline data collection activities. This is important to the MNO because engagement should involve two-way communication, information-sharing, and participation in project-related activities This is a project-specific interest.	In its comments on the 2017 draft EIS, the MNO expressed interest in being involved in collection of baseline data for areas of interest.
	(e) Geological and Hydrogeological site characterization It is important to the MNO that baseline hydrogeological conditions are accurate and well understood, so that the long-term impacts of the NPD Closure Project can be accurately assessed, and management plans can be made. This is a project-specific interest.	The MNO expressed a particular interest in hydrogeology including: • the groundwater flow characteristics being different from CRL site's decommissioning project; • long term impact of groundwater on infrastructure; • groundwater management plan.
6. Engagement	(a) Meaningful engagement using best practices. It is important for the MNO to be meaningfully engaged on the project, using protocols and a workplan that are appropriate for Indigenous engagement and have been developed in consultation with the MNO. This is a project-specific concern.	Early in the engagement process, MNO expressed concern with the level of engagement and the lack of funding to support their involvement. In its comments on the 2017 draft EIS, the MNO expressed the need for Indigenous specific engagement activities and capacity to support meaningful engagement on the NPD Closure Project. The MNO have requested funding to better enable participation, including for the completion of a TKLUS.
	(b) Terminology: Use of "Métis Nation" instead of "Métis community" This is important to the MNO because the language "Métis community" minimizes the political structure and organization that the MNO has and operates under. This is both a site-wide and project-specific concern.	In its comments on the 2017 draft EIS, the MNO requested that CNL use the terminology Metis Nation instead of Metis community.

Topic	MNO Key Interests and Concerns	Specific feedback provided by the MNO on this interest/concern
7. EA Process and Methodology	(a) Effects assessment methodology It is important that impacts of concern to the MNO be considered in the assessment of effects of the project on MNO citizens. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern in regards to assessment of residual effects, the criteria used to define significance of effects, likelihood analysis; consideration of MNO values, sustainability and uncertainty and CNL's conclusion on significance of effects.
	(b) Cumulative effects This is important to the MNO because it is interested in the overall protection of the Ottawa River and the NPD site, not just the impacts of a single project. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern about the potential that the NPD Closure Project may interact with existing and reasonably foreseeable projects and activities in the vicinity specifically those occurring at the CRL site.
8. Environmental Effects and Mitigation Measures	(a) Perceived effects of the project It is important to the MNO that the assessment of effects include the potential impacts of negative perceptions from Métis citizens. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern that the assessment did not include the potential perceptive effects of the project on the rights-bearing Métis Nation.
	(b) Impacts of increased dust and other emissions, noise, traffic volumes, and changes to access including those associated with transportation activities It is important to the MNO that they have input into mitigation and monitoring of dust, noise and emissions and other impacts to Métis harvesters who may be exercising their rights in the vicinity, to confirm that effects are low as predicted and do not extend beyond the project footprint.. MNO would like input in the selection of valued components for the assessment of potential effects. This is a project-specific concern	In its comments on the 2017 draft EIS, the MNO expressed concern and interest related to impacts on the Atmospheric Environment including: • Concern with the assumption that road dust, noise and emissions effects are negligible • An interest in providing input to the monitoring and mitigation for dust, noise and emissions • An interest in the VCs selected for evaluation of effects on the atmospheric environment • Concern about effects resulting from transportation activities
	(c) Involvement of MNO in developing mitigation measures This is important because the MNO feels that consultation and their input should have been sought to ensure reduction and elimination of potential effects. This is a project-specific interest.	In its comments on the 2017 draft EIS, the MNO expressed interest in collaborating to identify mitigation measures, where applicable and in providing input into alternate mitigation measures.
	(d) Need for additional mitigation measures in the surface water, aquatic and terrestrial environments This is important to the MNO because the Ottawa River is of great importance to Métis harvesters, and because effects on vegetation and wildlife may have potential impacts on Métis rights and interests. This a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed the following concerns related to mitigation measures: • Need for additional mitigation measures specific to the aquatic environment: Ottawa River, benthic invertebrates, aquatic vegetation, Emerald shiner, White sucker and Lake sturgeon. • The mitigation measures proposed for traditional land use activities are the same as those for the aquatic and terrestrial environments. • Need for additional mitigation measures (beyond standard construction practices) specific to wildlife and vegetation.
	(e) Effectiveness of Mitigation measures It is important to the MNO that the mitigation measures address the potential impacts on Métis citizens, and that the selected measures are likely to be successful. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed that mitigation measures and follow-up programs must address the potential impacts of the project on the rights-bearing Métis Nation. They expressed concern about the likelihood of mitigation being successful.

Topic	MNO Key Interests and Concerns	Specific feedback provided by the MNO on this interest/concern
9. Indigenous Health	(a) Postclosure Safety Assessment and Indigenous Health It is important to MNO that the human health assessment reflects the lifestyle of MNO citizens. This is a project-specific concern.	The MNO has raised concerns that their traditional food consumption levels are not reflected in the human health assessment. The MNO requested separate consideration of Indigenous Health within the EIS. The MNO would like involvement in the scoping/execution of future lifestyle surveys to ensure the best response rates of Métis harvesters.
10. Métis Rights and Interests	(a) Participation and engagement related to Métis rights and interests. The MNO believes that engagement is required to ensure that CNL understands, presents and assesses any Métis Rights and Interests that may be impacted in the general and surrounding areas resulting from the project. This is both a site-wide and a project-specific interest.	Early in the engagement process, the MNO identified a lack of documentation of Métis rights and interests. The MNO have requested to be more deeply engaged in the NPD Closure Project to ensure that Métis rights are incorporated. The MNO wishes to ensure that MNO rights in the vicinity of the project are accurately presented within the EIS. The MNO would like an opportunity to provide input into the Environmental Protection Program to ensure Métis rights are reflected in the document and for the ongoing reduction of potential effects on Métis rights and interests. The MNO specifically indicated that rights and interests go beyond hunting and trapping.
	(b) Impacts on Métis rights and interests. It is important to MNO that the rights and interests of the Métis Nation be understood and upheld. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern about the assessment of impacts on Métis rights and interests including: • Impacts on Métis harvesting rights. • Significant information gaps, including Métis-specific VCs and potential perceptive effects of the project on the regional rights-bearing Métis Nation. • MNO's perception and intangible aspects of Métis way-of-life – see Row 14c.
11. Monitoring	(a) Review and input to, monitoring plans This is important to the MNO because they want an opportunity to provide input into monitoring details (e.g., frequency, location, parameters) This is a project-specific interest.	In its comments on the 2017 draft EIS, the MNO requested that they be engaged to provide input into the final scope and framework of the follow-up monitoring program. The MNO have also indicated their desire to be involved in development and design of the draft follow-up monitoring plans. The MNO expressed specific interest in the monitoring plan design related to monitoring the preferential pathway and slope between the facility and the river and environmental monitoring of sediment.
	(b) Participation in monitoring This is important to MNO because they want to ensure transparency and confidence in monitoring activities. This is a project-specific interest.	The MNO have indicated that they wish to participate in implementation of the draft follow-up monitoring plans. MNO submitted supplemental comments on CNL's draft Follow-up monitoring plans (October 2019). Within the supplemental comments, the MNO requested that their input be sought during reviews and audits of the follow-up monitoring program. There was renewed interest from the MNO in the Fall of 2020 and early in 2021 in the draft follow-up monitoring plans and opportunities for involvement in monitoring activities.
	(c) Overall process and incorporating MNO comments It is important to the MNO that their comments are considered and incorporated into EA documents, including the draft follow-up monitoring plans. This is a project-specific concern.	The MNO wants to ensure that when their comments on the EIS are addressed that relevant changes are also incorporated in the draft follow-up monitoring plans. Similarly, the MNO provided comments on groundwater characterization that should be incorporated through changes to the groundwater monitoring plan as necessary. Finally, the MNO wants to ensure that MNO traditional uses and harvesting rights are included in the EIS and incorporated into the draft follow-up monitoring plans.
	(d) Specific technical comments on Follow-up monitoring Plans It is important to the MNO that the monitoring plans reflect their input on monitoring details (e.g., frequency, location, parameters) This is a project-specific concern.	MNO submitted supplemental comments on CNL's draft Follow-up monitoring plans (October 2019). Specific technical comments include: • Groundwater benchmarks used in the Groundwater Monitoring Plan; • Evaluation and Acceptance Criteria; • Tritium as an indicator contaminant of concern; • Baseline interactions between sediment, groundwater, and surface water; • Landfill groundwater monitoring; • More detail required on sample locations and number of samples.

Topic	MNO Key Interests and Concerns	Specific feedback provided by the MNO on this interest/concern
12. Socio-Economics	(a) Consideration of Métis use and enjoyment of the land This is important to the MNO because use and enjoyment of the land are values that may be affected by the project, and should be considered in the assessment. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern that assessment of impacts to the socio-economic component needed to consider Métis use and enjoyment of the land.
	(b) Socio-economic mitigation measures and follow-up monitoring This is a concern for the MNO because it is not clear how effects related to the socio-economic environment can be mitigated and/or verified through activities in other environmental compartments. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern that the proposed mitigation measures are those typically used for construction activities and may be inadequate to address indirect socio-economic effects. Further, the MNO identified a lack of follow-up monitoring for the socio-economic environment.
13. Technical	(a) Local Study Area does not vary between environmental components This is important to the MNO because they want to ensure that potential effects on the different types of VCs have been thoroughly considered and assessed. This is a project-specific concern.	In their comments on the 2017 draft EIS the MNO expressed concern that the Local Study Area does not vary between environmental components.
	(b) Concern about whether the Institutional Control Period is long enough This is important to the MNO because they would like assurance that the end state of the NPD site will be acceptable for safely engaging in unrestricted land use. This is a project-specific concern.	In their comments on the 2017 draft EIS, the MNO expressed concern about the length of the Institutional Control Period.
	(c) Benefits to Indigenous peoples The MNO is interested in reviewing changes to the project, which is also a requirement under the CNSC's Generic EIS Guidelines. This is a project-specific interest.	In their comments on the 2017 draft EIS the MNO expressed interest in seeing the changes that have been made to the project, including benefits of these changes.
14. Traditional Land and Resource Use and Cultural Impacts	(a) Métis traditional knowledge and Métis specific information should be collected and incorporated into the EIS. It is important to the MNO that community-specific knowledge be obtained and used, to properly characterize current conditions and develop scenarios that accurately represent potential future uses of the site. This is a project specific concern.	In its comments on the 2017 draft EIS, the MNO identified a number of areas related to traditional use where the assessment could be strengthened by integration of Metis specific information including: • collection of Métis specific information related to areas of interest, via a Métis -specific traditional land use study; • integration of Métis-specific information into the EIS and IER; • consideration of activities such as fishing in the Ottawa River and Métis harvesting regions; • description of the Indigenous rights practiced in the vicinity of the project; • inclusion of geographical setting from Indigenous perspective; • description of plants and other species of traditional importance to the MNO.
	(b) Spatial boundaries for Indigenous land and resource use It is important to the MNO that the determination of study areas takes into account the actual use of the land by Metis citizens for traditional purposes. This is a project-specific interest.	In its comments on the 2017 draft EIS, the MNO expressed interest in how the spatial boundaries for traditional land and resource use were determined.

Topic	MNO Key Interests and Concerns	Specific feedback provided by the MNO on this interest/concern
14. Traditional Land and Resource Use and Cultural Impacts	(c) Impacts on Indigenous traditional activities: biophysical effects on species of importance as well as perceptive and intangible effects on Métis way of life The MNO would like to ensure that all potential effects of concern have been considered and addressed. This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concerns about impacts to Indigenous traditional activities and CNL's assessment of those impacts including: • the need to consider all potential effects outlined in *CEAA* (2012); • consideration of impacts to the Metis way-of-life; • concern that the project-interactions matrix does not capture Métis rights and interests, including qualitative aspects; • ensuring the assessment includes aquatic and terrestrial species of importance to MNO citizens; • effects on harvester perceptions and access to species such as deer and walleye; • identification of intangible effects to Métis rights and interests, including perceptive effects; • assessment of impacts on Indigenous Health (this is discussed in Row 9 (a) above).
	(d) Separate assessment of the effects to Métis rights and interests. It is important to the MNO that the EIS consider the potential effects of the project on Métis rights and interests, as they differ from those of other Indigenous Nations, communities and organizations . This is a project-specific concern.	In its comments on the 2017 draft EIS, the MNO expressed concern that a separate assessment of the effects to Metis rights and interests was needed and that TLRU information from other Indigenous Nations, communities and organizations cannot be used as a proxy for the MNO (CNL PI-203).
15. Valued Components	(a) Inclusion of VCs identified by MNO This is of interest to the MNO because these species and features are of particular importance to the MNO. The VCs selected need to consider Metis rights and interests in the assessment and the potential for interaction with the project activities. This is a project-specific concern.	The MNO expressed concern that VCs were selected without seeking feedback or input from the MNO. The MNO expressed verbally, in negotiations on scope of MOU and formally submitted comments that VCs must be representative of Metis interests (CNL PI-197, CNL PI-252. Beyond species VCs, the MNO TKLUS report participants identified a number of features within proximity to the NPD Closure Project including: • Habitat for wildlife (e.g., moose, partridge, grouse, rabbit, deer, duck, goose); • Habitat for plants (e.g., oak, ground hemlock and berries); • Small and large game harvesting areas; • Métis cultural practice site; • Trapping; • Fish harvesting areas; • Plant and Natural materials harvesting areas. In their review of the 2017 draft EIS, the MNO also noted that the selected VCs contain significant information gaps, including Métis-specific VCs and potential perceptive effects of the project on the regional rights-bearing Métis Nation (CNL PI-15, CNL PI-125, CNL PI-135, CNL PI-187).

Métis Nation of Ontario (MNO) – Summary of Interests and Concerns

Table C-9 below summarizes the key interests and concerns that the MNO have raised on the NPD Closure Project, up to March 2024, through comments submitted on the 2017 draft EIS to the CNSC or through direct discussion and engagement between MNO and CNL.

The full submission of MNO comments on the 2017 draft EIS can also be found online: Comments on the 2017 draft EIS for NPD from Métis Nation of Ontario. These comments were summarized by CNSC and included as part of the CNL Table: Consolidated Public and Indigenous Groups' Comments on the Nuclear Power Demonstration Closure Project Draft EIS: IAA - NPD - Consolidated Public and Indigenous Comments (April 2018).

Table C-9 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS, this is also discussed;
- Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

Table C-9 MNO Key Interests and Concerns

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
1. Accidents & Malfunctions	(a) Effects of accidents and malfunctions including as applicable to offsite transportation activities It is important to the MNO that impacts from accidents and malfunctions be assessed, and that procedures are in place to notify and provide information to MNO citizens in the event of an accident or malfunction. This is both a site-wide and project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL's response has been accepted by the MNO. CNL Response: CNL has heard MNO's concerns about potential accidents and malfunctions resulting from the NPD Closure Project. CNL has assessed the various accidents or malfunctions that could occur during the three phases of the project: all effects from postulated accidents or malfunctions during all three phases were found to be below regulatory limits. With respect to off-site transportation, CNL would like to clarify that there will be no off-site transportation of radioactive waste because all waste is proposed to remain on-site and grouted in the facility. There will be shipments of raw construction material to site, but these transportation activities would be consistent with other construction projects. Building a batch plant on-site significantly reduces the amount transportation of material to the site. The NPD site has an Emergency Procedure that will remain in place and be updated as required throughout the Decommissioning Execution and Institutional Controls phases of this project. This procedure focuses on the prevention, mitigation of, preparedness for, response to, and recovery from a wide range of abnormal and emergency conditions including fires, floods, hazardous spills, loss of power, earthquakes, and tornados. The Emergency Procedure also defines the actions of specific staff/roles in such events. The NPD Emergency Plan is developed and maintained in accordance with CNL's company-wide Emergency Preparedness Program that has been accepted to meet the CNSC's requirements (under REGDOC-2.10.1). In the event of an accident or malfunction, CNL's Corporate Communications may activate its own local Emergency Information Centre to disseminate information to the public. In the event a site emergency occurs and escalates leading to potential off-site consequences, a Municipal Emergency Information Centre (MEIC) will be established by the municipality to provide emergency communications for the media and the public. This process will be followed for the NPD Project. CNL is willing to discuss this process with the MNO if requested.	Where is this topic discussed in the EIS? **Section 9.12** of the EIS discusses the various accidents or malfunctions (radiological and non-radiological) that could occur during the three phases of the project. **Section 10.2** discusses CNL's Emergency Preparedness Program, which includes process for public notification in the event of an accident or malfunction that could have an impact on the public or the environment The EIS directs readers to **Section 7.4** of the Decommissioning Safety Assessment TSD, which lists many examples of safeguards that will be applied to the project. **Section 9.10.3.3** of the EIS discusses the potential impacts of increased traffic volume on traditional land and resource use, noting that the increased traffic volume is expected to be temporary and minor, and that the Ministry of Transportation (MTO) has reviewed the project and concluded that it has no traffic or transportation-related concerns with respect to the project. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved CNL considers this concern to be resolved. MNO has acknowledged and accepted CNL's response on this topic.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
2. Alternatives	(a) Concern about the suitability of In-situ disposal (ISD). It is important to the MNO that future land users of the NPD site are protected. This is a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL's response has been accepted by the MNO. CNL Response: In discussions with the MNO, CNL agreed that protection of future land users is an important concern and has addressed it. CNL has assessed the suitability of ISD for NPD, and the EIS shows that such disposal is safe for human health and the environment in the short term and long term. CNL has considered national and international standards and guidelines and continues to believe that the NPD facility has characteristics that support ISD.	Where is this topic discussed in the EIS? Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment. However, CNL has revised **Section 4.2** of the EIS since the MNO's review – details are provided in the next row.	Status: Resolved CNL considers this concern to be resolved. MNO has acknowledged and accepted CNL's responses on this topic.
	(b) Input into the Alternative Means Assessment It is important that the MNO's perspectives be taken into account in the assessment of alternatives, because the approach selected has implications for Métis people's future use of the site. This is a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL has revised the EIS to include additional information on the alternative means assessment (AMA) and findings. As requested by MNO, the AMA TSD was shared with MNO in December 2017. In August 2021, the MNO indicated that they had no further comments on this topic. CNL Response: CNL is committed to meeting with the MNO to continue to discuss the four alternatives and describe how the approach selected interfaces with MNO's vision on potential future use of the site. In particular, CNL is interested in going over the changes incorporated in the revised version of the AMA TSD with the MNO to discuss the additional quantitative analyses conducted for each of the alternatives that were considered.	Where is this topic discussed in the EIS? Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? Since the MNO's review, CNL has revised the EIS **(Section 4.2)** to include additional information from the AMA TSD, to provide greater clarity on how the AMA was completed and what the results mean. In addition, both the AMA TSD and **Section 4.2** of the EIS were updated to assess the projected radiological dose and industrial safety risk to workers for each option.	Status: Resolved The MNO indicated in a meeting in August 2021 that they had no further comments on this topic.
3. Archaeology and Cultural Heritage	(a) Métis-specific Archaeology and Cultural Sites The MNO is concerned that without participation of MNO citizens, the project could potentially lack information about Métis-specific heritage resources. This is both a site-wide and project-specific concern.	As part of the Memorandum of Understanding (MOU) established between CNL and MNO, CNL has provided funding and the MNO has provided feedback on the Stage 1 Archaeological Assessment. CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses and agrees with the MNO request that Métis history be included in future CNL reports when it is relevant to the project. CNL concurs with the MNO that a Traditional Knowledge and Land Use Study (TKLUS) is a beneficial input to the project. CNL and the CNSC jointly funded the MNO TKLUS. CNL reviewed and incorporated relevant information from the MNO TKLUS into the EIS. CNL shared the revised sections of the EIS with the MNO for feedback on the incorporation of TKLUS results. CNL also conducted an MNO TKLUS follow-up meeting/presentation in North Bay in October 2019. In August 2021, the MNO indicated that they had no further comments on this topic. CNL Response: CNL is committed to working with the MNO to identify potential information regarding Métis specific heritage resources. CNL has conducted a Stage 1 Archaeological Assessment, and shared the results with the MNO. No further archaeological work is planned for NPD. If any archaeological reports	Where is this topic discussed in the EIS? Indigenous cultural resources and ceremonies, including the presence of Métis-specific cultural sites and features, are discussed in in **Section 8.9.3** of the EIS. **Section 8.11.4** of the EIS summarizes the **Archaeology TSD,** including the findings of the Stage 1 Archaeological Assessment. What changes have been made (and where)? CNL added information from the MNO TKLUS to **Section 8.9.3** of the EIS, specifically the spiritual and cultural connection that Métis citizens have with the Ottawa River corridor.	Status: Resolved The MNO indicated in a meeting in August 2021 that they had no further comments on this topic.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		are prepared in the future, CNL will add a section on Métis history to the Background section. CNL has incorporated information on Métis-specific archaeology and cultural sites into the EIS, based on the results available from the MNO TKLUS.		
3. Archaeology and Cultural Heritage	(b) Archaeological buffer zone and rating It is important that areas with high archaeological value are identified appropriately and protected from project-related impacts.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. In August 2021, the MNO indicated that they had no further comments on this topic. CNL Response: CNL acknowledges that the NPD property, including the shoreline of the Ottawa River, carries a high level of archaeological potential and warrants protection. However, as indicated in the Stage 1 Archaeological Assessment, because there is no disturbance planned for the shoreline outside of the project footprint, there is no trigger at this time for further archaeological assessment and subsequent application of such a buffer. This does not leave the area unprotected; rather, the entire NPD property will be managed, as all CNL operated sites currently are, under CNL's Environmental Protection Program and subsequent Cultural Resource Management practices. The Stage 1 Archaeological Assessment did not identify the need for a "moderate" potential rating, based on historical information and planned project activities. However, it does recommend the following: "should any construction be planned in the future, a further Stage 1&2 assessment would be in order".	Where is this topic discussed in the EIS? **Section 8.11.4** of the EIS summarizes the **Archaeology TSD,** including the findings of the Stage 1 archaeological assessment. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved The MNO indicated in a meeting in August 2021 that they had no further comments on this topic.
4. Atmospheric Environment	(a) Atmospheric study area boundaries and data It is important to the MNO that study areas are large enough to encompass intangible effects and that baseline conditions in the study areas are correctly represented. This is a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL, AECL and the MNO are working together on an LTRA that includes collaboration in the area of environmental monitoring at CNL sites including facilitating the involvement of MNO Monitors in environmental monitoring activities at the sites. CNL Response CNL acknowledges that there is some uncertainty involved with using data from "far away" locations to represent baseline conditions, in the absence of site-specific data for NPD. However, the uncertainty is deemed to be very minor. For example, the CRL site (used to represent Regional Study Area) and NPD share similar topography, latitude and distance from the Ottawa River. In addition, conservative assumptions were made, such as using air quality from urban areas that are likely to have worse air quality than the NPD site. The EIS found that when the impact to air quality from the project is added to the baseline air quality from the more urban areas, the resulting impact is still so low that it's not considered measurable. Follow-up monitoring will take place during the project execution to verify that the impact to the environment is low, as predicted in the EIS. With respect to the effects on Métis perception or intangible aspects of Métis way-of-life, CNL is eager to learn more and discuss how these effects may be minimized, for example through participation in air monitoring activities. In addition, to address avoidance, CNL is committed to providing on-going educational and awareness opportunities, to alleviate concerns related to safety and risk.	Where is this topic discussed in the EIS? The atmospheric environment is defined in **Section 8.2** of the EIS, including Study Areas in **Section 8.2.1**. Effects to the atmospheric environment are assessed in **Section 9.2** of the EIS. The EIS does not predict any adverse residual effects on the atmospheric environment (**Section 9.2.4**). MNO involvement in follow-up monitoring programs is discussed in **Section 6.2.4.4.3** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
4. Atmospheric Environment	(b) C-14 releases from the stack It is important to the MNO that they understand historic releases from the NPD site and implications of potential releases related to the project so they have confidence that the rights and interests of MNO citizens are upheld in relation to the environment. This is a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL, AECL and the MNO are working together on an LTRA that includes collaboration in the area of environmental monitoring at CNL sites including facilitating the involvement of MNO Monitors in environmental monitoring activities at the sites. CNL looks forward to ongoing discussions with the MNO, regarding MNO input in and participation in mitigation measures and environmental monitoring activities. CNL Response: The main reason for an increase/decrease in C-14 over the years and specifically the increase between 2012 and 2015 is the frequency of operation of the ventilation. In recent years CNL has been operating the ventilation fans more frequently than earlier years because more work has been undertaken in the nuclear area, such as asbestos abatement and characterization activities. CNL only operates the ventilation units when work is being undertaken in the nuclear area. With respect to stack modifications: The potential releases from stack modification activities have been assessed and were determined to be negligible. However, CNL is open to meeting with MNO further, to discuss its concerns about avoidance behaviours and opportunities for education, awareness and involvement.	Where is this topic discussed in the EIS? The planned stack modifications are discussed in **Section 4** (Project Description). Mitigation measures related to the stack are discussed in **Section 9.6.3.2.** MNO involvement in follow-up monitoring programs is discussed in **Section 6.2.4.4.3** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
5. Baseline Characterization	(a) Inclusion of Métis-specific socio-economic baseline data and effects This is important to the MNO because the socio-economic characterization and effects assessment should include consideration of Indigenous receptors (including citizens of the Métis Nation), and this can't be done without collecting information from Indigenous Nations, communities and organizations . This is a project-specific concern.	CNL has responded in writing to MNO comments on this topic citing relevant sections of the EIS in the response. MNO has engaged CNL and AECL in a preliminary tripartite discussion on a CNL Corporate LTRA. The LTRA discussion is expected to include socio-economic supports such as an Indigenous procurement policy. CNL Response CNL acknowledges the importance of collecting and incorporating information from the MNO, including socio-economic baseline information. CNL has jointly funded the MNO TKLUS and has reviewed and incorporated information from the MNO TKLUS into the EIS. CNL is also open to receiving more socio-economic information from the MNO; this information will be documented in the Indigenous Engagement Report that supports the EIS. CNL has added a new Indigenous socio-economic component and VCs to the EIS, in order to assess socio-economic impacts of the project on these VCs. The EIS does not predict any adverse residual effects on the Indigenous socioeconomic VCs.	Where is this topic discussed in the EIS? Indigenous socio-economic baseline is presented in **Section 8.10.1** of the EIS. The assessment of effects to Indigenous socio-economic VCs is discussed in **Section 9.10.1** of the EIS. What changes have been made (and where)? CNL added information from the MNO TKLUS into **Section 6.2.4.4** of the EIS and **Section 8.10** of the EIS, containing Indigenous Socioeconomic Baseline data. In response to this and other comments, CNL introduced a new Indigenous Socio-Economic component and VCs in **Section 5.2.4** of the EIS. This is discussed further in **Section 6.3** of the EIS. **Section 9.10** of the EIS presents assessment of effects on the new Indigenous socio-economic VCs.	Status: Resolved. CNL considers that this concern will be addressed through an appropriate commitment to develop an Indigenous procurement policy as part of the LTRA.
	(b) Baseline soil contamination (near historic landfill) This is a concern for the MNO because it is important that the final state of the NPD site is safe to use, regardless of whether the contamination comes from the NPD Closure Project or earlier activities. This is a project-specific concern.	CNL has responded in writing to MNO comments on this topic citing relevant sections of the EIS in the response. CNL has revised the EIS to state that there are no chemical contaminants of potential concern in soil. In August 2021, the MNO indicated that they had no further comments on this topic. CNL Response CNL investigated the original references and determined that the text in the EIS was incorrect. CNL has corrected the text.	Where is this topic discussed in the EIS? The text in question is from **Section 5.2.2** of the EIS. What changes have been made (and where)? CNL has revised **Table 5.2-2** in **Section 5.2.2** of the EIS.	Status: Resolved. The MNO indicated in a meeting in August 2021 that they had no further comments on this topic.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
5. Baseline Characterization	(c) Baseline for the Surface Water and Aquatic Environments This is important to the MNO because an understanding of current contamination in the Ottawa River is necessary in order to assess impacts on aquatic biota. It is also important to confirm that there are currently no discharges to the Ottawa River from NPD activities. This is a project-specific concern.	CNL has responded in writing to MNO comments on this topic citing relevant sections of the EIS in the responses. CNL undertook baseline studies of benthic macroinvertebrate, sediment quality and water quality in the Ottawa River in the summer of 2020. Samples were taken upstream, downstream and adjacent to the NPD facility. CNL has clarified in its responses to MNO that discharges to the Ottawa River have been discontinued since 2017. CNL Response CNL conducts a very rigorous effluent monitoring program and is committed to ensuring that the environment around the NPD site, including the Ottawa River, is protected. The use of CSA Standards is not intended to replace ensuring Métis rights and interest are considered, but it is important to include as a well-established standard when discussing monitoring plans. CNL is happy to further discuss the monitoring plans with the MNO, including possible opportunities for MNO participation in monitoring activities. There may also be opportunities for MNO participation in collection of baseline data before commencement of the project. Capacity for MNO's involvement may be covered under the LTRA, which is currently being discussed by AECL, CNL and the MNO. To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020. The study determined that the Ottawa River benthic invertebrate community near NPD is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. CNL is planning to regularly monitor the Ottawa River water quality.	Where is this topic discussed in the EIS? **Section 8 of the EIS** presents the baseline data available so far. **Section 8.3** presents baseline surface water and sediment data. **Section 8.4** presents the aquatic environment. **Section 12 of the EIS** presents CNL's plans for monitoring of the NPD site during all phases of the project. What changes have been made (and where)? New sediment and surface water data has been added to **Section 8.3**. **Section 8.4** now includes a description of the fish habitat near NPD. The benthic macroinvertebrate community as found in the 2020 study is now described. **Section 12** of the EIS addresses the interests and concerns expressed by the MNO, and notes that additional baseline data may be required to be collected before the project commences.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
	(d) MNO involvement in baseline data collection activities. This is important to the MNO because engagement should involve two-way communication, information-sharing, and participation in project-related activities This is a project-specific interest.	CNL has responded in writing to all MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL looks forward to ongoing discussions with the MNO regarding MNO input in and participation in baseline data collection activities and other monitoring activities. These activities will be captured under the LTRA that is being established between CNL, AECL and the MNO. CNL Response: CNL is committed to providing opportunities for MNO citizens to participate in activities related to baseline data collection. CNL is planning to undertake additional monitoring of the current environment in order to establish a baseline before the NPD Closure Project begins and would welcome MNO feedback on this aspect of monitoring.	Where is this topic discussed in the EIS? **Section 6.2.4.4** of the EIS discusses CNL and MNO's interest in participation of MNO citizens in monitoring programs. It also discusses the MOU and work towards establishing a LTRA. **Section 12** of the EIS discusses Indigenous group feedback on and participation in monitoring programs. What changes have been made (and where)? CNL has expanded its discussion of MNO interests and involvement, in **Section 6.2.4.4** of the EIS.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
5. Baseline Characterization	(e) Geological and Hydrogeological site characterization It is important to the MNO that baseline hydrogeological conditions are accurate and well understood, so that the long-term impacts of the NPD Closure Project can be accurately assessed, and management plans can be made. This is a project-specific interest.	CNL has responded in writing to MNO comments related to hydrogeology citing relevant sections of the EIS in the responses. In October 2019, CNL met with MNO Councillors and staff for an NPD Closure Project update and to review CNL comment responses. A key topic in the discussion was geological site characterization. CNL Response: CNL acknowledges that the 2017 draft EIS indicated a discrepancy in flow characteristics between the NPD and NSDF EIS, due to factors like sampling density (number of samples taken), and study methodology. Since that time, CNL has completed additional geoscientific characterization work to better understand the local geology and hydrogeology. These additional findings, which are consistent with observations at the NSDF Project site, are presented in CNL's 2019 Geoscientific Characterization Report. CNL has also developed a detailed, calibrated groundwater flow model used to define hydrogeological conditions into the future to support Postclosure Safety Analysis. CNL has updated the EIS to incorporate the new hydrogeological data. With respect to long-term impacts of groundwater on the grouted NPDWF: this has been assessed. The Postclosure Safety Assessment (PostSA) technical supporting document (TSD) evaluates cases where groundwater comes in to contact with the grouted NPD facility and discharges to sediments at the base of the Ottawa River and where this groundwater discharges along the slope between the NPD facility and the Ottawa River. The predicted concentrations of contaminants in this groundwater and its discharge points are considered for the Indigenous receptor who is living a traditional self-sufficient lifestyle and are carried to the Ecological Risk Assessment (EcoRA), where risk to valued species (including those identified by the MNO in the MNO TKLUS) is evaluated. Both the EcoRA and PostSA conclude that humans and the environment remain protected. Follow up monitoring of groundwater will be used to confirm the predictions in the EcoRA and PostSA. Groundwater monitoring will commence before project approval (in order to obtain baseline data) and continue throughout the Decommissioning Execution and Institutional Controls phases of the project.	Where is this topic discussed in the EIS? **Section 8.5.5** of the EIS presents the hydrogeological baseline data. **Section 9.1.1.1** discusses the expected and gradual degradation of parts of the facility through contact with groundwater, and that this degradation is considered in the assessment of long-term safety of the facility. **Section 9.5** of the EIS presents the expected changes to the hydrogeological environment, including groundwater concentrations calculated in the PostSA TSD, and concludes that no adverse residual effects on will occur as a result of the NPD Closure Project. The predicted concentrations of contaminants in groundwater and its discharge points are considered in **Section 9.10.2** for the Indigenous receptor who is living a traditional self-sufficient lifestyle and in **Sections 9.4 and 9.6** for non-human biota. These assessments also conclude that humans and the environment remain protected. **Section 9.9** of the EIS evaluates the effects of the project on Indigenous Land and Resource use and concludes that no adverse residual effects on Indigenous land and resource use will occur as a result of the NPD Closure Project. What changes have been made (and where)? CNL updated **Section 8.5.5** of the EIS to include information that is more recent and more consistent with the NPD site. CNL updated **Section 9.5** of the EIS to incorporate the new geoscientific characterization information.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
6. Engagement	(a) Meaningful engagement using best practices. It is important for the MNO to be meaningfully engaged on the project, using protocols and a workplan that are appropriate for Indigenous engagement and have been developed in consultation with the MNO. This is a project-specific concern.	CNL heard the MNO's request for on-going meaningful engagement, and since 2016 has carried out extensive engagement with the MNO, implemented a MOU, funded information-gathering studies such as the MNO TKLUS, and carried out engagement activities with the MNO. For CNL, meaningful engagement involves listening to the citizens' concerns and making real changes to the EIS and/or to the project as appropriate, for example: • Changes to monitoring plan based on MNO feedback (see row later in this table). • Incorporation of information from the MNO TKLUS into the EIS. • Addition of VCs based on inputs from the MNO and other Indigenous Nations, communities and organizations (e.g., the Indigenous Health receptor). • Commitments to participation of Indigenous Nations, communities and organizations in future monitoring activities (see row later in this table). CNL has responded to MNO specific comments on the EIS, in writing. Some of the engagement activities that CNL has conducted specifically for the MNO include: Community information session for MNO citizens in North Bay (2019 October)	Where is this topic discussed in the EIS? **Section 6.2.4.4** of the EIS summarizes CNL engagement with MNO to date and presents information on CNL and MNO's MOU for the NSDF and NPD projects. What changes have been made (and where)? CNL has updated **Section 6.2.4.4** of the EIS (and Section 4.4 of the IER) to reflect recent and planned engagement activities to support the MNO's meaningful participation in the EA process. **Section 6.2.4.4.1** of the EIS directs the reader to the IER for a detailed listing of MNO-specific engagement activities. CNL added information from the MNO TKLUS to **Section 8.9.3** of the EIS. CNL revised the VCs to incorporate input from MNO, adding new human and ecological receptors (**Section 6.3** of the EIS).	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for ongoing engagement and participation objectives as part of the LTRA. CNL will continue to engage with the MNO, e.g., through the MOU, on the topic of meaningful engagement, including specific engagement activities.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		Focused meetings on monitoring, including monitoring involvement, with the Consultation Committee (2020 November and 2021 February) Funding for a TKLUS, including a specific VC workshop CNL, AECL and the MNO are working together on an LTRA that includes collaboration in the area of engagement and communication in order to enable MNO participation and community capacity, including providing funding for the MNO to maintain open dialogue with its citizens about Projects. CNL Response: CNL is committed to open, transparent and continuing engagement with the MNO. Since submission of the EIS, CNL has expanded its engagement with the MNO through dedicated meetings and communications. CNL and the MNO have agreed to a mutually beneficial, ongoing working relationship and to provide a process by which CNL can engage with the MNO at the local and regional levels in order to better understand any Métis Rights and Interests that may be impacted in the general and surrounding areas resulting from the project.		
6. Engagement	(b) Terminology: Use of “Métis Nation” instead of “Métis community” This is important to the MNO because the language “Métis community” minimizes the political structure and organization that the MNO has and operates under. This is both a site-wide and project-specific concern.	CNL’s Actions to Address the Concern: CNL has revised the EIS and the IER to use Métis Nation of Ontario (MNO) when referring to the governing body. A few instances of “Métis communities” or “Métis community” occur in the EIS and IER TSD when used in a similar context as is in the MNO Traditional Knowledge and Land Use Study (TKLUS) or in a historical context. For example, **Section 8.9.2.4** of the EIS (which discusses Gathering activities) states: The MNO TKLUS (KnowHistory 2019) documented that the collection of plants, berries, wood and other natural materials is a practice associated with both historical and modern day Métis communities. In August 2021, the MNO indicated that they had no further comments on this topic. CNL Response CNL acknowledges the difference and is committed to using the correct terminology in the EIS and supporting documents.	Where is this topic discussed in the EIS? The MNO is discussed throughout the EIS, appearing most frequently in **Sections 6.2.4.4, 6.3, 8.9 and 9.9**. What changes have been made (and where)? CNL has revised the language throughout the EIS. It appears mostly in **Sections 6.2.4.4, 6.3, 8.9 and 9.9**.	Status: Resolved. The MNO indicated in a meeting in August 2021 that they had no further comments on this topic.
7. EA Process and Methodology	(a) Effects assessment methodology It is important that impacts of concern to the MNO be considered in the assessment of effects of the project on MNO citizens. This is a project-specific concern.	CNL has responded in writing to the MNO’s comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL is willing to participate in discussions with MNO focused on these concerns. CNL response CNL acknowledges the MNO’s concerns about the EA process and methodology, in particular: the process for determination of significance; consideration of likelihood of residual effects; success of mitigation measures; consideration of societal values and sustainability; measures to address uncertainty; and conclusions on significance. The criteria used for the evaluation of significance are from the CNSC (2020) Regulatory Document 2.9.1, Environmental Protection: Environmental Principles, Assessments and Protection Measures. CNL is willing to present to the MNO its process and findings on the environmental effects of the project and explain and discuss the process and thresholds for determination of significance of adverse residual effects.	Where is this topic discussed in the EIS? **Section 9.1.2** of the EIS explains the methodology used for the determination of significance of residual effects. It also presents the criteria used for the evaluation of significance, which are from the CNSC (2020) Regulatory Document 2.9.1, Environmental Protection: Environmental Principles, Assessments and Protection Measures. **Section 11** of the EIS, Conclusion on Significance, discusses the assessment findings. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
7. EA Process and Methodology	(b) Cumulative effects This is important to the MNO because it is interested in the overall protection of the Ottawa River and the NPD site, not just the impacts of a single project. This is a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: CNL acknowledges the MNO's concern about the effects on the Ottawa River and NPD site from various activities in the past, present and future. As discussed in the EIS and outlined in the technical guidance Assessing Cumulative Environmental Effects under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2018), a cumulative effects assessment is only required to be undertaken for residual effects of the project. For all environmental components, since it was determined that no adverse residual effects are expected to occur from the NPD project, there is no potential for the occurrence of cumulative effects, including no potential for synergistic and/or additive effects. CNL will undertake follow-up monitoring of the environment including the Ottawa River to verify the predictions of the EIS. CNL looks forward to ongoing discussions with the MNO regarding MNO participation in environmental monitoring activities.	Where is this topic discussed in the EIS? **Section 9.13** of the EIS describes the process for evaluating cumulative effects and presents CNL's assessment of cumulative effects for the NPD Closure Project. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
8. Environmental Effects and Mitigation Measures	(a) Perceived effects of the project It is important to the MNO that the assessment of effects include the potential impacts of negative perceptions from Métis citizens. This is a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL is attempting to address these concerns by: (i) Incorporating information from MNO's TKLUS and MNO's VC workshop into the EIS. (ii) involving the Indigenous Nations, communities and organizations, including MNO, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective; and (iii) developing an Indigenous-driven risk-informed communications program for the NPD Closure Project, to promote understanding of the EIS results, and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern. CNL Response: CNL acknowledges MNO's concerns about perceived effects from the NPD site. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. This will potentially result in additional lands being freed-up for traditional harvest. CNL stands by its conclusion that the project will not interfere with traditional activities nor impact biological resources upon which they are dependent. However, CNL is open to increased engagement, education and participatory involvement in monitoring activities at CNL operated sites to help alleviate any concerns.	Where is this topic discussed in the EIS? **Section 8.9** of the EIS discusses presents specific information about the MNO obtained from the MNO TKLUS report. **Section 9.9.5** of the EIS discusses CNL's understanding and approach towards negative perceptions associated with the NPD Closure Project. What changes have been made (and where)? CNL added content from the MNO TKLUS report to the EIS **(Sections 6.3 and 8.9).** The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests (including MNO input) have been incorporated into the VCs selected for the NPD Closure Project.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
8. Environmental Effects and Mitigation Measures	(b) Impacts of increased dust and other emissions, noise, traffic volumes, and changes to access including those associated with transportation activities It is important to the MNO that they have input into mitigation and monitoring of dust, noise and emissions and other impacts to Métis harvesters who may be exercising their rights in the vicinity, to confirm that effects are low as predicted and do not extend beyond the project footprint. MNO would like input in the selection of valued components for the assessment of potential effects. This is a project-specific concern	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL, AECL and the MNO are working together on an LTRA that includes collaboration in the area of environmental monitoring at CNL sites including facilitating the involvement of MNO Monitors in environmental monitoring activities at the Sites CNL looks forward to ongoing discussions with the MNO, regarding MNO input in and participation in mitigation measures and environmental monitoring activities. CNL Response: CNL understands the MNO's concerns about project impacts from noise, dust and emissions, and from transportation-related impacts such as noise, traffic, changes to routes and access, and other inconveniences. The EIS assesses potential effects related to dust and noise nuisance, loss of connection, safety of harvesting and consuming local foods, and changes to access and identified no significant adverse effects. The EIS assesses the traffic and transportation effects on traditional land and resource use. The EIS notes that the increased traffic volume on the highway is expected to be temporary and minor, and noise related to this transportation is expected to be very minor and temporary. No residual adverse effects are predicted. CNL has developed mitigation measures for the protection of the atmospheric environment. For example, CNL has planned comprehensive dust suppression techniques and is willing to work with the MNO to explore further ways to minimize effects on nearby land users such as harvesters. The construction area for the project is surrounded by a larger restricted area where traditional harvesting does not occur. No large plumes of dust are anticipated to be released from the project. In addition, follow-up monitoring of the environment will be undertaken to verify the EIS predictions of no significant adverse effect and to confirm that mitigation measures are effective. With respect to noise, a baseline noise survey took place in 2020. Eleven locations around the NPD site were monitored, as well as one location offsite, in Swisha which is the nearest community to the NPD site, located approximately 1 km northwest of the NPD site. Baseline noise on the NPD site was similar to a quiet rural area (≤ 45 dBA), with slightly higher noise measured near Highway 17 (the entrance to the NPD site) and in Swisha. Noise will be monitored during the Decommissioning Execution phase of the project and CNL would welcome MNO input and involvement in noise monitoring activities. CNL is eager to learn more about the exercise of Métis rights and how ambient noise can affect perceived and actual use of the project area (e.g., impact on MNO harvesting timing windows).	Where is this topic discussed in the EIS? The atmospheric environment is defined in **Section 8.2** of the EIS and effects on the atmospheric environment are discussed in **Section 9.2**. Mitigations for the atmospheric environment and additional context on hazardous substances have been included in **Section 9.2.3** and are summarized in **Section 10.** The EIS does not predict any adverse residual effects on the atmospheric environment (**Section 9.2.4**). **Section 9.9.3.3** of the EIS discusses the effect of increased traffic volume from the project on traditional land and resource use. There are no adverse residual effects predicted. **Section 12** of the EIS summarizes the draft Follow-up Monitoring Plans. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
8. Environmental Effects and Mitigation Measures	(c) Involvement of MNO in developing mitigation measures This is important because the MNO feels that consultation and their input should have been sought to ensure reduction and elimination of potential effects.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL has revised the EIS to include mitigation measures specifically for Indigenous Socio-economic and Health and Traditional Land and Resource Use. CNL is willing to host workshops to gather MNO feedback on effects and mitigation measures.	Where is this topic discussed in the EIS? **Section 6.2.4.4** of the EIS discusses CNL and MNO's interest in participation of MNO citizens in development of mitigation measures. It also discusses the MOU and work towards establishing a LTRA. A full list of mitigation measures is presented in **Table 10.3-1** of the EIS. Some examples of mitigation measures are	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to seek and incorporate MNO input on mitigation measures, as part of the MOU.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	This is a project-specific interest.	CNL Response: CNL agrees that MNO input into mitigation measures will be valuable. Since these comments were submitted, the MNO and CNL have signed an MOU. Within this framework, CNL will seek to work together with the MNO regarding their input on alternate mitigation measures. CNL is committed to providing opportunities for MNO citizens to identify mitigation measures. The project is also eager to collaboratively discuss the list of mitigation measures proposed for the NPD Closure Project.	misting to control dust, and site sweeps of work areas to determine if Species at Risk are present (e.g., milksnakes, bats, monarchs). What changes have been made (and where)? CNL has added mitigation measures for Indigenous Land and Resource Use to **Section 9.9.3.2** of the EIS, and for Indigenous Socio-Economic and Health in **Section 9.10.1.3.2** of the EIS. CNL has expanded its discussion of MNO interests and involvement, in **Section 6.2.4.4** of the EIS.	Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
8. Environmental Effects and Mitigation Measures	(d) Need for additional mitigation measures in the surface water, aquatic and terrestrial environments This is important to the MNO because the Ottawa River is of great importance to Métis harvesters, and because effects on vegetation and wildlife may have potential impacts on Métis rights and interests. This a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. The MNO has reviewed the Environmental Monitoring Plan reports and submitted technical comments. CNL and MNO have discussed them once, and plan to conduct a more thorough discussion of all the MNO comments on follow-up monitoring at a subsequent meeting. CNL looks forward to future meetings with the MNO to resolve all comments on the draft follow-up monitoring plans. CNL Response: CNL appreciates that the aquatic environment and terrestrial environments are very important to the Métis citizens. CNL has developed mitigation for the protection of both the Ottawa River (as part of the Surface Water Environment), aquatic species (as part of the Aquatic Environment) and wildlife and vegetation (as part of the Terrestrial Environment). CNL is open to considering additional mitigation measures. In addition, follow-up monitoring of the environment will be undertaken to verify the EIS predictions of no significant adverse effect and to confirm that mitigation measures are effective. In response to concerns that CNL has proposed the same mitigation measures for the terrestrial and aquatic environments, as for minimizing potential effects on trapping, hunting, fishing and gathering of Indigenous Nations, communities and organizations. This is because those mitigation measures are needed in order to prevent effects on plants, wildlife and fish upon which resource harvest is based. They are not the only mitigation measures employed. CNL prepared three draft Follow-up Monitoring Plans, which provide more detail on the proposed monitoring for the NPD Closure Project. One of the plans, the Environmental Follow-Up Monitoring Plan, describes the planned monitoring of Ottawa River water, sediment, fish and benthic macroinvertebrates. To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020. The study determined that the Ottawa River benthic invertebrate community near NPD is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. This study can be repeated when decommissioning is complete, to verify if the project has had an impact. CNL is planning to regularly monitor the Ottawa River water quality before the project begins.	Where is this topic discussed in the EIS? Mitigation measures for the protection of the surface water, aquatic and terrestrial environments are discussed in **Sections 9.3.3.2, 9.4.3.2 and 9.6.3.2** of the EIS. They are also summarized in **Section 10** of the EIS. **Section 12** of the EIS summarizes the draft Follow-up Monitoring Plans. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
8. Environmental Effects and Mitigation Measures	(e) Effectiveness of mitigation measures It is important to the MNO that the mitigation measures address the potential impacts on Métis citizens, and that the selected measures are likely to be successful. This is a project-specific concern.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. The MNO has also reviewed the Environmental Monitoring Plan reports and submitted technical comments. CNL and MNO have discussed these comments once, and plan to conduct a more thorough discussion of all the MNO comments on follow-up monitoring at a subsequent meeting. CNL looks forward to future meetings with the MNO to resolve all comments on the draft follow-up monitoring plans. CNL Response: CNL agrees with MNO that it is important to develop mitigation measures that are likely to be successful at reducing potential impacts. CNL has used information from the MNO TKLUS to develop and/or confirm mitigation measures that will reduce impacts on Métis citizens. With respect to the likelihood of mitigation being successful, most of the mitigation measures identified in the EIS are for activities in the Decommissioning Execution phase. These consist of standard mitigation measures for those activities (e.g., demolition, construction, transportation, storage of chemicals) and reflect industry best management practices. As such, these mitigation measures are assumed to be effective. The remaining mitigation measures consist of in-design mitigation measures. These are features included in the project design for the purpose of pre-empting possible environmental effects, such as the grout used to fill the structure restricts contaminant release from the NPD disposal facility. In order to reduce the uncertainty of the characteristics of these design features, the assessment includes sensitivity analysis to understand how much the impact to the environment would change if scenarios are changed. In addition, follow-up monitoring of the environment will be undertaken to verify the EIS predictions of no significant adverse effect and to confirm that mitigation measures are effective.	Where is this topic discussed in the EIS? Mitigation measures for the protection of the surface water, aquatic and terrestrial environments are discussed in **Sections 9.3.3.2, 9.4.3.2 and 9.6.3.2** of the EIS. They are also summarized in **Section 10** of the EIS. **Section 12** of the EIS summarizes the draft Follow-up Monitoring Plans. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
9. Indigenous Health	(a) Postclosure Safety Assessment and Indigenous Health It is important to MNO that the human health assessment reflects the lifestyle of MNO citizens. This is a project-specific concern.	CNL has provided funding to MNO through an MOU to ensure that the MNO can be meaningfully engaged in the NPD regulatory review process. Under the MOU was the provision of capacity to undertake a TKLUS. The MNO's TKLUS was submitted to CNL in February 2019. CNL reviewed and discussed the MNO TKLUS report with the MNO at engagements starting in February 2019. CNL has incorporated findings from the MNO TKLUS into the EIS, including addition of an Indigenous receptor for the assessment of health effects. CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: CNL has added an Indigenous receptor group to the PostSA TSD. CNL also added a separate section on Indigenous Health.	Where is this topic discussed in the EIS? With respect to Indigenous Health, Indigenous consumption of country foods is considered under Human Health (**Section 8.8 and 9.8** of the EIS) and CNL has added a stand-alone section on Indigenous Health (**Section 8.10.2** and **9.10.2** of the EIS). What changes have been made (and where)? An Indigenous receptor was added to the human health assessment in the PostSA and EIS.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		In the 3rd iteration of the PostSA TSD issued in March 2020, CNL included a Potential Exposure Group consisting of a family of self-sufficient Indigenous receptors in the NPD Area. The exposure profile in the postclosure period was developed based on a traditional Indigenous lifestyle pre-European contact (SENES 2014). This lifestyle results in a more cautious dose estimate than that based on current day lifestyle, where some food is store-bought and likely not from the contaminated area. The EIS does not predict any adverse residual effects to human health or Indigenous health.		confidence and trust in CNL's assessment.
10. Métis Rights and Interests	(a) Participation and engagement related to Métis rights and interests. The MNO believes that engagement is required to ensure that CNL understands, presents and assesses any Métis Rights and Interests that may be impacted in the general and surrounding areas resulting from the project. This is both a site-wide and a project-specific interest.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL has changed the terminology in the EIS to reference Indigenous rights. The MNO and CNL have signed an MOU. Together the two organizations have agreed to a mutually beneficial, ongoing working relationship and to provide a process to which CNL can engage with the MNO at the local and regional levels in order to better understand any Métis Rights and Interests that may be impacted in the general and surrounding areas around the projects. Canadian Nuclear Laboratories and the MNO are jointly working to establish additional engagement opportunities under this MOU. The MNO has also reviewed the Environmental Monitoring Plan reports and submitted technical comments. CNL and MNO have discussed these comments once, and plan to conduct a more thorough discussion of all the MNO comments on follow-up monitoring at a subsequent meeting. CNL looks forward to future meetings with the MNO to establish commitments for MNO involvement in monitoring. <u>CNL Response:</u> The EIS recognizes the MNO's assertion of rights in the vicinity of the NPD site. MNO, MNO North Bay, MNO Mattawa Métis, and MNO Sudbury (included via the Mattawa/Lake Nipissing Traditional Territory Consultation Committee) are identified in **Table 6.2-1**. In order to enable ongoing meaningful engagement with the MNO, CNL supported participation through a MOU with the MNO. Through the MOU, the MNO completed a TKLUS; the MNO shared the report with CNL in April 2019 and which contained information that CNL incorporated into the EIS. Trapping and hunting remain as VCs, along with fishing, gathering, and cultural resources & ceremonies under the Traditional Land and Resource Use component. CNL welcomes MNO's feedback on the planned monitoring program. CNL and the MNO have agreed to conduct a more thorough discussion of all the MNO comments on follow-up monitoring at a future meeting.	<u>Where is this topic discussed in the EIS?</u> **Section 6.2.4** of the EIS discusses CNL's willingness to involve Indigenous Nations, communities and organizations, including the MNO, in its monitoring programs. The follow up monitoring program is described at a high level in **Section 12** of the EIS, with significant details developed compared to the 2017 draft EIS. <u>What changes have been made (and where)?</u> **Section 6** of the EIS includes reference to MNO's stated rights in the vicinity of the project. CNL has changed the terminology in the EIS to reference Indigenous rights.	<u>Status:</u> Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
10. Métis Rights and Interests	(b) Impacts on Métis rights and interests. It is important to MNO that the rights and interests of the Métis Nation be understood and upheld. This is a project-specific concern.	CNL has responded in writing to MNO comments related to assessment of impacts on rights citing relevant section of the EIS as part of the comment response. CNL is continuing its efforts to address this concern by: (i) Involving the Indigenous Nations, communities and organizations, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective. (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL, AECL and the MNO are working towards establishing a Long-Term Relationship Agreement (LTRA) that includes support for MNO involvement and participation in environmental monitoring. The MNO indicated in a meeting in August 2021 that they had no further comments on this topic. <u>CNL Response:</u> CNL acknowledges MNO's concerns about assessment of impacts to rights and traditional land and resource use, driven by distrust in the safety of the land and water. CNL is open to increased engagement, education and participatory involvement in monitoring activities at its sites to address these concerns. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. This solution has the potential to result in additional lands being freed up for traditional harvest or other uses by Indigenous peoples or the public. CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. Ultimately, the decision of impacts to rights rests with the CNSC. It is CNL's understanding that the CNSC will engage directly with MNO on a rights assessment related to the NPD Closure Project. As the proponent of the project holding the responsibility to inform and engage the MNO, CNL will support that process where needed.	<u>Where is this topic discussed in the EIS?</u> **Sections 6 and 8** of the EIS present information about Indigenous rights. The EIS does not predict any adverse residual effects to traditional land and resource use (**Section 9.9.3.5**). <u>What changes have been made (and where)?</u> **Sections 5, 6, 8 and 9** of the EIS now reference Indigenous and/or treaty rights to be inclusive of Métis rights and interests.	<u>Status:</u> Resolved. The MNO indicated in a meeting in August 2021 that they had no further comments on this topic.
11. Monitoring	(a) Review and input to, monitoring plans This is important to the MNO because they want an opportunity to provide input into monitoring details (e.g., frequency, location, parameters) This is a project-specific interest.	Follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to the MNO. CNL has committed to involving Indigenous Nations, communities and organizations in its environmental monitoring programs and to hosting workshops in spring 2022 to gather more feedback on the draft follow-up monitoring plans. CNL has responded in writing to MNO comments related to review and input to monitoring plans and met with the MNO in February 2021 to further discuss MNO's involvement in long-term monitoring.	<u>Where is this topic discussed in the EIS?</u> CNL has indicated that it is willing to involve the MNO in its monitoring programs (**Section 6.2.4.4.3**). Sediment monitoring locations are discussed in the draft Environmental Monitoring Plan, and in **Section 9.3.5.2** and **Section 12** of the EIS. The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans.	<u>Status:</u> Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL Response: Potential contaminant migration through the preferential groundwater flow pathway (i.e., pipe trench) is assessed in the PostSA, as well as the EcoRA. Both the EcoRA and PostSA conclude that humans and the environment remain protected. Additionally, the draft follow-up monitoring plan proposes several wells along the preferential pathway for groundwater flow. Sediment monitoring locations are proposed in the draft Environment Monitoring Plan. Only the "primary" monitoring locations are shown (i.e., the triggered monitoring locations were not shown). The draft Environmental Monitoring Plan explains that sediment sampling locations would be co-located with surface water monitoring locations, if triggered.	What changes have been made (and where)? No changes have been made to the EIS in response to this interest.	mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
11. Monitoring	(b) Participation in monitoring This is important to MNO because they want to ensure transparency and confidence in monitoring activities. This is a project-specific interest.	CNL has indicated to the MNO willingness to collaborate and engage with interested Indigenous Nations, communities and organizations on environmental monitoring activities specific to the NPD Closure Project and the NPD site. CNL, AECL and the MNO are working together on an LTRA that includes collaboration in the area of environmental monitoring at CNL sites including facilitating the involvement of MNO Monitors in environmental monitoring activities at the Sites. CNL is open to discussing with the MNO the preferred ways of MNO involvement in monitoring plan design, implementation and communication of changes. CNL has responded in writing to MNO comments on this topic and met with the MNO in February 2021 to further discuss MNO's involvement in long-term monitoring. CNL Response: CNL is committed to involving the Indigenous Nations, communities and organizations, including MNO, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help build confidence that the decommissioning strategy and mitigation measures are effective.	Where is this topic discussed in the EIS? CNL has indicated that it is willing to involve the MNO in its monitoring programs (**Section 6.2.4.4.3**). The follow up monitoring program is described at a high level in **Section 12** of the EIS with significant details developed compared to the 2017 draft EIS. These details come through the development of the three draft follow-up monitoring plans for effluent, environment and groundwater. What changes have been made (and where)? No changes have been made to the EIS in response to this concern.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
	(c) Overall process and incorporating MNO comments It is important to the MNO that their comments are considered and incorporated into EA documents, including the draft follow-up monitoring plans. This is a project-specific concern.	Follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to the MNO. CNL has committed to involving Indigenous Nations, communities and organizations in its environmental monitoring programs and to hosting workshops in spring 2022 to gather more feedback on the draft follow-up monitoring plans. CNL met with the MNO in November 2020 to provide an overview presentation on the draft follow-up monitoring plans for the NPD Closure project with focus on monitoring aspects that were raised through MNO's comments on the draft EIS. CNL has responded in writing to MNO comments on this topic and met with the MNO in February 2021 to further discuss MNO's involvement in long-term monitoring. CNL Response: CNL has been working with the MNO to share more detailed information on follow-up monitoring through the provision of three draft follow-up monitoring plans. The MNO has provided feedback on the three drafts and CNL is looking at how to best incorporate this feedback. The monitoring plans were prepared as drafts to reflect the fact that CNL is seeking input on the plans, including through engagement with the MNO. There is an opportunity to update these plans with additional feedback from the MNO and others. Additional groundwater characterization and site data have been undertaken and added to the EIS.	Where is this topic discussed in the EIS? CNL has indicated that it is willing to involve the MNO in its monitoring programs (**Section 6.2.4.4.3**). The follow up monitoring program is described at a high level in **Section 12** of the EIS with significant details developed compared to the 2017 draft EIS. These details come through the development of the 3 draft follow-up monitoring plans for effluent, environment and groundwater. What changes have been made (and where)? The EIS was updated to include an expanded description of traditional uses, and harvesting rights related to Traditional Land Use.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
11. Monitoring	(d) Specific technical comments on Follow-up monitoring Plans It is important to the MNO that the monitoring plans reflect their input on monitoring details (e.g., frequency, location, parameters) This is a project-specific concern.	CNL met with the MNO in November 2020 to provide an overview presentation on the draft follow-up monitoring plans for the NPD Closure project with focus on monitoring aspects that were raised through MNO's comments on the draft EIS. CNL has responded in writing to MNO comments on this topic and met with the MNO in February 2021 to further discuss MNO's involvement in long-term monitoring. CNL Response: CNL has been working with the MNO to share more detailed information on follow-up monitoring through the provision of three draft follow-up monitoring plans. The MNO has provided feedback on the three drafts and CNL is looking at how to best incorporate this feedback. In the absence of CCME standards for groundwater, the groundwater monitoring plan uses Health Canada and MECP standards. Tritium is used as an indicator contaminant of concern due to its mobility in groundwater, which means that tritium would be the first contaminant seen flowing out of the facility. However, other parameters, gross beta and gross alpha, will also be measured. Groundwater near the landfills has been assessed through comprehensive campaigns in 2014 and 2017 and no groundwater impacts were noted related to the landfills. CNL has also conducted additional baseline surveys of sediment quality and benthic macroinvertebrates.	Where is this topic discussed in the EIS? The follow up monitoring program is described at a high level in **Section 12** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this concern.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
12. Socio-Economics	(a) Consideration of Métis use and enjoyment of the land This is important to the MNO because use and enjoyment of the land are values that may be affected by the project and should be considered in the assessment. This is a project-specific concern.	CNL has responded in writing to MNO comments on this topic citing relevant sections of the EIS in the response. CNL has added a new Indigenous socio-economic environmental component and VCs, in order to address these concerns. CNL Response CNL agrees that use and enjoyment of the land is an important consideration. Therefore, CNL has added a new Indigenous socio-economic component to the EIS. Use and enjoyment of the land is one of the VCs for this component, alongside several other socio-economic VCs specific to Indigenous Nations, communities and organizations including the MNO. The EIS does not predict any adverse residual effects on the Indigenous socioeconomic VCs.	Where is this topic discussed in the EIS? Indigenous socio-economic VCs are presented in **Section 5.2.4** of the EIS, and baseline is presented in **Section 8.10.1** of the EIS. The assessment of effects to Indigenous socio-economic VCs is discussed in **Section 9.10.1** of the EIS. What changes have been made (and where)? In response to this and other comments, CNL introduced a new Indigenous Socio-Economic component and VCs in **Section 5.2.4** of the EIS. This is discussed further in **Section 6.3** of the EIS.	Status: Resolved. CNL believes that these concerns are addressed through additional VCs and revisions to the EIS.
12. Socio-Economics	(b) Socio-economic mitigation measures and follow-up monitoring This is a concern for the MNO because it is not clear how effects related to the socio-economic environment can be mitigated and/or verified through activities in other environmental compartments. This is a project-specific concern.	CNL has responded in writing to MNO comments on this topic citing relevant sections of the EIS in the response. The MNO and CNL have signed an MOU and are working towards establishing a LTRA. Within this framework, CNL will seek to work together with the MNO regarding their feedback on alternate mitigation measures, and MNO participation in monitoring activities. CNL Response The reason why the EIS identifies no mitigation measures for land use is because a decision hasn't yet been made on the future land use designation of the unaffected areas of the NPD site. The NPD property belongs to AECL, a federal Crown corporation. Once CNL completes the decommissioning of the NPDWF, AECL will look at the future of the lands and consider input from Indigenous Peoples (as described in **Section 4.3.1.9** of the EIS). In the meantime, CNL is willing to discuss this topic with the MNO to better understand the indirect socio-economic effects from land use. As discussed at the 2019 October 23 meeting with the MNO Consultation Committee, CNL is also preparing a document which elaborates on CNL's plan for site restoration after	Where is this topic discussed in the EIS? **Section 9.10.1.3.2** of the EIS describes the proposed mitigation measures for the Indigenous Socio-Economic environment. The EIS does not predict any adverse residual effects on the Indigenous socioeconomic environment. **Section 9.10.1.5** of the EIS discusses follow-up and monitoring for this component. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be addressed through an appropriate commitment to develop an Indigenous procurement policy and support MNO involvement in environmental monitoring to be established as part of the LTRA.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		decommissioning is complete. When the document is complete, CNL will share it with the MNO in order to seek feedback on site restoration plans. With respect to follow-up monitoring for effects to the socio-economic environment: CNL's approach involves verifying effects in the socio-economic environment through other environmental components: The negative impacts are primarily nuisance effects (dust, noise) on use and enjoyment of private property, occurring during the Decommissioning Execution phase. Ensuring that the environmental impact from dust and noise is minimized through air quality monitoring is a way to minimize these negative impacts. Potentially positive economic and employment benefits to MNO citizens have also been identified. Some discussions have occurred on the types of economic opportunities associated with the NPD Closure Project (e.g., MNO participation in environmental monitoring). CNL is committed to further discussions on this topic with the MNO, including how to verify potential positive effects, perhaps through tracking of participation of MNO citizens in environmental monitoring.		
13. Technical	(a) Local Study Area does not vary between environmental components This is important to the MNO because they want to ensure that potential effects on the different types of VCs have been thoroughly considered and assessed. This is a project-specific concern.	CNL has responded in writing to MNO comments on this topic citing relevant sections of the EIS in the response. CNL Response: Early in the assessment process, the Local Study Area was chosen to be the NPD property as a convenient estimate of this area, with the intention of increasing the boundary if required, based on the results of the assessment. In **Section 9** of the EIS, the assessment confirmed that there are no measurable effects for any environmental component beyond the Local Study Area.	Where is this topic discussed in the EIS? **Section 5.2.1** of the EIS explains the general selection of study areas. The study areas selected for each environmental compartment are presented in **Section 8** of the EIS (e.g., **8.2.1** for Atmospheric Environment, **8.3.1** for Surface Water Environment, etc.). Study areas for Traditional Land and Resource Use are presented in **Section 8.9** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
	(b) Concern about whether the Institutional Control Period is long enough This is important to the MNO because they would like assurance that the end state of the NPD site will be acceptable for safely engaging in unrestricted land use. This is a project-specific concern.	CNL has responded in writing to MNO comments on this topic citing relevant sections of the EIS in the response. CNL Response: CNL understands MNO's concern about the length of the Institutional Control period being insufficient. CNL is proposing a minimum of a 100-year Institutional Control period; however, this time period could be extended much longer and will be based on regulatory approval and public and Indigenous engagement at that time. The PostSA TSD demonstrates that beyond the Institutional Controls period, under all scenarios, the impact on the public, Indigenous and the environment is negligible.	Where is this topic discussed in the EIS? The phases of the project are introduced in **Section 3.2** of the EIS. Temporal Boundaries are discussed in **Section 5.2.1.2.** CNL's plans for the Institutional Controls phase are also discussed throughout the EIS, e.g., in **Section 4.1 (Project Description), Section 9 (Effects Assessment) and Section 12 (Follow-up Program).** What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
13. Technical	(c) Benefits to Indigenous peoples The MNO is interested in reviewing changes to the project, which is also a requirement under the CNSC's Generic EIS Guidelines. This is a project-specific interest.	The MNO and CNL have signed an MOU. Together the two organizations have agreed to a mutually beneficial, ongoing working relationship and to provide a process to which CNL can engage with the MNO at the local and regional levels in order to better understand any Métis Rights and Interests that may be impacted in the general and surrounding areas around the projects. CNL Response CNL has revised the EIS to incorporate MNO feedback shared through the context of the MOU and includes a summary of how public and Indigenous feedback has impacted decisions made on the project.	Where is this topic discussed in the EIS? **Section 6.3.1 of the EIS** summarizes changes that have been made to the project based on feedback from the public and Indigenous Peoples. What changes have been made (and where)? **CNL added discussion to Section 6.3.1** of the EIS, summarizing changes that have been made to the project based on feedback from Indigenous Peoples. CNL added and evaluated new Indigenous health and traditional land and resource use VCs (**Sections 6.3 and 9.9** of the EIS).	Status: Resolved. CNL considers that this concern will be addressed through an appropriate commitment to develop an Indigenous procurement policy as part of the LTRA.
14. Traditional Land and Resource Use and Cultural Impacts	(a) Métis traditional knowledge and Métis specific information should be collected and incorporated into the EIS. It is important to the MNO that community-specific knowledge be obtained and used, to properly characterize current conditions and develop scenarios that accurately represent potential future uses of the site. This is a project specific concern.	CNL sent two letters asking specific questions of MNO to align with the requirements of *CEAA* (2012) Section 5(1)(c). These questions included: • Do you have any members that currently practice traditional activities such as trapping, hunting, fishing and/or gathering, near the two projects? • Does [the MNO], or any members, have sites of ceremonial significance in close proximity [of NPD], or more generally, any cultural activities near [the NPD site]? CNL contributed funds for the MNO to undertake a TKLUS, which was completed in February 2019. CNL has incorporated findings from the MNO TKLUS into the EIS and shared the revised sections of the EIS with the MNO for feedback on the incorporation of TKLUS results. CNL has responded in writing to MNO comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL is looking forward to continuing to work with the MNO to ensure that information on the Métis way-of-life is incorporated into the project. CNL Response: CNL agrees that Métis-specific information and traditional knowledge from the MNO and other Indigenous Nations, communities and organizations should be integrated into the EIS. Since receiving this feedback, CNL has contributed funding to the preparation of a TKLUS from the MNO and has integrated the findings and concerns into the EIS. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that in the future there is an interest to re-establish traditional use activities on the NPD site. CNL has incorporated important Métis-specific information into the EIS, from sources such as the MNO Traditional Knowledge and Land Use (TKLUS) study as well as findings from the Valued Components (VC) workshop. Examples are as follows: • Species of important traditional value to the Métis have informed the Valued Components selected for the project. Based on MNO feedback, moose and berries were added as VCs in the EIS. • Fish species identified in the MNO TKLUS (walleye, bass, trout) were assessed in the EcoRA TSD, which concludes that there is a negligible impact to fish from the NPD	Where is this topic discussed in the EIS? **Section 8.9** of the EIS presents information about traditional land and resource use, including specific information about the MNO (**Section 8.9.2.2.4**). The assessment of effects to traditional land and resource use VCs is discussed in **Section 9.9** of the EIS. What changes have been made (and where)? CNL added information from the MNO TKLUS to **Section 8.9.3** of the EIS, including Métis harvesting regions. The potential impacts of the project on traditional land and resource use (including perceptive and other intangible effects) are discussed in **Section 9.9** of the EIS. CNL added content from the MNO TKLUS report to the EIS **(Sections 6.3 and 8.9).** The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		Closure Project. Fishing in the Ottawa River is assessed in the EIS as a traditional land and resource use VC. • With respect to plant species of importance: CNL reviewed the MNO TKLUS and noted the following plant species of value: wintergreen, blueberries, raspberries, chaga, choke cherries, fiddleheads, and trees suitable for the traditional Métis craft of canoe building (cedar, oak, ash and yellow birch).Of these species, blueberries, raspberries, maple trees, eastern white cedar, white ash and (white) birch are noted as observed on the NPD property in Appendix B of the Ecological Land Classification (ELC) TSD. The EIS has been updated to include these species of interest of the MNO. CNL is always open to providing a tour of the site to MNO citizens if there is interest in plant species in the forested areas of the NPD site.		
14. Traditional Land and Resource Use and Cultural Impacts	(b) Spatial boundaries for Indigenous land and resource use It is important to the MNO that the determination of study areas takes into account the actual use of the land by Metis citizens for traditional purposes. This is a project-specific interest.	CNL has responded in writing to the MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response For the assessment of effects on traditional land and resource use, CNL selected a Local Study Area that extends beyond NPD property boundaries, including Crown land in Ontario and Quebec, and the Ottawa River. If any effects were to be experienced, they would occur in the selected Local Study Area. If required, based on the results of the assessment, the boundaries of the Local Study Area could be extended. In **Section 9** of the EIS, the assessment confirmed that there are no measurable effects for any environmental component beyond the Local Study Area. Enlarging the Local Study Area would not change these findings. Similarly, the Regional Study Area boundaries were chosen to include the expected area of possible effects. The assessment, which was conducted per *CEAA* (2012) requirements, found that no measurable effects on traditional land use VCs in the Regional Study Area are expected from the project. The Local Study Area covers possible Métis harvest area on the Ottawa River and the Regional Study Area includes some crown land in which some Métis harvesters might practice traditional activities.	Where is this topic discussed in the EIS? **Section 5.2.1** of the EIS explains the general selection of study areas. The study areas selected for each environmental compartment are presented in **Section 8** of the EIS (e.g., **8.2.1** for Atmospheric Environment, **8.3.1** for Surface Water Environment, etc.). Study areas for Traditional Land and Resource Use are presented in **Section 8.9** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
	(c) Impacts on Indigenous traditional activities: biophysical effects on species of importance as well as perceptive and intangible effects on Métis way of life The MNO would like to ensure that all potential effects of concern have been considered and addressed. This is a project-specific concern.	CNL has sent two targeted letters asking specific questions of MNO to align with the requirements of *CEAA* (2012) Section 5(1)(c). CNL has responded in writing to MNO comments on impacts on Indigenous traditional activities citing relevant section of the EIS as part of the comment response. CNL is continuing its efforts to address these concerns by involving the Indigenous Nations, communities and organizations, including MNO, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective CNL incorporated information from the MNO TKLUS study into the EIS and has revised the EIS to include new Indigenous Socioeconomic & Health components, each with distinct VCs of interest to the MNO. CNL is willing to review the project-interactions matrix with the MNO to ensure all interactions are correctly identified and that the matrix properly captures qualitative aspects such as Métis perceptions and way-of-life. For example, CNL is willing to learn more about Métis harvesters' rights, perceptions and concerns about access to hunting species such as white-tailed deer.	Where is this topic discussed in the EIS? The EIS discusses Métis rights and interests and negative perceptions of the project as key concerns from the MNO, in **Section 6.2.4.4** and in **Section 9.9** within the EIS. The EIS discusses concerns about potential loss of connection to land and water (e.g., feeling of discomfort or concern), and loss of land and water use in **Section 9.9.5** within the EIS. **Section 8.9** of the EIS presents information about traditional land and resource use, including specific information about the MNO (**Section 8.9.2.2.4)**. **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs. **Section 9.1.1.1** of the EIS presents the future exposure scenarios and groups that are considered in the PostSA TSD.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that in the future there is an interest to re-establish traditional use activities on the NPD site CNL has assessed the potential effects of the project on several VCs, including those of importance to the MNO. With respect to potential impacts on species of importance and perceptions of Métis way-of-life, CNL is eager to learn more and discuss how these effects may be minimized. The Ecological Risk Assessment Technical Support Document (EcoRA TSD) also assessed species of value identified by the MNO. For example, fish species identified in the MNO TKLUS (walleye, bass, trout) were assessed in the EcoRA TSD, which concludes that there is a negligible impact to fish from the NPD Closure Project. Similarly, the EcoRA TSD was updated to include terrestrial species of value identified by the MNO (e.g., moose, goose, partridge, turkey, berries). The MNO and CNL have signed a Memorandum of Understanding (MOU). Together the two organizations have agreed to a mutually beneficial, ongoing working relationship and to provide a process to which CNL can engage with the MNO at the local and regional levels in order to better understand any Métis Rights and Interests that may be impacted in the general and surrounding areas around the projects. CNL is looking forward to continuing to work with the MNO to ensure any effects on the Métis way-of-life are incorporated into the applicable project phase. CNL is also committed to ongoing communications and involving the MNO in environmental monitoring which may help improve perceptions of the NPD site and NPD Closure Project. CNL Response: CNL acknowledges MNO's concerns about potential impacts on the rights of the MNO and other Indigenous Nations, communities and organizations to practice traditional activities around the NPD site. CNL has assessed potential effects related to dust and noise nuisance, loss of connection, safety of harvesting and consuming local foods, and changes to access and identified no significant adverse effects. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the MNO and other Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm the predictions of the EIS. The PostSA TSD addresses the potential for concerns about loss of connection to land and water, and about food safety. The PostSA and EIS (and other supporting studies) have demonstrated that, there are no concerns about the accessibility or safety of the NPD site in the long term based on several different future use scenarios, including self-sufficient Indigenous receptors. The EIS concludes that no adverse residual effects on Indigenous health, socio-economics, and land and resource use will occur as a result of the NPD Closure Project. The proposed activities will result in an enhancement of current conditions at the NPD site and will improve the ability to practice traditional activities in the area surrounding the NPD site. These findings, which will be confirmed by monitoring, may reduce concerns about loss of connection to land and water, and about food safety.	What changes have been made (and where)? Findings from the MNO TKLUS study and more recent engagement activities have been incorporated into **Sections 5, 6, 8 and 9** of the EIS as follows: In **Section 5** of the EIS, CNL added new Indigenous Health and Socio-economic components and VCs and assessed project interactions. **Table 6.3-3** was added to the EIS, summarizing VCs identified as important in the MNO TKLUS, and how they have been represented in the EIS. CNL expanded the description of traditional uses in **Section 8.9** of the EIS based on information from the MNO TKLUS. CNL evaluated the new Indigenous health and socio-economic VCs and the traditional land and resource use VCs in **Section 9.9 and 9.10** of the EIS.	

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
14. Traditional Land and Resource Use and Cultural Impacts	(d) Separate assessment of the effects to Métis rights and interests. It is important to the MNO that the EIS consider the potential effects of the project on Métis rights and interests, as they differ from those of other Indigenous Nations, communities and organizations . This is a project-specific concern.	CNL has responded in writing to the MNO comments on the EIS, describing how Métis-specific information has been collected (e.g., the MNO TKLUS and VC Workshop) and incorporated into the EIS. CNL Response CNL acknowledges that the citizens of the Métis Nation have distinctive cultural perceptions, ways of life and activities. CNL notes that the practice of Indigenous assessments under *CEAA* (2012) is to not assess individual Indigenous Nations, communities and organizations separately. However, CNL has updated the EIS to incorporate the information obtained from the MNO TKLUS and meetings with the MNO (including information about Métis traditional land use and perceptions) and to address VCs identified by the MNO.	Where is this topic discussed in the EIS? **Section 6.2.4.4** of the EIS discusses the Métis-specific information obtained from the MNO as part of engagement activities. **Section 8.9** of the EIS presents a description of traditional land and resource uses, including information incorporated from the MNO TKLUS. **Table 6.3-3** was added to the EIS, summarizing VCs identified as important in the MNO TKLUS, and how they have been represented in the EIS. The potential impacts to these VCs are assessed in **Section 9** of the EIS, including: **Sections 9.4 and 9.6** for wildlife VCs, **Section 9.9** for Indigenous health and socio-economic VCs and **Section 9.10** for the traditional land and resource use VCs. What changes have been made (and where)? Findings from the MNO TKLUS study and more recent engagement activities have been incorporated into **Sections 5, 6, 8 and 9** of the EIS as follows: In **Section 5** of the EIS, CNL added new Indigenous Health and Socio-economic components and VCs and assessed project interactions. **Table 6.3-3** was added to the EIS, summarizing VCs identified as important in the MNO TKLUS, and how they have been represented in the EIS. CNL expanded the description of traditional uses in **Section 8.9** of the EIS based on information from the MNO TKLUS. CNL evaluated the new Indigenous health and socio-economic VCs and the traditional land and resource use VCs in **Section 9.9 and 9.10** of the EIS.	Status: Resolved. CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for monitoring and engagement to be established as part of the LTRA. Continued engagement between CNL and the MNO may result in additional mitigation measures or commitments that support MNO involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.
15. Valued Components	(a) Inclusion of VCs identified by MNO This is of interest to the MNO because these species and features are of particular importance to the MNO. The VCs selected need to consider Metis rights and interests in the assessment and the potential for interaction with the project activities. This is a project-specific concern.	With funding support from the CNSC and CNL, the MNO completed a Traditional Knowledge and Land Use (TKLUS) study, which was shared with CNL in February 2019. Findings from the MNO TKLUS study have been incorporated into the EIS. CNL and the CNSC provided capacity funding to the MNO to conduct a Valued Components (VC) workshop which was also submitted to CNL in 2019. Findings from the VCs study have been incorporated into the EIS. In April 2019, CNL met with MNO Councilors and staff for a NPD Closure Project update, including a presentation on proposed NPD VCs. The VCs presentation included definition and identification, types of VCs, approach and selection of NPD VCs and the MNO VCs addressed in the NPD EIS. All questions were addressed verbally at the meeting. This	Where is this topic discussed in the EIS? **Section 6.3** of the EIS captures VCs identified by Indigenous Nations, communities and organizations, including mapping of Indigenous VCs to the effects assessment. **Table 6.3-1(c)** shows the new VCs added to the assessment and **Table 6.3-3** of the EIS highlights how VCs identified by MNO are represented by the species that are evaluated in the NPD EIS. The EIS includes an expanded description of traditional uses in **Section 8.9**.	Status: Resolved The MNO indicated in a meeting in August 2021 that they had no further comments on this topic.

Topic	MNO Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		meeting also included a review and discussion of the draft dispositions to MNO VCs workshop comments. CNL also held a community information session in North Bay for MNO citizens. MNO citizens were able to discuss and share feedback on VC, TKLUS, and the NPD Closure Project in general with CNL representatives. CNL has also responded in writing to all MNO's comments on this topic, citing relevant sections of the EIS as part of the comment responses. In August 2021, the MNO indicated that they had no further comments on this topic. <u>CNL Response:</u> CNL agrees that VC selection should consider Metis rights and interests. CNL has contributed funding to the preparation of a MNO TKLUS and a targeted VC workshop and has integrated findings and into the EIS. CNL initially created a Master List of Candidate Valued Components by reviewing relevant reference documents and applying EA process and site knowledge. These candidate VCs include biota such as fish or birds, as well as abiotic qualities such as cultural and heritage sites, or socio-economic entities such as fishing. CNL provides rationale for including or not including species as a VC. The VCs selected for the NPD Closure Project reflect a wide range of Indigenous interests. Many of the interests and concerns raised by Indigenous Nations, communities and organizations, correspond directly or indirectly to the VCs selected for the project. Based on Indigenous group feedback received during engagement activities, CNL has added several human and non-human VCs that were identified as being of importance to Indigenous Nations, communities and organizations. Berries, mushrooms, mink, river otter, weasel, red fox, moose and monarch butterflies were added as VCs, as well as soil quality, groundwater quality, groundwater flow and several Indigenous socio-economic and Indigenous health VCs. In some cases, no new VCs were added, because direct, representative or related VCs that encompass the value or interest of the Indigenous Nation, community or organization were already included in the assessment. CNL includes a detailed table (**Table 6.3-1 (c)**) that shows how the interests and concerns and specific species VCs identified by the MNO are considered and captured by CNL's assessment.	**Section 9.6.3.2** describes the mitigation, monitoring and follow up activities for the Terrestrial Environment VCs. **Section 9.9** describes the VCs related to Traditional Land Use, including the rationale, the mitigation, monitoring and follow-up activities related to the Traditional Land Use VCs. The EIS does not predict any adverse residual effects to traditional land and resource use (**Section 9.9.3.3**). The EIS does not predict any residual effects for the terrestrial environment (**Section 9.6.3.3**). <u>What changes have been made (and where)?</u> CNL has developed a detailed table for **Section 6.3** of the EIS that captures VCs of Indigenous Nations, communities and organizations and demonstrates how they are either directly or indirectly assessed in the EIS and shared this with MNO for comment on November 4, 2021. With respect to the VCs indicated by the MNO, some were added to the EIS, and others were represented by species that CNL was already evaluating as VCs. The EIS also includes an expanded description of existing traditional uses.	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Appendix C.4 – Record of Engagement and Tables of Interests and Concerns for the Algonquin Anishinabeg Nation Tribal Council (AANTC)

This appendix provides a complete record of all engagement between CNL and AANTC from June 2016 to March 2024 (Table C-10). Table C-10 includes the date and method of the communication/engagement, the topics discussed and participants. The table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement is a mapping of how the summary of interests and concerns were compiled (Table C-11), as well as a summary of interests and concerns raised by AANTC (Table C-12).

Section 6.2.4.5.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and the AANTC.

Table C-10 Record of Engagement with the Algonquin Anishinabeg Nation Tribal Council (AANTC)

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Director General of the AANTC introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	√
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Director General of the AANTC inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of AANTC's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Do members of the AANTC have traditional territory near the NSDF and/or NPD Closure Project?* • *What is the history of the AANTC using the areas around the two projects?* • *Do you have any members that currently live in close or reasonable proximity to either of the projects?* • *Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does the AATNC have sites of cultural significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the AANTC and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
April 26, 2017 Meeting	This meeting occurred in Maniwaki, Quebec with representatives from the AANTC (including the Grand Chief and the Director General), CNL (including the Director of Corporate Communications and the Director of Environmental Protection), the CNSC (including the Participant Funding Program Administrator) and representatives from two member First Nations of the AANTC – KZA and KFN. CNL shared information in English and French and heard some interests and concerns from the AANTC. Information shared on the NPD Closure Project included: • Site location; • Project components; • Timeline; • Species at risk; • Proposed end state; • Safety barriers (how the environment will remain protected).			√	√					√	
November 15, 2017 Outgoing email	This email from a communications officer with CNL to the Director General of the AANTC enclosed links to the full draft EIS, an interactive “public-friendly” executive summary of the draft EIS, the CNSC’s public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a communications officer to the Director General of the AANTC enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: *“CNL would be pleased to update information in this current draft with input from your community.”*	√	√	√	√	√	√	√	√	√	
December 14, 2017 Incoming email	This email from the AANTC’s consultant to CNL’s Director of Corporate Communications requested a tour of the NPD site and more information on the existing groundwater and surface water conditions at the site, as well as annual compliance and monitoring information. This was one of the first indications of the AANTC’s interest in monitoring.	√								√	
December 19, 2017 Outgoing email	This email from a communications officer with CNL to the AANTC’s Director General and the AANTC consultant sharing the requested information (the two most recent ACMRs and the Updated Groundwater Modeling Report), as well as all the technical support documents to the draft EIS.	√	√		√		√	√		√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
January 11, 2018 Meeting	This meeting between six representatives of CNL on the NPD Closure Project (including the Decommissioning Manager, a hydrogeological subject matter expert and a communications officer) and the Director General of the AATNC and the AANTC consultant included a site visit at NPD. Discussions and presentations covered the following topics: • An overview of the project; • Current hydrology and surface water conditions; • Groundwater modelling; • Postclosure Safety Assessment. The AANTC's consultant also brought forward a number of information requests and questions at this meeting, related to the following: • Derived Release Limits for the NPD site; • Monitoring locations and groundwater flow on a map; • Surface water generated from precipitation; • Hydrogeological characterization of the site; • Tritium; • Licensing information; • Interim end state; • Former decommissioning plans.	√	√	√	√		√	√	√	√	
January 22, 2018 Outgoing email	This email from a communications officer with CNL to the AANTC consultant was in follow-up to the meeting at the beginning of January. CNL shared 17 documents and written responses to the questions the AANTC consultant had brought forward on January 11, 2018.	√			√					√	
February 13, 2018 Letter to the CNSC	This letter was addressed to the CNSC from the Grand Chief of the AANTC and copying the Director of Corporate Communications. The letter enclosed the AANTC's comments on the Project Description, which outlined the AANTC's interests in the following: • Alternatives; • Baseline Characterization; • Monitoring; • Technical; • EA Process and Methodology; • EIS – Language.		√		√					√	
February 15, 2018 Incoming letter	This letter from the Grand Chief of the AANTC to the CEO of CNL requested that CNL cease liquid effluent releases from the NPD site.									√	
March 08, 2018 Outgoing letter	This letter from the CEO of CNL to the Grand Chief of the AANTC provided context on the releases from the NPD site and shared information on how the releases fall within safe regulatory limits.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 09, 2018 Outgoing email	This email from CNL staff to the AANTC Director General and their consultant provided an additional annual monitoring report (2017 ACMR), which had been requested by the AANTC.	√								√	
December 05, 2019 Outgoing email	This email from a communications officer with CNL to the AANTC's consultant was in follow-up to the AANTC's previously identified areas of interest by sharing seven documents related to the following; • Surveillance during the institutional control period; • Geocharacterization; • Draft follow-up monitoring plans.	√					√		√	√	
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
March 23, 2020 Incoming email	This email from the AANTC consultant to CNL's Director of Corporate Communications inquired about the updated timeline for the project.			√							
March 25, 2020 Outgoing email	This email from CNL's Director of Corporate Communications to the AANTC's consultant was in response to the previous email and provided updates on the project timeline for the NPD Closure Project, the EA process and regulatory timelines. The letter also indicated interest in meeting.									√	√
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the AANTC Director General enclosed a preliminary version of the 2020 EIS and an updated IER and indicated an interest in meeting with the AANTC to discuss the previously shared documents in December 2019, as well as the AANTC's comments on the 2017 draft EIS. This letter also asked for feedback in the following seven areas: • *Do any AANTC communities have additional information that they would like to provide in the context of traditional territory near the NPD site? (Based on the above noted value placed on the Ottawa River, CNL would be interested to learn of community practices near the NPD project as they pertain to traditional use and modern day harvesting).* • *Do the AANTC communities have any members who currently live close or in reasonable proximity to the NPD site?* • *Do any AANTC communities have historical and/or current traditional practices near the NPD site, specifically we are interested in AANTC communities' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies? (Recognizing the Ottawa River as a component on which the AANTC places a high value, CNL is interested in knowing if the AANTC can describe any member use in close proximity to the NPD site).* • *Do any AANTC communities have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to AANTC communities near the NPD site.* • *If there is use in close proximity to the NPD site, is current AANTC community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.*	√	√		√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 14, 2020 Incoming letter	This letter from Kebaowek First Nation Chief and the AANTC Grand Chief was addressed to Prime Minister Trudeau outlining concerns with inconsistencies in the EA processes which included the NPD Closure Project. CNL's Director of Corporate Communications was copied on the letter.					√					
May 26, 2020 Outgoing email	This email from a communications officer with CNL to the Director General of the AANTC indicated interest in pursuing a contribution agreement with the AANTC to support their participation in the environmental assessment process for the NPD Closure Project.										√
May 28, 2020 Incoming email	This email from the Director General of the AANTC to CNL staff indicated that the AANTC were interested in being involved in the EA process and would be interested in support for continued participation.									√	
June 12, 2020 Incoming email	This email from the AANTC consultant to CNL staff requested a hard copy of 2020 draft EIS to support their review on behalf of the AANTC.									√	
June 17, 2020 Virtual meeting	This meeting between eight CNL representatives (including the Director of the NPD Closure Project, the Manager of Regulatory Approvals and the Manager of Stakeholder Relations) and five representatives of the AANTC (including the Grand Chief, the Director General, a policy consultant with KFN, an economic development officer and a consultation coordinator with the AANTC) was not considered engagement or consultation by the AANTC. It focused on how CNL could support AANTC participation in the environmental assessment process through a contribution agreement or other formal mechanism.									√	
June 24, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC Director General was to follow-up on items from the virtual meeting in June.										√
July 16, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC Director General shared an overview presentation on the NPD Closure Project and inquired on a follow-up meeting with respect to the contribution agreement discussions.										√
July 25, 2020 Incoming email	This email from the AANTC consultant to a communications officer with CNL was to confirm that they were beginning review of the 2020 draft EIS.										√
July 29, 2020 Incoming email	This email from the AANTC consultant to a communications officer with CNL was to request a number of supplementary documents in hard copy to assist in their review of the 2020 draft EIS.			√	√					√

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 29, 2020 Outgoing emails	These two emails from a communications officer with CNL to the AANTC's consultant were to confirm that the following documents would be mailed out: • Groundwater Modelling TSD, REV 0; • Geosynthesis TSD, REV 1; • Environmental Site Assessment Report; • 2020 Resaturation Modelling Report; • Draft Effluent Follow-Up Monitoring Plan; • Draft Environmental Follow-Up Monitoring Plan; • Draft Groundwater Follow-Up Monitoring Plan.	√					√		√	√	
August 14, 2020 Outgoing email	This email from CNL staff to the AANTC Director General inquired on a follow-up meeting with respect to the contribution agreement discussions.										√
August 26, 2020 Incoming letter	This letter from the AANTC and Kebaowek First Nation to the Minister of Natural Resources, copying CNL and the CNSC, indicated dissatisfaction with the regulatory process for a number of projects including the NPD Closure Project.					√					
August 31, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC Director General inquired on a follow-up meeting with respect to the contribution agreement discussions.										√
September 01, 2020 Outgoing letter	This letter from CNL's Manager of ERM Stakeholder Relations to the AANTC Director General enclosed CNL's draft responses to the Algonquin of Anishinabeg Nation Tribal Council's (AANTC) comments on the 2017 draft EIS and inquired on a meeting with the AANTC.		√		√					√	
September 03, 2020 Incoming email	This email from the AANTC Director General to a communications officer with CNL stated that the AANTC was not interested in meeting until the letter to the Minister sent in August had been addressed.									√	
September 04, 2020 Incoming email	This email from the AANTC consultant to a communications officer with CNL was to confirm their receipt of the responses sent on September 01 and to confirm that these responses would be considered in their review of the 2020 draft EIS.										√
October 02, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC Director General enclosed a French translation of CNL's draft response to the AANTC comments on the 2017 draft EIS.		√		√					√	
October 26, 2020 Incoming email	This email from the AANTC consultant to a communications officer with CNL responded to the CNL responses to AANTC comments sent on September 01, 2020 with a number of follow-up questions relating to effluent, waste water management and groundwater.		√		√					√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
October 28, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC consultant responded to the AANTC consultant's questions from October 26, 2020.		√		√					√	
October 30, 2020 Incoming email	This email from the AANTC consultant a communications officer with CNL had a few further clarifying questions on waste water management.		√		√					√	
November 05, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC consultant responded to the clarifying questions on waste water management.		√		√					√	
November 05, 2020 Incoming letter	This letter from the Minister of Natural Resources to the AANTC Grand Chief and Kebaowek First Nation Chief responded to the letter of August 2020. CNL's Director of Corporate Communications was copied.					√					
November 18, 2020 Incoming email	This email from the AANTC consultant to a communications officer with CNL was to inquire on further information related to waste water management.		√		√					√	
November 18, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC consultant confirmed that CNL would provide more information and offered a virtual meeting to discuss the issue further.		√		√					√	
November 27, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC consultant provided the requested information to address the question from November 18.		√		√					√	
January 11, 2021 Incoming letter	This letter from the AANTC's Grand Chief and Kebaowek FN Chief to the Minister of Natural Resources (copying CNL's Director of Corporate Communications) outlined concerns with the resolution of problems regarding supporting Indigenous participation for CNL and CRL-based projects. The letter requested a meeting to discuss issues in detail and arrive at mutually satisfactory conditions supporting Indigenous consultation and engagement.					√					
January 19, 2021 Outgoing email	This email from a communications officer with CNL to the Director General of the AANTC offered a meeting and further discussion on a contribution agreement.										√
April 12, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Director General of the AANTC enclosed a preliminary list of commitments and indicated interest in meeting to discuss.										√
April 22, 2021 Incoming letter	This letter from the Grand Chief of the AANTC and the Chief of KFN to CNL's Manager of Stakeholder Relations indicated that neither was in agreement with the list of commitments and indicated that engagement with the AANTC and KFN was essential.									√	

Environmental Impact Statement - NPD Closure Project

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
April 30, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Grand Chief of the AANTC and the Chief of KFN shared that the letter was not intended to provide a final set of commitments and CNL was interested in engaging with the AANTC and KFN to determine a mutually agreed upon set of commitments.									√	
May 06, 2021 Outgoing email	This email from a communications officer with CNL to a consultation coordinator with KFN (copying the Director General of the AANTC) followed up on the previous letter.										√
May 27, 2021 Outgoing email	This email to the consultation coordinator with the AANTC from a communications officer with CNL was to determine who the primary point of contact with the AANTC was.										√
June 21, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Director General of the AANTC enclosed a draft summary of the AANTC"s interests and concerns for the NPD Closure Project for the AANTC's review and verification.									√	√
July 5, 2021 Outgoing email	This email from a communications officer with CNL to the Director General of the AANTC was to follow-up on the June 21, 2021 letter.										√
July 13, 2021 Outgoing email	This email from a communications officer with CNL to a consultation coordinator with the AANTC was to follow-up on the June 21, 2021 letter.										√
July 14, 2021 Outgoing email	This email from a communications officer with CNL to the AANTC's general mailbox was to follow-up on the June 21, 2021 letter and to seek a point of contact.										√
August 12, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the KFN Chief and AANTC Grand Chief enclosed CNL's response to the July 15, 2021 letter from AANTC's Grand Chief and the KFN Chief. CNL's response included information on the role of CNL in the EA process, how CNL documents comments from the AANTC and KFN on the NSDF and NPD Closure Project, CNL's willingness to a draft letter of Intent and draft process Agreement for AATNC and KFN, information on a regional assessment, the opportunity to provide into follow-up monitoring, and CNL's response to the request to include the letter of July 15, 2021 in the IAA registry. This letter also indicated a need for any additional feedback on the Summary of Interests and Concerns to be brought forward by August 31, 2021 in order to be reflected in the NPD revised draft EIS.									√	√
October 21, 2021 Outgoing Email	This email from a CNL Senior Communications Officer to the AANTC consultation coordinator and the Director General sought confirmation that the AANTC's interests (attached in the email) on the NPD Closure Project were accurate and up to date. CNL informed AANTC of the new timeline for submission of the revised draft EIS and the need to receive any feedback on AANTC's summary of interests and concerns by November 15, 2021.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
March 08, 2022 Outgoing email	This email from a CNL Senior Communications Officer to AANTC consultation that the NPD Closure Project had to revise how they presented the summary table of interests and concerns and requested that the AANTC verify that the new table still reflects their interests and concerns. CNL requested that AANTC review the table within the next 2 weeks.										√
April 18, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the AANTC Consultation Coordinator was to extend an invitation to Industry Day on June 2, 2022.										√
May 06, 2022 Outgoing email	Email invitation to AANTC to the CNL Industry Day at the Chalk River Laboratories on June 2, 2022 to promote the broader engagement between CNL's nuclear industry partners and our local supply chain.										√
October 03, 2022 Outgoing letter	This letter addressed to the Director General of the AANTC from CNL's Director of Indigenous Relations provided a project update and the engagement status with the AANTC. CNL stated it is committed to incorporating the ANNTC's interests and concerns into the EIS. CNL provided an engagement status and next steps, including a site visit and establishing commitments to ensure that all interests and concerns are addressed and tracked to resolution. CNL offered to discuss capacity and establish commitments before December 2022. CNL requested that the ANNTC respond confirming their agreement to proceed with the engagement activities, or modified engagement activities.									√	
October 03, 2022 Outgoing email	Email from a CNL Senior Communications Officer to the Director General of the AANTC attached the NPD Project's updated draft set of commitment for the ANNTC's review.									√	
October 26, 2022	Email from CNL Senior Communications Officer to the Director General of the AANTC following up on a letter sent from CNL's Director of Indigenous Relations about CNL's NPD Closure Project and if they would like to discuss further.									√	
November 23, 2022 Outgoing telephone call	Telephone call from a CNL Senior Communications Officer to the general inbox for the AANTC stating CNL was following up on October 3, 2022 letter for NPD Closure Project. CNL left a message.									√	
January 20, 2023 Outgoing email	This email from a CNL Senior Communications Officer to the AANTC (including, AANTC Consultation AANTC Director General) to inform of the decision to postpone the submission of the NPD Closure Project's draft EIS until 2023 May to allow for additional Indigenous input. CNL proposed the next step would be to discuss the ANTC's interest and desired involvement in the NPD project.										√
March 14, 2023 Outgoing email	This email from a CNL Senior Communications Officer to the AANTC (including, AANTC Consultation AANTC Director General) sharing CNL's Indigenous Relations Procurement Strategy.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

March 16, 2023 Outgoing email	This email from a CNL Communications Officer to AANTC Consultation is to confirm with AANTC that CNL accurately recorded the interests and concerns of AANTC related to the NPD Closure Project. CNL shared the current version of the AANTC Interests and Concerns Table (AANTC I&C) for AANTC verification. CNL also included a mapping table that indicates where/how the interest was received (AANTC Mapping). CNL requested AANTC verify its completeness and accuracy by 2023 June 20.									√	
June 01, 2023 Outgoing email	This email from a CNL Communications Officer to AANTC Consultation is to follow up on CNLs correspondence from 2023-05-16.									√	√
June 12, 2023 Outgoing email	This email from a CNL Communications Officer to AANTC Consultation is to request AANTC verification that CNL had accurately recorded the interests and concerns of your organization related to the NPD Closure Project. CNL welcomed feedback and offered to schedule a meeting to discuss.									√	√
July 05, 2023 Outgoing email	This email from a CNL Communications Officer to AANTC Consultation is to follow up on CNLs correspondence from 2023-05-16.									√	√
October 17, 2023 Outgoing Email	This email from CNL Manager of Communications and Engagement to AANTC FN is to provide an invite to the 2023 October 20 Career Fair being held In Pembroke.										√

AANTC - Mapping of Key Interests and Concerns

Table C-11 presents a mapping of how the key interests and concerns relate to detailed feedback and input from the AANTC, up to March 2024.

Table C-11 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-11 Mapping of AANTC Key Interests and Concerns

Topic	Key Interests and Concerns	Specific feedback provided by the AANTC on this interest/concern
1. Alternatives	(a) Concern that the alternative means assessment does not provide sufficient detail on each alternative, or assess all potential effects. It is important to the AANTC that they have enough information to be able to evaluate the alternatives in terms of potential impact to traditional land and resource use / AANTC rights. This is a project-specific concern.	In comments on the 2017 draft EIS, the AANTC expressed concern about the alternative means assessment (AMA). The AANTC indicated that the AMA needed to be expanded and rewritten to better present and articulate the relative advantages and disadvantages of each option.
2. Baseline Characterization	(a) Characterization of the bedrock groundwater flow system This is important to the AANTC because an understanding of current conditions and characteristics of the groundwater system surrounding the NPD facility is necessary in order to assess the potential impacts from the project to traditional land and resource use / AANTC rights. This is a project-specific concern.	In comments on the 2017 draft EIS, the AANTC raised concerns about the geological and hydrogeological characterization of the site. Specifically, the AANTC expressed that insufficient work has been done to characterize and understand the bedrock groundwater flow system.
3. Engagement	(a) Meaningful participation and consultation It is important to the AANTC that its members be engaged/consulted meaningfully, not just informed. This is both a project-specific concern and a concern for the Crown.	In 2021 correspondence, the AANTC and KFN expressed concern about meaningful Indigenous Participation and adequate Crown consultation in environmental assessments (EAs) for the NPD Closure Project and the NSDF Project.
	(b) Capacity for technical review of the EIS It is important to the AANTC that plans and agreements are in place with CNL, to support technical reviews and provide other opportunities for discussion to ensure that the AANTC's interests and values are taken into consideration with respect to the project.	The AANTC indicated an interest in financial support to participate in the EA process in 2020 May in response to CNL's offer of capacity.
4. EA Process and Methodology	(a) Relevant legislation It is important to the AANTC that the NPD Closure Project Environmental Assessment is carried out using up-to-date legislation (e.g., the *Impact Assessment Act*) as the new Act directly recognizes the need for reconciliation. This is not a project-specific interest.	In a May 2020 letter to the Prime Minister, the AANTC expressed concern about the continued use of *CEAA* (2012) for the NPD Closure Project rather than the new *Impact Assessment Act*.
	(b) Aggressive timelines for the project The AANTC want to understand the decision-making behind the NPD Closure Project timeframes as the AANTC believes there are potential impacts to traditional land and resource use and AANTC rights. This is a project specific concern.	In comments on the 2017 draft EIS, the AANTC raised a number of technical concerns, including general concern about the project timeline being too aggressive, given that the potential impacts are long term. With respect to the timeline of the project itself, the AANTC is particularly concerned with the 100-year Institutional Control period being arbitrary.
	(c) Availability of the EIS in both official languages. It is important to the AANTC that the EIS be available in English and in French, so that it is accessible to more community members for review to enable meaningful engagement. This is both a site-wide and project-specific concern.	In May 2017 the AANTC requested that the EIS be available in both official languages.

Topic	Key Interests and Concerns	Specific feedback provided by the AANTC on this interest/concern
5. Monitoring	(a) Timeline of the follow-up monitoring program It is important to the AANTC that CNL commit to monitoring the proposed disposal for as long as necessary to ensure the environment is protected, as the environment are of particular value to the AANTC. This is a project-specific concern.	In comments on the 2017 draft EIS, the AANTC raised concerns about the time frame of CNL's follow-up monitoring program: whether the duration is long enough and whether it will be updated over time. Specific comments include: • CNL should commit to monitoring "as long as required" (and at a minimum, for the desired period of at least 100 years), with no automatic termination at all. • CNL should prepare a "Check Point Report" outlining the results of a full final site investigation (including field studies and a future-risk analysis). This type of report should be required prior to any proposed termination of monitoring and Institutional Controls to confirm that it is safe to abandon the site. The "Check Point Report" should be submitted for regulatory consideration and circulated to the public and Aboriginal groups for review and comment beforehand. • CNL should commit to updating and improving the follow-up and monitoring program over time. A commitment from CNL to adaptively update the follow-up and monitoring program in concert with technological advances is essential, but is currently missing from the draft EIS.
	(b) Sharing monitoring program results with the public and Indigenous Nations, communities and organizations, and having them reviewed by independent researchers As long-term stewards and users of the land, it is important for the AANTC to be involved and informed of the monitoring program to confirm and build knowledge of any impacts to the environment. This is a project-specific concern	In comments on the 2017 draft EIS, the AANTC raised concerns about CNL sharing the results of the follow-up monitoring program. Specifically: • Rather than a commitment to provide results to the public and Indigenous Nations, communities and organizations, it states that this will be done "as required". • There is no actual commitment for CNL to have the results of the follow-up monitoring program reviewed by independent researchers – only that this "will also be assessed". • CNL should add a provision to the follow-up monitoring program to subject it to independent and proponent-funded review, make the full monitoring program results readily available to the public and Aboriginal communities, and as a result, ensure the programs remain relevant and up-to-date.
	(c) The proposed follow-up monitoring program for groundwater and surface water quality is missing details As long-term stewards and users of the land and waters, it is important to the AANTC that appropriate controls and plans are in place to protect the environment. This is a project-specific concern.	In comments on the 2017 draft EIS, the AANTC raised concerns about the lack of details provided in the EIS for CNL's proposed follow-up monitoring program for groundwater and surface water quality. The AANTC provided a list of components, including a map, parameter list, trigger levels and contingency plans) that should be included.
6. Protection of the Ottawa River	(a) Impacts on groundwater and surface water quality As stewards of lands and waters, it is important to the AANTC that the environment is protected and that potential impacts to traditional land and resource use / AANTC rights are examined. This is both a site-wide and project-specific concern.	In comments on the 2017 draft EIS, the AANTC raised several technical questions about the completeness of information on effluent discharges at the site, and plans for overall surface water management. Also in February 2018, CNL received a letter from the Grand Chief of the AANTC requesting that CNL cease liquid effluent releases from the NPD site. The AANTC raised concerns about the potential impacts of the project on water quality. Concerns included: • Releases from current NPD operations to the aquatic environment; • Liquid effluent releases from other CNL facilities along the Ottawa River, including CRL; • Potential merit of constructing a surface water management pond for site runoff during Decommissioning; • Inadequacy of the assessment of potential impacts on groundwater and surface water.

Topic	Key Interests and Concerns	Specific feedback provided by the AANTC on this interest/concern
7. Technical	(a) Concrete Cap and Engineered Barrier design details are missing. As long-term stewards and users of the land and waters, it is important to the AANTC that barriers are in place to protect the environment.	In comments on the 2017 draft EIS, the AANTC raised several technical questions about the concrete cap and engineered barrier. Specific details of interest included: • The proposed precise footprint, thickness, and other construction details for the reinforced concrete cap (designed to prevent intrusion into the concrete monolith). • The design longevity and permeability of the engineered barrier (designed to minimize infiltration into the concrete monolith). • Specific details on any inspection/monitoring program intended to verify that the engineered barrier is performing as intended, and specific details regarding what if anything would trigger replacement of the engineered barrier. • Detail(s) and thickness(es) of any material(s) which will separate the concrete cap from the overlying engineered barrier. • Details of the proposed grading below and above the engineered barrier.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Algonquin Anishinabeg Nation Tribal Council (AANTC) – Summary of Interests and Concerns

Table C-12 below summarizes the key interests and concerns that the AANTC have raised on the NPD Closure Project, up to March 2024, through comments submitted on the 2017 draft EIS to the CNSC or through direct discussion and engagement between AANTC and CNL.

The full submission of AANTC comments on the 2017 draft EIS can also be found online: Comments on the 2017 draft EIS for NPD from Algonquin Anishinabeg Nation Tribal Council. These comments were summarized by CNSC and included as part of the CNL Table: Consolidated Public and Indigenous Groups' Comments on the Nuclear Power Demonstration Closure Project Draft EIS: IAA - NPD - Consolidated Public and Indigenous Comments (April 2018).

The AANTC includes two First Nations that CNL has communicated with on the NPD Closure Project: Kebaowek First Nation (see Section C.4.1) and Kitigan Zibi Anishinabeg First Nation (see Section C.4.2).

Table C-12 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS, this is also discussed;
  Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

Table C-12 AANTC Key Interests and Concerns

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
1. Alternatives	(a) Concern that the alternative means assessment does not provide sufficient detail on each alternative, or assess all potential effects. It is important to the AANTC that they have enough information to be able to evaluate the alternatives in terms of potential impact to traditional land and resource use / AANTC rights**.** This is a project-specific concern.	In response to the AANTC request (and requests from other), CNL has added some quantitative assessments to the Alternative Means Assessment (AMA) technical support document (TSD); for example, the projected radiological dose and Industrial Safety risk to workers for each option were added. CNL also updated the alternatives considered to include an additional scenario where a new disposal facility, such as a geological repository for intermediate level waste becomes available during the Institutional Control period for all waste that is shipped back to the Chalk River site for storage. CNL incorporated additional information from the AMA TSD into the EIS to provide greater clarity on how the AMA was completed and what the results mean. As requested, CNL shared all TSDs, including the AMA TSD, to the AANTC in December 2017. CNL has responded in writing to AANTC comments on alternatives citing relevant sections of the EIS as part of the comment response. CNL has also offered to meet with the AANTC and AANTC consultants to understand and discuss this concern. CNL Response: CNL acknowledges that the AANTC has requested more details on the advantages and disadvantages of each alternative. The EIS provides a summary of the information in the AMA TSD. The TSD, which was made available to the AANTC in 2017, provides a thorough evaluation of the alternatives considered by CNL. With respect to the assessment of effects, the objective of the AMA is to provide a qualitative analysis of the environmental risks (including health) of alternative decommissioning techniques and select a preferred means. CNL followed the	Where is this topic discussed in the EIS? **Section 4.2** of the EIS contains a summary of the Alternative Means Assessment TSD. What changes have been made (and where)? CNL has included additional information from the AMA TSD in **Section 4.2** of the EIS, to provide greater clarity on how the AMA was completed and what the results mean. In addition, both the AMA TSD and **Section 4.2** of the EIS were updated to assess the projected radiological dose and industrial safety risk to workers for each option.	Status: Resolved. CNL believes that they have addressed this concern with the revisions to the EIS**.** CNL remains committed to ongoing engagement with the AANTC.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		framework laid out in the *Canadian Environmental Assessment Act (CEAA*) Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2015) for the evaluation of alternatives, which allows for a qualitative assessment. The potential impacts of each alternative on each Valued Component group developed as part of the EIS, were assessed and compared against the three timeframes of the project (i.e., Decommissioning Execution, Institutional Controls and Post-Institutional Controls).		
2. Baseline Characterization	(a) Characterization of the bedrock groundwater flow system This is important to the AANTC because an understanding of current conditions and characteristics of the groundwater system surrounding the NPD facility is necessary in order to assess the potential impacts from the project to traditional land and resource use / AANTC rights This is a project-specific concern.	In response to AANTC concern on the characterization of bedrock flow system, CNL has completed additional geoscientific characterization and updated its geosynthesis report to better understand the local geology and hydrogeology. CNL has also updated and calibrated the groundwater flow model used to define hydrogeological conditions into the future to support Postclosure Safety Analysis. As requested, CNL shared all TSDs, including the Geosynthesis and Groundwater Modelling TSD, to the AANTC in December 2017. CNL has responded in writing to AANTC comments on baseline characterization citing relevant section of the EIS as part of the comment response. CNL also met with the AANTC and AANTC's consultant in January 2018 to understand and discuss this concern. CNL Response: In 2018/2019, in response to AANTC concerns, CNL completed a fieldwork campaign to sample and characterize the bedrock around the NPD facility. The fieldwork included coring of 10 boreholes to a depth of 50 metres into bedrock and several overburden boreholes, with installation of wells for sampling and hydraulic property determinations. The Geoscientific Characterization Report was used to revise the Geosynthesis TSD and the various models (i.e., Groundwater Modelling TSD, Resaturation Modelling). The results of these reports were incorporated into the third iteration of the Postclosure Safety Assessment (PostSA) TSD, enabling CNL to assess potential effects to valued components (VC) in the aquatic and terrestrial ecosystems. The additional field investigations and updated models support the conclusion that the NPD Closure Project is protective of human health and the environment. The EIS has been updated to contain this new information.	Where is this topic discussed in the EIS? **Section 8.5** of the EIS presents information on geological and hydrogeological conditions around the NPD site and study areas. What changes have been made (and where)? **Section 8.5** of the EIS includes the improved understanding of baseline geological and hydrogeological conditions, resulting from completion of the additional geoscientific characterization work, groundwater flow modelling results as well as updates to the Geosynthesis report.	Status: Resolved. CNL believes that they have addressed this concern by conducting additional geoscientific characterization, groundwater modelling and subsequent revisions to the EIS. CNL remains committed to ongoing engagement with the AANTC.
3. Engagement	(a) Meaningful participation and consultation It is important to the AANTC that its members be engaged/consulted meaningfully, not just informed. This is both a project-specific concern and a concern for the Crown.	CNL heard the AANTC's concern about meaningful Indigenous participation in the EA for the NPD Closure Project, has sought feedback from and offered engagement opportunities for AATNC on numerous occasions since the beginning of the project. CNL and the AANTC have had several meetings and other correspondence related to the NPD Closure Project since initial discussions in 2016. Within its role as project proponent, CNL remains committed to ongoing engagement with the AANTC on the NPD Closure Project, and will continue to work towards an agreement with the AANTC to support engagement.	Where is this topic discussed in the EIS? **Section 6.2.4.5** of the EIS summarizes CNL engagement with AANTC to date. What changes have been made (and where)? CNL updated **Sections 6.2, 6.3, 8.9, 9.9, 12** of the EIS in response to comments from the AANTC (and other Indigenous Nations, communities and organizations), and to reflect developments in the relationship between the AANTC and CNL.	Status: Resolution is in progress. CNL remains committed to ongoing engagement with the AANTC.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL Response: Note that this concern was raised with the federal government. For the NPD Closure Project the Crown's responsibility for consultation falls with the CNSC. CNL acknowledges the AANTC's request for meaningful two-way engagement on both the NPD Closure Project and the NSDF project and is committed to open, transparent and continuing engagement with the AANTC within its role as the project proponent. CNL continues to communicate with and provide engagement opportunities for the AANTC. Engagement Highlights: CNL first reached out to the AANTC in 2016 with two letters addressed to the Grand Chief; both letters shared information and one inquired on traditional land use. CNL and the AANTC met several times between 2016 and 2018, including a meeting at the NPD site with the AANTC's consultant. In June 2020, CNL and AANTC began a discussion on a contribution agreement to support the AANTC's participation in the EA process. Although CNL attempted further correspondence with the AANTC through July and August 2020, in September 2020, the AANTC informed CNL that they would not be willing to meet again until the latest letter sent to the Minister received a response. CNL sought feedback from the AANTC in 2021 on preliminary project commitments and on the summary of interests and concerns. CNL has and will continue to communicate with and provide engagement opportunities to the AANTC.		
3. Engagement	(b) Capacity for technical review of the EIS It is important to the AANTC that plans and agreements are in place with CNL, to support technical reviews and provide other opportunities for discussion to ensure that the AANTC's interests and values are taken into consideration with respect to the project. This is a project specific interest.	In May 2020, CNL initiated discussions with the AANTC to establish a contribution agreement for the NSDF and NPD Closure Project to ensure support of the AANTC's participation in the EA process. A first meeting occurred on 2020 June 17. Although CNL attempted further correspondence on the concern with the AANTC through July and August 2020, in September 2020, the AANTC informed CNL that they would not be willing to meet again until the latest letter sent to the Minister receives a response and requests are met. CNL followed up on this in January 2021 and responded to correspondence from the AANTC in April 2021 indicating interest in continuing discussions and a contribution agreement. CNL continues to follow-up with the AANTC. CNL reached out four times in 2021 with respect to verification of EIS information; each time CNL inquired whether the AANTC needed support for participation. CNL Response CNL agrees that it is important to provide support to the AANTC in conducting technical reviews. CNL and the AANTC have had initial discussions on the	Where is this topic discussed in the EIS? **Section 6.2.4.5** of the EIS summarizes CNL engagement with the AANTC to date. What changes have been made (and where)? No changes were made to the EIS in response to this comment.	Status: Resolution in Progress. CNL will continue to follow-up with the AANTC on provision of capacity through a contribution agreement or via another mechanism that is preferable to the AANTC.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		development of a contribution agreement that would support the AANTC's participation in the EA process for NPD.		
4. EA Process and Methodology	(a) Relevant legislation It is important to the AANTC that the NPD Closure Project Environmental Assessment is carried out using up-to-date legislation (e.g., the *Impact Assessment Act*) as the new Act directly recognizes the need for reconciliation. This is not a project-specific interest.	No actions - the NPD Closure Project EA will continue under *CEAA* (2012). CNL Response Note this concern was raised with the federal government. This interest is generally beyond the scope of the project. As per direction from the CNSC and transitional provisions of the *Impact Assessment Act*, CNL is continuing its EA for the NPD Closure Project under *CEAA* (2012). Letter to CNL - Changes to Federal Legislation. CNL recognizes that what AANTC is requesting is consistent with the new provisions and commitments under the *Impact Assessment Act (IAA*) but is beyond the scope of *CEAA* (2012) and this EA, and therefore is not required to be considered. The final NPD EIS will meet the requirements of *CEAA* (2012) but will also incorporate good practices consistent with the *IAA*.	Where is this topic discussed in the EIS? **Section 3.5** of the EIS discusses the regulatory framework of the project. What changes have been made (and where)? CNL added text to **Section 3.5** to the EIS, providing clarification on this issue. A reference was added to a letter received from the CNSC, which indicates that the NPD Closure Project will continue under *CEAA* (2012).	Status: Resolved. With respect to the NPD Closure Project, CNL believes that they have addressed this concern with the revisions to the EIS that provide the regulatory framework and outline CNL's approach and commitment to reconciliation. CNL understands that the AANTC may still prefer that the project is subject to the *Impact Assessment Act*. For the NPD Closure Project, the CNSC has determined that the project will be evaluated under *CEAA* (2012).
	(b) Aggressive timelines for the project The AANTC want to understand the decision-making behind the NPD Closure Project timeframes as the AANTC believes there are potential impacts to traditional land and resource use and AANTC rights. This is a project specific concern.	CNL has responded in writing to the AANTC comments on project timelines citing relevant section of the EIS as part of the comment response. CNL Response: Responsibly enacting solutions for Canada's legacy waste is part of CNL's commitment to Canadians. The timeline for the NPD Closure Project was developed with the goal of completing the project in a manner that allowed sufficient time for public engagement and participation in the regulatory process and was cost-effective to the Canadian public. This timeline is also taking into account CNL's effective management of legacy liabilities such as NPD to reduce uncertainty and increase control. The timeline for the NPD Closure Project was never static and has adapted to ensure applicable changes are incorporated based on regulatory, as well as Indigenous feedback. As it stands, the NPD Closure Project initiated engagements in 2015 October, and the two-part hearing with the CNSC is expected to take place in 2023, with the final decision on whether the project will go ahead later that same year. Within this roughly eight-year timeframe there is significant time and capacity for Indigenous participation and input into decisions on the project. It is important to note that the timeline of the NPD Closure Project is ultimately dependent on regulatory decisions made by the Canadian Nuclear Safety Commission. The Institutional Control period was set at 100 years to model the impacts to the environment in the case that features like the concrete cap and tile drains hypothetically start to fail at 100 years. In reality the Institutional Controls phase (and associated follow-up monitoring) will last as long as necessary, as determined by regulatory agencies.	Where is this topic discussed in the EIS? **Section 5.2.1.2** of the EIS discusses the project timeline. What changes have been made (and where)? CNL modified the text in **Section 5.2.1.2** of the EIS, to clarify that the Institutional Control period is to be a minimum of 100 years or as long as necessary, as determined by regulatory authorities.	Status: Resolved. CNL believes that they have addressed this concern, with the responses provided and the EIS updates. CNL remains committed to ongoing engagement with the AANTC.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
4. EA Process and Methodology	(c) Availability of the EIS in both official languages. It is important to the AANTC that the EIS be available in English and in French, so that it is accessible to more community members for review to enable meaningful engagement. This is both a site-wide and project-specific concern.	CNL continues to translate versions of the EIS into French. CNL has evolved in communication of the NPD Closure Project from hosting regular in-person information sessions to hosting quarterly and now bi-monthly webinars in English and French, which is a more accessible approach to disseminate information to individuals from all regions as well as the opportunity for their questions to be answered. CNL has offered simultaneous interpretation to accommodate meetings with the AANTC. CNL has provided the AANTC with draft responses to AANTC comments in English and French (May 2019, September 2020). CNL Response CNL agrees that it is important that the EIS be provided in both English and French. CNL submitted English and French versions of the 2017 Draft EIS and posted these publicly. CNL also shared French and English versions of CNL responses to the AANTC comments with the AANTC. The Final EIS will be available in both English and French. CNL has also provided communications, including presentation and handout material, with the AANTC in French and English.	Where is this topic discussed in the EIS? French translation is discussed in **Section 3.5** of the EIS in general, and in **Section 6.2.4.5.2** of the EIS with respect to AANTC concerns. What changes have been made (and where)? No changes were made to the EIS in response to this comment however CNL has evolved its overall communication efforts on the NPD Closure Project to offer webinars and meetings with simultaneous interpretation.	Status: Resolved. CNL believes that they have addressed this concern by providing translations and other communications in both English and French. CNL remains committed to ongoing engagement with the AANTC, with continued provision of French translation for the EIS as well as simultaneous interpretation to accommodate meetings in English and French.
5. Monitoring	(a) Timeline of the follow-up monitoring program It is important to the AANTC that CNL commit to monitoring the proposed disposal for as long as necessary to ensure the environment is protected. This is a project-specific concern.	CNL is seeking feedback on the draft monitoring plans. The follow-up monitoring reports were provided to the AANTC in 2019 December. CNL is interested in meeting with the AANTC to review these plans and receive feedback. CNL is open to working with the AANTC to ensure AANTC involvement in reviewing the draft follow-up monitoring plans during the Institutional Control period. CNL has responded in writing to AANTC comments on the timeframe of Institutional Control and monitoring citing relevant section of the EIS as part of the comment response. CNL has also offered to meet with the AANTC and AANTC consultants to understand and discuss this concern. CNL Response CNL wishes to clarify that follow-up monitoring will continue for as long as required. The Institutional Control period was set at 100 years to model the impacts to the environment in the case that features like the concrete cap and tile drains hypothetically start to fail at 100 years. In reality the Institutional Controls phase (and associated follow-up monitoring) will last as long as necessary, as determined by regulatory agencies. This is stated in **Section 5.2.1.2** of the EIS where the project phases are described: "**Institutional Controls**, or a period of at least 100 years, but lasting as long as necessary, as determined by regulatory agencies that follows the Decommissioning Execution phase, where long term care and maintenance, oversight, and environmental monitoring would be performed by CNL in order to ensure that the disposal system performs as expected, that human safety is ensured until the short lived nuclear wastes decay to below the acceptance	Where is this topic discussed in the EIS? **Section 5.2.1.2** of the EIS discusses the project timeline. **Section 12** of the EIS summarizes the follow-monitoring plans developed for the project. What changes have been made (and where)? CNL modified the text in **Section 5.2.1.2** of the EIS, to clarify that the Institutional Control period is to be a minimum of 100 years or as long as necessary, as determined by regulatory authorities.	Status: Resolution is in progress. CNL believes that they have addressed the AANTC's concern about the timeline of the follow-up monitoring program, with the responses provided and the EIS updates. CNL will propose meetings with the AANTC, to discuss and receive feedback on the monitoring program.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		criteria and that problems that may impact the long-term stability of the facility can be rectified…" CNL acknowledges the AANTC suggestion to prepare a "Check Point Report" prior to any proposed termination of monitoring and Institutional Controls. CNL would like to discuss this idea with the AANTC to ensure that this requirement is appropriately incorporated in the draft follow-up monitoring plans. With respect to updating the monitoring plans over time: The plans incorporate a requirement for periodic review of the monitoring plans and results, in order to determine if any modifications to monitoring are required (for example if new monitoring locations or additional parameters are required). Any changes to the monitoring plan would require a supporting rationale. Monitoring plans for the Chalk River Laboratories site currently undergo an annual review in order to ensure that the plans are modified as required to stay meaningful and that technological advances are incorporated where possible. The draft follow-up monitoring plans for the NPD Closure Project would also follow this system of annual review.		
5. Monitoring	(b) Sharing monitoring program results with the public and Indigenous Nations, communities and organizations, and having them reviewed by independent researchers As long-term stewards and users of the land, it is important for the AANTC to be involved and informed of the monitoring program to confirm and build knowledge of any impacts to the environment. . This is a project-specific concern	CNL is open to working with the AANTC to ensure AANTC involvement in reviewing the draft follow-up monitoring plans. In addition, CNL is interested in hearing more specific details on the AANTC's recommendation for independent review of the annual results and invites AANTC for further engagement with CNL on this topic. CNL has responded in writing to AANTC comments on sharing and review of monitoring program results, citing relevant section of the EIS as part of the comment response. CNL has also offered to meet with the AANTC and AANTC consultants to understand and discuss this concern. CNL Response CNL would like to clarify that results of the follow up monitoring program will be submitted annually to the Canadian Nuclear Safety Commission (CNSC) (as the Responsibly Authority) and will be made available to Indigenous Nations, communities and organizations and the public on the CNL website. At this time CNL does not commit to independent review of the results. The EA follow-up program is considered draft until the EA and license process is complete. As part of the development of the follow-up program expert federal authorities (such as Environment and Climate Change Canada) will be reviewing the draft follow-up monitoring plans. The CNSC will provide final direction on the program. In addition, the CNSC also performs occasional independent monitoring through their Independent Environmental Monitoring Program.	Where is this topic discussed in the EIS? **Section 6.2.4.5** of the EIS summarizes CNL engagement with AANTC to date, including discussions about AANTC feedback on the monitoring programs. **Section 12** of the EIS summarizes the follow-monitoring plans developed for the project. What changes have been made (and where)? No changes have been made to the EIS in response to this concern.	Status: Resolution is in progress. CNL believes that they have addressed the AANTC's concern about distribution and review of the follow-up monitoring program, with the responses to AANTC comments. CNL will propose meetings with the AANTC, to discuss and receive feedback on the monitoring program.
	(c) The proposed follow-up monitoring program for groundwater and surface water quality is missing details As long-term stewards and users of the land and waters, it is important to the AANTC that appropriate controls and plans are in place to protect the environment. This is a project-specific concern.	CNL has provided written responses to these AANTC comments, addressing each of the requested pieces of information. In response to these comments, CNL has revised the EIS to include more details about follow-up monitoring from the three draft monitoring plans. CNL is seeking feedback on the draft monitoring plans, which were provided to the AANTC in 2019 December. CNL proposes a workshop or meeting to discuss and obtain AANTC feedback. CNL Response CNL acknowledges the AANTC's concerns about the lack of detail in the EIS.	Where is this topic discussed in the EIS? **Section 9.5** of the EIS presents the proposed groundwater monitoring locations. **Section 12** of the EIS presents the proposed monitoring locations in the Ottawa River. What changes have been made (and where)? CNL has added more details to **Section 12** of the EIS, summarizing and/or referring to the details in the monitoring program documents.	Status: Resolution is in progress. CNL believes that they have addressed each of the AANTC's requests for detailed information on the follow-up monitoring programs, within the responses to AANTC comments. CNL will propose meetings with the AANTC, to discuss and receive feedback on the monitoring program.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
6. Protection of the Ottawa River	(a) Impacts on groundwater and surface water quality As stewards of lands and waters, it is important to the AANTC that the Ottawa River is protected. This is both a site-wide and project-specific concern.	CNL provided detailed responses to each individual technical question from the AANTC. CNL's responses included description of upcoming additional information-gathering (e.g., flow sampling), and reference to the detailed monitoring plans that have been developed for the NPD Closure Project. CNL has revised sections of the EIS to include more detail. CNL has responded in writing to AANTC comments on groundwater and surface water quality citing relevant section of the EIS as part of the comment response. CNL has also offered to meet with the AANTC and AANTC consultants to understand and discuss this concern. CNL Response In 2018, in response to public and Indigenous concerns, CNL ceased the practice of discharging liquid effluent from the NPD facility sumps to the Ottawa River, and arranged for water to be sent to the Waste Treatment Centre at the CRL site. This is CNL's plan for all collected water from the sump, including that water which will make up the final pump-out prior to grouting. Full details regarding liquid effluent releases from all CNL facilities are given in the Annual Compliance Monitoring Reports available at the following CNL webpage: https://www.cnl.ca/en/home/environmental-stewardship/performance-report/default.aspx. With respect to the need for constructing a stormwater pond: During the Decommissioning Execution phase of the project, existing drainage features at the site will be maintained and silt fencing will be placed in areas used for stockpiles of raw material (i.e., sand) to prevent runoff into the Ottawa River. For the Institutional Control period, the need for a storm water management pond was taken into consideration during the design of the cover system. The cover is designed to convey storm water to ditches on the south, east and western perimeters of the mound which then connect to the existing ditch systems which are on the east and west sides of the NPD facility. The ditch systems are lined with rock and would enable infiltration of storm water. Because of this design of water conveyance features, it was determined that a storm water management pond was not required. Since this design was developed after the draft EIS was prepared, CNL is willing to meet with the AANTC to discuss the design of the cover system with respect to storm water management, including design drawings illustrating the water conveyance features. CNL has assessed the potential impact of the NPD Closure Project on surface water and groundwater quality. The EIS concludes that no significant residual adverse environmental effects from the project are expected, including to surface and ground water. CNL has developed mitigation measures for the protection of surface water and groundwater during all phases of the project. This finding will be confirmed with the NPD Closure Project follow-up monitoring activities, which will include monitoring groundwater and surface water quality.	Where is this topic discussed in the EIS? **Section 4.3** of the EIS describes the project activities and presents CNL's plans with respect to surface drainage. **Section 4.5** of the EIS describes CNL's plans for handling project-related liquid releases. **Sections 9.3 and 9.5** of the EIS presents the assessment of potential impacts to surface water and groundwater respectively. Mitigation measures for the protection of surface water and groundwater are provided, including CNL's process for non-routine discharges. No un-assessed liquid effluent releases are permitted. The EIS does not predict any adverse residual effects on the surface water or groundwater environments. **Section 12** of the EIS summarizes the Monitoring Plans developed for the project. What changes have been made (and where)? CNL modified the text in **Sections 2.2 and 4.5** of the EIS to add details on liquid wastes (generation and handling) during the Decommissioning Execution phase. CNL provided additional explanation in **Section 8.3.3** of the EIS to clarify the history and basis for monitoring of the wells area sump. CNL added text about management of liquid waste to **Section 9.3.3.2** of the EIS (Mitigation Measure). CNL modified text in several sections of the EIS (**Sections 1, 2, 4, 5 and 6**) to clarify the duration of the Institutional Controls period. CNL has added substantial detail to the summary of the follow up monitoring program in **Section 12** of the EIS.	Status: Resolution in progress For the NPD Closure Project, CNL believes that they have mostly addressed this concern with the revisions to the EIS. CNL will follow up with the AANTC on the need for any additional discussion, such as a meeting to discuss the draft follow-up monitoring plans or the draft restoration plan.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
7. Technical	(a) Concrete Cap and Engineered Barrier design details are missing. As long-term stewards and users of the land and waters, it is important to the AANTC that barriers are in place to protect the environment. This is a project-specific concern.	CNL has provided written responses to these AANTC comments, addressing each of the requested pieces of information. CNL has revised sections of the EIS to include more detail. CNL has responded in writing to AANTC comments on the concrete cap and engineered barrier citing relevant section of the EIS as part of the comment response. In 2019 December, CNL shared high-level information about the concrete cap and engineered barrier and Institutional Control Surveillance Plan to the AANTC and offered to meet to further discuss this topic. CNL Response The reinforced concrete cap will be placed over the Nuclear Area of the NPD Waste Facility (NPDWF), as a barrier against inadvertent human intrusion. The concrete cap is designed to support the loads of the Engineered Barrier and its construction. The cap will be present only over the Nuclear Area because of the long-lived radionuclides present here, within the irradiated reactor components and Reactor Vault, and consequences of intrusion are higher than elsewhere in the facility. The design life of the Engineered Cover (and the concrete cap) is 100 years. The concrete cap will be placed on the Reactor Hall Floor, following completion of grouting. The cap has a thickness of 0.40 metres (1'-4") at the edge, and rises to a thickness of 0.71 metres (2'-4") at the centre. The area of the cap is approximately 600 m^2 (6430 ft^2), and it is dowelled to the foundation walls of the existing structure for anchorage. A multi-layered engineered cover will be placed over the grouted facility, following placement of the concrete cap. The engineered cover consists of a compacted layer of select fill at the bottom a minimum of 1.2 m thick. This bottom layer is overlain by a very low permeability membrane called a geosynthetic clay liner (GCL) and a geogrid, and covered by a 0.15 m thick sand cushion supporting a 0.15 m thick layer of clear stone. The GCL is designed to intercept water percolating through the top of the engineered cover and direct the water to the outside of the engineered cover where it can drain away. The clear stone serves as a drainage layer while the sand cushion also provides some drainage capability and acts as a protective layer to the GCL. Over the clear stone, a geotextile will be placed and covered by a 0.3 m thick layer of select fill, upon which 0.15 m of topsoil is placed and seeded, to form a shallow-rooted vegetative cover at the top of the engineered cover. The geotextile allows water to drain through the select fill to the drainage layer below, while preventing the select fill from being washed into and clogging the drainage layer. Permeability through the barrier is projected to be 0.96 mm/yr based on total precipitation of 870 mm/year. The engineered barrier is designed to limit the infiltration of surface water into the facility to slow resaturation and thus limit releases of tritium. Groundwater monitoring around the site would indicate the release rate of tritium.	Where is this topic discussed in the EIS? **Section 4.3.1** of the EIS describes the Concrete Cap and Engineered Cover and Long Term Care and Maintenance. What changes have been made (and where)? CNL modified the text in **Section 4.3.1.9** of the EIS to provide additional details for the concrete cap and engineered barrier, CNL added **Section 4.3.1.10** of the EIS to provide a summary of long term care and maintenance activities.	Status: Resolution in progress For the NPD Closure Project, CNL believes that they have mostly addressed this concern with the revisions to the EIS. CNL will follow up with the AANTC on the need for any additional discussion, such as a meeting to discuss the design of the concrete cap and plans for long term care and maintenance.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		The Institutional Control Surveillance Plan (provided to the AANTC in 2019 December) has been developed to verify the integrity of accessible passive barriers and support structures, and to enable the prompt identification of conditions that may lead to a migration or release of radionuclides or other contaminants to the environment. The plan outlines the maintenance program to be executed to ensure accessible features of the new disposal facility are maintained (e.g. periodic inspection of the cover and maintenance when required) over the Institutional Control period. The only mechanism that would require the replacement of the cover would be a catastrophic failure of both the geosynthetic clay liner and the geotextile membrane in conjunction with levels of tritium released in excess of acceptance criteria.		

Appendix C.4.1 – Record of Engagement and Tables of Interests and Concerns for Kebaowek First Nation

This appendix provides a complete record of all engagement between CNL and Kebaowek First Nation (a member nation of AANTC) from June 2016 to June 2024 (Table C-13). Table C-13 includes the date and method of the communication/engagement, the topics discussed and participants. This table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement is a mapping of how the summary of interests and concerns were compiled (Table C-14), as well as a summary of interests and concerns raised by Kebaowek First Nation (Table C-15).

Section 6.2.4.6.1. of the EIS summarizes the engagement activities that have taken place to date between CNL and the KFN.

Table C-13 Record of Engagement with the Kebaowek First Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Kebaowek (then Eagle Village) First Nation (FN) Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
October 24, 2016 Outgoing telephone call	This call from a communications officer with CNL to the office of the Kebaowek FN Chief was to follow up on the July letter.									√	
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Kebaowek (then Eagle Village) FN Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Kebaowek FN's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Does Eagle Village First Nation have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of Eagle Village First Nation using the areas around the two projects?* • *Do you have any members of Eagle Village First Nation that currently live in close or reasonable proximity to either of the projects?* • *Does Eagle Village First Nation have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does Eagle Village First Nation, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the FN and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
April 26, 2017 Meeting	This meeting occurred in Maniwaki, Quebec with representatives from the AANTC (including the Grand Chief and the Director General), CNL (including the Director of Corporate Communications and the Director of Environmental Protection), the CNSC (including the Participant Funding Program Administrator) and representatives from two member First Nations of the AANTC – KZA and KFN. CNL shared information in English and French and heard some interests and concerns from the AANTC. Information shared on the NPD Closure Project included: • Site location; • Project components; • Timeline; • Species at risk; • Proposed end state; • Safety barriers (how the environment will remain protected).			√	√					√	
November 15, 2017 Outgoing email	This email from a CNL communications officer to the Kebaowek FN Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a CNL communications officer to the Kebaowek FN Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: *"CNL would be pleased to update information in this current draft with input from your community."*	√	√	√	√	√	√	√	√	√	
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Kebaowek FN Chief enclosed a preliminary version of the 2020 EIS and an updated IER. This letter also asked for feedback in the following seven areas: • *Does Kebaowek First Nation have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Does Kebaowek First Nation have any members who currently live close or in reasonable proximity to the NPD site?* • *Does Kebaowek First Nation have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Does Kebaowek First Nation have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to Kebaowek First Nation near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.* This letter also indicated an interest in meeting with Kebaowek FN to discuss any interests or concerns.	√	√		√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 14, 2020 Incoming letter	This letter from Kebaowek First Nation Chief and the AANTC Grand Chief was addressed to Prime Minister Trudeau outlining concerns with inconsistencies in the EA processes which included the NPD Closure Project. CNL's Director of Corporate Communications was copied on the letter.					√					
May 26, 2020 Outgoing email	This email from a communications officer with CNL to the Kebaowek FN Chief was to follow up on the May letter.									√	
June 17, 2020 Virtual meeting	This meeting between eight CNL representatives (including the Director of the NPD Closure Project, the Manager of Regulatory Approvals and the Manager of Stakeholder Relations) and five representatives of the AANTC (including the Grand Chief, the Director General, a policy consultant with KFN, an economic development officer and a consultation coordinator with the AANTC) was not considered engagement or consultation by the AANTC. It focused on how CNL could support AANTC participation in the environmental assessment process through a contribution agreement or other formal mechanism.									√	
June 24, 2020 Outgoing email	This email from a communications officer with CNL to the KFN representatives, including the economic development officer, was to follow-up on items from the virtual meeting in June.										√
July 16, 2020 Outgoing email	This email from a communications officer with CNL to the AANTC Director General and the KFN representatives, including the economic development officer, shared an overview presentation on the NPD Closure Project and inquired on a follow-up meeting with respect to the contribution agreement discussions.			√							√
August 26, 2020 Incoming letter	This letter from the AANTC and Kebaowek First Nation to the Minister of Natural Resources, copying the Director of Corporate Communications with CNL, indicated dissatisfaction with the regulatory process for a number of projects including the NPD Closure Project.					√					
November 05, 2020 Incoming letter	This letter was from the Minister of Natural Resources to the Grand Chief of the AANTC and Kebaowek First Nation Chief (copying the Director of Corporate Communications with CNL) responding to the letter of August 2020.					√					
January 11, 2021 Incoming letter	This letter from the AANTC's Grand Chief and Kebaowek FN Chief to the Minister of Natural Resources (copying CNL's Director of Corporate Communications) outlined concerns with the resolution of problems regarding supporting Indigenous participation for CNL and CRL-based projects. The letter requested a meeting to discuss issues in detail and arrive at mutually satisfactory conditions supporting Indigenous consultation and engagement.					√					
January 19, 2021 Outgoing email	This was an email from a communications officer with CNL to the Director General of the AANTC copying the Kebaowek FN Chief, which offered a meeting and further discussion on a contribution agreement.										√
April 12, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Director General of the AANTC enclosed a preliminary list of commitments and indicated interest in meeting to discuss.										√
April 22, 2021 Incoming letter	This letter from the Grand Chief of the AANTC and the Chief of KFN to CNL's Manager of Stakeholder Relations indicated that neither was in agreement with the list of commitments and indicated that engagement with the AANTC and KFN was essential.									√	
April 30, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Grand Chief of the AANTC and the Chief of KFN shared that the letter was not intended to provide a final set of commitments and CNL was interested in engaging with the AANTC and KFN to determine a mutually agreed upon set of commitments.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 06, 2021 Outgoing email	This email from a communications officer with CNL to a consultation coordinator with KFN followed up on the previous letter.										√
June 21, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the KFN Chief enclosed a draft summary of KFN's interests and concerns for the NPD Closure Project for the KFN's review and verification.									√	√
July 5, 2021 Outgoing email	This email from a Communications Officer with CNL to the Chief of KFN was to follow-up on the June 21, 2021 letter.										√
July 14, 2021 Incoming email	This email from the Consultation Coordinator with KFN to a communications officer with CNL was to confirm they would be responding.										√
July 15, 2021 Incoming letter	This letter from the KFN Chief to the Manager of ERM Stakeholder Relations described a number of issues with Crown consultation and the duty to consult, asked for a pause on the EA process and an agreement with the government on consultation. The letter also stated an interest in an LOI and process agreement with CNL.					√				√	√
July 15, 2021 Outgoing email	This email from the ERM Stakeholder Relations Manager to the KFN Chief was to confirm receipt of the July 15, 2021 letter.										√
August 12, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the KFN Chief and AANTC Grand Chief enclosed CNL's response to the July 15, 2021 letter from AANTC's Grand Chief and the KFN Chief. CNL's response included information on the role of CNL in the EA process, how CNL documents comments from the AANTC and KFN on the NSDF and NPD Closure Project, CNL's willingness to a draft letter of Intent and draft process Agreement for AATNC and KFN, information on a regional assessment, the opportunity to provide into follow-up monitoring, and CNL's response to the request to include the letter of July 15, 2021 in the IAA registry. This letter also indicated a need for any additional feedback on the Summary of Interests and Concerns to be brought forward by August 31, 2021 in order to be reflected in the NPD revised draft EIS.									√	√
August 26, 2021 Incoming email	This email from the KFN Consultation Coordinator to CNL's Manager of Stakeholder Relations and communications officer expressed that KFN would share a draft LOI towards the development of a Process Agreement(s) for the NSDF Project and NPD Closure Project.									√	√
September 8, 2021 Incoming letter	This letter from the KFN Consultation Coordinator to CNL's Manager of Stakeholder Relations enclosed a draft LOI for project consultation agreement(s) with CNL.									√	√
September 24, 2021 Incoming email	This email from the KFN Consultation Coordinator to a CNL communications officer was to inquire whether CNL had reviewed the LOI yet and proposed to set up an October meeting on the LOI.									√	√
September 24, 2021 Outgoing email	This email from an ERM Communications Officer to the KFN Consultation Coordinator informed KFN FN that CNL's legal team was currently reviewing the LOI, and that CNL will touch base internally and prioritize having the draft LOI back in advance of the next meeting. CNL asked KFN FN what dates would work for a meeting.									√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
October 20, 2021 Outgoing letter	This email from a Senior Communications Officer to the KFN Consultation Coordinator enclosed a covering letter and CNL's revisions to the LOI.									√	√
October 28, 2021 Outgoing email	This email from a CNL Communications Officer to the KFN Consultation Coordinator proposed several meeting dates to further discuss the LOI and informed KFN of the decision to delay the EIS submission for the NPD Closure Project. CNL welcomed KFN FN to provide further feedback on the updated summary table of interest and concerns (attached) by November 26, 2021.									√	√
November 12, 2021 Incoming email	This email from a consultant for KFN to a Senior Communications Officer at CNL responded to the email from CNL, seeking to coordinate a meeting date on the LOI.									√	√
November 15, 2021 Emails	These emails between a consultant for KFN and a Senior Communications Officer at CNL coordinated a meeting to discuss the LOI on December 8, 2021.									√	√
December 8, 2021	This meeting between representatives of KFN (including a councillor for KFN, a consultant and a consultation coordinator) and CNL (the Manager of ERM Stakeholder Relations and a Senior Communications Officer) and AECL (the Director of Communications and Government Reporting was to discuss a draft LOI to progress with a relationship.									√	
December 8, 2021 Incoming email	This email from KFN to CNL attached KFN's revisions to CNL's last LOI draft. KFN requested that CNL coordinate complete the revisions.									√	
December 9, 2021 Outgoing email	This email from a CNL Senior Communications Officer to KFN noted that CNL had shared the revisions and KFN's contact information to CNL's legal team. CNL noted that they will connect again soon to coordinate next steps once KFN and CNL had clarified the draft LOI.									√	
December 9, 2021 Outgoing email	This email from CNL's legal department (articling student) was to get an understanding of KFN's thoughts on the purpose of the LOI. CNL noted that they were open to covering KFN's costs to reach a Framework Agreement. CNL attached a copy of the draft LOI to that effect. For a more comprehensive commitment regarding all of KFN's costs for engagement, CNL noted that a Framework Agreement would be more suited for purpose instead of an LOI. CNL noted that they could accelerate the process and go directly into negotiations regarding capacity funding and the Framework Agreement at the next meeting if KFN would like.									√	
December 14, 2021 Incoming email	This email from KFN to CNL's legal department noted that KFN would do a close review and consideration of the proposed path forward and get back to CNL soon.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
January 26, 2022 Incoming email	This email from KFN's legal contact to CNL's legal department confirmed that KFN is agreeable with the proposed changes to the LOI and to the approach to covering KFN costs that CNL had outlined. KFN's legal contact included a suggested limit on costs and attached to the email. KFN's legal contact noted that if this is agreeable to CNL, they would propose that the LOI is signed as soon as possible so that both parties could move into Framework Agreement discussions.									√	
January 26, 2022 Outgoing email	This email from the ERM Communications Manager to KFN Consultation to confirm with legal what next steps are, but safe to say we can all do a review of edits to make sure we are ok with the attached.										√
February 8, 2022 Incoming email	This email from KFN informed CNL that the KFN negotiation team will be KFN legal counsel supported by Leadership. KFN and CNL coordinated the next meeting.										√
February 8, 2022 Incoming email	This email from the KFN economic development officer to CNL asked CNL to share a copy of the LOI signed by both parties.										√
February 18, 2022 Outgoing email	This email from a CNL Senior Communications Officer to KFN included a poll to determine the next meeting date to discuss the LOI.										√
March 8, 2022 Outgoing email	This email from a CNL Senior Communications Officer to KFN was to inform KFN that CNL had included a revised column to link each of KFN's interests and concerns to a specific aspect of the project, and/or an Aboriginal and treaty right, where possible. The interest and concerns previously identified will remain unchanged as part of the Environmental Impact Statement (EIS) and Indigenous Engagement Report that is submitted alongside the EIS. CNL asked KFN to confirm whether you would like to verify that the revised table reflects your interests and concerns, focusing on the new column that ties your interest/concern to the project or Aboriginal and treaty right, and identify why it is of concern to your community. CNL requested that KFN confirm whether they would like to review the updated interest and concerns table before submission.										√
March 9, 2022 Incoming email	This email from KFN to CNL confirmed KFN's interest to review the table and requested CNL to add a consultation request as it relates to a broader discussion on completing the consultation Framework Agreement and actions on CNL's various projects at CRL and NPD.										√
March 9, 2022 Meeting invitation	Email invitation sent to Kebaowek First Nation for a Thursday, March, 10, 2022 meeting to discuss project consultation on the NSDF and NPD Projects, the Framework Agreement and next steps.										√
March 10, 2022 Virtual Meeting	This meeting between Kebaowek First Nation (including KFN consultation staff, Councillor and legal counsel) and CNL (including a Senior Communications Officer and Manager of ERM Stakeholder Relations) was to discuss the project consultation opportunities and requests related to the NSDF Project and NPD Closure Project and the next steps to develop a Framework Agreement.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
March 10, 2022 Incoming email	This email from Kebaowek First Nation's consultation consultant to a CNL Senior Communications Officer sharing a news story about Combining Malacology and Underwater Cave Diving in the Ottawa River and a video about the Algonquin Aki Sibi Project. Both items were mentioned during the Thursday, March, 10, 2022 meeting.										√
April 01, 2022 Outgoing email	This email from a CNL Senior Communications Officer to KFN attached the repackaged summary table of interests and concerns. This repackaging is based on feedback from the Canadian Nuclear Safety Commission (CNSC) on our December 2021 draft EIS submission package. To meet the CNSC needs, CNL added a column called 'Project Aspects of Interest/Concern.' CNL requested KFN review the updated table and offered to provide time and capacity for the review.									√	
April 14, 2022 Outgoing email	Email invitation sent to Kebaowek First Nation for the Thursday, April, 14, 2022 meeting to discuss project consultation on the NSDF and NPD Projects, the Framework Agreement and next steps.										√
April 14, 2022 Virtual Meeting	This meeting between Kebaowek First Nation (including KFN consultation staff, Councillor and legal counsel) and CNL (including a Senior Communications Officer and Manager of ERM Stakeholder Relations) was to discuss the project consultation opportunities and requests related to the NSDF Project and NPD Closure Project.										√
April 18, 2022 Outgoing email	This email invitation a CNL Senior Communications Officer to Kebaowek First Nation's consultation consultant to the CNL Industry Day at the Chalk River Laboratories on Thursday, June, 2, 2022 to promote the broader engagement between CNL's nuclear industry partners and our local supply chain.										√
May 09, 2022 Outgoing email	This email from a CNL Senior Communications Officer to KFN to follow up on the April 01, 2022 email requesting CNL to review the repackaged summary table of interests and concerns.									√	
May 10, 2022 Incoming email	This email from Kebaowek First Nation's consultation consultant to a CNL Senior Communications Officer confirmed KFN would send CNL comments on the repackaged summary table of interests and concerns. KFN indicated this working would be billed against the framework agreement negotiations budget until a separate study budget is established.									√	
May 10, 11 & 12, 2022 Incoming/Outgoing email	These emails from Kebaowek First Nation's consultation consultant to a CNL Senior Communications Officer discussed the availability of the EIS revision history. CNL sent the most recent EIS submission.										√
May 20, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's consultation consultant shared the proposed Framework Agreement, to be discussed at the next meeting. Kebaowek First Nation requested to postpone the Tuesday, May, 24, 2022 meeting. The meeting was cancelled due to scheduling conflicts.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 06, 2022 Incoming email	This email from Kebaowek First Nation's consultation consultant to a CNL Senior Communications Officer provided CNL KFN's comments on the repackaged summary table of interests and concerns. CNL confirmed receipt and committed to sharing an updated copy back to KFN.									√	
June 08, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's consultation consultant shared a draft agenda for the Thursday, June 9, 2022 meeting. The agenda included: 1. Opportunity to open in a good way; 2. Reflections from KFN and CNL on the NSDF hearing; 3. Discussion on the draft Framework Agreement provided by KFN; 4. Next steps – principles for engagement and alignment with Framework Agreement. CNL also asked if Kebaowek First Nation's legal counsel will be present at the meeting.										√
June 08, 2022 Incoming email	This email from Kebaowek First Nation's consultation consultant to a CNL Senior Communications Officer confirmed Kebaowek First Nation's legal counsel will be present at the Thursday, June 9, 2022 meeting.										√
June 09, 2022 Virtual meeting	Meeting between Kebaowek First Nation (including KFN consultation staff, Councillor and legal counsel) and CNL (including a Senior Communications Officer and Manager of ERM Stakeholder Relations) to discuss the Framework Agreement.										√
July 17, 2022 Outgoing email	Email invitation from a CNL Senior Communications Officer to Kebaowek First Nation's consultation consultant to register and attend the Chalk River Open House on Saturday, August 6, 2022.										√
July 18, 2022 Incoming email	This email from Kebaowek First Nation's consultation consultant to a CNL Senior Communications Officer proposed a meeting and requesting a marked-up version of the Framework Agreement in advance. CNL sent a meeting invitation and agree to send a marked-up version of the Framework Agreement in advance.										√
July 21, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's consultation consultant sent the updated summary tables of interests and concerns for Kebaowek First Nation. CNL offered a meeting to discuss and additional feedback on the table.									√	
July 25, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's consultation consultant shared a revised draft of the Framework Agreement, in both clean and blackline versions, for consideration in advance of the Tuesday, July 26, 2022 meeting. The meeting was rescheduled for July 29, 2022 due to a network outage.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 29, 2022 Virtual Meeting	Meeting between Kebaowek First Nation (including KFN consultation staff, Councillor and legal counsel) and CNL (including a Senior Communications Officer and Manager of ERM Stakeholder Relations) to discuss the Framework Agreement.										√
August 6, 2022 Open House	Kebaowek First Nation (including the Chief and consultation consultant) attended CNL's 2022 Open House at the Chalk River Laboratories site. The open house included a NPD project booth.										√
August 9, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's legal counsel to shared Kebaowek First Nation's revisions to the latest draft Framework Agreement.										√
August 11, 2022 Meeting	Meeting between Kebaowek First Nation (including KFN consultation staff, Councillor and legal counsel) and CNL (including a Senior Communications Officer, CNL legal counsel and Manager of ERM Stakeholder Relations) to discuss legal update on Framework Agreement and further plan a leadership meeting.										√
August 18, 2022 Incoming email	This email from Kebaowek First Nation's consultation consultant to a Senior Communications Officer proposed a leadership meeting for CNL, AECL and KFN to Tuesday, August, 31, 2022 at Fitzpatrick Island. CNL accepted the invitation.										√
August 31, 2022 Meeting	Meeting between Kebaowek First Nation leadership (including KFN consultation staff, Councillor and Chief) and CNL (including the Manager of ERM Stakeholder Relations, AECL President and CEO and CNL President and CEO) at Fitzpatrick Island.										√
September 07, 2022 Incoming email	This email from Kebaowek First Nation's legal counsel to legal counsel for CNL requested CNL's changes or comments to the draft agreement that KFN sent on Tuesday, August, 9th, 2022. KFN requested a copy before the planned September 8th, 2022 meeting. The meeting was rescheduled.										√
September 13, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's legal counsel shared the revised draft of the Framework Agreement for review.										√
September 13, 2022 Incoming email	This email from Kebaowek First Nation's legal counsel to legal counsel for CNL requesting a Word version of the "Compare" PDF of the Framework Agreement. CNL sent the version requested.										√
September 15, 2022 Meeting	Meeting between Kebaowek First Nation (including KFN consultation staff, Councillor and legal counsel) and CNL (including a Senior Communications Officer and Manager of ERM Stakeholder Relations) to discuss legal update on Framework Agreement, provide updates on an activities schedule and further plan a leadership meeting.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
September 29, 2022 Outgoing email	This email from legal counsel for CNL to Kebaowek First Nation's legal counsel asking KFN to confirm whether CNL can expect to hear back from KFN on the draft agreement after the Thursday, October, 6th, 2022 meeting? CNL offered a separate to discuss the framework if needed.										√
October 03, 2022 Outgoing letter	This letter addressed to Kebaowek First Nation's Chief from CNL's Director of Indigenous Relations provided a project update and the engagement status with KFN. CNL stated it is committed to incorporating KFN's interests and concerns into the EIS. CNL provided an engagement status and next steps, including a site visit and establishing commitments to ensure that all interests and concerns are addressed and tracked to resolution. CNL sent an updated draft set of commitments for KFN's review. CNL acknowledge the work done to date including the signature of a Letter of Intent and the progression towards a Framework Agreement. CNL offered to discuss capacity and establish commitments before December 2022. CNL requested that KFN respond confirming their agreement to proceed with the engagement activities, or modified engagement activities.									√	
October 06, 2022 Incoming email	This email from Kebaowek First Nation's legal counsel to legal counsel for CNL shared the latest edits to the Framework Agreement. KFN requested a separate meeting Tuesday, October, 11th, 2022 to discuss the edits. CNL proposed an alternative date to discuss edits.										√
October 07, 2022 Meeting	Meeting between Kebaowek First Nation (legal counsel) and CNL (including legal counsel) to discuss the Framework Agreement.										√
October 07, 2022 Incoming email	This email from Kebaowek First Nation's legal counsel to legal counsel for CNL shared the latest edits to the Framework Agreement.										√
October 12, 2022 Meeting	Meeting between Kebaowek First Nation (including KFN consultation staff, Councillor and legal counsel) and CNL (including a Senior Communications Officer, CNL legal counsel and Manager of ERM Stakeholder Relations) to discuss legal update on Framework Agreement and further plan a leadership meeting.										√
October 24, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's legal counsel shared the revised draft of the Framework Agreement for review. CNL offered to meeting with Kebaowek First Nation Legal Counsel to discuss the framework.										√
October 25, 2022 Outgoing email	This email from a CNL Senior Communications Officer to Kebaowek First Nation's consultation consultant sent date options for a leadership meeting. CNL requested KFN vote on the date options. CNL later revised the dates based on CNL's President and CEO is availability. KFN confirmed receipt.										√

October 19, 2023 Meeting	This meeting between CNL (Including the acting Director NPD Closure Project, Director, Communications and Engagement, Manager, Communications and Engagement, Communications Officer, CNL Legal Counsel), and KFN (including, KFN Consultant, Legal Counsels, KFN Engineering Advisor, Councillor). This meeting was to discuss other areas of interest to KFN and the NPD Closure Project Letter of Intent (LOI). CNL and KFN legal counsel discussed language in the LOI. CNL asked if KFN had an update on their EIS review.										√
October 26, 2023 Outgoing Email	This email from CNL Communications Officer to KFN is to provide an action list from the 2023 October 19 NSDF/NPD KFN-CNL monthly meeting.										√
December 19, 2023 Emails	This email from CNL Director of Communications and Engagement to KFN is to follow-up on their capacity to work with us and review the NPD materials. CNL noted the existing framework agreement in place that we can add additional schedules and funding to by a simple amendment. CNL has and will provide capacity for KFN and CNL to effectively work together, we know through dialogue at our last meeting that there is an immediate need for this funding so we are hopeful that we can get clarity in the very near term and move forward with the work and corresponding invoicing to meet both parties' objectives. KFN confirmed they will proceed with the funding schedules for the NPD under the existing CNL KFN consultation and engagement funding agreement. KFN noted sending costs over by the 2024 January 11 meeting.										√
January 11, 2024 Meeting	This meeting between CNL (Including the Indigenous Engagement Coordinator, Communications Officers, Senior Communications Officer, Manager, and Director of Communications and Engagement, and Manager of Environmental Protection, and Environmental Specialist, Acting director of NPD, and Decommissioning Specialist), and KFN (Including Councillor, Legal Counsels, and Consultant) is to act as the January monthly meeting. Discussion included next steps for Section 82 projects, work details for NPD Closure Project (adding "Schedule D" to existing Framework Agreement), and NSDF Project update (if required).										√
January 12, 2024 Outgoing Email	This email from CNL Legal Counsel to KFN is to provide a draft amendment to the Consultation and Engagement Framework Agreement between KFN, CNL and AECL in order to incorporate a new Schedule to the Agreement which will provide the work plan and budget for the NPD Project as a Project-Specific Agreement. KFN Confirmed receipt of the draft agreement.										√
January 19, 2024 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to KFN is to follow-up from the actions from the 2024 January 11 KFN - CNL January Working Group meeting. CNL requested dates to discuss the MCECE, and the NPE EIS review.										√
January 31, 2024 Incoming Email	This email from KFN Legal Counsel to CNL Legal Counsel provided an update on the NPD amendment to the Consultation and Engagement Framework Agreement. KFN noted they were still working to prepare a workplan and budget. CNL confirmed receipt.										√

April 29, 2024 Outgoing Email	This email from CNL Director of Communications and Engagement to KFN is to follow-up on the KFN timeline for review for the NPD EIS. CNL noted the desire to have KFN's comments such that concerns of the community can be included the upcoming revised draft EIS submission. CNL looked to confirm when KFNs review of the EIS can be completed.									√	√
May 01, 2024 Outgoing Email	This email from CNL Indigenous Engagement Officer to KFN is to invite KFN to the 2024 May 22 Chimney Swift night count night being held at the NPD site.										√
May 09, 2024 Meeting	This virtual meeting between CNL (including, Communications Officer, Director and Manager of Communications and Engagement, Indigenous Engagement Officer, Legal Counsel, Senior Communications Officer, Director NPD Closure Project, NPD Decommissioning Specialist and Director of Corporate Environmental Protection) AECL (including Manager of Engagement and Communications, and Senior Indigenous Relations Advisor) and, KFN (including Councillor, KFN Consultants, and legal counsel) is to act as the 2024 May KFN - AECL - CNL monthly meeting. Discussion included, the KFN letter to the CNSC on the NPD Project and the NPD EIS.									√	√
May 09, 2024 Incoming Email	This email from KFN Legal Counsel to CNL Director of Communications and Engagement is to provide CNL with a copy of the letter KFN sent to the CNSC, requesting a Procedural Order. CNL acknowledged receipt of the referenced letter.									√	
May 23, 2024 Event at NPD	KFN members attended the Chimney Swift Count Night at the NPD site.										√
May 23, 2024 Incoming Email	This email from KFN Consultant to CNL Indigenous Engagement Officer is to provide CNL with KFN's Information Requests (IR's) on the NPD Project. CNL confirmed receipt and noted further follow-up.									√	

KFN - Mapping of Key Interests and Concerns

Table C-14 presents a mapping of how the key interests and concerns relate to detailed feedback and input from KFN, as of June 2024.

Table C-14 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-14 Mapping of KFN Key Interests and Concerns

Topic	Project Aspects of Interest/Concern	Specific feedback provided by KFN on this interest/concern
1. Alternatives	a) Alternative project options and technologies It is important that KFN and CNL collaborate on the evaluation of alternatives and that alternatives are evaluated using a balance of land use, social and cultural aspects important to KFN, because the approach selected has implications for the Algonquin people's future use of the site. This is a project-specific concern.	In June 2022, KFN provided feedback to CNL on the interests and concerns recorded for their community. KFN identified the need to collaborate on alternative project options and technologies taking into account land use, social, and cultural impacts. KFN has concerns that internationally, the practice of "in situ" decommissioning is only permitted in the case of an emergency or an accident which does not apply in the case of the NPD Closure Project (TBD by KFN third party review).
	b) Emphasis on financial costs in determining preferred alternative means. KFN is interested in understanding more fully NPD's financial guarantee. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is interested in the detailed cost break down for each alternative option for NPD. KFN understands that the current proposal for decommissioning the NPD site would replace the preliminary decommissioning plans that informed the basis for the NPD's financial guarantee.
	c) Technical suitability of the ISD concept KFN is inquiring about CNL's approach to applying relevant IAEA standards. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN understands that the in-situ disposal option is not a method that has been employed yet at a Canadian-regulated nuclear facility. KFN is also interested in obtaining more information on CNL's consideration and application of IAEA standards for decommissioning and their application to the in-situ option.
2. Baseline Characterization	a) Geological site characterization It is important to KFN that baseline geological conditions are accurate and well understood, so that the long-term impacts of the NPD Closure Project can be accurately assessed. This is a project-specific interest.	During a site visit in April 2023, a Kebaowek community member asked questions about the quality of the bedrock around the facility and CNL's characterization work. The community member was also interested in how the facility will resaturate.
3. Engagement	a) Meaningful Indigenous participation and adequate Crown consultation in environmental assessments for the NPD Closure Project and the NSDF Project; Meeting the requirements of CEAA 2012 Section 5 (c) and United Nations Declaration on the Rights of Indigenous peoples Act (UNDA) 2021. This is both a project-specific concern and a concern for the Crown.	Meaningful Indigenous participation and adequate Crown consultation in environmental assessments (EAs) for the NPD Closure Project and the NSDF Project. AANTC and KFN sent a letter to the Prime Minister (May 14, 2020), which expressed consultation process concerns and a second letter was sent to the Minister of Natural Resources (August 26, 2020). This concern was reiterated in KFN's April 2021 response to CNL's letter outlining a preliminary commitment list for the NPD Closure Project and in KFN's July 2021 response to CNL's letter enclosing a summary of interests and concerns on the NPD Closure Project. KFN expressed their interest via a letter to CNL in summer 2021 to develop a Framework Agreement with CNL. KFN is looking for Algonquin engagement protocols to be established and recognized. In June 2022, KFN reiterated that it is seeking a fair legislative opportunity to engage. KFN highlighted that Section 19 (3) *CEAA*

Topic	Project Aspects of Interest/Concern	Specific feedback provided by KFN on this interest/concern
		(2012) provides for meaningful consultation, early engagement, and consideration of Indigenous Knowledge in EA. KFN must be provided adequate notice, relevant information, and opportunity to comment on Project Description, EIS, and draft EA as per *CEAA* (2012). KFN is seeking a fair legislative opportunity to engage and does not agree with CNL's assessment of "lack of participation" by KFN. The time period of no comments was in keeping with KFN correspondence with the Federal government seeking the opportunity to engage using the evolved legislative environment (Impact Assessment Act) and UNDA 2021 and 2023 Action Plan items.
3. Engagement	b) KFN wants to ensure that consultation and/or accommodation occurs with the Algonquin Anishinaabeg rights holders. This is both a project-specific concern and a concern for the Crown.	KFN takes issue that CNL has established project "Relationship Agreements" with umbrella organizations. KFN wants to ensure that non-Indigenous or non-Section 35 rights holders' participation in engagement with CNL and consultation with the CNSC, and Canada does not negatively impact human rights of true Algonquin Anishinaabeg rights holders. KFN has highlighted the non-Section 35 Rights holders are only entitled to engagement. KFN seeks collective clarity from CNL and CNSC as to how the NPD assessment distinguishes engagement from consultation with non-Section 35 Rights holders. KFN seeks definition and distinction in the CNL EIS between Section 35 Rights holders and non-Section 35 Rights holders.
	c) Funding for Participation in NPD EA process including review of existing studies and the EIS and community consultation. It is important to KFN that they have an opportunity to review the NPD Closure Project assessment and supporting documents and that there is meaningful engagement because the project is located within the traditional territory of KFN. This is a project-specific interest.	KFN has requested an opportunity to review the existing studies and NPD Closure Project EIS. As of June 6, 2022, KFN has only reviewed the Indigenous Engagement Section of the EIS. CNL and KFN have not established a budget that will support review of the entirety of the EIS. KFN highlighted that Section 19 (3) *CEAA* (2012)provides for meaningful consultation, early engagement, and consideration of Indigenous Knowledge in EA. KFN is seeking, with adequate notice, the relevant information, and an opportunity to comment on the Project Description, EIS, and draft EA. Through the negotiation of the Framework Agreement, CNL understands that KFN wants to ensure that information is disseminated to, and perspectives are heard from, community members through a Community Consultation Process. The objectives of a Community Consultation Process are: • to inform the people of the First Nation regarding CNL`s designated projects. • to learn what members of the First Nation think about (i) CNL`s designated projects, (ii) how the CNL`s designated projects may affect their Aboriginal rights and interests, (iii) how they would like to participate in the review of the EIS for the NPD Closure Project and community-led studies. • to provide additional information supporting community led assessment studies relevant to the EIS.
4. EA Process and Methodology	a) Continued use of *CEAA,* 2012 for the NPD Closure Project rather than the new *Impact Assessment Act*. It is important to KFN that the environmental assessment be carried out using the more recent *Impact Assessment Act* because it expressly recognizes the need for reconciliation. This is not a project-specific interest.	Continued use of *CEAA* (2012)for the NPD Closure Project rather than the new Impact Assessment Act (May 2020 Letter to Prime Minister). KFN has communicated on numerous occasions that *CEAA* (2012)legislation is not in parallel with the evolving EA landscape. KFN is seeking a fair legislative opportunity to engage and does not agree with CNL's assessment of "lack of participation" by KFN. The time period of no comments was in keeping with KFN correspondence with the Federal government seeking the opportunity to engage using the evolved legislative environment (Impact Assessment Act).

Topic	Project Aspects of Interest/Concern	Specific feedback provided by KFN on this interest/concern
		Further, KFN is seeking clarity from CNL and CNSC to distinguish consultation and engagement between non-Section 35 and Section 35 Rights holders as it applies to the NPD Assessment. In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN has asked how or if CNL has considered environmental justice within its assessment highlighting that Indigenous Nations, communities and organizations are disproportionately impacted by environmental harms and underrepresented in applicable decision-making processes.
4. EA Process and Methodology	b) Concern about the methodology of the cumulative effects assessment KFN is inquiring about CNL's assessment of cumulative effects, including CNL's assertion that only a high-level assessment is required due to its assertions of no residual effects associated with its preferred option for the NPD Closure Project. This is a project-specific interest.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS that highlights topics of interests and concerns for KFN that KFN would like additional information on. KFN is inquiring about CNL's assertion that an absence of residual effects should allow only a high-level consideration of possible cumulative effects. KFN is interested in obtaining more information on work that CNL has done on the identification, assessment, and analysis of potential cumulative effects.
5. End State, Site Restoration and Future Use of the Land	a) Preparation of on-site landfills for the post-closure period KFN is inquiring into plans for managing the on-site landfills for all project alternatives. This is a project-specific interest.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is looking for additional information on the two legacy landfills on the NPD site including management of the land area and continuation of monitoring, if required. Closure plans for the on-site landfills are important to KFN because it wants to ensure that the environment around the site of the NPD Closure Project is protected.
6. Environmental Effects and Mitigation Measures	a) Implementation of appropriate measures to prevent or mitigate any negative impacts from the project. KFN would like provide input on mitigation to ensure reduction and elimination of potential effects. It is important to KFN that the mitigation measures address the potential impacts on KFN, taking into consideration the importance of and balancing of interrelationships among cultural, environmental, and social elements. This is a project-specific interest.	In June 2022, KFN provided feedback to CNL on the interests and concerns recorded for their community. KFN expressed concern that appropriate measures are not being taken to prevent or mitigate any negative impacts of proposed studies, developments, or monitoring. This evaluation is to properly consider the importance of balancing interrelationships among cultural, environmental, and social elements, including Trauma Informed Impact Assessment. As of 2023 June, KFN has communicated that researching and defining *CEAA* (2012) project impact pathways is a priority area of interest for Kebaowek.
	b) Potential impacts to aquatic species from NPD decommissioning activities The Kichi-Sibì and aquatic species are of particular importance to KFN. KFN would like additional information on plans, protocols, or strategies for Indigenous engagement/consultation on potential impacts to the aquatic environment. This is a project-specific concern	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is seeking information relating to any aquatic *Species at Risk Act* and *Fisheries Act* permitting assessments for the NPD Closure Project and how consultation activities required by those Act, relevant agencies and MOU agreements are being undertaken. KFN is seeking more information relating to historical practices at the NPD site whereby contaminated water was released into the Kichi-Sibì. KFN is seeking more information that comprehensively assesses all potential sources of contamination from the NPD site to Kichi-Sibì as this is not clearly delineated in the most recent EIS.
7. Free Prior and Informed Consent (FPIC)	a) United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) and UNDA 2021. KFN is seeking incorporation and advancement of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) including the principle of Free Prior and Informed Consent (FPIC) prior to proceeding with the proposed ISD Project. This is a project-specific concern.	KFN is seeking recognition of Algonquin jurisdiction within the context of FPIC and UNDRIP. In June 2022, KFN provided feedback to CNL on the interests and concerns recorded for their community. KFN is seeking to incorporate UN guiding Principles for Human Rights and Business and UNDRIP. Additionally, KFN highlights that the *IAA* works to advance UNDRIP, endorsed and enacted by the Government of Canada, including FPIC. KFN has identified a pilot Impact Assessment for the Temiskaming Dam Replacement Project under *CEAA* (2012) that takes into consideration historic rights and UNDRIP.
8. Indigenous Health	a) Methodology for conducting the Indigenous health assessment, receptors, and diet. KFN is interested in how Indigenous receptors have been defined in CNL's assessment and how CNL meets the requirements under CSA N288.1. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD revised draft EIS. KFN is looking for additional information on the definitions for "Indigenous People" and "Indigenous Worker" which are identified as specific receptors for calculating exposure to potential health risks.

Topic	Project Aspects of Interest/Concern	Specific feedback provided by KFN on this interest/concern
9. Inventory	a) Inventory of the NPD disposal facility KFN is seeking further information about the nuclear waste that may remain on site and the radiological inventory of the proposed NPD disposal facility. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN wants to better understand the nuclear waste/contamination that is expected to be present at the NPD site, and requests more information on the radiological inventory (quantities and radioactivity) of the proposed NPD disposal facility.
10. Long-term Safety	a) Technical suitability of In-Situ Disposal concept It is important to KFN that CNL demonstrate the design is appropriate in terms of waste inventory, containment, grouting of the NPD structure, and international best practice, because the NPD site is located within KFN traditional territory, and it is important that future users of the land at the NPD site are protected. This is a project-specific concern.	In June 2022, KFN provided feedback to CNL on the interests and concerns recorded for their community. KFN identified the need to incorporate long-term nuclear waste effect-related concerns into the evaluation of the NPD Closure Project. This evaluation should properly account for cultural, environmental, and social concerns and interests of the community, including gender-based analysis. In April 2023 KFN asked questions about the waste inventory, radionuclides and their half-lives.
	b) Long term site integrity KFN is interested in seeing examples of in-situ disposal used elsewhere and the performance of this concept. KFN wants confidence in the performance of the facility over the long-term to protect humans and the environment. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is inquiring about the comparative studies and assessments for in-situ disposal used by CNL and how they account for the significant differences in surface ecology and climate at NPD, as well as impacts to subsurface conditions and behaviour at less than 5m depth. KFN is inquiring about social and cultural considerations in CNL's comparisons between analogous sites for their proposed NPD in-situ disposal.
	c) Potential effects of the environment on the facility KFN is seeking more information about how CNL determines whether or to what extent environmental events may affect the long-term safety of the facility. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN seeks more information about potential impacts of extreme weather or natural hazards on the NPD facility. KFN is interested to understand how the effects of extreme weather, climate change including storm projections and severe forest fires are considered in the NPD Closure Project's assessment. KFN is also interested in the effect of seismic events on long term safety.
11. Monitoring	a) Current monitoring and impacts from site operation. KFN is interested to understand CNL's past environmental performance at the NPD site via access to environmental monitoring plans and data. This is a project-specific concern.	In April 2023 KFN asked questions about the operational history, accidents, and details of the NPD intake/outfall. KFN was interested to know if there was a sediment plume at the outfall for NPD similar to the contaminated Ottawa riverbed sediments near the Chalk River site. In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is interested in learning more about the current routine environmental monitoring at NPD. KFN is concerned that there is no publicly accessible Environmental Risk Assessment (ERA) or other publicly accessible source of monitoring data or monitoring plan descriptions for the NPD Closure Project. KFN requires a more comprehensive list and description of routine monitoring activities.
	b) EA Follow-up Monitoring KFN is interested in the proposed EA follow-up monitoring plans, especially comprehensive descriptions of monitoring pathways, locations, and frequencies. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS.

Topic	Project Aspects of Interest/Concern	Specific feedback provided by KFN on this interest/concern
12. Protection of Flora and Fauna	a) Biota and Species at Risk KFN is inquiring about the potential impacts to Chimney Swifts from remedial and closure activities for the NPD ventilation stack. This is a project-specific concern	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is inquiring about potential impacts to the chimney swift. KFN is interested in current contaminant levels present in the stack, specifically frequency of stack monitoring, sampling methodologies, and disaggregated monitoring results.
	b) Species at Risk permits. KFN is inquiring about a lack of engagement/consultation during the SAR permitting process. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is interested in the constitutional and regulatory aspects of species at risk permitting assessments. Specifically, KFN is looking for actions taken and status on CNL's plans, protocols, or strategies for Indigenous engagement/consultation on species at risk.
13. Protection of the Ottawa River	a) KFN expressed concern about watershed sustainability. As stewards of the lands and waters, it is important to KFN that the environment around the site of the NPD Closure Project including the Ottawa River is protected. KFN exercises rights and carries out traditional and contemporary activities, many of which rely on the health and well-being of the Ottawa River to maintain the health of the Anishnabeg Peoples. This is a project-specific concern.	In June 2022, KFN provided feedback to CNL on the interests and concerns recorded for their community. KFN identified the need to incorporate watershed sustainability concerns into the NPD EIS. This evaluation should properly account for cultural, environmental, and social concerns and interests of the community, including gender-based analysis.
	b) Impacts on groundwater and surface water quality KFN is inquiring about contamination releases to surface water during proposed decommissioning activities on the NPD site. As stewards of the lands and waters, it is important to KFN that the Ottawa River is protected. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is concerned that the Ottawa River is protected. KFN is interested in both historic liquid effluent discharge practices for the NPD facility sumps to the Ottawa River, as well as the current process involved in transferring the wastewater to the CRL site. KFN is also inquiring about the additional potential sources or pathways of liquid emissions from the NPD site during proposed decommissioning: the two tile drainage systems on site; stormwater channels (surface ditches); an equipment washout pit, and potential wastewater generated by the proposed grout mixing plant for the NPD decommissioning activities. It is unclear to KFN from the EIS how all these potential sources of water contamination will be addressed in proposed decommissioning activities. Further, KFN is also interested in any studies, assessments, or documents specifically relating to whether expected releases to surface water may require a *Fisheries Act* authorization.
14. Technical	a) Technical details for the batch mixing plant. It is important for KFN to understand CNL's plans for the proposed batch mixing plant to ensure that potential effects on the aquatic environment are properly assessed. This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is interested in the technical details of the batch mixing plant including additional information on the water source, volume, or intake rate required for the grout mixing plant.

Topic	Project Aspects of Interest/Concern	Specific feedback provided by KFN on this interest/concern
15. Traditional Land and Resource Use and Cultural Impacts	a) Algonquin traditional knowledge should be collected and incorporated into the EIS. It is important to KFN that CNL solicit and use KFN's community-specific knowledge in order to properly characterize current site conditions, develop scenarios that accurately represent potential future uses of the site, and ensure that species and traditional uses are properly considered by the project. This is a project-specific concern.	KFN is seeking recognition and support of Algonquin community-led assessment. In June 2022, KFN provided feedback to CNL on the interests and concerns recorded for their community. KFN identified that traditional knowledge needed to be properly incorporated and considered within the EIS. KFN also identified their capacity to carry out independent studies as part of environmental, social, and cultural impact-assessment processes, with due regard to ownership of and the need for the protection and safeguarding of traditional knowledge. KFN is seeking to collaborate with CNL on appropriate land use, social, and cultural impact study methodologies with suitable timeframes to implement studies. As noted through the Framework Agreement, KFN was interested in several studies for the NSDF project that may be applicable to NPD. These supplemental Indigenous-led studies are related to Indigenous land and resource use, occupancy, socio-economic conditions, health and well-being and knowledge verification, applicable for CNL's designated projects: • Terrestrial animals' displacement, engineering and resettlement effects and traditional use assessment • Historical overview, displacement and resettlement effects, spatial and temporal boundaries, ceremonial jurisdiction • Baseline overview, historical effects, cumulative effects of CNL`s sites
16. Valued Components	a) Selection of valued components KFN is interested in the identification, selection, and assessment of "candidate species" (i.e., VCs) This is a project-specific concern.	In May 2024, KFN provided an Information Request (IR) to CNL as part of KFN's technical review of the NPD EIS. KFN is interested to understand how VCs at all trophic levels were selected for the project, as well as the frequency and duration of any field studies to confirm the selection of VCs, and any further assessments relating to CNL's application of an "ecosystem approach" to the identification and representativeness of VCs for the project.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Kebaowek First Nation (KFN) – Summary of Interests and Concerns

Table C-15 below summarizes the key interests and concerns that Kebaowek First Nation (KFN) have raised on the NPD Closure Project, up to June 2024. CNL also includes engagement beyond this cut-off date in order to capture receiving KFN's preliminary EIS review comments. KFN is part of the AANTC and did not submit separately comments on the 2017 draft EIS. As noted above, the full submission of AANTC comments on the 2017 draft EIS can be found online: Comments on the 2017 draft EIS for NPD from Algonquin Anishinabeg Nation Tribal Council.

Table C-15 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, and why it is important to the Indigenous Nation, community or organization. This interest or concern is also connected to a project aspect or an Aboriginal or treaty right wherever possible. This column may present a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern.
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS, this is also discussed;
- Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

The summary of KFN *Key Interests and Concerns* are derived from CNL's various engagements with KFN, including oral and written correspondence since 2016 when CNL introduced the NPD Closure Project proposal. Of note, KFN submitted information requests (IRs) to CNL on May 23, 2024, for specific topic areas where more information and data is required (as indicated below), based on KFN's technical review of the EIS. It is understood that the specific topic areas identified through the IRs are based on KFN's preliminary review of the EIS and does not constitute specific issues of concern for KFN as it remains too early in the review process for KFN to make this determination. CNL recognizes that KFN's review and assessment of the draft EIS remains underway, and therefore, the interests and concerns of KFN as described may change once the review and studies are completed and such changes will be captured in the final EIS.

Table C-15 Kebaowek First Nation Interests and Concerns

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
1. Alternatives	a) Alternative project options and technologies It is important that KFN and CNL collaborate on the evaluation of alternatives and that alternatives are evaluated using a balance of land use, social and cultural aspects important to KFN, because the approach selected has implications for the Algonquin people's future use of the site. This is a project-specific concern.	CNL would be happy to provide an overview of the in-situ disposal concept to KFN, including how CNL conducted the alternative means assessment (AMA) and why in-situ disposal is the preferred approach. KFN has requested further information from CNL on this issue as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL shared with KFN the requested supplemental reference documents in July 2024. Further discussions may proceed after CNL responds to KFN's requests (planned for Fall 2024). CNL Response: When conducting the AMA, CNL followed the regulatory framework laid out in the Canadian Environmental Assessment Agency (CEAA) Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2015) for the evaluation. of alternatives. The level of analysis conducted for each alternative is consistent with the *CEAA* requirements. The NPD site has been safely managed for over 55 years. CNL is reducing the waste liability by converting the waste into a form that provides safe, permanent waste disposal. CNL agrees that protection of future land users is an important concern and has addressed this subject. CNL has assessed the suitability of in-situ disposal for the NPD site, and the EIS shows that such a disposal	Where is this topic discussed in the EIS? Alternative means are discussed in the **AMA TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received June 2022).	Status: Outstanding CNL understands that project alternatives are an area of interest for KFN, and respects that KFN has a different opinion on the most suitable decommissioning approach for NPD. CNL maintains that the proposed in-situ disposal is the preferred option to undergo an environmental assessment (EA) and will await the outcome of the CNSC's decision on the Project. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue. Through engagement, CNL hopes that the parties are able to find common ground on

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		option is safe for human health and the environment in the short term and long term. Based on its consideration of national and international standards and guidelines, CNL continues to believe that the NPD facility has characteristics that support in-situ disposal. CNL is committed to meeting with KFN to hear community perspectives on alternatives.		this topic, including the development of commitments to build confidence and trust in the in-situ disposal concept.
1. Alternatives	b) Emphasis on financial costs in determining preferred alternative means. KFN is interested in understanding more fully NPD's financial guarantee. This is a project-specific concern.	CNL would be happy to provide an overview of the in-situ disposal concept to KFN, including how CNL conducted the AMA and why in-situ disposal is the preferred approach. KFN has requested further information from CNL on this issue as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL shared with KFN the requested supplemental reference documents in July 2024. Further discussions may proceed after CNL responds to KFN's requests (planned for Fall 2024). <u>CNL Response:</u> CNL's role is to determine the most effective method to safely and securely manage the nuclear liabilities at the NPD site. In alignment with the CEAA Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *CEAA*, 2012, an AMA was completed. According to the AMA, in-situ disposal was not determined to be the fastest and cheapest of all the options, however in-situ disposal was the most preferable based on several factors such as technical feasibility (proven technology and compliance with regulatory requirements), financial feasibility and effects on the people and the environment. CNL evaluated the various options based on an analysis of not only the technical possibilities, but also of their costs to lead to a decision that is in the best interests of Canada. In-situ disposal was found to be the preferred means for completing the NPD Closure Project, an option which was supported by AECL to undergo an EA.	<u>Where is this topic discussed in the EIS?</u> Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback (received May 2024).	<u>Status:</u> Outstanding CNL understands that project alternatives are an area of interest for KFN, and respects that KFN has a different opinion on the most suitable decommissioning approach for NPD. CNL maintains that the proposed in-situ disposal is the preferred option to undergo an EA and will await the outcome of the CNSC's decision on the Project. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. <u>Next Steps:</u> KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue. Through engagement, CNL hopes that the parties are able to find common ground on this topic, including the development of commitments to build confidence and trust in the in-situ disposal concept.
1. Alternatives	c) Technical suitability of the ISD concept KFN s inquiring about CNL's approach to applying relevant IAEA standards. This is a project-specific concern.	CNL would be happy to provide an overview of the in-situ disposal concept to KFN, including how CNL conducted the AMA and why in-situ disposal is the preferred approach. KFN has requested further information from CNL on this issue as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL shared with KFN the requested supplemental reference documents in July 2024. Further	<u>Where is this topic discussed in the EIS?</u> Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback (received May 2024).	<u>Status:</u> Outstanding CNL understands that project alternatives are an area of interest for KFN, and respects that KFN has a different opinion on the most suitable decommissioning approach for NPD. CNL maintains that the proposed in-situ disposal is the preferred option to undergo

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		discussions may proceed after CNL responds to KFN's requests (planned for Fall 2024). CNL Response: The proposal to create a disposal facility on the NPD reactor site through in-situ decommissioning has been chosen as a safe and immediate decommissioning option for the NPD reactor with respect to the environment, workers, and the public. It is important to highlight that this closure will reduce historic nuclear liabilities for Canada and, at the same time, reduce the footprint of the NPD site. The risks associated with in-situ disposal are lower than other options. In-situ disposal is a well-known technique used since the 1960's at many nuclear sites worldwide. Sites contaminated with toxic and hazardous wastes are also remediated using this technique. This approach requires the project to apply for a license as a disposal facility, and hence the facility must also meet the regulations for a disposal facility. In the case of the NPD reactor, the decommissioning strategy is to incorporate the reactor into a new disposal facility, which is in accordance with the IAEA definition of decommissioning, IAEA Safety Glossary (IAEA 2019). This strategy also meets the Canadian regulatory requirements, in particular the requirements of Section 5.1 of REGDOC-2.11.2, Decommissioning. Therefore, entombment is not being used as a decommissioning strategy for the decommissioning of the NPD reactor. The NPD reactor has a low inventory. Tritium is the major radionuclide and will decay to low levels during the Institutional Control period. The longer-lived Intermediate Level Waste (ILW) consists of small quantities of low energy beta emitters. The beta emitters have low radiotoxicity and do not generate heat. These are activation products inside the metal of the calandria in the reactor vault. The reactor vault is reinforced concrete with walls 3 m thick located around 10 m below grade in bedrock. The location of the reactor vault isolates the wastes making it hard to access. These are all features that are consistent with IAEA Safety Standard SSR-5, Disposal of Radioactive Waste, regarding cavern or vault disposal for ILW. CNL has written a report summarizing facilities worldwide that use in-situ disposal, (Aikens 2019b). The report is not limited to nuclear reactors or processing facilities and includes mines and hazardous waste sites. The report also describes what each of the facilities have in common, why in-situ disposal is the preferred approach and how it applies to NPD. In summary, in-situ disposal is a viable option for NPD. It is CNL's belief that the NPD facility has characteristics that support in-situ disposal. CNL is committed to ongoing engagement with KFN to gain a greater understanding of their concerns about the long-term safety of nuclear waste.		an EA and will await the outcome of the CNSC's decision on the Project. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue. Through engagement, CNL hopes that the parties are able to find common ground on this topic, including the development of commitments to build confidence and trust in the in-situ disposal concept.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
2. Baseline Characterization	a) Geological site characterization It is important to KFN that baseline geological conditions are accurate and well understood, so that the long-term impacts of the NPD Closure Project can be accurately assessed. This is a project-specific interest	During the April 2023 site visit CNL summarized verbally some of the geologic and site investigation undertaken to support the project. As a follow-up, CNL shared the Geosynthesis report. CNL Response: In 2018/19 CNL undertook a geoscientific fieldwork campaign to sample and characterize the bedrock around the NPD facility. The fieldwork included coring of 10 boreholes to a depth of 50 metres into bedrock and several overburden boreholes, with installation of wells for sampling and hydraulic property determinations. The Geoscientific Characterization Report was used to revise the Geosynthesis report and the various models (i.e., Groundwater Model, Resaturation Model). The results of these reports were incorporated into the Postclosure Safety Assessment (PostSA) technical supporting document (TSD), enabling CNL to assess potential effects to valued components (VC) in the aquatic and terrestrial ecosystems. The additional field investigations and updated models support the conclusion that the NPD Closure Project is protective of human health and the environment.	Where is this topic discussed in the EIS? **Section 8.5** of the EIS presents the geological baseline data. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received June 2022).	Status: Resolution in Progress The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.
3. Engagement	a) Meaningful Indigenous participation and adequate Crown consultation in environmental assessments for the NPD Closure Project and the NSDF Project; Meeting the requirements of CEAA 2012 Section 5 (c) and United Nations Declaration on the Rights of Indigenous peoples Act (UNDA) 2021. This is both a project-specific concern and a concern for the Crown.	CNL heard KFN's concern about meaningful Indigenous participation in the EA for the NPD Closure Project. CNL has sought feedback from, and offered engagement opportunities for, KFN on numerous occasions since the beginning of the project and signed a Letter of Intent for the development of a Framework Agreement. The Framework Agreement was signed in January 2023 detailing how CNL and KFN engage on CNL activities and projects, including the NPD Closure Project. CNL Response: For the NPD Closure Project, the responsibility for assessing that adequate Crown consultation has been undertaken falls with the CNSC. CNL recognizes that the number of emails, meetings, and phone calls does not equate to meaningful consultation. At its core, meaningful consultation is demonstrating integrity through a purposeful attempt to understand and address concerns through the context of reconciliation. CNL is committed to open, transparent, and continuing engagement with KFN within its role as the project proponent. CNL continues to communicate with, and provide engagement opportunities for, KFN. In April 2023, KFN visited the NPD site and had initial discussions about the project. CNL is looking forward to building an NPD specific work plan under the Framework Agreement to work on addressing areas of interest and concern from KFN. Engagement Highlights: CNL first reached out to KFN in 2016 with two letters addressed to the Chief; both letters shared information and one inquired on traditional land use.	Where is this topic discussed in the EIS? **Section 6.2 4.6.1** of the EIS summarizes CNL engagement with KFN including signing a Letter of Intent and a Framework Agreement that details how CNL and KFN engage on CNL activities and projects, including the NPD Closure Project. What changes have been made (and where)? CNL has updated **Section 6.2.4.6.1** of the EIS to reflect new and planned engagement activities to support KFN's meaningful participation in the EA process.	Status: Resolution in Progress CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. It is noted that this topic extends beyond the scope of the NPD Closure Project. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		As a part of the AANTC, KFN attended an introductory project meeting between the AANTC and CNL in 2017 April to share project information and hear feedback from the AANTC leadership. The CNL presentation included: site location, project components and timeline, species at risk, proposed end state, and safety barriers for the protection of the environment. In June 2020, CNL and AANTC, including KFN began a discussion on a contribution agreement to support KFN's participation in the EA process. Although CNL attempted further correspondence with KFN through July and August 2020, in September 2020, the AANTC informed CNL that they would not be willing to meet again until the latest letter, sent to the Minister, received a response. CNL sought feedback from KFN in 2021 on preliminary project commitments and on the summary of interests and concerns. In July 2021 CNL and KFN agreed to move forward with the development of a framework agreement with CNL, with the first step being a Letter of Intent. Two-way communication (correspondence and meetings) in the second half of 2021 resulted in a signed Letter of Intent between CNL and KFN in January 2022. CNL and KFN signed a framework agreement in January 2023. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024.		
3. Engagement	b) KFN wants to ensure that consultation and/or accommodation occurs with the Algonquin Anishinaabeg rights holders. This is both a project-specific concern and a concern for the Crown.	<u>CNL Response:</u> CNL appreciates and understands the feedback that as a rights holding Indigenous Nation, KFN needs to be consulted with and engaged directly, and through the right processes with the right representatives. CNL understands the importance of establishing a unique relationship with KFN to ensure that they may bring forward any concerns or interest they have specific to the rights held collectively by the Nation. CNL is committed to building positive long-term relationships with Indigenous Nations and communities who have treaty and Aboriginal rights on the lands for the proposed NPD disposal facility, as well as working with other interested Indigenous Nations, communities and organizations. CNL will continue to directly build a relationship with KFN in a way that KFN wants to be engaged.	<u>Where is this topic discussed in the EIS?</u> CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback.	<u>Status:</u> Outstanding The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL understands that this concern remains outstanding for KFN until CNL and CNSC provide clarity on how the NPD assessment distinguishes engagement from consultation with non-Section 35 Rights holders. CNL remains committed to ongoing engagement with KFN within its role as the project proponent. It is noted that this topic extends beyond the scope of the NPD Closure Project. <u>Next Steps:</u> CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
3. Engagement	c) Funding for Participation in NPD EA process including review of existing studies and the EIS and community consultation. It is important to KFN that they have an opportunity to review the NPD Closure Project assessment and supporting documents and that there is meaningful engagement because the project is located within the traditional territory of KFN. This is a project-specific interest.	CNL Response: CNL is committed to open, transparent, and continuing engagement with KFN. CNL and KFN have entered into a Framework Agreement, which provides for engagement directly between the parties on the NPD Closure Project as well as capacity funding to support KFN's participation in the EA process. As the engagement has deepened, it is expected that work on NPD will include disseminating communications materials and capturing community members' perspectives on the NPD Closure Project. CNL looks forward to meaningful engagement with KFN accomplished in good faith by all to understand KFN's concerns and work towards addressing them together.	Where is this topic discussed in the EIS? **Section 6.2 4.6.1** of the EIS summarizes CNL engagement with KFN to date. What changes have been made (and where)? CNL has updated **Section 6.2.4.6.1** of the EIS to reflect new and planned engagement activities to support KFN's meaningful participation in the EA process.	Status: Resolution in Progress The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. A work plan is being developed which will identify, amongst other things, capacity to support review of existing studies and the EIS. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.
4. EA Process and Methodology	a) Continued use of *CEAA*, 2012 for the NPD Closure Project rather than the new *Impact Assessment Act*. It is important to KFN that the environmental assessment be carried out using the more recent *Impact Assessment Act* because it expressly recognizes the need for reconciliation. This is not a project-specific interest.	No actions – the NPD Closure Project EA will continue under *CEAA* (2012). CNL Response: Note this concern was raised with the Federal Government. While the topic of regulatory requirements for an EA process is broad and not specific to the NPD Closure Project, KFN's comments were directed at the regulatory regime under which the NPD Closure Project should be assessed. As per direction from the CNSC and transitional provisions of the *Impact Assessment Act*, CNL is continuing its EA for the NPD Closure Project under *CEAA* (2012). Letter to CNL - Changes to Federal Legislation. CNL recognizes that what KFN is requesting is consistent with the new provisions and commitments under the *Impact Assessment Act* (*IAA*), but is beyond the scope of *CEAA* (2012) and therefore is not required to be considered. The final NPD EIS will meet the requirements of *CEAA* (2012) but will also incorporate good practices consistent with the *IAA*.	Where is this topic discussed in the EIS? **Section 3.5** of the EIS summarizes the regulatory framework for the NPD Closure Project. **Section 6.4** outlines CNL's approach and commitment to reconciliation. What changes have been made (and where)? **Section 3.5** of the EIS reflects the provisions in subsection 182 of the *IAA* for continuation of ongoing projects under *CEAA* (2012).	Status: Resolved For the NPD Closure Project, CNL considers this concern addressed by the revisions to the EIS that provide the regulatory framework and outline CNL's approach and commitment to reconciliation. While KFN may still prefer that the project is subject to the *IAA*, the CNSC has determined that the project will be evaluated under *CEAA* (2012). CNL understands that this concern remains outstanding for KFN until CNL and CNSC provide clarity on how the NPD assessment distinguishes engagement from consultation with non-Section 35 Rights holders. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on the environmental justice issue as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to KFN's queries on this issue.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
4. EA Process and Methodology	b) Concern about the methodology of the cumulative effects assessment KFN is inquiring about CNL's assessment of cumulative effects, including CNL's assertion that only a high-level assessment is required due to its assertions of no residual effects associated with its preferred option for the NPD Closure Project. This is a project-specific interest.	CNL Response: CNL's view is that a cumulative effects assessment is required only where adverse residual effects have been identified, a position consistent with *CEAA* (2012). The EIS identified no adverse residual effects are expected to occur from the NPD Closure Project. According to *CEAA* (2012), cumulative effects assessment is not required for negligible potential effects. Therefore, conducting a cumulative effects assessment would be beyond the scope of *CEAA* (2012) and this EA.	Where is this topic discussed in the EIS? **Section 9.13** of the EIS provides the process for evaluating cumulative effects and the assessment of cumulative effects for the NPD Closure Project. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL understands that assessment of cumulative effects is an area of concern for KFN. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
5. End State, Site Restoration and Future Use of the Land	a) Preparation of on-site landfills for the post-closure period KFN is inquiring about plans for managing the on-site landfills for all project alternatives. This is a project-specific interest.	CNL Response: CNL acknowledges KFN's request for more information on the landfill areas at the NPD site. Groundwater near the landfills has been assessed through comprehensive campaigns in 2014 and 2017 and no groundwater impacts were noted related to the landfills. Landfill #1 was used for conventional purposes (e.g., office and cafeteria waste) during the operation of the facility and has a certificate of approval (A413107) from the Ontario MOECC acknowledging closure of the landfill. The certificate of approval includes conditions for regular inspections of Landfill #1. An annual inspection takes place which includes inspecting the landfill for settlement or fallen trees, ensuring survey markers and sign posts are not damaged and ensuring the general aesthetics are maintained. In terms of the impact to the environment from Landfill #1, minor greenhouse gases are emitted from the decomposition of organic matter (wood, cafeteria waste). These emissions are insignificant - approximately 128 tonnes of CO_2 equivalent per year, which is much lower than the reporting threshold to Environment and Climate Change Canada of 10,000 tons of CO_2 equivalent per year. Groundwater quality around Landfill #1 has been evaluated several times over the years (summarized in Section 8.5.6.1 of the Environmental Impact Statement (EIS)). The campaigns assessed	Where is this topic discussed in the EIS? The former landfills are introduced in **Section 3.3.1** of the EIS (Structures at the NPD Site). General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. **Section 8.5** describes the geology and baseline characterization near the former landfills. Landfill monitoring activities are discussed in **Section 12** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress CNL understands that ensuring that lands on and in the vicinity of the NPD site are responsibly managed is an area of concern for KFN. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		radiological, inorganic, and organic water quality and concluded that there was no contaminant concentrations in groundwater that exceeds available federal water quality guidelines for drinking water. Landfill #1 will undergo annual inspections indefinitely. No other assessment or preparation of Landfill #1 is required. Landfill #2 was used as a laydown area during construction of the site and contains mainly construction rubble. An assessment of groundwater quality around Landfill 2 was undertaken in 2014 (see Section 8.5.6.1 of the EIS). One of the sample locations north-east of Landfill 2 showed manganese concentrations in exceedance of the Health Canada Drinking Water standards, but the study concluded that this value is likely not due to contamination, and that no groundwater issues were noted for NPD. Manganese is a naturally occurring metal and is abundant. For example, wells in background areas of the Chalk River Laboratories Site (unaffected by site operations) have natural Manganese concentrations up to 800 ug/L. Because it is not a registered landfill, no annual inspections will be required for Landfill #2. No other assessment or preparation of Landfill #2 is required.		information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
6. Environmental Effects and Mitigation Measures	a) Implementation of appropriate measures to prevent or mitigate any negative impacts from the project. KFN would like to provide input on mitigation to ensure reduction and elimination of potential effects. It is important to KFN that the mitigation measures address the potential impacts on KFN, taking into consideration the importance of and balancing of interrelationships among cultural, environmental, and social elements. This is a project-specific interest.	<u>CNL Response:</u> The EIS identified no adverse residual effects as a result of the project. CNL is continuing its efforts to address concerns related to potential effects and mitigation measures by offering an opportunity to all Indigenous Nations, communities and organizations to be involved in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help build confidence that the decommissioning strategy and mitigation measures are effective. CNL stands by its conclusion that the project will not interfere with traditional activities nor impact biological resources upon which they are dependent. However, CNL is open to increased engagement, education, and participatory involvement in monitoring activities at CNL operated to help alleviate any concerns.	<u>Where is this topic discussed in the EIS?</u> **Section 10** of the EIS, specifically **Table 10.3-1** summarized the mitigation measures identified for the various environmental components assessed under this EIS. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback (received June 2022).	<u>Status:</u> Resolution in Progress CNL understands that further discussions are needed with KFN to help address this concern, based on feedback received in May 2024. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL understands that researching and defining *CEAA* (2012) project impact pathways is a priority area of interest for KFN. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. <u>Next Steps:</u> CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. Forward engagement between CNL and KFN may result in specific project commitments on additional mitigations measures that will enhance confidence and trust that negative impacts are minimized.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
6. Environmental Effects and Mitigation Measures	b) Potential impacts to aquatic species from NPD decommissioning activities The Kichi-Sibì and aquatic species are of particular importance to KFN. KFN would like additional information on plans, protocols, or strategies for Indigenous engagement/consultation on potential impacts to the aquatic environment. This is a project-specific concern	CNL Response: CNL agrees that protection of aquatic species in the Ottawa is important. The EIS demonstrated there are no predicted adverse impacts from the project on aquatic species. To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020. The study determined that the Ottawa River benthic invertebrate community near NPD is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. This study can be repeated when decommissioning is complete, to verify if the project has had an impact. CNL is planning to regularly monitor the Ottawa River water quality before the project begins. CNL is willing to discuss fish tissue sampling with KFN and review past studies of fish tissue in the NPD area. Follow-up monitoring for the NPD Closure Project will include monitoring of the Ottawa River to verify that there are no effects.	Where is this topic discussed in the EIS? The EIS does not predict any adverse residual effects on the Surface Water Environment (**Section 9.3.3.5**) or the aquatic environment (**Section 9.4.3.5**). CNL has developed mitigation measures and draft follow-up monitoring plans for the protection of the Kichi-Sibì (**Sections 9.3.3.2** and **12.3** of the EIS). What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress CNL understands that further discussions are needed with KFN to help address this concern, based on feedback received in May 2024. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024.CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
7. Free, Prior, and Informed Consent (FPIC)	a) United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) and UNDA 2021. KFN is seeking incorporation and advancement of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP) including the principle of Free Prior and Informed Consent (FPIC) prior to proceeding with the proposed ISD Project. This is a project-specific concern.	CNL Response: It is the position of KFN that their consent is required for the creation of a permanent hazardous waste disposal facility in its traditional territory, per Section 29.2 of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP). CNL will work with KFN towards the achievement of that principle to the extent possible. CNL is committed to ensuring meaningful participation of Indigenous peoples in decisions that affect their nations, communities, and territories. CNL, as the licensee, is committed to work towards consensus and consent, with an understanding that UNDRIP does not necessitate a veto in decision-making. We recognize that we must learn from each other and work together to strengthen relationships and enable fulsome Indigenous participation in CNL's designated projects. The regulatory decision-making process considers UNDRIP and the extent to which its principles are met.	Where is this topic discussed in the EIS? **Section 6.2 4.6.3** of the EIS summarizes KFN's interests and concerns including governance. What changes have been made (and where)? No changes have been made to the EIS in response to this concern.	Status: Outstanding The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL understands that UN guiding principles for human rights and UNDRIP are areas of importance for KFN. CNL remains committed to seeking common ground with KFN in the interest of moving closer towards consent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
8. Indigenous Health	a) Methodology for conducting the Indigenous health assessment, receptors, and diet. KFN is interested in how Indigenous receptors have been defined in CNL's assessment and how CNL meets the requirements under CSA N288.1. This is a project-specific concern.	CNL Response: CNL acknowledges KFN's concerns about the methodology used to assess Indigenous health effects from the NPD Closure Project. CNL has added an Indigenous receptor group to the PostSA TSD. In the third iteration of the PostSA TSD issued in March 2020, CNL included a Potential Exposure Group consisting of a family of self-sufficient Indigenous receptors in the NPD Area. The exposure profile in the postclosure period was developed based on a traditional Indigenous lifestyle pre-European contact (SENES 2014). This lifestyle results in a more cautious dose estimate than that based on current-day lifestyle, where some food is store-bought. The predicted peak dose to an Indigenous receptor (from the 3rd iteration PostSA) is 0.0004 mSv/yr, which is 500 times less than the dose criterion. The analysis demonstrates that the impact on the public, Indigenous peoples and the environment is negligible under all scenarios. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL is open and willing for KFN and other Indigenous Nations, communities, and organizations to be involved in the monitoring program, which aims to confirm the predictions of the EIS. CNL maintains that human health has been conservatively assessed for Indigenous Nations, communities, and organizations within the EIS and looks forward to discussing this topic further with KFN.	Where is this topic discussed in the EIS? The EIS presents the PostSA results for the Indigenous receptor group in **Section 9.10.2**. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress CNL's technical assessment shows that there are no predicted impacts to Indigenous biophysical health resulting from the NPD Closure Project. CNL understands that further discussions are needed with KFN to help address this concern, based on feedback received in May 2024. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
9. Inventory	a) Inventory of the NPD disposal facility KFN is seeking further information about the nuclear waste that may remain on site and the radiological inventory of the proposed NPD disposal facility. This is a project-specific concern.	CNL shared the waste inventory report as a follow-up to the 2023 April site visit. CNL Response: The NPD reactor has a low radionuclide inventory. Tritium is the major radionuclide and will decay to low levels during the Institutional Control period (~100 years). The proposed waste disposal facility barriers have a design life consistent with that timeframe. The longer-lived ILW consists of small quantities of low energy beta emitters. The beta emitters have low radiotoxicity. The main barrier to containing the radioactivity on long timescales is that 83% of the initial inventory (mostly activation products) is embedded within steels and Zircaloy which corrode very slowly, particularly in an alkaline environment. The metals used in the reactor vault are corrosion-resistant alloys, with stainless steel taking approximately 30,000 years to fully corrode and zircaloy up to 300,000 years to fully corrode. The low corrosion rates allow the radioactivity to decay before it is released into the reactor vault. Once in the reactor	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress CNL understands that further discussions are needed with KFN to help address this concern, based on feedback received in May 2024. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		vault the radioactive contaminants sorb onto the grout which further delays its diffusion out of the facility. Based on its consideration of national and international standards and guidelines, CNL continues to believe that the NPD facility has characteristics that support in-situ disposal. CNL is committed to ongoing engagement with KFN to gain a greater understanding of their concerns about the long-term safety of nuclear waste.		key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
10. Long-term Safety	a) Technical suitability of in-situ disposal concept It is important to KFN that CNL demonstrate the design is appropriate in terms of waste inventory, containment, grouting of the NPD structure, and international best practice, because the NPD site is located within Kebaowek traditional territory, and it is important that future users of the land at the NPD site are protected. This is a project-specific concern.	CNL shared the waste inventory report as a follow-up to the 2023 April site visit. <u>CNL Response:</u> CNL agrees that protection of future land users is an important concern and has addressed this subject. CNL has assessed the suitability of ISD for NPD, and the resulting EIS shows that such disposal is safe for human health and the environment in the short term and long term. Design features of the NPD facility make it conducive to disposing of the material in place. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. CNL includes an Indigenous receptor group in its assessment of long-term safety. The predicted peak dose to an Indigenous receptor is 0.0004 mSv/yr which is 500 times less than the dose criterion. The analysis demonstrates that the impact on Indigenous Peoples and the environment is negligible. The proposed NPD Closure Project conforms with all applicable Canadian codes and standards as well as international best practices to ensure protection of the environment and safety throughout the life of the facility. CNL is committed to ongoing engagement with KFN to gain a greater understanding of their concerns about the long-term safety of nuclear waste.	<u>Where is this topic discussed in the EIS?</u> **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback (received June 2022).	<u>Status:</u> Outstanding The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL understands that the long-term management and safety of nuclear waste is a concern for KFN, and respects that KFN has a different opinion on the most suitable decommissioning approach for NPD. CNL maintains that the proposed in-situ disposal is the preferred option to undergo an EA and will await the outcome of the CNSC's decision on the Project. CNL remains committed to ongoing engagement with KFN within its role as the project proponent. <u>Next Steps:</u> CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.
10. Long-term Safety	b) Long term site integrity KFN is interested in seeing examples of in-situ disposal used elsewhere and the performance of this concept. KFN wants confidence in the performance of the facility over the long-term to protect humans and the environment. This is a project-specific concern.	<u>CNL Response:</u> CNL has written a report that summarizes facilities worldwide that use in-situ disposal. The report is not limited to nuclear reactors or processing facilities but includes mines and hazardous waste sites. The report also describes what each of the facilities have in common, why in-situ disposal is the preferred approach and how it applies to NPD. 16 projects are described, the majority of the examples are reactors, and all are permanent disposal solutions. CNL has assessed the suitability of in-situ disposal for NPD, and the EIS demonstrates that such disposal is safe for human health and the environment in the short term and long term.	<u>Where is this topic discussed in the EIS?</u> **Section 11.2** of the EIS confirms that in-situ disposal is a proven technology in use for over 50 years. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback (received May 2024).	<u>Status:</u> Outstanding CNL understands that project alternatives are an area of interest for KFN, and respects that KFN has a different opinion on the most suitable decommissioning approach for NPD. CNL maintains that the proposed in-situ disposal is the preferred option to undergo an EA and will await the outcome of the CNSC's decision on the Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL has considered national and international standards and guidelines and continues to believe that the NPD facility has characteristics that support in-situ disposal.		CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue. Through engagement, CNL hopes that the parties are able to find common ground on this topic, including the development of commitments to build confidence and trust in the in-situ disposal concept.
10. Long-term Safety	c) Potential effects of the environment on the facility KFN is seeking more information about how CNL determines whether or to what extent environmental events may affect the long-term safety of the facility. This is a project-specific concern.	CNL Response: CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change, and has concluded that these events will have no undue effects on people or the environment around the site. The NPD site has an Emergency Procedure that will remain in place and be updated as required throughout the Decommissioning Execution and Institutional Controls phases of this project. This procedure focuses on the prevention, mitigation of, preparedness for, response to, and recovery from a wide range of abnormal and emergency conditions including fires, floods, hazardous spills, loss of power; earthquakes, and tornados. The Emergency Procedure also defines the actions of specific staff/roles in such events. Following any of these emergency events, as soon as it is safe for staff to do so, site and facility condition are evaluated, and any necessary actions will be taken to make repairs. The NPD Emergency Procedure is developed and maintained in accordance with CNL's company-wide Emergency Preparedness Program that has been accepted to meet the CNSC's requirements (under REGDOC 2.10.1 - Nuclear Emergency Preparedness and Response). Further, throughout all project phases (Decommissioning Execution, Institutional Controls and Post-Institutional Controls) CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change, and has concluded that these events will have no undue effects on people or the environment around the site.	Where is this topic discussed in the EIS? **Section 8.12** of the EIS discusses the relevant natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River. Additional details and a range of scenarios that encompass the potential impacts from extreme weather and natural hazards are examined in the DecomSA TSD and the PostSA TSD. What changes have been made (and where)? No changes have been made to the EIS in response to this concern (from feedback received May 2024).	Status: Resolution in Progress CNL's technical assessment shows that accidents and natural hazards which could affect the facility will not result in undue effects on people and the environment around the site. CNL understands that further discussions are needed with KFN to help address this concern, based on feedback received in May 2024. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
11. Monitoring	a) Current monitoring and impacts from site operation KFN is interested to understand CNL's past environmental performance at the NPD site via access to environmental monitoring plans and data. This is a project-specific concern.	CNL shared a link to the annual summary or environmental performance as a follow-up to the 2023 April site visit. CNL would be pleased to share any other historic environmental monitoring data as requested by KFN. CNL Response: CNL conducts a rigorous monitoring program and is committed to ensuring that the environment around the NPD site, including the Ottawa River, is protected. Monitoring of the environment (a) Ottawa River water: Radioactivity measured in the Ottawa River upstream and downstream of the NPD site are very low (<0.01% of the derived release limit). (b) Surface soil and Vegetation: Tritium in soil and vegetation on the NPD site is very low (< 0.01% of the derived release limit). The results demonstrate that the public and the environment around the NPD site continues to be protected. In addition to the CNL monitoring program, the CNSC leads an Independent Environmental Monitoring Program (IEMP) designed to verify that the public and the environment around licensed nuclear facilities are protected. As part of its IEMP, the CNSC samples and analyzes surface water upstream and downstream of the NPD site (including sampling for non-radiological parameters). The CNSC IEMP results confirm that the public and the environment around the NPD site are protected and that there are no expected health impacts.	Where is this topic discussed in the EIS? Historic environmental monitoring is summarized in the description of the existing environment (**Section 8**) of the EIS. Specifically, **Sections 8.2** – Atmospheric Environment, **8.3** Surface Water Environment, **8.5.6** Groundwater Quality and **8.7** Ambient Radioactivity. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in progress CNL considers this interest has been addressed with the information shared to KFN. CNL notes that impacts from past operations are out of scope of this EA. CNL remains committed to ongoing engagement with KFN within its role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
11. Monitoring	b) EA Follow-up Monitoring KFN is interested in the proposed EA follow-up monitoring plans, especially comprehensive descriptions of monitoring pathways, locations, and frequencies. This is a project-specific concern.	CNL Response: CNL conducts a rigorous environmental monitoring program and is committed to ensuring that the environment around the NPD site, including the Ottawa River, is protected. CNL is seeking to work together with Indigenous Nations, communities, and organizations, the public and stakeholders regarding their feedback before finalizing the EA Follow-up Program (**Section 12** of the EIS). The monitoring of the environment will be undertaken to verify the EIS predictions of no significant adverse effect and to confirm that mitigation measures are effective. Groundwater wells will be located between the NPD facility and the Ottawa River to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River. A dedicated Indigenous-led, Indigenous Knowledge driven component integrated into the site environmental monitoring at NPD can help build confidence and trust in CNL's assessment. CNL has indicated that it is willing to involve all Indigenous Nations, communities, and organizations in its environmental monitoring programs and is willing to explore	Where is this topic discussed in the EIS? The draft follow-up monitoring plans for the NPD Closure project are included in **Section 12** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress CNL understands that ensuring that lands on and in the vicinity of the NPD site are responsibly managed and monitored is an area of concern for KFN. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		involvement in environmental monitoring work with KFN, if desired. CNL is also open and willing to share the draft follow-up monitoring plans with KFN for review, if desired. CNL will conduct environmental monitoring for as long as necessary to verify the results of the assessment in the EIS. The results demonstrate that the public and the environment around the NPD site continues to be protected.		CNL is open and willing to have a dedicated discussion with KFN on the follow-up monitoring program for the NPD site and is willing to discuss involvement in environmental monitoring by KFN, if desired. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue. Once responses are received and reviewed by KFN experts, discussions may resume.
12. Protection of Flora and Fauna	a) Biota and Species at Risk KFN is inquiring about the potential impacts to Chimney Swifts from remedial and closure activities for the NPD ventilation stack. This is a project-specific concern	<u>CNL Response:</u> The ventilation stack at NPD is 46 m in height. Chimney Swifts spend the spring and summer months in the area. They arrive in early May and migrate south at the end of August. At the NPD site, swifts roost in the top few metres of the stack. The swifts don't build nests in the stack; swifts that are ready to nest leave the stack and live in the forest during the breeding season (June-July) The level of contamination in the concrete at the top of the stack (where the swifts roost) was measured in 2014 using thermoluminescent dosimeters and the dose was at background levels. CNL is planning to empty water/sludge from the base of the stack to enable inspection of the stack base. This work is planned to take place within the next few months. Pumping out of the water/sludge will take place at a time when swifts are not in the stack. The sludge is composed of rainwater and biological waste from the swifts. It contains tritium and gross beta radioactivity due to contact with the stack concrete. CNL will prepare an “environmental review” document for this activity which will outline the timing restrictions to the work to ensure minimal impact to chimney swifts and outline other measures that must be taken to prevent adverse impacts to the environment (e.g. preventing spills from vehicles). This waste will be managed at the Sewage Treatment Plant at the Chalk River Laboratories site. Once the proposed in-situ decommissioning is complete, the ground level around the ventilation stack will be higher due to the engineered barrier that is proposed to cover the facility. CNL plans to grout the base of the ventilation stack up to a level approximately 8-10 feet above the current ground level. This will isolate the ventilation stack from the rest of the NPD facility and create a new higher “bottom” of the ventilation stack. Several holes will be cored in the stack at the level of the new base to allow the draining of any rain and melt water that might enter the stack from the opening at the top, and to allow for periodic camera inspections of the interior, if required. The holes will also help induce an airflow up	<u>Where is this topic discussed in the EIS?</u> General plans for the ventilation stack are described in **Section 4.3.1.6** of the EIS. **Section 9.6.3.2** of the EIS includes comprehensive mitigations to ensure effects on Chimney Swifts are minimized. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback (received May 2024).	<u>Status:</u> Resolution in Progress CNL understands that ensuring that lands on and in the vicinity of the NPD site are responsibly managed and monitored is an area of concern for KFN. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL’s role as the project proponent. <u>Next Steps:</u> CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. CNL is open and willing to have a dedicated discussion with KFN on environmental monitoring activities at the NPD site and is willing to discuss involvement in monitoring by KFN, if desired. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue. Once responses are received and

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		the ventilation stack, due to stack effect that is intended to mimic the current passive airflow present in the ventilation stack. Animal-resistant louvers are proposed to be placed over the drain holes, to ensure free drainage of water while denying animals access to the stack interior. The ventilation stack will be inspected periodically for signs of degradation and will be removed when no longer structurally suitable for continued use as a chimney swift roost. For planning purposes, this is assumed to be 50 years following completion of decommissioning.		reviewed by KFN experts, discussions may resume.
12. Protection of Flora and Fauna	b) Species at Risk permits. KFN is inquiring about a lack of engagement/consultation during the SAR permitting process. This is a project-specific concern.	<u>CNL Response:</u> CNL is committed to the protection of species at risk and has and will apply for any necessary permits from ECCC. In its effects assessment, when considering species at risk, CNL considers impacts to an individual and not just the overall population. Several species at risk have been identified at the NPD site and key aspects of CNL's plan to protect these species are included below. Early in the NPD Closure Project, CNL undertook investigation of the viability of ventilation stack removal. It was decided that ventilation stack retention would mitigate the risk of abandonment by the Chimney Swift. CNL has applied for a species at risk permit from ECCC for the potential harm and harassment of chimney swifts during decommissioning activities. The draft conditions of that permit (mitigations for the protection of the Chimney Swift) are included in the EIS. In response to observations of milkweed at the NPD site, monarch butterfly has been added as a valued component to the EIS and mitigations are in place to preserve and reseed with milkweed (critical habitat). CNL does not predict any adverse residual effects to the chimney swift, monarch and other species at risk.	<u>Where is this topic discussed in the EIS?</u> Collectively, mitigation measures for the protection of flora and fauna, specifically species at risk are outlined in **Section 9.6.3.2** (Terrestrial Environment). <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback (received May 2024).	<u>Status:</u> Resolution in Progress CNL understands that further discussions are needed with KFN to help address this concern, based on feedback received in May 2024. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. <u>Next Steps:</u> CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
13. Protection of the Ottawa River	a) KFN expressed concern about watershed sustainability. As stewards of the lands and waters, it is important to KFN that the environment around the site of the NPD Closure Project including the Ottawa River is protected. KFN exercises rights and carries out traditional and contemporary activities, many of which rely on the health and well-being of the Ottawa River to maintain the health of the Anishnabeg Peoples. This is a project-specific concern.	<u>CNL Response:</u> The potential for contamination to reach the Ottawa river is assessed in the EIS and is supported by long term modelling and detailed groundwater modelling. The EIS predicts no effects to surface water (including the Ottawa River), and follow-up monitoring will be implemented to confirm these predictions. To verify that the engineered barriers are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it	<u>Where is this topic discussed in the EIS?</u> **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment including the Ottawa River Mitigation measures for the protection of surface water (**Section 9.3.3.2**) (including the Ottawa River) have been updated and expanded from the 2017 draft EIS.	<u>Status:</u> Outstanding The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL understands that watershed sustainability is an area of concern for KFN. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. <u>Next Steps:</u>

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		reaches the Ottawa River. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. CNL is committed to ongoing engagement with KFN to gain a greater understanding of their concerns about watershed sustainability related to the NPD Closure Project.	The EIS does not predict any adverse residual effects on the surface water environment (**Section 9.3.3.5**). What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received June 2022).	CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.
13. Protection of the Ottawa River	b) Impacts on groundwater and surface water quality KFN is inquiring about contamination releases to surface water during proposed decommissioning activities on the NPD site. As stewards of the lands and waters, it is important to KFN that the Ottawa River is protected. This is a project-specific concern.	CNL Response: In 2018, in response to public and Indigenous concerns, CNL ceased the practice of discharging liquid effluent from the NPD facility sumps to the Ottawa River and arranged for water to be sent to the Waste Treatment Centre at the CRL site. This is CNL's plan for all collected water from the sump, including that water which will make up the final pump-out prior to grouting. Full details regarding liquid effluent releases from all CNL facilities are given in the Annual Compliance Monitoring Reports available at the following CNL webpage: https://www.cnl.ca/en/home/environmental-stewardship/performancereport/default.aspx. CNL has assessed the potential impact of the NPD Closure Project on surface water and groundwater quality. The EIS concludes that no significant residual adverse environmental effects from the project are expected, including to surface water and groundwater. CNL has developed mitigation measures for the protection of surface water and groundwater during all phases of the project. This finding will be confirmed with the NPD Closure Project follow-up monitoring activities, which will include monitoring groundwater and surface water quality. With respect to the need for constructing a stormwater pond: During the Decommissioning Execution phase of the project, existing drainage features at the site will be maintained and silt fencing will be placed in areas used for stockpiles of raw material (i.e., sand) to prevent runoff into the Ottawa River. For the Institutional Control period, the need for a storm water management pond was taken into consideration during the design of the cover system. The cover is designed to convey storm water to ditches on the south, east and western perimeters of the mound which then connect to the existing ditch systems which are on the east and west sides of the NPD facility. The ditch systems are lined with rock and would enable infiltration of storm water. Because of this design of water conveyance features, it was determined that a storm water management pond was not required. Since this design was developed after the draft EIS was prepared, CNL is willing to meet with the AANTC to discuss the design of the cover system with respect to storm water management, including design drawings illustrating the water conveyance features. CNL is committed to the protection of the Kichi-Sìbì (Ottawa River) and looks forward to continuing discussions on this topic with KFN.	Where is this topic discussed in the EIS? **Section 4.3** of the EIS describes the project activities and presents CNL's plans with respect to surface drainage. **Section 4.5** of the EIS describes CNL's plans for handling project-related liquid releases. **Sections 9.3 and 9.5** of the EIS presents the assessment of potential impacts to surface water and groundwater respectively. Mitigation measures for the protection of surface water and groundwater are provided, including CNL's process for non-routine discharges. No un-assessed liquid effluent releases are permitted. The EIS does not predict any adverse residual effects on the surface water or groundwater environments. **Section 12** of the EIS summarizes the Monitoring Plans developed for the project. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress CNL understands that ensuring that the lands and waters on and in the vicinity of the NPD site are responsibly managed and monitored is an area of concern for KFN. The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. CNL is open and willing to have a dedicated discussion with KFN on monitoring activities at the NPD site and is willing to discuss involvement in monitoring by KFN, if desired. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue. Once responses are received and reviewed by KFN discussions can resume.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
14. Technical	a) Technical details for the batch mixing plant. It is important for KFN to understand CNL's plans for the proposed batch mixing plant to ensure that potential effects on the aquatic environment are properly assessed. This is a project-specific concern.	CNL Response: CNL acknowledges that KFN is interested in the final details for the batch mixing plant. The final design of the mixing plant and items such as a wash out pit will be dependent on the contractor awarded the work. The technical requirements of the work imposed by CNL will include the recycle of wash waters used, back into the grout mix. No release of water will be allowed without first being tested and approved for disposition by the CNL Environmental Program. Typical wash out pits are shallow excavations with polymer liners. Others use large poly sacs to retain the grout debris and allow water to filter through and be collected. CNL has done additional research in the operations of batch plants, and we do not believe that a washout pit will be required. If it is determined one is required, CNL will provide these details to review together to understand any concerns.	Where is this topic discussed in the EIS? Batch plant construction details are discussed in **Section 4.3.1.2** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.
15. Traditional Land and Resource Use and Cultural Impacts	a) Algonquin traditional knowledge should be collected and incorporated into the EIS. It is important to KFN that CNL solicit and use KFN's community-specific knowledge in order to properly characterize current site conditions, develop scenarios that accurately represent potential future uses of the site, and ensure that species and traditional uses are properly considered by the project. This is a project-specific concern.	CNL Response: CNL agrees that KFN-specific information and traditional knowledge from the KFN and other Indigenous nations should be integrated into the EIS. Prior to the June 2022 feedback, CNL sent two letters asking specific questions of KFN to align with the requirements of *CEAA* (2012) Section 5(1)(c). These questions included: • Do you have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects? • Does [Kebaowek], or any members, have sites of ceremonial significance in close proximity [of NPD], or more generally, any cultural activities near [the NPD site]? The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that in the future there is an interest to re-establish traditional use activities on the NPD site. CNL includes an Indigenous receptor group in its PostSA. The predicted peak dose to an Indigenous receptor is 0.0004 mSv/yr which is 500 times less than the dose criterion. The analysis demonstrates that the impact on Indigenous Peoples and the environment is negligible.	Where is this topic discussed in the EIS? **Section 8.9** of the EIS presents information about traditional land and resource use, including limited information about KFN (**Section 8.9.2.2.6**). In lieu of more comprehensive community specific knowledge, CNL includes its assumptions (**Section 8.9.2.1**). The assessment of effects to traditional land and resource use VCs is discussed in **Section 9.9** of the EIS. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that there will be future interest in re-establishing traditional use activities on the NPD site. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received June 2022).	Status: Outstanding The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024, which will enable specific studies. CNL understands that project incorporation of traditional knowledge and community capacity for independent studies as part of the EA process is an area of concern for KFN. CNL recognizes that traditional knowledge, culture, and ceremony will have much to offer the Project as it moves forward. CNL remains committed to ongoing engagement with KFN within CNL's role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
16. Valued Components	a) Selection of valued components and application of an ecosystem approach KFN is interested in the identification, selection, and assessment of “candidate species” (i.e., VCs). This is a project-specific concern.	CNL Response: CNL initially created a Master List of Candidate Valued Components by reviewing relevant reference documents and applying EA process and site knowledge. These candidate VCs include biota such as fish or birds, as well as abiotic qualities such as cultural and heritage sites, or socioeconomic entities such as fishing. CNL provides rationale for including or not including species as a VC. The VCs selected for the NPD Closure Project reflect a wide range of Indigenous interests. Many of the interests and concerns raised by Indigenous Nations, communities and organizations, correspond directly or indirectly to the VCs selected for the project. Based on Indigenous feedback received during engagement activities, CNL has added several human and nonhuman VCs that were identified as being of importance to Indigenous Nations, communities and organizations. Berries, mushrooms, mink, river otter, weasel, red fox, moose, and monarch butterflies were added as VCs, as well as soil quality, groundwater quality, groundwater flow and several Indigenous socioeconomic and Indigenous health VCs. In some cases, no new VCs were added, because direct, representative, or related VCs that encompass the value or interest of the Indigenous Nation, community or organization were already included in the assessment. CNL has also updated the draft EIS to include a mapping of Indigenous VCs to the effects assessment.	Where is this topic discussed in the EIS? A complete listing of VCs assessed by the project can be found in **Table 5.2-3** of the EIS while **Appendix B** provides a Master List of Candidate Valued Components, providing a rationale for including or not including the species as a VC. **Section 6.3** of the EIS captures VCs identified by Indigenous Nations, communities and organizations. CNL has developed a detailed table (**Table 6.3-1**) for **Section 6.3** of the EIS that captures VCs of Indigenous Nations, communities and organizations and demonstrates how they are either directly or indirectly assessed in the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2024).	Status: Resolution in Progress The amendment to the Framework Agreement was executed by the parties and came into effect as of July 2024. CNL remains committed to ongoing engagement with KFN within CNL’s role as the project proponent. Next Steps: CNL and KFN continue to work together towards the development of a work plan on key topics of interest for KFN, enabled through the Framework Agreement. KFN has requested further information from CNL on topics of importance to KFN as the most recent EIS does not contain enough information for its third party experts to conduct their assessments. CNL will provide responses in writing to its queries on this issue.

Appendix C.4.2 – Record of Engagement and Tables of Interests and Concerns for the Kitigan Zibi Anishinabeg First Nation (KZA)

This appendix provides a complete record of all engagement between CNL and Kitigan Zibi Anishinabeg First Nation (KZA, a member nation of AANTC) from June 2016 to May 2024 (Table C-16). Table C-16 includes the date and method of the communication/engagement, the topics discussed and participants. The table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement is a mapping of how the summary of interests and concerns were compiled (Table C-17), as well as a summary of interests and concerns raised by Kitigan Zibi Anishinabeg First Nation (Table C-18).

Section 6.2.4.7.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and the KZA.

Table C-16 Record of Engagement with Kitigan Zibi Anishinabeg First Nation (KZA)

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 17, 2016 Incoming letter	This letter from the Kitigan Zibi Anishinabeg First Nation (KZA) Chief to the CNSC's Director of the Environmental Assessment Division raised interests and concerns on the NPD Closure Project related to the following: • Protection of the Ottawa River; • Interest in viewing the Environmental Impact Statement; • Indigenous rights.				√	√				√	
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the KZA Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
October 24 Outgoing telephone call	This telephone call from a communications officer with CNL to the KZA staff in the Department of Natural Resources and Wildlife to follow-up on the July letters. CNL offered a presentation and meeting or to send poster information. KZA stated that they would be interested in poster information and CNL shared the posters for the NPD Closure Project via email.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the KZA Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of KZA's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Does Kitigan Zibi Anishinabeg First Nation have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of Kitigan Zibi Anishinabeg First Nation using the areas around the two projects?* • *Do you have any members of Kitigan Zibi Anishinabeg First Nation that currently live in close or reasonable proximity to either of the projects?* • *Does Kitigan Zibi Anishinabeg First Nation have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does Kitigan Zibi Anishinabeg First Nation, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the KZA and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
November 14, 2016 Outgoing email	This email to the KZA staff in the Department of Natural Resources and Wildlife and the Forestry Department from a communications officer with CNL was to follow-up on the November letter.										√
April 26, 2017 Meeting	This meeting occurred in Maniwaki, Quebec with representatives from the AANTC (including the Grand Chief and the Director General), CNL (including the Director of Corporate Communications and the Director of Environmental Protection), the CNSC (including the Participant Funding Program Administrator) and representatives from two member First Nations of the AANTC – KZA and KFN. CNL shared information in English and French and heard some interests and concerns from the AANTC. Information shared on the NPD Closure Project included: • Site location; • Project components; • Timeline; • Species at risk; • Proposed end state; • Safety barriers (how the environment will remain protected).			√	√					√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 03, 2017 Meeting	This meeting, between three representatives of KZA, including two specialists in biology and forestry and one Councilor, and four representatives of CNL, including one environmental specialist and the Manager of Decommissioning) It was an opportunity for open discussion on the project with and to discuss KZA's comments on the project description. The presentation focused on: • Environmental assessment and environmental monitoring; • Indigenous requirements in an EIS; • A project overview; • Timeline; • End state. Interests raised during this meeting included the following: • Species at risk (Chimney Swift and turtles); • Interest in a visit to the NPD site.	√		√	√						
July 19, 2017 Outgoing email	This email from a communications officer with CNL to the KZA staff in the Department of Natural Resources and Wildlife and the Forestry Department was to follow-up on a number of items from the May meeting. The email indicated that hard copies of requested information including CNL's species at risk handbook and environmental monitoring reports would be made available for collection on July 20, when the KZA came for the site visit at NPD.	√			√					√	
July 20, 2017 Meeting	This meeting between representatives from CNL (including the Manager of Decommissioning, a communications officer and an environmental specialist) and the KZA staff in the Department of Natural Resources and Wildlife and the Forestry Department included a visit to the NPD site. One of CNL's environmental specialists discussed ecological and archeological studies. The KZA representatives had the opportunity to ask questions or offer feedback on the project, including feedback on species at risk. Interests discussed included species at risk (Chimney Swift, Monarch butterflies). All questions were addressed verbally.				√					√	
November 15, 2017 Outgoing email	This email from a communications officer with CNL to the KZA Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and EA, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a communications officer with CNL to the KZA Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: *"CNL would be pleased to update information in this current draft with input from your community."* Note that this had been a requested document and CNL had indicated in their email of July 19 that it would be shared with KZA, once it was complete.	√	√	√	√	√	√	√	√	√

CNL requested KZA propose date options. CNL further noted that they recognize and appreciate the KZA had some specific questions. CNL is currently preparing responses that will be ready to share early in September									√	√
August 29, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to express CNL commitment to incorporating KZA's interests and concerns into the Revised Draft EIS, as KZA input is essential to the environmental assessment process. CNL asked that KZA propose times. CNL also noted that they understand that KZA is interested in reviewing the revised draft EIS. CNL offered capacity to support KZA's participation in the EA process. CNL suggested provision of funding through a contribution agreement (a template was sent August 21, 2023).									√	
August 29, 2023 Incoming Email	This email from KZA Impact Assessment Coordinator to CNL Communications Officer is in response to the email from CNL on 2023 August 29. KZA proposed dates for a meeting to discuss NPD. CNL confirmed that 2023 September 7th works for CNL and sent a meeting invite (3 emails).										√
September 06, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to provide KZA with the draft agenda for the 2023 September 07 KZA - NPD Interest and Concerns and Commitment list discussion.										√
September 06, 2023 Incoming Email	This email from KZA Impact Assessment Coordinator to CNL Communications Officer is to request the latest version of the NPD Closure Project EIS. CNL provided a copy of the EIS to KZA.										√
September 07, 2023 Meeting	This meeting with CNL (including, Manager, NPD Closure Project, Decommissioning and Environmental Specialist, Communications Officer, Indigenous Engagement Coordinator, and Manager Communications and Engagement) and KZA including (Including Consultation Coordinator, and Impact Assessment Coordinator) provided KZA with an overview presentation of the project with the opportunity to ask questions and seek clarification. CNL and KZA also discussed the Reviewed Draft EIS submission timeline and capacity support.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
September 09, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to provide KZA with follow-up from the KZA NPD meeting held on 2023 September 06. CNL attached the presentation, links to the CNSC website and a review of the Consolidated Table of Federal and Provincial Comments on the Draft Environmental Impact Statement for the NPD Closure Project (also on the IAA website).										√
September 11, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to KZA Is to provide the draft agenda for the 2023 September monthly meeting being held on 2023 September 13. NPD was not a topic on the agenda.										√
September 15, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to provide KZA with follow-up from the KZA NPD meeting held on 2023 September 06. CNL attached the response to KZA questions shared during the review of the Interests and Concerns list (received July 28), Section 6 of the EIS, Table C-16 KZA Record of engagement, Table C-17 Mapping of key interests and concerns to detailed input from KZA, and Table C-18 (of the EIS).				√	√	√			√	√
September 15, 2023 Incoming Email	This email from KZA Impact Assessment Coordinator to CNL Communications Officer is to inform CNL that the KZA Natural Resource and Wildlife office, on Wednesday, September 13th 2023, held an open community engagement session. KZA provided community members a high-level overview of the NPD Closure Project and a brief explanation of the current stage of the EIS. KZA shared the main areas of interest and questions. CNL confirmed receipt of the email; CNL also noted providing answers to questions soon.									√	
September 29, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to provide the draft agenda for the 2023 October 11 KZA- Monthly Meeting. CNL proposed the meeting focus on the NPD Closure Project. CNL is working to put together a presentation to address the areas of interest identified in the KZA September 15 email.										√
October 06, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to follow-up from their email on 2023 September 29 looking to confirm the monthly meeting for 2023 October 11. CNL re-attached the proposed draft agenda.										√
October 11, 2023 Meeting	This meeting with CNL (including, NPD Closure Project, Decommissioning and Environmental Specialist, Director of Communications and Engagement, Communications Officer, and manager Communications and Engagement) and KZA including (Including Consultation Coordinator, and Impact Assessment Coordinator) and AECL (Manager Communications and Engagement) was to discuss an update on the NPD funding agreement (EIS review) and have an update from KZA on their EIS review. CNL also gave a presentation to address questions and areas of interest from the community information session on the NPD Project.									√	
October 17, 2023 Outgoing Email	This email from CNL Manager of Communications and Engagement to KZA is to provide an invite to the 2023 October 20 Career Fair being held In Pembroke. KZA looked to confirm registration requirements. CNL confirmed registration is not required. (3 Emails).										√
October 18, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to KZA is to provide the actions from the 2023 October 11 KZA - CNL monthly meeting.										√
November 01, 2023 Incoming Email	This email from KZA Impact Assessment Coordinator to CNL Communications Officer is to request the slide deck for the NPD specific meeting held on October 11, as well as a copy of the capacity funding agreement. CNL Director, NPD provided both.									√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 07, 2023 Emails	This email from CNL Manager Communications and Engagement to KZA is to provide KZA with the draft agenda for the 2023 November 08 KZA – AECL - CNL monthly meeting. KZA confirmed receipt of the draft agenda and requested to add discussion on KZA points of concern/areas of interest on the NPD EIS as well as providing some high-level comments on some of the CNL actions and accommodation measures added to the tracking table back in July. CNL recommended an NPD - Specific meeting to discuss the KZA concerns / area of interest.									√	
November 08, 2023 Meeting	This meeting between CNL (including CNL Manager, Communications and Engagement, Director NPD Closure Project, Indigenous Engagement Coordinator, Director, Communications and Engagement, Communications Officer, and decommissioning and Environmental Specialist, and CNL Legal Counsel), AECL (Including, Manager of Communication and Engagement) and, KZA (Including Consultation Coordinator, and Impact Assessment Coordinator) is to discuss the NPD Closure Project Status Update, Discuss dates for an NPD project specific meeting to discuss KZA's interests and concerns table (NPD EIS), and CNL Waste Strategy and Fuel Inventory Overview Presentation and Discussion. KZA noted they had comments on the I&C table and requested an NPD focused meeting.									√	
November 09, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to KZA Is to provide KZA with the Actions from the 2023 November 08 CNL-AECL-KZA Monthly meeting.										√
November 14, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to request the KZA-NPD meeting time be changed to 1:30 pm. KZA confirmed.										√
November 14, 2023 Meeting	This meeting between CNL (including Director NPD Closure Project, Decommissioning and Environmental Specialist, Communications Officers and Indigenous relations coordinator) and KZA (including Impact Assessment coordinator) is to discuss the NPD KZA interests and concerns table, and KZA's initial feedback.									√	
November 14, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to provide the initial materials as requested in the monthly meeting for the Community engagement session. CNL attached the image with all the CNL monitoring locations (not just NPD) and the Archaeological Technical Supporting Document.									√	√
November 20, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to KZA is to provide KZA with the meeting notes from the 2023 November 14 NPD Interests and Concerns meeting.									√	√
November 27, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to follow-up from the last meeting and see how the community engagement session was and if there is any feedback to share with CNL? Community feedback can be incorporated into the updates to the table that captures KZA's interests and concerns. CNL also inquired about where the KZA office will be closing for the holidays. KZA noted that they will be providing notes from the town hall meeting.									√	√
November 30, 2023 Outgoing Email	This email from CNL Communications Officer to KZA is to note that CNL has used the feedback from the conversation on November 14, 2023 and made additions to the Interests and Concerns Table. CNL attached the tracked changes files (CNL also included the Mapping Table (Table C-17) which works together with the Interests and Concerns Table (Table C-18) to paint a fuller picture of KZAs concerns while Table C-18 focuses on CNL's response to the concern).									√	√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
December 19, 2023 Incoming Email	This email from KZA Impact Assessment Coordinator to CNL Communications Officer is to provide CNL with KZA's submission of feedback on the V3 draft EIS for the NPD closure project. CNL confirmed the receipt of the submission.	√	√	√	√	√	√	√	√	√	
December 20, 2023 Meeting	This meeting between KZA (Including KZA Impact Assessment Coordinator), CNL (Director NPD, Communications Officer, Indigenous Engagement Coordinator, and Environmental and Decommissioning Specialist), and AECL (Manager, Communications and Engagement) is to discuss the feedback from the KZA Community session, and the KZA EIS review.	√	√	√	√	√	√	√	√	√	
January 02, 2024 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to KZA is to provide the actions from the 2023 December 20 KZA - CNL Monthly meeting (NPD Focused). In the email, CNL also shared the link to the updated CNL Integrated Waste Strategy, and the link to the GCT #3 Nuclear 101 Guidebook.										√
January 05, 2024 Outgoing Email	This email from CNL Communications Officer to KZA Impact Assessment Coordinator is to confirm the 2024 January KZA - CNL monthly meeting. CNL also asked if KZA had topics they wished to discuss. KZA requested that the meeting be moved to 2024 February. CNL confirmed receipt of date change.										√
January 29, 2024 Outgoing Email	This email from CNL Communications Officer to KZA Impact Assessment Coordinator provided CNL's response to the KZA EIS review (December 19, 2023). CNL provided an updated Interests and Concerns table based on the feedback, highlighted the themes, corrected the misinformation related to the KFN visit in Spring 2023 and offered further discussions on areas of interest and a site tour.	√	√	√	√	√	√	√	√	√	√
January 29, 2024 Incoming Email	This email from the KZA Impact Assessment Coordinator to a CNL Communications Officer confirmed receipt of the updated Interests and Concerns table. KZA indicated they would review the updates for accuracy by February 14, 2024, and requested time at the February monthly meeting to discuss.									√	
February 20, 2024 Incoming Email	This email from the KZA Impact Assessment Coordinator to CNL provided feedback on the NPD Interests and Concerns table (sent January 29, 2023). KZA indicated that Table C-17 has thoroughly captured the majority of KZA's comments and they appreciated the use of language taken directly from previous submissions to ensure concerns were appropriately described. KZA stated they maintain that the project poses significant risk of detrimental impact to Kitigan Zibi Anishinabeg. CNL's response to address KZA's concerns has not been enough to erase them, specifically those listed in Table C-18 under the following topic numbers 5 d & e, 9, 11 a and 15 a. KZA recognized that the parties may not always be able to reach a consensus or agree on a topic and they would like to reiterate that KZA remain committed to working respectfully and collaboratively with CNL. KZA noted that outstanding concerns will be addressed with the CNSC.	√	√	√	√	√	√	√	√	√	
February 20, 2024 Outgoing Email	This email from a CNL Communications Officer to the KZA Impact Assessment Coordinator confirmed receipt of the email providing feedback on the NPD Interests and Concerns table. CNL offered to address any NPD topic of interest at the next working group meeting.									√	√
March 07, 2024 Outgoing Email	This email from a CNL Communications Officer to the KZA Impact Assessment Coordinator noted that the KZA - CNL monthly meeting falls on March Break. CNL asked if the meeting could be postponed due to staff shortages. KZA confirmed postponing the meeting. CNL proposed 2024 March 20 as the new meeting date.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
March 20, 2024 Meeting	This meeting between KZA (Including KZA Impact Assessment Coordinator) and CNL (Communications Officer, Director of Engagement and Communications, Director NPD, Communications Officer, and Environmental and Decommissioning Specialist) focused on CNL demonstrating to KZA how feedback was used to update the *Table of Interest and Concerns* and Sections of the EIS. KZA noted satisfaction with the language used to capture KZA's interest and concerns, specifically, that CNL used KZA own language. CNL and KZA discussed including language in the EIS to reflect the Summary of KZA Key interests and concerns has been developed at the working group level based on community feedback but that this information has not been reviewed or vetted by KZA leadership.	√	√	√	√	√	√	√	√	√

KZA - Mapping of Key Interests and Concerns

Table C-17 presents a mapping of how the key interests and concerns relate to detailed feedback and input from KZA, up to May 2024.

Table C-17 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-17 Mapping of KZA Key Interests and Concerns

Topic	Key Interests and Concerns	Specific feedback provided by KZA on this interest/concern (validated)
1. Accidents and Malfunctions	(a) KZA expressed concern about proximity of the disposal facility to the Ottawa River and potential effects of malfunctions, accidents and deterioration of the disposal facility over time The Kichi-Sìbì is a major artery and is very important to KZA and must be protected from long-term impacts from the disposal facility. The Kichi-Sìbì not only paramount to the Anishinabe, it is the main drinking water source for millions of people living along the river, in particular the Country's capital, Ottawa. Many KZA community members live in the Ottawa and Gatineau region. This is a project-specific concern.	During a community meeting in November 2022, KZA First Nation community members expressed concerns about the proximity of disposal facilities to the river and the potential for waste and contamination to leak into the water. In July 2023, KZA shared context about KZA's heightened concerns related to drinking water. Drinking water within the KZA community has unsafe levels of uranium and radium. Although drinking water advisories for the community center, the local school and the wellness centre have been lifted (the public systems), private wells within the community are still unusable. KZA lives with, knows and faces the impacts of naturally occurring radioactivity (in groundwater) in its daily life. Its community's health, safety and wellbeing is affected by it. KZA highlights that it is essential that the potential impacts and risks from the NPD closure project be assessed cumulatively in light of the psychological and physical harm colonization continues to cause upon Indigenous peoples. KZA highlights that clean water is also essential to local economy health (agriculture), especially in a context where domestic production will be more important (national security). In KZA's preliminary written feedback on the EIS (2023 December), KZA notes that the EIS contains little to no information on the expected lifespan of the concrete, particularly how many years is it expected to last before it cracks and what effect a crack in the grout would have on the release of contaminants to the environment. Other gaps in the EIS include what the actual steps are following a disaster resulting in the release of contaminants, or the failure of one or more barriers described in the current EIS.
2. Alternatives	(a) Technical suitability of the ISD concept KZA has expressed concern about the societal and ethical choice of in-situ decommissioning, in particular about the future impacts to Indigenous Nations, communities and organizations. Further KZA has expressed interest that the NPD Closure Project selected alternative of ISD be compared against international best practices. It is the position of KZA to advocate for that all materials and contaminants present at the NPD site should be removed and permanently stored in a deep geological repository off-site. This is a project-specific concern.	In July 2023, KZA highlighted that the IAEA (Specific Safety Guide SSG-47, article 5.18) states: "…. If entombment is selected, it will impose a burden on future generations owing to the need for long term monitoring of the site and owing to possible future actions necessary to prevent and reduce leakages of radioactive material from the facility." Since contact, First Nations have been harmed by the impacts of colonization, and are still today facing these impacts and their burden in their communities. KZA is concerned that Canada would select entombment and impose ongoing burden on future generations, including First Nations generations. KZA believes that pursuing ISD for the decommissioning of NPD is not in alignment with genuine (re)conciliation. Further, in KZA's comparison of the NPD project to international best practices, KZA raises the following concerns and questions : • Why choose *in situ* disposal when disposal technologies and designs evaluated by the IAEA for radioactive waste management do not tend to include *in situ* management for non-mining facilities?

Topic	Key Interests and Concerns	Specific feedback provided by KZA on this interest/concern (validated)
		• Why choose an entombment method when the IAEA does not accept "entombment" for planned decommissioning? • What objectives, criteria and thresholds are included in the decision-making process/assessment? In KZA's preliminary written feedback on the EIS (2023 December), KZA advocates for all materials and contaminants present at the NPD site to be removed and permanently stored in a deep geological repository off-site. Based on current level of information and understanding by KZA on Canada's Policy for Radioactive Waste Management and Decommissioning. KZA views the complete removal of all contaminants at the NPD site for the eventual long-term disposal in a deep geological repository as the safest, most responsible, and preferred method.
2. Alternatives	(b) Inadequate consideration of long-term risk KZA is concerned that the evaluation of alternatives did not include a thorough risk assessment, considering worst-case scenarios, emergency protocols and remediation measures. This is a project-specific concern.	In July 2023, KZA expressed concern about CNL's evaluation of project alternatives. KZA highlighted that the evaluation does not properly account for long-term risks and remediation plans including their costs. KZA re-enforced that the principle of precaution should paramount at all times and for all decisions.
	(c) Process for Assessment of Alternatives It is important to KZA that the process of assessing and accepting alternative means includes KZA. KZA highlights that joint assessment of alternatives is considered best practice and are commonly implemented for projects that are of high concern to Indigenous Peoples. This is both a CNL-wide and a project-specific concern.	In KZA's preliminary written feedback on the EIS, KZA notes that the weighting structure used in the CNL assessment of alternative means is unclear and the methods used to calculate potential risk are not specified. Potential contamination of the Ottawa River and the risk to surrounding wildlife are of great concern for KZA. KZA's values and the weight placed on risks to wildlife and water health may be different from CNL's weighting structure due to cultural differences. Indigenous Nations, communities and organizations should be given the opportunity to be involved in the initial selection of the project method. This would help build Trust. It would allow for increased ability on proponents' behalf to design projects that greater reflect First Nations values and principles. It would also increase the ease of incorporation of future accommodation measures for First Nations groups identified throughout the consultation process which could streamline the entire process and avoid unnecessary conflicts. If Indigenous Nations, communities and organizations had been allowed to voice concerns before the project method was formalized, perhaps the feedback received coupled with public opinion from other groups would have driven further investigation into the alternative means and the in-situ model would not have been chosen as the preferred method.
3. Archaeology and Cultural Heritage	a) KZA has expressed concern about the archaeological potential on the site. In that context, KZA has expressed interest in the archaeological studies for the NPD site. It is important to KZA First Nation to be aware of the archaeological potential and activities at the site, to ensure that artefacts with cultural value and significance are identified and protected. This is a project-specific concern.	In May 2022, KZA requested a discussion related to archeological studies of the NPD site. KZA is concerned that artefacts by returned to rightful Anishinabeg owners if discovered.
4. Engagement	a) Effective, transparent, understandable and timely information sharing. As of May 2022, KZA has indicated improved understanding by their technical team treating nuclear files and have brought forward more project specific concerns. This is a project-specific concern.	Representatives of KZA have had general questions about the NPD Closure Project (engagement in 2017 and 2021). The natural resource and consultation team has changed significantly since 2017 and would like to review the communication protocol and engagement possibilities. In July 2023, KZA highlighted that effective information sharing also includes answering KZA questions and information requests with the best information available, in a clear and transparent way and in a timely manner. KZA has also highlighted that effective information sharing should include answering KZA questions and information requests with the best information available, again in a clear and transparent way and in a timely manner.

Topic	Key Interests and Concerns	Specific feedback provided by KZA on this interest/concern (validated)
4. Engagement	b) Meaningful engagement It is important to KZA that meaningful Indigenous participation and adequate Crown consultation occurs for the NPD Closure Project and the NSDF Project environmental assessments. This is both a project-specific concern and a concern for the Crown.	During a community meeting in November 2022, KZA community members expressed concerns that their Nation had not been engaged at the outset of the project and that they had not been properly consulted on the project. In July 2023, KZA shared preliminary concerns on the project itself but also on the consultation process, looking at meaningful consultation, accommodation and (re)conciliation. KZA highlighted that it cannot speak of reconciliation since no “conciliation” or Nation-to-Nation relationship ever happened. KZA continue to assert its rights as a Nation and, ever since colonization, is still looking at a Nation-to-Nation relationship and respect. KZA has identified that comments are only preliminary and will evolve through the consultation process which should be flexible and dynamic. KZA highlights that the Interests and Concerns list does not constitute consultation, as meaningful consultation goes far behind exchanging a list of concerns and interests. It has to include KZA in the decision-making process, early in the process, to enable effective accommodation measures. This obligation is yet to be fulfilled. This concern has been repeated in KZA’s preliminary written feedback on the EIS (2023 December). As a rights-holder, KZA’s early participation in the decision-making process – in this case in the identification of the best-suited method for long-term disposal of the NPD facility waste – is a pre-requisite for meaningful consultation. KZA highlights that meaningful consultation must include KZA early in the decision-making process to enable effective accommodation measures and respect of KZA rights. It remains a concern that this obligation is currently not met through a poor informative approach.
5. EA Process and Methodology	a) Relevant legislation and current framework KZA expressed concern on continued use of *CEAA* (2012) rather than the more recent *Impact Assessment Act*. KZA expects that the NPD Closure Project Environmental Assessment is carried out using up-to-date legislation, fulfilling Canada’s international engagements, especially regarding Indigenous rights. This is not a project-specific concern.	During a community meeting in November 2022, KZA expressed concerns about the project continuing under *CEAA* (2012). In order to be meaningfully consulted, in July 2023 KZA has requested to review the scope of the NPD environmental assessment (EA), to ensure it enables assessing all impacts to KZA rights and interests thoroughly. In KZA’s preliminary written feedback on the EIS, KZA notes that the current framework used to assess the NPD project fails to acknowledge the colonial context. KZA’s sacred responsibilities for this land have never ceased despite our displacement however CNL fails to acknowledge how our Anishinabe laws and governance systems still apply, reinforcing our jurisdiction in this matter; the rights that flow from these responsibilities are broader than any specific fishing, harvesting, trapping, or plant gathering activities noted in the EIS. These underlying responsibilities, laws and governance systems are also much broader than any criteria referenced in *CEAA* (2012) in s. 5(1)(c) or elsewhere. The act of the Crown’s definition of terms and criteria results in a restriction of voice and shifts the exploration of impacts to a search for evidence to prove an argument based on a predetermined set of values that do not serve KZA. The viewpoint of KZA is that the criteria set out in *CEAA* (2012) section 5.1.c is very limiting and does not address specifically how the NPD Closure Project impacts KZA members. KZA notes that *CEAA* (2012) section 5.1.c and the four criteria it defines will not be there to help when the intermediate level waste at the NPD site begins to leach into the soils and rivers.

Topic	Key Interests and Concerns	Specific feedback provided by KZA on this interest/concern (validated)
5. EA Process and Methodology	b) Cumulative effects KZA is interested in the overall protection of the Ottawa River and land at, and in the vicinity of, CNL sites, not just the impacts of a single project. This is a CNL-wide concern.	During a community meeting in November 2022, KZA expressed concern about cumulative effects from all CNL sites and operations. In July 2023 KZA also identified that the EA process should include cumulative effects studies and an ecosystem approach. KZA would like to see a cumulative effects study conducted by CNL that measures the impacts and effects of CNL's activities and legacy waste in and around CNL sites, including the NPD site using a pre-disturbance baseline. KZA is looking for a more holistic impact analysis study that considers the impact of NPD in the area.
	c) Access to, and use of, information KZA is interested in data sovereignty and in conducting its own environmental and impact assessment, inventories and monitoring studies. KZA is concerned that failing to observe Indigenous knowledge in favour of the more limited CNL studies conducted to date cannot be fully relied on to adequately protect the land. Specifically, KZA notes that data access and governance must approach the First Nation as authorities and partners, rather than subjects of study. This is a project-specific concern.	In July 2023, KZA identified the importance of data sovereignty (e.g. ensuring Indigenous Peoples' data access) and in conducting its own environmental and impact assessment, inventories and monitoring studies along with the need for capacity to perform this work. KZA also highlighted the importance of protection of Indigenous data as outlined by the OCAP® principles (The First Nations principles of ownership, control, access, and possession, https://fnigc.ca/ocap-training/). This concern has been highlighted in KZA's preliminary written feedback on the EIS (December 2023). KZA notes that Traditional Ecological Knowledge (TEK) and Indigenous Knowledge (IK) – Anishinaabe gikendaasowin – is co-produced by all Creation. Over thousands of years, KZA has developed this knowledge and the approaches to governance and stewardship of our lands and waters that it requires. KZA keeps this knowledge alive from generation to generation, and the body of knowledge continues to grow and deepen to this day, despite colonial displacement and attempts to root our language which contains so much of this knowledge. The brief surveys used to inform CNL's current EIS cannot compare to this knowledge, and cannot be relied on to adequately protect the land on their own. Conforming to the Crown's system of formal reports, lengthy essays, and peer-reviewed studies all fail to capture the essence of what KZA is trying to express. KZA is concerned for the health of the land, the waters, the plants, the animals, and the people, and call on CNL to address this gap in research.
	d) Lack of integration of KZA information and knowledge in the NPD EIS KZA is concerned that CNL has not incorporated available information on KZA's history in the region or outlined the harmful past interactions between the nuclear industry and KZA in general. This is both a project-specific concern and company-wide concern.	Within KZA's preliminary written feedback on the EIS, KZA identified that available information and knowledge for KZA's correspondence with the NSDF Project has not been acknowledged or incorporated into the EIS for the NPD Closure Project. Those submissions detailed several aspects of KZA's relationships with this region of our territory and outlined the harmful past interactions between the nuclear industry and KZA. A great deal of time, resources, and effort goes into preparing submissions in hopes of contributing to better cultural understanding, which in turn results in more sensitive and responsive communication. It is disrespectful and unreasonable to expect all projects (especially those with the same proponents, and in the same Indigenous territories) to start at square one each time. Such an approach unfairly burdens Indigenous Nations with all the responsibilities of consultation for nuclear facilities we have never given permission for in the first place – and for projects we are not responsible for proposing. In order to demonstrate good faith, CNL must show and acknowledge how it is learning from our past interventions and incorporating the knowledge shared by KZA into future proceedings. Further, CNL has an obligation to provide clear summarized information in easy to follow formats. KZA has found the structure of the EIS difficult to follow, and therefore needs improvement.

Topic	Key Interests and Concerns	Specific feedback provided by KZA on this interest/concern (validated)
5. EA Process and Methodology	e) Concern about the methodology for conducting the effects assessment KZA is concerned that the First Nation is being asked to restrict KZA's exploration of impacts to the health and socioeconomic conditions, the physical and cultural heritage, the use of lands and resources, and the historical archeological, paleontological or architecturally significant structure or thing based on limited methodology. This is a project-specific concern.	Within KZA's preliminary written feedback on the EIS, KZA identified CNL asked KZA to address specifically how the NPD Closure Project impacts them based on the criteria set out in *CEAA* (2012) section 5.1.c. There are four categories identified in this piece of legislation that every interested Indigenous party in Canada must use to structure every piece of information they interact with during their exploration of impacts in order for it to be considered valid by CNL and the Crown. This is a legal text written by the Crown to achieve its own goals. The cultures, values, resources, and histories of the various Indigenous peoples in Canada are extremely diverse and unique. KZA is being asked to restrict our exploration of impacts to the health and socio economic conditions, the physical and cultural heritage, the use of lands and resources, and the historical archeological, paleontological or architecturally significant structure or thing. These explorations are costly, time-consuming, resource-draining, and historically ineffective at changing the outcome of project progression.
6. End State, Site Restoration and Future Use of the Land	a) Collaborative end land use planning There is a strong desire from KZA for future use of the NPD site. It is important to KZA that it receives reassurance that the area will move towards renaturalization and healing over time, so that KZA community members can reconnect with the site and be able to practice traditional activities. KZA affirms that the NPD site should be remediated before being returned to the care of Indigenous Peoples who have always been responsible for these lands and waters. This is both a CNL-wide and project-specific concern.	During an NPD-specific meeting with the KZA Working Group in November 2023, KZA expressed preliminary interest to be involved in site restoration and end state planning at the NPD site. This concern has been repeated in KZA's preliminary written feedback on the EIS (December 2023). It is the position of KZA that the NPD site should be remediated before being returned to the care of Indigenous Peoples who have always been responsible for these lands and waters. If there is a possibility for the return of these lands for Indigenous use, they should not be returned to Indigenous Peoples contaminated and destroyed.
7. Free Prior and Informed Consent (FPIC)	a) Principle of consent KZA asserts that permission for the construction of the NPD site was never originally given by KZA. It is important to KZA that CNL work to secure its free, prior and informed consent through meaningful consultation. This is both a CNL-wide and project-specific concern.	In July 2023, KZA highlighted that in order for KZA to consider providing consent, CNL and KZA should work to develop, agree and implement accommodation and mitigation measures. KZA also highlighted that with respect to KZA prior and informed consent, KZA expects effective information sharing with CNL. KZA has indicated that all relevant information should be shared to KZA in a clear, transparent and understandable way and in a timely manner. KZA needs sufficient time to review and comment on this information and that information should be "word-count effective" (focusing on the main information/fact, without diluting it through a lot of general text). Permission for the NPD site has never been given by KZA; in KZA's words "our forced displacement from many parts of our homelands due to the reserve system and other measures; our sacred responsibilities for this land have never ceased despite our displacement however CNL fails to acknowledge how our Anishinabe laws and governance systems still apply, reinforcing our jurisdiction in this matter; the rights that flow from these responsibilities are broader than any specific fishing, harvesting, trapping, or plant gathering activities noted in the EIS." As a rights-holder, KZA's early participation in the decision-making process – in this case in the identification of the best-suited method for long-term disposal of the NPD facility waste – is a pre-requisite for meaningful consultation.

Topic	Key Interests and Concerns	Specific feedback provided by KZA on this interest/concern (validated)
8. Impacts on Rights	a) Impacts on KZA Rights It is important to KZA that the rights and interests of the Nation are understood and upheld. This is both a CNL-wide and project-specific concern.	KZA submitted comments to the CNSC on the Project Description, (July 2016) KZA stated that it had never given up nor sold its traditional ancestral territory. KZA territory has never been under treaty and is subject to Algonquin Aboriginal Title. KZA asserts its rights to co-governance and sovereignty over the lands to which the NPD Closure Project is subject. As the recognized stewards, it is KZA's duty to protect the lands and waters that have allowed our people to thrive from time immemorial. These responsibilities constitute the laws and governance systems that underpin the Anishinabe jurisdiction. KZA has strong environmental, legal, and ethical concerns linked to these aforementioned rights and the NPD Closure Project. As the true stewards of the land, it is KZA's duty to respect it and maintain its health and wealth for the next 7 generations. KZA asserts its sovereignty and laws over its traditional land and this project, and asserts its rights to consultation and accommodation.
9. Inventory	a) Inventory of the NPD disposal facility KZA is concerned about the nuclear waste that will remain on site and the radiological content (inventory) of the proposed NPD disposal facility. This is a project-specific concern.	In July 2023, KZA expressed concern about the nuclear waste on site, including legacy waste, and radiological content (inventory) of the proposed NPD disposal facility.
10. Long-term Safety	a) Long-term site integrity It is important to KZA that there is confidence in the performance of the facility over the long-term and that there are barriers in place to protect the environment, taking into account the worst case scenario in terms of climate change and extreme natural disturbance. This is a project-specific concern.	During a community meeting in November 2022, KZA community members expressed concern about the changing environment. There was a lack of confidence in the science behind the long-term performance of waste disposal facilities and an overall concern for protection of the environment. In July 2023, KZA also expressed concerns about the long-term performance of the barriers, since no barrier have been shown remain effective for the hazardous lifetime of some of the waste material.
11. Monitoring	a) Monitoring locations and implementation of mitigation measures. KZA has expressed concern about water management and monitoring specifically locations for monitoring to occur and mitigation measures in the event that water becomes contaminated. This is a project-specific concern.	In July 2023, KZA identified that it expects monitoring to occur both at the NPD site and offsite. This monitoring should check all waters (groundwater and surface water) coming into or leaving the NPD site. This water should be monitored to ensure it remains uncontaminated with particularly attention given to water flowing to the Kichi Sìbì. KZA is concerned that any contaminated water be isolated from the water network and remediated.
	b) Participation in Monitoring KZA would be interested in being involved in a monitoring strategy to provide assurance to KZA members that CNL is regularly monitoring the environment around CNL sites. This is both a CNL-wide and project-specific concern.	During an NPD-specific meeting with the KZA Working Group in November 2023, KZA expressed interest in being involved in regular monitoring.
12. Protection of Flora and Fauna	a) Biota and Species at Risk KZA expressed concerns about potential project impacts to biota, and its natural habitat, specifically SAR at the NPD site – chimney swifts and Monarch butterflies. In particular, KZA has questions about leaving the ventilation stack in place. This is a project-specific concern.	KZA expressed concerns about impacts to biota, specifically chimney swifts, at a meeting in May 2017. KZA identified the potential for Monarch butterflies on a site tour at NPD in July 2017 when KZA biologists identified SAR habitat (milkweed). In July 2023 KZA also expressed concerns about leaving the NPD ventilation stack in place. Specifically, KZA was interested in knowing the contamination levels in the ventilation stack, the toxicity thresholds that have been set for the Chimney Swift and a desire to see conservative thresholds set.

Topic	Key Interests and Concerns	Specific feedback provided by KZA on this interest/concern (validated)
13. Protection of the Ottawa River	a) KZA expressed concern about the potential impacts of nuclear waste on the health of the Ottawa River), and its entire watershed, including wildlife and flora. This is a concern for KZA because for the Anishinaabe peoples, water is sacred and essential for all life and must be protected. This is a project-specific concern.	KZA submitted comments to the CNSC on the Project Description (July 2016) In July 2023, KZA voiced concerns about the proximity of the NPD Project to natural waterways (the Ottawa River) and the potential for impacts on the health of the Ottawa River For the Anishinaabe peoples, water is sacred and essential for all life. As noted under topic 1(a) KZA has historically and continues to be impacted by a lack of clean drinking water within their community and therefore have a heightened concern about the protection of water. KZA has requested that the project apply the most modern and stringent environmental protection measures to ensure that contamination does not enter waterways. This concern has been repeated in KZA's preliminary written feedback on the EIS (2023 December). KZA continues to raise concerns that the EIS contains little to no information on the pathways for contamination or the potential repercussions of contamination. Instead it states that levels of radioactive waste that will reach the river are negligible, the risks are low, and the parameters will be closely monitored. This information is too vague to alleviate the worries of KZA. For example, KZA is still unclear on what risk the in-situ disposal method poses for aquatic species considering the phenomena of bio-magnification.
14. Socio-economic	a) Contracting opportunities KZA is interested in contracting opportunities with CNL to enhance community opportunities. This is a CNL-wide interest.	KZA expressed some interest in contracting opportunities.
15. Traditional Land and Resource Use and Cultural Impacts	a) Impact on ability to practice traditional activities KZA is concerned that the EIS neglects to acknowledge CNL's responsibility in creating and perpetuating avoidance of the area by KZA members. KZA notes that there is a lack of desire to hunt and fish near the site and reluctance to gather plants that were grown in soils affected by radioactive contamination. The idea that KZA must hunt, fish and gather at the site to validate KZA claims to the right to co-manage and protect it is a shortfall in the understanding of KZA culture and values. This is a project-specific concern.	In KZA's preliminary written feedback on the EIS (2023 December), KZA notes that the EIS neglects to acknowledge CNL's responsibility in creating and perpetuating First Nations avoidance of the area. Many First Nations people presently avoid the area due to its history of nuclear activity and contamination. CNL's current occupation, the inventory of radioactive waste, and a history of nuclear disasters on-site have created a dynamic of fear, avoidance, and grief for First Nations people. It is the viewpoint of KZA that the loss of the land on the NPD site and its subsequent mistreatment by CNL also contribute to the avoidance of the area. However, KZA stresses that the lack of desire to hunt and fish near the Chalk River site and reluctance to gather plants that were grown in soils ravaged by radioactive contamination does not mean that KZA is no longer connected to this area nor negates responsibility to protect it. Oral cultures value person-to-person interaction. They require intensive listening skills and an equal commitment from all parties involved to share the burden of understanding. All listeners (including CNL and CNSC representatives) ultimately have individual and personal responsibilities as well as collective ones to contribute their knowledge and incorporate what they learn into their actions moving forward. Addresses, presentations, and stories from Elders, leadership, and community members require considerable work on the part of listeners to understand and implement. More work is required on the part of CNL to gain a greater understanding of KZA culture and values.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Kitigan Zibi Anishinabeg First Nation (KZA) – Summary of Interests and Concerns

Table C-18 below summarizes the key interests and concerns that Kitigan Zibi Anishinabeg First Nation (KZA) have raised on the NPD Closure Project, up to May 2024. KZA is part of the AANTC and did not submit separately comments on the 2017 draft EIS.

Note: The Summary of KZA key interests and concerns has been developed at the Working Group level based on community feedback. The KZA community consultation information has been shared with KZA leadership. This information has not been reviewed or vetted by KZA leadership, however KZA representation in the Working Group have confirmed that KZA has fully participated in pre-consultation efforts to the best of KZA's availability. CNL has tried to accurately portray the interests and concerns of KZA however it is understood the KZA may articulate these concerns differently. KZA and CNL remain committed to working respectfully and collaboratively at the Working Group level and will seek opportunities to present this information to leadership.

Table C-18 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS outcome, this is also discussed;
- Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

Table C-18 Summary of Kitigan Zibi Anishinabeg (KZA) Key Interests and Concerns and CNL Actions

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
1. Accidents and Malfunctions	a) KZA expressed concern about proximity of the disposal facility to the Ottawa River and potential effects of malfunctions, accidents and deterioration of the disposal facility over time. The Kichi-Sìbì is a major artery and is very important to KZA and must be protected from long-term impacts from the disposal facility. The Kichi-Sìbì is not only paramount to the Anishinabe, it is the main drinking water source for millions of people living along the river, in particular the Country's capital, Ottawa. Many KZA community members live in the Ottawa and Gatineau region. This is a project-specific concern.	CNL is attempting to address concerns related this topic by: (i) Involving the Indigenous Nations, communities and organizations, including KZA if interested, in monitoring activities that will confirm the conclusions of the EIS (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). <u>CNL Response:</u> CNL's Emergency Procedure for the NPD site includes actions for specific staff roles in the event of a wide range of emergency conditions including fires, floods, and hazardous spills, loss of power, earthquakes, and tornados. This procedure was developed and is updated in accordance with CNL's company-wide Emergency Preparedness Program, which has been accepted by the CNSC and meets the requirements of REGDOC 2.10.1 Nuclear Emergency Preparedness and Response. It will remain in place and be updated as required throughout the Decommissioning Execution and Institutional Control phases of this project. As per the plan, as soon as it is safe to do so following an emergency event, CNL staff will evaluate site and facility	<u>Where is this topic discussed in the EIS?</u> **Section 8.12** of the EIS discusses the natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River. Additional details and a range of scenarios that encompass the potential impacts from extreme weather and natural hazards are examined in the Decommissioning Safety Assessment TSD and the PostSA TSD. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this comment.	<u>Status:</u> Resolution is in progress. CNL's technical assessment shows that accidents and natural hazards which could affect the facility will not result in undue effects on people and the environment around the site. Further engagement may result in additional commitments which will enhance confidence and trust in CNL's assessment. CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. <u>Next steps:</u> CNL and KZA to discuss forward communication for the project and support needed for continued involvement by KZA in the NPD EA.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		conditions and arrange for any necessary repairs to be made. CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change through all project phases (Decommissioning Execution, Institutional Controls and Post-Institutional Controls) and has concluded that these events will have no undue effects on people or the environment around the site. CNL models several scenarios in its Postclosure Safety Assessment (PostSA) technical supporting document (TSD) which considers how accidents and natural hazards could affect the facility. These scenarios are called disruptive events. One such case models severe erosion (flood) while another case models extreme degradation of the facility (the concrete structure and the grout). In both of these cases, the predicted doses to receptors are still well below the dose criterion of 0.25 mSv/yr; 0.009 mSv/yr and 0.0009 mSv/yr, respectively. To verify that the engineered barriers as a whole are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. CNL is open to increased engagement, education and participatory involvement in monitoring activities at CNL operated sites to help alleviate any concerns.		
2. Alternatives	a) Technical suitability of the ISD concept KZA has expressed concern about the societal and ethical choice of *in-situ* decommissioning, in particular about the future impacts to Indigenous Nations, communities and organizations. Further KZA has expressed interest that the NPD Closure Project selected alternative of ISD be compared against international best practices. It is the position of KZA that all materials and contaminants present at the NPD site should be removed and permanently stored in a deep geological repository off-site. This is a project-specific concern.	CNL would be happy to provide an overview of the in-situ disposal concept to KZA, including how CNL conducted the alternative means assessment (AMA) and why in-situ disposal is the preferred approach. CNL Response: The risks associated with in-situ disposal are lower than other options. In-situ disposal is a well-known technique used since the 1960's at many nuclear sites worldwide. Sites contaminated with toxic and hazardous wastes are also remediated using this technique. This approach requires the project to apply for a license as a disposal facility, and hence the facility must also meet the regulations for a disposal facility. In the case of the NPD reactor, the decommissioning strategy is to incorporate the reactor into a new disposal facility, which is in accordance with the IAEA definition of	Where is this topic discussed in the EIS? The in-situ disposal approach is described in **Section 3.2** of the EIS. Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment. **Section 11.2** of the EIS confirms that in-situ disposal is a proven technology in use for over 50 years. What changes have been made (and where)?	Status: Further alignment on this concern is unlikely CNL's technical assessment shows that the in-situ design is appropriate for the hazardous timeframe of the contaminants and is consistent with national and international standards. KZA and CNL disagree on the preferred option to decommission the NPD site. CNL understands that this concern is outstanding from KZA's perspective based on KZA feedback in July 2023 and February 2024. KZA's laws require that KZA continues to advocate for the complete removal of all contaminated materials as KZA's assessments have determined this to be the preferred option. Next steps:

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		decommissioning, IAEA Safety Glossary (IAEA 2019). This strategy also meets the Canadian regulatory requirements, in particular the requirements of Section 5.1 of REGDOC-2.11.2, Decommissioning (CNSC 2021b). Therefore, entombment is not being used as a decommissioning strategy for the decommissioning of the NPD reactor. The NPD reactor has a low inventory. Tritium is the major radionuclide and will decay to low levels during the Institutional Control period. The longer-lived Intermediate Level Waste (ILW) consists of small quantities of low energy beta emitters. The beta emitters have low radiotoxicity and do not generate heat. These are activation products inside the metal of the calandria in the reactor vault. The reactor vault is reinforced concrete with walls 3 m thick located around 10 m below grade in bedrock. The location of the reactor vault isolates the wastes making it hard to access. These are all features that are consistent with IAEA Safety Standard SSR-5, Disposal of Radioactive Waste (IAEA 2014d), regarding cavern or vault disposal for ILW. CNL has written a report summarizing facilities worldwide that use in-situ disposal (Aikens 2019b). The report is not limited to nuclear reactors or processing facilities, and also includes mines and hazardous waste sites. The report also describes what each of the facilities have in common, why in-situ disposal is the preferred approach and how it applies to NPD. In summary, in-situ disposal is a viable option for NPD. It is CNL's belief that the NPD facility has characteristics that support in-situ disposal. CNL is committed to ongoing engagement with KZA to gain a greater understanding of their concerns about the long-term safety of nuclear waste.	As a result of its engagement with Indigenous Peoples on Alternative Means, CNL EIS **Section 4.2 (**Alternative Means) in the EIS to include alternative perspectives. The 2020 EIS already included the following improvements: • CNL incorporated additional information from the AMA TSD in the EIS (**Section 4.2**) to provide greater clarity on how the alternative means was completed and what the results mean. • CNL enhanced the assessment of alternatives in the AMA TSD; for example, the projected radiological dose and industrial safety risk to workers for each alternative means was presented. Though all alternatives can be performed safely, there is an increased risk to workers from industrial hazards and radiological dose for the removal alternative means compared to in-situ disposal.	Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic which may include proposed commitments.
2. Alternatives	b) Inadequate consideration of long-term risk KZA is concerned that the evaluation of alternatives did not include a thorough risk assessment, considering worst-case scenarios, emergency protocols and remediation measures. This is a project-specific concern.	In October 2023, CNL provided a presentation to the KZA Monthly Working Group with additional information on the contaminants involved in the NPD Closure Project, including: • main contaminants of concern; • half-life and LLW/HLW categorization; • threshold limits and how they are established; • lifespan of the grout/concrete structure; • effects of the contaminants at higher levels on the environment and human health; • the mobility of the contaminants (how they move within the environment and how they affect the things around them); • overview of the various proposed protection measures (the role of grout and other barriers);	<u>Where is this topic discussed in the EIS?</u> Alternative means are discussed in the Alternative Means Assessment TSD (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. **Section 8.5** of the EIS presents the geological baseline data. **Section 8.12** of the EIS discusses the relevant natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River.	<u>Status:</u> Further alignment on this concern is unlikely CNL's technical assessment shows that the in-situ design is appropriate to ensure long term safety. KZA and CNL disagree on the process for assessing alternatives and on the preferred option to decommission the NPD site. CNL understands that this concern is outstanding from KZA's perspective based on KZA feedback in July 2023 and February 2024. <u>Next steps:</u>

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		• how in-situ disposal compares and contrasts with Deep Underground Repositories; and • what route would the contaminants (even if they are at 'acceptable levels') travel after the concrete/grout decays. <u>CNL Response:</u> CNL acknowledges KZA's concerns about the long-term safety of the NPD site. CNL followed the framework laid out in the *Canadian Environmental Assessment Act* (*CEAA*) Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2015) for the evaluation of alternatives, which allows for a qualitative assessment. The level of analysis conducted for each alternative is consistent with the *CEAA* requirements. CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above ground natural hazards and extreme temperature change through all project phases (Decommissioning Execution, Institutional Controls and Post-Institutional Controls), and has concluded that these events will have no undue effects on people or the environment around the site. CNL models several scenarios in its PostSA TSD which take into account how accidents and natural hazards could affect the facility. These scenarios are called disruptive events. One such case models severe erosion (flood) while another models extreme degradation of the facility (the concrete structure and the grout). In both of these cases the predicted doses to receptors are still well below the dose criterion. In 2018/19, CNL undertook a geoscientific fieldwork campaign to sample and characterize the bedrock around the NPD facility. The fieldwork included coring of 10 boreholes to a depth of 50 meters into bedrock and several overburden boreholes, with installation of wells for sampling and hydraulic property determinations. The Geoscientific Characterization Report was used to revise the Geosynthesis report and the various models (i.e., Groundwater Model, Resaturation Model). The results of these reports were incorporated into the PostSA TSD, enabling CNL to assess potential effects to valued components (VC) in the aquatic and terrestrial ecosystems. The additional field investigations and updated models support the conclusion that the NPD Closure Project is protective of human health and the environment. CNL, as the licensee, is responsible for conducting the long-term management of the site during the Institutional Controls period, which will last a minimum of 100 years and will be	The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. Additional details and a range of scenarios that encompass the potential impacts from extreme weather and natural hazards are examined in the DecomSA TSD and the PostSA TSD <u>What changes have been made (and where)?</u> CNL has revised the EIS (**Section 4.2)** to include additional information from the AMA TSD, to provide greater clarity on how the AMA was completed and what the results mean. In addition, both the Alternative Means TSD and **Section 4.2** of the EIS were updated to assess the projected radiological dose and industrial safety risk to workers for each option.	Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic, which may include proposed commitments.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		extended as long as is necessary to ensure protection of people and the environment. The EIS predicts no effects to surface water (including the Ottawa river); CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. CNL is open and willing to meet with KZA to discuss the four alternatives used in the AMA TSD and how long term risk was considered in the assessment. In particular, CNL is interested in going over the changes incorporated in the revised version of the AMA TSD with KZA to discuss the additional quantitative analyses conducted for each of the alternatives that were considered.		
2. Alternatives	c) Process for Assessment of Alternatives It is important to KZA that the process of assessing and accepting alternative means includes KZA. KZA highlights that joint assessment of alternatives is considered best practice and are commonly implemented for projects that are of high concern to Indigenous Peoples. This is both a CNL-wide and a project-specific concern.	CNL would be open and willing to provide an overview of the in-situ disposal concept to KZA, including how CNL conducted the AMA and why in-situ disposal is the preferred approach. CNL Response: When conducting the AMA, CNL followed the regulatory framework laid out in the Canadian Environmental Assessment Agency (CEAA) Operational Policy Statement: Addressing "Purpose of" and "Alternative Means" under the *Canadian Environmental Assessment Act*, 2012 (CEAA 2015) for the evaluation of alternatives. The level of analysis conducted for each alternative is consistent with the *CEAA* requirements. The waste at NPD has been there for over 55 years. CNL is reducing the waste liability by converting the waste into a form that provides safe, permanent waste disposal. It is CNL's belief that the NPD facility has characteristics that support in-situ disposal. CNL is interested in continuing engagement with KZA to gain a greater understanding of KZA concerns on the alternative assessment methodology.	Where is this topic discussed in the EIS? The in-situ disposal approach is described in **Section 3.2** of the EIS. Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Further alignment on this concern is unlikely. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012), and concludes that ISD is the preferred means to execute the NPD Closure Project. KZA disagrees that this concern is adequately addressed. KZA and CNL disagree on the process for assessing alternatives and on the preferred option to decommission the NPD site. CNL understands that this concern is outstanding from KZA's perspective based on KZA preliminary feedback on the EIS in December 2023 and February 2024. Next steps: Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic, which may include proposed commitments.
3. Archaeology and Cultural Heritage	a) KZA has expressed concern about the archaeological potential on the site. In that context, KZA has expressed interest in the archaeological studies for the NPD site. It is important to KZA to be aware of the archaeological potential and activities at the site, to ensure that artefacts with cultural value and significance are identified, protected and returned to the community. This is a project-specific concern.	In July 2017, KZA staff toured the site with technical and environmental experts. CNL's biologist was on hand to discuss ecological and archaeological studies. KZA First Nation had the opportunity to ask questions or offer feedback on the project, including feedback on species at risk. All questions were addressed verbally at the tour. CNL will share the results of the archaeological assessment with KZA and would be pleased to provide a summary and overview presentation on the archaeological work conducted on the site. CNL Response: CNL's archaeology consultant determined that there was no archeological potential for the Site Study Area (where project	Where is this topic discussed in the EIS? The NPD EIS includes a summary of the archaeological assessment (**Section 8.11.4**). CNL describes proposed mitigation measures that will be employed if undocumented archaeological resources (including burial sites) are discovered during the project in **Section 9.9.3.2** of the EIS. The EIS does not predict any adverse residual effects on the socio-economic environment (**Section 9.11.3.3**) or traditional land and resource use (**Section 9.9.3.3**) (encompassing archaeological resources).	Status: Resolution in Progress CNL understands that there is renewed interest from KZA First Nation in the archaeological studies of the NPD site. CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. Next Steps: CNL will share the Stage 1 archaeological assessment results.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		activities will take place), because that area has already been completely disturbed during site construction. However, in response to concerns expressed by Indigenous Nations, communities and organizations, CNL did conduct a Stage 1 archaeological assessment of the remainder of the NPD site. No further archaeological work is planned for NPD.	What changes have been made (and where)? In **Section 9.9.3.2** of the EIS, CNL added proposed mitigation measures that will be employed if undocumented archaeological resources are discovered during the project.	
4. Engagement	a) Effective, transparent, understandable and timely information sharing As of May 2022, KZA has indicated improved understanding by their technical team treating nuclear files and have brought forward more project specific concerns. This is a project-specific concern.	As a part of the AANTC, KZA attended a meeting between the AANTC and CNL in 2017 April to share project information and hear feedback from the AANTC leadership. CNL's presentation included: site location, project components and timeline, species at risk, proposed end state, and safety barriers for the protection of the environment. In May 2017, CNL met with KZA, including two specialists in biology and forestry and one Councilor. This was an opportunity for open discussion on the project with NPD Closure Project team members as well as discuss KZA's comments on the Project Description. CNL provided an overview presentation and shared information on: EA and environmental monitoring, Indigenous requirements in an EIS, project overview and timeline and end state. In July 2017, KZA staff, which included technical experts, toured the NPD site. CNL's biologist was on hand to discuss ecological and archeological studies. KZA staff asked questions and offered feedback on the project, including feedback on species at risk. All questions were addressed verbally at the tour. CNL has responded to all questions, comments, and information requests to date. CNL has reached out to KZA on an ongoing basis since the beginning of the project and has met with KZA in 2017 and in 2021. At the meeting in November 2021, CNL expressed interest in entering into an agreement to provide capacity funding to enable participation in the EA process. CNL Response: CNL responded to all questions from KZA in real-time during the 2017 engagements. Since the summer of 2023, CNL and KZA have been meeting monthly about the NPD Closure Project. CNL has provided reference material and discussed topics identified by KZA. CNL will continue to work with KZA to respond to areas of concern and identify additional opportunities for engagement.	Where is this topic discussed in the EIS? **Section 6.2 4.7.1** of the EIS summarizes CNL engagement with KZA. What changes have been made (and where)? CNL has updated **Section 6.2.4.7.1** of the EIS with all engagement efforts to the May of 2023.	Status: Resolution in Progress There were no outstanding questions from KZA following the 2017 engagements. CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. Next Steps: CNL and KZA to discuss forward communication for the project and support needed for continued involvement by KZA in the NPD EA.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
4.Engagement	b) Meaningful engagement It is important to KZA that meaningful Indigenous participation and adequate Crown consultation occurs for the NPD Closure Project and the NSDF Project environmental assessments. This is both a project-specific concern and a concern for the Crown.	CNL has heard KZA's concern about meaningful Indigenous participation in the EAs for CNL's designated projects and has sought feedback from and offered engagement opportunities for KZA on numerous occasions since the beginning of the NPD Closure Project. CNL Response: For the NPD Closure Project, the responsibility for assessing that adequate Crown consultation has been undertaken falls with the CNSC. CNL is committed to open, transparent and continuing engagement with KZA within CNL's role as the project proponent. CNL and KZA have been meeting monthly since summer 2023 and CNL will continue to provide engagement opportunities for KZA. Engagement Highlights: CNL first reached out to KZA in 2016 with two letters addressed to the Chief; both letters shared information and one inquired on traditional land use. As a part of the AANTC, KZA attended an introductory project meeting between the AANTC and CNL in 2017 April to share project information and hear feedback from the AANTC leadership. The CNL presentation included: site location, project components and timeline, species at risk, proposed end state, and safety barriers for the protection of the environment. In May 2017, CNL met with KZA including two specialists in biology and forestry and one Councilor. This was an opportunity for open discussion on the project with NPD Closure Project team members as well as discuss KZA's comments on the Project Description. CNL provided an overview presentation and shared information on: EA and environmental monitoring, Indigenous requirements in an EIS, project overview and timeline and end state. In July 2017, KZA staff, which included technical experts, toured the NPD site. CNL's biologist was on hand to discuss ecological and archeological studies. KZA staff asked questions and offered feedback on the project, including feedback on species at risk. All questions were addressed verbally at the tour. CNL has responded to all questions, comments, and information requests to date. CNL has reached out to KZA on an ongoing basis since the beginning of the project and has met with KZA in 2017 and in 2021. At the meeting in November 2021, CNL expressed	Where is this topic discussed in the EIS? **Section 6.2.4.7.1** of the EIS summarizes CNL engagement with KZA. What changes have been made (and where)? CNL has updated **Section 6.2.4.7.1** of the EIS to reflect new and planned engagement activities to support KZA's meaningful participation in the EA process.	Status: Resolution in Progress CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. It is noted that this topic extends beyond the scope of the NPD Closure Project. Next Steps: CNL and KZA to discuss forward communication for the project and support needed for continued involvement by KZA in the NPD EA.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		interest in entering into an agreement to provide capacity funding to enable participation in the EA process. Since the summer of 2023, CNL and KZA have been meeting monthly about the NPD Closure Project. CNL has provided reference material and discussed topics identified by KZA. In May 2024, KZA community members, including high school students and elders, visited the CRL site. KZA community members shared feelings with CNL about projects, including the NPD project. CNL will continue to work with KZA to respond to areas of concern and identify additional opportunities for engagement.		
5. EA Process and Methodology	a) Relevant legislation and current framework KZA expressed concern on continued use of *CEAA, 2012* rather than the more recent *Impact Assessment Act*. KZA expects that the NPD Closure Project Environmental Assessment is carried out using up-to-date legislation, fulfilling Canada's international engagements, especially regarding Indigenous rights. This is not a project-specific concern.	No actions – the NPD Closure Project EA will continue under *CEAA* (2012). CNL Response: Note this concern was raised with the Federal Government. This interest is generally beyond the scope of the project. As per direction from the CNSC and transitional provisions of the *Impact Assessment Act*, CNL is continuing its EA for the NPD Closure Project under *CEAA* (2012). Letter to CNL - Changes to Federal Legislation. While the topic of regulatory requirements for an EA process is broad and not specific to the NPD Closure Project, KZA's comments were directed at the regulatory regime under which the NPD Closure Project should be assessed. CNL recognizes the importance of addressing this concern. Therefore, the NPD EIS was revised to include a reference to the *IAA* transitional provisions for continuing the NPD Closure Project EA under *CEAA* (2012) given that it was commenced under *CEAA* (2012) before the *IAA* came into force in 2019.	Where is this topic discussed in the EIS? **Section 3.5** of the EIS summarizes the regulatory framework for the NPD Closure Project. **Section 6.4** outlines CNL's approach and commitment to reconciliation. What changes have been made (and where)? **Section 3.5** of the EIS reflects the provisions in subsection 182 of the *IAA* for continuation of ongoing projects under *CEAA* (2012).	Status: Further alignment on this concern is unlikely For the NPD Closure Project, CNL considers this concern addressed by the revisions to the EIS that provide the regulatory framework and outline CNL's approach and commitment to reconciliation. While KZA may still prefer that the project is subject to the *Impact Assessment Act*, the CNSC has determined that the project will be evaluated under *CEAA* (2012). In feedback provided by KZA in December 2023 and February 2024, KZA is addressing concerns on the current legislative framework with the CNSC who on behalf of the Crown holds the responsibility and duty to consult with and accommodate KZA for the proposed NPD closure project. KZA's laws require that KZA continue to advocate for the complete removal of all contaminated materials as the preferred option. CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent.
	b) Cumulative effects KZA is interested in the overall protection of the Ottawa River and land at, and in the vicinity of, CNL sites, not just the impacts of a single project. This is a CNL-wide concern.	In November 2023, KZA's Impact Assessment Coordinator shared that KZA is looking for a more holistic cumulative effects study that considers the impact of NPD in the area. KZA would like this study to consider all CNL projects on KZA traditional territory and measure the impacts and effects of CNL's activities and legacy waste in and around CNL sites. CNL proposes a dedicated meeting on this topic to fully understand KZA's interest on cumulative effects and continue dialogue on a desired KZA cumulative effects study.	Where is this topic discussed in the EIS? **Section 9.13** of the EIS describes the process for evaluating cumulative effects, and presents CNL's assessment of cumulative effects for the NPD Closure Project. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolution in progress CNL considers that this concern will be fully addressed through an appropriate commitment to provide capacity for including Indigenous Peoples in CNL's monitoring programs. Engagement between CNL and the KZA may result in specific project commitments on additional mitigations measures or commitments that support KZA's involvement in monitoring activities that will enhance confidence and trust in CNL's assessment.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL Response: CNL acknowledges KZA's concern about the effects on the Ottawa River and land at, and in the vicinity of the NPD site from various activities in the past, present and future. As discussed in the EIS and outlined in the CEAA technical guidance Assessing Cumulative Environmental Effects under the *Canadian Environmental Assessment Act*, 2012 (2015), a cumulative effects assessment is only required to be undertaken for residual effects of the project. For all environmental components, since it was determined that no adverse residual effects are expected to occur from the NPD Closure Project, there is no potential for the occurrence of cumulative effects, including no potential for synergistic and/or additive effects. CNL respects that Indigenous Nations, communities and organizations often prefer to evaluate the effects assessment against a different baseline than CNL. The baseline used in the EIS reflects current-day conditions, in accordance with *CEAA* (2012) requirements. CNL maintains the view that past disturbances, i.e., those that occurred during the pre-construction of the NPD facility, are not in scope. CNL notes that the proposed NPD Closure Project will improve the long-term environmental conditions and safety of the NPD site and surroundings, which will be confirmed by Indigenous-led monitoring programs.		CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. Next steps: CNL and KZA to discuss continued involvement by KZA in the NPD EA, which may include a dedicated discussion on cumulative effects.
5. EA Process and Methodology	c) Access to, and use of, information KZA is interested in data sovereignty and in conducting its own environmental and impact assessment, inventories and monitoring studies. KZA is concerned that failing to observe Indigenous knowledge in favour of the more limited CNL studies conducted to date cannot be fully relied on to adequately protect the land. Specifically, KZA notes that data access and governance must approach the First Nation as authorities and partners, rather than subjects of study. This is a project-specific concern.	CNL Response: CNL acknowledges that KZA is interested in conducting its own EA, inventories and monitoring studies. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that there will be future interest in re-establishing traditional use activities on the NPD site. CNL has determined that there are no adverse impacts on Traditional Land and Resource Use resulting from the NPD Closure Project. Indigenous Nations, communities and organizations often prefer a different approach, consider different factors, and evaluate against a different baseline than CNL and, subsequently, the findings of the Indigenous Nations, communities and organizations, and CNL, differ. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. This	Where is this topic discussed in the EIS? **Section 8.9** of the EIS presents information about traditional land and resource use. **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs, including new VCs (**Sections 6.3 and 9.9** within the EIS). **Section 9.1.1.1** of the EIS presents the future exposure scenarios and groups that are considered in the PostSA TSD. What changes have been made (and where)? CNL expanded the description of traditional uses and added and evaluated new traditional land and resource use VCs (**Sections 6.3 and 9.9** of the EIS). The EIS update includes additional detail on the VC-related engagement process (**Section 6.3**) and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project.	Status: Resolution in progress CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL understands that this concern is outstanding from the KZA's perspective based on KZA feedback in July 2023. Next steps: Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		solution has the potential to result in additional lands being freed up for traditional harvest or other uses by Indigenous peoples or the public. CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. Ultimately, the decision of impacts to rights rests with the CNSC. If the CNSC finds any potential impacts to KZA's Indigenous and/or treaty rights, CNL remains committed to understanding these rights and working collaboratively to ensure that they are appropriately mitigated to the greatest extent possible.		
5. EA Process and Methodology	d) Lack of integration of KZA information and knowledge in the NPD EIS KZA is concerned that CNL has not incorporated available information on KZA's history in the region or outlined the harmful past interactions between the nuclear industry and KZA in general. This is both a project-specific and company-wide concern.	CNL Response: CNL is working to incorporate KZA feedback and knowledge shared with CNL on the NPD and NSDF project in its next revision of the NPD EIS. NPD Closure Project representatives are eager to hear from KZA to learn more about KZA history, traditions and culture through the method desired by KZA. CNL will continue to communicate openly and transparently with KZA, and provide engagement opportunities for KZA within CNL's role as the project proponent.	<u>Where is this topic discussed in the EIS?</u> **Section 6.2 4.7.1** of the EIS summarizes CNL engagement with KZA. <u>What changes have been made (and where)?</u> CNL has updated **Section 6.2.4.7.1** of the EIS with all engagement efforts to the May of 2023. <u>Where is this topic discussed in the EIS?</u> **Section 6.2.4.7.1** of the EIS summarizes CNL engagement with KZA. <u>What changes have been made (and where)?</u> CNL has updated **Section 6.2.4.7.1** of the EIS to reflect new and planned engagement activities to support KZA's meaningful participation in the EA process.	<u>Status:</u> Resolution in progress CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). KZA disagrees that this concern is adequately addressed based on KZA feedback from December 2023 and February 2024. <u>Next Steps:</u> CNL is working to incorporate KZA feedback and knowledge shared with CNL on the NPD and NSDF project in its next revision of the EIS.
	e) Concern about the methodology for conducting the effects assessment KZA is concerned that the First Nation is being asked to restrict KZA's exploration of impacts to the health and socioeconomic conditions, the physical and cultural heritage, the use of lands and resources, and the historical archeological, paleontological or architecturally significant structure or thing based on limited methodology. This is a project-specific concern.	CNL is continuing its efforts to address these concerns by: (i) Involving Indigenous Nations, communities and organizations, including KZA, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective. (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern.	<u>Where is this topic discussed in the EIS?</u> **Section 9.1.2** of the EIS explains the methodology used for determining the significance of residual effects. It also presents the criteria used to evaluate significance, which are from CNSC REGDOC 2.9.1 (2020), Environmental Protection: Environmental Principles, Assessments and Protection Measures. **Section 11** of the EIS, Conclusion on Significance, discusses the assessment findings. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this comment.	<u>Status:</u> Further alignment on this concern is unlikely CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). KZA disagrees that this concern is adequately addressed based on KZA feedback from December 2023 and February 2024. <u>Next Steps:</u> KZA and CNL remain committed to working respectfully and collaboratively with each other. CNL wishes to continue discussions with KZA to better understand the community's perspective and values and any fears, or concerns associated with the NPD site and traditional use near the site.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL Response: The methodology used in the EIS for assessing the significance of residual effects for the NPD Closure Project is an established methodology that was used in the EA for the Darlington New Nuclear Project, which currently has an approved License to Prepare Site. The criteria for the evaluation of significance are from the CNSC REGDOC 2.9.1(2020), Environmental Protection: Environmental Principles, Assessments and Protection Measures. The baseline used in the EIS reflects current-day conditions, in accordance with *CEAA* (2012) requirements. CNL notes that the proposed NPD Closure Project will improve the long-term environmental conditions and safety of the NPD site and surroundings, which will be confirmed by Indigenous-led monitoring programs. The participation of KZA in monitoring work for the NPD Closure Project would help to ensure consideration of Indigenous knowledge, collaboration, mutual respect, ongoing participation and relationship building for the future. CNL is open and willing to have a dedicated meeting with KZA to review all environmental effects of the project and present the methodology for determining significance of adverse residual effects.		
6. End State, Site Restoration and Future Use of the Land	a) Collaborative end land use planning There is a strong desire from KZA for future use of the NPD site. It is important to KZA that it receives reassurance that the area will move towards renaturalization and healing over time, so that KZA community members can reconnect with the site and be able to practice traditional land use activities. KZA affirms that the NPD site should be remediated before being returned to the care of Indigenous Peoples who have always been responsible for these lands and waters. This is both a CNL-wide and project-specific concern.	CNL received preliminary feedback on KZA's desire to be involved in site restoration and end state planning during an NPD-specific meeting with the KZA Working Group in November 2023. CNL is committed to sharing the draft restoration plan with KZA once it is developed. CNL Response CNL acknowledges KZA's desire for the NPD site to move towards renaturalization and healing. CNL has used the terms renaturalize/renaturalization to mean: return to natural. As the majority of the site is forested, disturbed areas outside the final licensed area will be left to return to natural via natural succession. Renaturalization will have a positive impact on terrestrial biodiversity because vegetation will provide habitat for nests and dens, cover for animals as they roam, and will promote movement of animals by increasing connectivity (reducing habitat fragmentation). Future land use is a discussion topic that requires the participation of AECL as the owner of the NPD site, in consultation with Indigenous Nations, communities, and organizations, the public, as well as industry and government. As the licensee, CNL is committed to engagement and consultation with Indigenous Nations, such	Where is this topic discussed in the EIS? General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Resolution in progress. This interest and concern is in progress pending engagement on site restoration and end-state planning. Next Steps: CNL will engage with KZA through targeted discussions to seek input prior to and during restoration plan development. The restoration and end state plan draft will be shared with KZA to verify that input has been adequately recorded. CNL is committed to seeking input from the KZA on the proposed ISD project end state, including KZA input on lands restoration of the disturbed areas.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		as KZA, on future end state and land use. The potential land options will not be fully determined until the NPD Closure Project EA and license amendment process proceeds further. In the meantime, CNL is preparing a plan for site restoration after decommissioning is complete, which CNL is committed to sharing with KZA.		
7. Free Prior and Informed Consent (FPIC)	a) Principle of consent KZA asserts that permission for the construction of the NPD site was never originally given by KZA. It is important to KZA that CNL work to secure its free, prior and informed consent through meaningful consultation. This is both a CNL-wide and project-specific concern.	<u>CNL Response:</u> CNL acknowledges that it is understood by KZA that an Indigenous Nation, community or organization's consent is required for the creation of a permanent hazardous waste disposal facility in its traditional territory, per Section 29.2 of the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP). As the licensee, CNL is committed to work towards consensus and consent, with an understanding that UNDRIP does not necessitate a veto in decision-making. CNL is committed to ensuring meaningful participation of Indigenous peoples in decisions that affect their nations, communities and territories.	<u>Where is this topic discussed in the EIS?</u> **Section 3.5** of the EIS summarizes the regulatory framework for the NPD Closure Project. **Section 6.4** outlines CNL's approach and commitment to reconciliation **Section 6.2 4.7.3** of the EIS summarizes KZA's interests and concerns including governance. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this comment.	<u>Status:</u> Resolution in progress CNL understands that UN guiding principles for human rights and UNDRIP are areas of importance for KZA. CNL remains committed to seeking common ground with KZA in the interest of moving closer towards consent. <u>Next Steps:</u> Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic.
8. Impacts on Rights	a) Impacts on KZA Rights KZA is concerned about the impacts of the NPD Closure Project on its Aboriginal Title rights. It is important to KZA that the rights and interests of the Nation are understood and upheld. This is both a CNL-wide and project-specific concern.	CNL has sent 3 targeted letters asking specific questions of KZA to align with the requirements of *CEAA* 2012 Section 5(1)(c) including Indigenous rights. CNL has reached out to KZA on an ongoing basis since the beginning of the project and has met with KZA in 2017 and in 2021. At the meeting in November 2021, CNL expressed interest in entering into an agreement to provide capacity funding to enable participation in the EA process. CNL seeks to develop a mutual understanding of the perceived effects of NPD Closure Project activities on the environment and any potential negative impacts on Aboriginal and/or treaty rights. This includes, but is not limited to, rights to trap, hunt, fish, gather, or harvest as well as the continuation and uninterrupted access to cultural and spiritual activities on the lands and waters. CNL is continuing its efforts to address this concern by committing to: (i) Involving the Indigenous Nations, communities and organizations in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective. (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to	<u>Where is this topic discussed in the EIS?</u> **Table 6.2-2** of the EIS summarizes the identified Indigenous Nations, Communities and Organizations for the NPD Closure Project including information about the location of their traditional territory and assertion of rights. <u>What changes have been made (and where)?</u> Note that this concern was raised at the Project Description stage and therefore no changes were made to the EIS as **Table 6.2-2** has been present since the initial draft.	<u>Status:</u> Further alignment on this concern unlikely CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). CNL acknowledges that the findings of the KZA-CNSC rights impact assessment may require additional engagement and a mutually agreed upon resolution of any found impacts on rights. KZA remains concerned that the project poses significant risk of detrimental impact to KZA, as communicated in KZA preliminary feedback on the EIS in December 2023 and February 2024. <u>Next steps:</u> Through continued engagement at the Working Group, CNL hopes that the parties are able to find common ground on this topic, which may include proposed commitments.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL Response: Table 6.2-1 of the EIS notes that the NPD site is located within the vicinity of known traditional territory of the AANTC. It also indicates assertion of rights. CNL acknowledges KZA's concerns about assessment of impacts to rights and traditional land and resource use, driven by concerns about contamination of and distrust in the safety of the land and water. CNL is open to increased engagement, education, and participatory involvement in monitoring activities at its sites to address these concerns. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. This solution has the potential to result in additional lands being freed up for traditional harvest or other uses by Indigenous peoples or the public. CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. Ultimately, the decision of impacts to rights rests with the CNSC, therefore CNL is unable to comment on an assessment of impacts to rights at this time. If the CNSC finds any potential impacts to KZA's Indigenous and/or treaty rights, CNL remains committed to understanding these rights and working collaboratively to ensure that they are appropriately mitigated to the greatest extent possible.		
9. Inventory	a) Inventory of the NPD Disposal Facility KZA is concerned about the nuclear waste that will remain on site and the radiological content (inventory) of the proposed NPD disposal facility. This is a project-specific concern.	CNL Response: CNL agrees that protection of future land users is an important concern and has addressed this subject. CNL has assessed the suitability of in-situ disposal for the NPD site, and the EIS shows that such a disposal is safe for human health and the environment in the short term and long term. The NPD reactor has a low radionuclide inventory. Tritium is the major radionuclide and will decay to low levels during the Institutional Control period (~100 years). The proposed waste disposal facility barriers have a design life consistent with that timeframe. The longer-lived ILW consists of small quantities of low energy beta emitters. The beta emitters have low radiotoxicity. The main barrier to containing the radioactivity on long timescales is that 83% of the initial inventory (mostly activation products) is embedded within steels and zircaloy which corrode very slowly, particularly in	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment. What changes have been made (and where)? No changes were made to the EIS as a result of this concern.	Status: Resolution In progress CNL's technical assessment shows that the in-situ design is appropriate for the hazardous timeframe of the contaminants and is consistent with national and international standards. CNL understands that this concern is outstanding from KZA's perspective based on feedback in July 2023. Next steps: Through engagement, CNL hopes that the parties are able to find common ground on this topic, including the development of commitments to build confidence and trust in the in-situ disposal concept.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		an alkaline environment. The metals used in the reactor vault are corrosion-resistant alloys, with stainless steel taking approximately 30,000 years to fully corrode and zircaloy up to 300,000 years to fully corrode. The low corrosion rates allow the radioactivity to decay before it is released into the reactor vault. Once in the reactor vault the radioactive contaminants sorb onto the grout which further delays its diffusion out of the facility. Based on its consideration of national and international standards and guidelines, CNL continues to believe that the NPD facility has characteristics that support in-situ disposal.		
10. Long-term Safety	a) Long-term site integrity It is important to KZA that there is confidence in the performance of the facility over the long-term and that there are barriers in place to protect the environment, taking into account the worst case scenario in terms of climate change and extreme natural disturbance.. This is a project-specific concern.	In October 2023, CNL provided a presentation to the KZA Monthly Working Group with additional information on the contaminants involved in the NPD Closure Project, including: • main contaminants of concern; • half-life and LLW/HLW categorization; • threshold limits and how they are established; • lifespan of the grout/concrete structure; • effects of the contaminants at higher levels on the environment and human health; • the mobility of the contaminants (how they move within the environment and how they affect the things around them); • overview of the various proposed protection measures (the role of grout and other barriers); • how in-situ disposal compares and contrasts with Deep Underground Repositories; and • what route the contaminants would travel (even if they are at 'acceptable levels') after the concrete/grout decays. CNL is attempting to address concerns related to long-term safety at the NPD site by: (i) Involving the Indigenous Nations, communities and organizations, including KZA if interested, in monitoring activities that will confirm the conclusions of the EIS. (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS). CNL Response: CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and	Where is this topic discussed in the EIS? **Section 8.12** of the EIS discusses the relevant natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Further alignment on this concern is unlikely CNL's technical assessment shows that there are no long-term effects resulting from the NPD Closure Project. KZA disagrees that this concern is adequately addressed based on KZA feedback from December 2023 and February 2024. KZA's laws require that KZA continues to advocate for the complete removal of all contaminated materials as KZA's assessments have determined this to be the preferred option. CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. Next Steps: Through engagement, CNL hopes that the parties are able to find common ground on this topic, including the development of commitments to build confidence and trust in the in-situ disposal concept.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		extreme temperature change on the integrity of the grouted facility and concluded that these events will have no undue short-term or long-term effects on people or the environment around the site. The PostSA TSD demonstrates that beyond the Institutional Controls period, under all scenarios, the impact on the public, Indigenous and the environment is negligible. To verify that the engineered barriers as a whole are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. The proposed NPD Closure Project conforms with all applicable Canadian codes and standards as well as international best practices to ensure protection of the environment and safety throughout the life of the facility. CNL is committed to further engagement with KZA to obtain a greater understanding of their concerns about the long-term safety of nuclear waste.		
10. Long-term Safety	b) Consideration of unique pathways for potential contamination exposure It is the view of KZA that there is a significant gap in research on the unique pathways for exposure to contaminants for Anishinabe people that needs to be addressed in the EIS in order for the project to move forward. It is important to KZA that CNL recognizes the unique pathways of potential exposure, therefore KZA would like to be involved in identifying the source of these of pathways to instill confidence for KZA members practicing traditional activities on the site in the future. This is a project-specific concern.	CNL received preliminary input on this concern during an NPD-specific meeting with KZA in November 2023. CNL re-iterates that the details of CNL's research on the unique pathways for exposure to contaminants are described in CNL's PostSA TSD and associated TSDs. The NPD EIS contains a summary of the results. CNL is open and willing to hold a dedicated Working Group meeting to further describe the studies that have been done and provide an explanation of the results. CNL is continuing its efforts to address these concerns by committing to: (i) Involving the Indigenous Nations, communities and organizations, including KZA, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective. (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to	<u>Where is this topic discussed in the EIS?</u> The EIS presents the PostSA results for the Indigenous receptor group in **Section 9.10.2.** <u>What changes have been made (and where)?</u> CNL's has updated its PostSA TSD. This update includes an Indigenous receptor whose characteristics have been based on the results of a local Indigenous Nation harvest and diet study. Two additional medicinal pathways have been added in addition to ingestion (inhalation and skin application). The human health assessment in the PostSA also includes an even more conservative scenario where an Indigenous receptor where characteristics match a pre-European contact lifestyle. The results of the PostSA have been integrated into the EIS.	<u>Status:</u> Resolution is in progress CNL's technical assessment shows that there are no predicted impacts to Indigenous biophysical health resulting from the NPD Closure Project. Continued engagement with KZA may result in commitments that will enhance confidence and trust in CNL's assessment. <u>Next Steps:</u> Review with KZA the exposure pathways included in CNL's assessment and hear feedback from KZA on any pathways that may have not been adequately considered. KZA's primary goal is to responsibly assess the project to ensure the health and well-being of its people and the environment. KZA appreciates CNL's willingness to continue to explore this topic.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		negative perceptions and feelings of discomfort and concern (**Section 9.9.5** of the EIS) CNL Response: CNL agrees that traditional activities and resource use is important to integrate into the EIS with consideration of potential unique pathways of exposure for materials harvested or gathered in the area. In the third iteration of the PostSA TSD issued in March 2020, CNL included a Potential Exposure Group consisting of a family of self-sufficient Indigenous receptors in the NPD Area. The exposure profile in the postclosure period was developed based on a traditional Indigenous lifestyle pre-European contact (SENES 2014). This lifestyle results in a more cautious dose estimate than that based on current-day lifestyle, where some food is store-bought and likely not from the contaminated area. The predicted peak dose to an Indigenous receptor (from the 3rd iteration PostSA) is 0.0004 mSv/yr, which is 500 times less than the dose criterion. The analysis demonstrates that the impact on the public, Indigenous peoples and the environment is negligible under all scenarios. Through use of a Diet and Harvest Study prepared by a local Indigenous Nation, CNL has updated the exposures to an Indigenous receptor within its PostSA TSD. This receptor already included pathways to wild foods harvested from the area but now also considers exposure through traditional use of materials harvested or gathered from the area. The new pathways include inhalation of smoke from burning medicinal plants and rubbing of plants into the skin. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the KZA and other Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm the predictions of the EIS.		
11. Monitoring	a) Monitoring locations and implementation of mitigation measures KZA has expressed concern about water management and monitoring specifically locations for monitoring to occur and mitigation measures in the event that water becomes contaminated. This is a project-specific concern.	In July 2023, KZA identified that it expects monitoring to occur both at the NPD site and offsite. CNL Response: The potential for contamination to reach the Ottawa river is assessed in the EIS, and is supported by long term modelling and detailed groundwater modelling. The EIS	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the Ottawa River.	Status: Resolution in progress. CNL understands that this concern is outstanding from KZA's perspective. A dedicated Indigenous-led, Indigenous Knowledge driven component integrated into the site monitoring at NPD can help build confidence and trust in CNL's assessment.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		predicts no effects to surface water (including the Ottawa river. CNL has added information to the EIS about the washout pit and historic water discharges from the wells area sump. Monitoring results capture the effects of historic activities. Groundwater modelling was conducted for the NPD site. The PostSA TSD incorporates the results of groundwater modelling and, where necessary, uses conservative assumptions, (e.g., the tile drains remain functional and serve as a faster pathway to the Ottawa River), and considers the tile drains to have failed (so that the facility resaturates more quickly). The PostSA TSD concludes that no residual effects are expected from potential contaminant migration in groundwater. The tile drain system is expected to fail at some point during the Institutional Controls phase. In addition, monitoring of the environment will be undertaken to verify the EIS predictions of no significant adverse effect and to confirm that mitigation measures are effective. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. Through engagement, CNL is open and willing to collaboratively discuss the list of mitigation measures proposed for the NPD Closure Project as well as KZA's interests in water monitoring and mitigation efforts.	Mitigation measures for the protection of surface water are described in **Section 9.3.3.2** of the draft EIS. The EIS does not predict any adverse residual effects on the surface water environment (**Section 9.3.3.3** and **9.3.3.5**). The follow-up monitoring program is described at a high level in **Section 12** of the EIS. Groundwater modelling has been conducted in the Groundwater Modelling TSD. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this comment.	<u>Next Steps:</u> Through engagement, CNL hopes that the parties are able to find common ground on this topic. CNL and KZA to have a dedicated discussion to discuss KZA's involvement in monitoring at the NPD site.
11. Monitoring	b) Participation in monitoring KZA would be interested in being involved in a monitoring strategy to provide assurance to KZA members that CNL is regularly monitoring the environment around CNL sites. This is both a CNL-wide and project-specific concern.	CNL received preliminary feedback on this topic during an NPD-specific meeting with the KZA Working Group in November 2023. As follow-up from the meeting, CNL sent an infographic to KZA that illustrates CNL's environmental monitoring (i.e., water sampling locations) throughout the Regional Study Area. <u>CNL Response:</u> CNL is committed to involving Indigenous Nations, such as KZA, in its monitoring programs, and is open and willing to explore options for KZA's desired involvement in monitoring at the NPD site. The participation of KZA in monitoring work for the NPD Closure Project ensures consideration of Indigenous knowledge, collaboration, mutual respect, ongoing participation and potential relationship building for the future.	<u>Where is this topic discussed in the EIS?</u> **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the Ottawa River. Mitigation measures for the protection of surface water are described in **Section 9.3.3.2** of the draft EIS. The EIS does not predict any adverse residual effects on the surface water environment (**Section 9.3.3.3** and **9.3.3.5**). The follow-up monitoring program is described at a high level in **Section 12** of the EIS.	<u>Status:</u> Resolution in progress. CNL understands that this concern is outstanding from KZA's perspective. A dedicated Indigenous-led, Indigenous Knowledge driven component integrated into the site monitoring at NPD can help build confidence and trust in CNL's assessment. <u>Next Steps:</u> Through engagement, CNL hopes that the parties are able to find common ground on this topic. CNL and KZA to have a dedicated discussion to discuss KZA's involvement in monitoring at the NPD site.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
			Groundwater modelling has been conducted in the Groundwater Modelling TSD. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	
12. Protection of Flora and Fauna	a) Biota and Species at Risk KZA expressed concerns about potential project impacts to biota and its natural habitat, specifically SAR at the NPD site -chimney swifts and Monarch butterflies. In particular, KZA had questions about leaving the ventilation stack in place This is a project-specific concern.	In May 2017, CNL met with KZA including two specialists in biology and forestry and one Councilor. This was an opportunity for open discussion on the project with NPD Closure Project team members as well as to discuss KZA's comments on the Project Description. CNL provided an overview presentation and shared information on: EA and environmental monitoring, Indigenous requirements in an EIS, project overview and timeline and end state. The discussion also included Species at Risk and interest in a visit to NPD. In July 2017, KZA staff toured the site with technical and environmental experts. CNL's biologist was on hand to discuss ecological and archaeological studies. KZA had the opportunity to ask questions or offer feedback on the project, including feedback on species at risk. All questions were addressed verbally on the tour. CNL Response: CNL involved third party experts through a workshop and evaluated all possible options to best protect the chimney swift. The recommendations from the workshop was to retain the ventilation stack as critical habitat. CNL has submitted a permit to Environment and Climate Change Canada as part of the project. The draft conditions of that permit (mitigations for the protection of the chimney swift) are included in the EIS. In response to observations of milkweed at the NPD site by KZA staff during their site visit, monarch butterfly has been added as a valued component to the EIS and mitigations are in place to preserve and reseed with milkweed (critical habitat).	Where is this topic discussed in the EIS? Collectively, mitigation measures for the protection of flora and fauna, specifically species at risk are outlined in **Sections 9.6.3.2** (Terrestrial Environment). No residual effects for the terrestrial environment are predicted (**Section 9.6.3.5**). What changes have been made (and where)? As a result of feedback from KZA staff and technical experts, monarch butterflies were added as a VC (see **Section 6.2.4.7** and **Appendix B** of the EIS). Habitat effects on the monarch butterfly are considered and mitigations are outlined in **Section 9.6.3.2**. The EIS includes additional mitigations related to milkweed (important habitat for monarch butterflies), migratory birds, bats, chimney swifts and milksnakes.	Status: Resolution in Progress CNL considers this concern has been addressed by changes to the EIS, including the addition of monarch butterfly to the VC list, as well as the site tour and meetings. CNL understands that the concerns of KZA relating to protection of flora and fauna have greatly evolved since 2017. CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. Next Steps: CNL proposes a meeting with KZA to discuss how the species they have identified are considered and included in CNL's assessment.
13. Protection of the Ottawa River	a) KZA expressed concern about the potential impacts of nuclear waste on the health of the Ottawa River and its entire watershed including wildlife and flora. This is a concern for KZA because for the Anishinaabe peoples, water is sacred and essential for all life and must be protected. This is a project-specific concern.	As a part of the AANTC, KZA attended a meeting with the AANTC and CNL in 2017 April to share project information and hear feedback from the AANTC leadership. CNL's presentation included: site location, project components and timeline, species at risk, proposed end state, and safety barriers for the protection of the environment. In May 2017, CNL met with KZA including two specialists in biology and forestry and one Councilor. This was an opportunity for open discussion on the project with NPD	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment including the Ottawa River. Mitigation measures for the protection of surface water (**Section 9.3.3.2**) (including the Ottawa	Status: Resolution in Progress CNL considers this concern has been addressed by the draft EIS content and CNL's ongoing outreach to engage the KZA through a variety of means. CNL remains committed to ongoing engagement with KZA within CNL's role as the project proponent. Next Steps:

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		Closure Project team members as well as discuss KZA's comments on the Project Description. CNL provided an overview presentation and shared information on: EA and environmental monitoring, Indigenous requirements in an EIS, project overview and timeline and end state. In July 2017, the KZA staff toured the NPD site with technical and environmental experts. CNL's biologist was on hand to discuss ecological and archeological studies. KZA staff asked questions and offered feedback on the project, including feedback on species at risk. All questions were addressed verbally at the tour. CNL has reached out to KZA on an ongoing basis since the beginning of the project and has met with KZA in 2017 and in 2021. At the meeting in November 2021 CNL expressed interest in entering into an agreement to provide capacity funding to enable participation in the EA process. <u>CNL Response:</u> CNL has assessed in-situ disposal of the waste as safe for the public and the environment, particularly the Ottawa River, over both short and long-term periods (e.g.,100,000 years). If the EA for in-situ disposal of the NPD facility is approved, the CNSC will require CNL to monitor and control access to the site during the Institutional Control period currently proposed for a minimum of 100 years. Once the regulator allows for Institutional Controls to cease, there will be no requirement for future monitoring or maintenance as the in-design features or passive barriers of the disposal facility, such as the grout, will help protect the public and the environment from radioactive and non-radioactive wastes. To verify that the engineered barriers as a whole are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. CNL is working to involve Indigenous Nations, communities and organizations, including KZA if interested, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective.	River) have been updated and expanded from the 2017 draft EIS. The EIS does not predict any adverse residual effects on the surface water environment (**Section 9.3.3.3**). <u>What changes have been made (and where)?</u> Note that this concern was raised at the Project Description stage and therefore no changes were made to the EIS as the above assessment has been present since the initial draft.	CNL will continue to follow-up with the KZA on opportunities for involvement in monitoring.
14. Socioeconomic	a) Contracting opportunities	CNL discussed contracting opportunities with KZA at a May 2017 meeting.	<u>Where is this topic discussed in the EIS?</u>	<u>Status:</u> Resolved

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	KZA is interested in contracting opportunities with CNL to enhance community opportunities. This is a CNL-wide interest.	CNL Response: CNL is committed to improved economic outcomes and benefits for Indigenous Peoples from its projects. CNL has acknowledged this gap and is working to develop a company-wide Indigenous Procurement Strategy, as well as a Reconciliation Action Plan, which includes a commitment to advance economic reconciliation.	Not applicable. What changes have been made (and where)? No impact to the EIS.	Economic opportunities for KZA are considered to be a broader CNL issue and not specific to the EA for the NPD Closure Project. It is noted that this topic extends beyond the scope of *CEAA* (2012) and the NPD Closure Project.
15. Traditional Land and Resource Use and Cultural Impacts	a) Impact on ability to practice traditional activities KZA is concerned that the EIS neglects to acknowledge CNL's responsibility in creating and perpetuating avoidance of the area by KZA members. KZA notes that there is a lack of desire to hunt and fish near the site and reluctance to gather plants that were grown in soils ravaged by radioactive contamination. The idea that KZA must hunt, fish and gather at the site to validate KZA claims to the right to co-manage and protect it is a shortfall in the understanding of KZA culture and values. This is a project-specific concern.	CNL is continuing its efforts to address these concerns by committing to: (i) Involving the Indigenous Nations, communities and organizations, including KZA, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near the CNL operated sites and build confidence that the decommissioning strategy and mitigation measures are effective (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern. CNL seeks to develop a mutual understanding of the perceived effects of the NPD Closure Project activities on the environment and any potential negative impacts on Aboriginal and/or treaty rights. This includes, but is not limited to, rights to trap, hunt, fish, gather, or harvest as well as the continuation and uninterrupted access to cultural and spiritual activities on the lands and waters. CNL Response: CNL acknowledges KZA's concerns about the safety of the NPD site and the potential impacts on the rights of the KZA and other Indigenous Nations, communities and organizations to practice traditional activities around the NPD site. CNL has assessed potential effects related to dust and noise nuisance, loss of connection, safety of harvesting and consuming local foods, and changes to access and identified no significant adverse effects. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve the KZA and other Indigenous Nations, communities and organizations in the monitoring program, if desired, which aims to confirm the predictions of the EIS.	Where is this topic discussed in the EIS? The EIS discusses concerns about potential loss of connection to land and water (e.g., feeling of discomfort or concern), and loss of land and water use in **Section 9.9.5**. General plans for restoration and end state, including access considerations, are described in **Section 4.3.1.9** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this comment.	Status: Further alignment on this concern is unlikely. CNL's conclusion is that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. CNL's technical assessment was conducted in accordance with the requirements of *CEAA* (2012). KZA remains concerned that the project poses significant risk of detrimental impact to KZA, as communicated in KZA preliminary feedback on the EIS in December 2023 and February 2024. Next steps: CNL wishes to continue discussions with KZA to better understand the community's perspective and values and any fears, or concerns associated with the NPD site and traditional use near the site. CNL proposes a dedicated Working Group meeting focused on effects to traditional land and resource use.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL notes that the final end state is the only time when changes to access will occur; the final end state of the NPD site will be an improvement from current conditions. The PostSA TSD addresses the potential for concerns about loss of connection to land and water, and about food safety. The PostSA and EIS (and other supporting studies) have demonstrated that, there are no concerns about the accessibility or safety of the NPD site in the long term based on several different future use scenarios, including self-sufficient Indigenous receptors. The proposed activities will result in an enhancement of current conditions at the NPD site and will improve the ability to practice traditional activities in the area surrounding the NPD site. These findings, which will be confirmed by monitoring, may reduce concerns about loss of connection to land and water, and about food safety.		

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Appendix C.5 – Record of Engagement and Tables of Interests and Concerns for Williams Treaties First Nations (WTFN)

This appendix provides a complete record of all engagement between CNL and Williams Treaties First Nations (WTFN) from June 2016 to March 2024 (Table C-19). A record of engagement for each of the individual WTFN is included in subsequent tables:

- Table C-20 – Alderville First Nation
- Table C-21 – Curve Lake First Nation
- Table C-22 – Hiawatha First Nation
- Table C-23 – Mississaugas of Scugog Island First Nation
- Table C-24 – Chippewas of Rama First Nation
- Table C-25 – Chippewas of Georgina Island First Nation
- Table C-26 – Chippewas of Beausoleil First Nation

These tables include the date and method of the communication/engagement, the topics discussed and participants. The tables also highlight engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act,* 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement tables is a mapping of how the summary of interests and concerns were compiled (Table C-27), as well as a summary of interests and concerns raised by Williams Treaties First Nations (Table C-28).

Section 6.2.4.9.1, 6.2.4.10.1, 6.2.4.11.1, 6.2.4.12.1, 6.2.4.13.1, 6.2.4.14.1 and 6.2.4.15.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and the WTFN.

Table C-19 Record of Engagement with Williams Treaties First Nations (WTFN)

January 20, 2017 Outgoing email	This email from CNL communications staff to the WTFN Process Coordinator was to follow up again on previous correspondence, inquiring about whether the WTFN as a whole were interested in engaging with CNL on the NPD Closure Project.										√
November 15, 2017 Outgoing email	This email from CNL communications staff to the WTFN Process Coordinator enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from CNL communications staff to the WTFN Process Coordinator enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: "CNL would be pleased to update information in this current draft with input from your community."	√	√	√	√	√	√	√	√	√	
February 20, 2020 Outgoing email	This email from CNL communications staff to the WTFN Process Coordinator inquired about whether the WTFN as a whole were interested in engaging with CNL on the CNL's projects (NPD Closure Project).										√
March 02, 2020 Outgoing telephone call	This telephone call from CNL communications staff to the WTFN Process Coordinator was to follow-up on previous correspondence.										√
March 03, 2020 Outgoing email	This email from CNL communications staff to the WTFN Process Coordinator was to follow-up previous efforts at connecting.										√
March 3, 2020 Outgoing email	This email from CNL communications staff to the Williams Treaties First Nations general email inquiry mailbox was to inquiry/confirm Williams Treaties First Nations Process Coordinator contact details as we have had received no response on any correspondence.										√

Table C-20 Record of Engagement with Alderville First Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Alderville First Nation (FN) Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Alderville FN Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Alderville FN's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Does Alderville First Nation have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of Alderville First Nation using the areas around the two projects?* • *Do you have any members of Alderville First Nation that currently live in close or reasonable proximity to either of the projects?* • *Does Alderville First Nation have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does Alderville First Nation, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites*? CNL also indicated interested in learning more about the FN and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
November 15, 2017 Outgoing email	This email from a CNL communications officer to the Alderville FN Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a CNL communications officer to the Alderville FN Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: *"CNL would be pleased to update information in this current draft with input from your community."*	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
April 09, 2020 Outgoing email	This email from a communications officer to representatives of the different WTFN communities (including the Lands and Resources Communications Officer with Alderville FN) was to propose a virtual webinar meeting on the NPD Closure Project and the NSDF Project.										√
May 04, 2020 Outgoing email	This email from CNL staff to representatives of the WTFN communities (including representative of Alderville FN) enclosed an action list.										√
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Alderville FN Chief enclosed a preliminary version of the 2020 EIS and an updated IER. This letter also asked for feedback in the following seven areas: • *Does Alderville First Nation have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Does Alderville First Nation have any members who currently live close or in reasonable proximity to the NPD site?* • *Does Alderville First Nation have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Does Alderville First Nation have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to Alderville First Nation near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.* This letter also indicated an interest in meeting with Alderville FN to discuss any interests or concerns.	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 19, 2020 Virtual meeting	This meeting between four representatives of different WTFN communities (specifically, Hiawatha FN's Land and Resources consultation workers, Alderville FN's lands and community engagement officer, Curve Lake FN's lands and resources consultation officer and Georgina Island FN's consultation coordinator attended) and six CNL representatives (including the Manager of Stakeholder Relations, the Manager of Regulatory Approvals for the NPD Closure Project and communications officers with CNL) included an interactive webinar overview presentation on the project with the opportunity for questions. Specific topics discussed included the following: • Project overview and components; • Timeline; • Waste inventory; • Monitoring; • VCs; • Species at risk; • traditional land and resource use; • Effects on the environment. The Alderville FN representative had interests and questions with respect to the Chimney Swifts and the height of the ventilation stack in relation to its long-term maintenance.	√		√	√		√	√	√	√	
May 26, 2020 Outgoing email	This email from CNL communications officer to representatives of the WTFN communities (including Lands and Resources Communications Officer with Alderville FN) enclosed the follow-up information responding to all questions from the meeting on May 19, including the Alderville FN representative's questions on the Chimney Swift (a species at risk) and ventilation stack at the NPD site.	√			√					√	
May 27, 2020 Incoming email	This email from Alderville First Nation's Lands and Resources Communications Officer to a CNL communications officer was to inquire if any issues had not been closed off in the previous virtual meeting.										√
May 27, 2020 Outgoing email	This email from a CNL communications officer to Alderville FN Lands and Resources Communications Officer confirmed and enclosed the follow-up information from the previous virtual meeting.										√
July 27, 2020 Outgoing email	This email from a CNL communications officer to representatives of the WTFN communities (including Alderville FN's Lands and Resources Communications Officer) enclosing the presentation from the previous meeting in May.	√		√	√		√	√	√	√

In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
April 09, 2020 Outgoing email	This email from a communications officer with CNL to representatives of WTFN communities (including the Lands and Resources Consultation coordinator with Hiawatha FN) was to propose a virtual webinar meeting on the NPD Closure Project and the NSDF Project.										√
April 14, 2020 Incoming email	This email from Hiawatha First Nation's Lands and Resources Consultation Coordinator to a CNL communications officer was to confirm attendance and date preference for the webinars.										√
April 17, 2020 Outgoing email	This email from a communications officer with CNL to representatives of WTFN communities (including the Lands and Resources Consultation coordinator with Hiawatha FN) was to confirm the webinar, and offer to test the virtual meeting platform.										√
April 29, 2020 Outgoing email	This email from a communications officer with CNL to representatives of WTFN communities (including the Lands and Resources Consultation coordinator with Hiawatha FN) enclosed a copy of the overview presentations for the webinars.										√
May 04, 2020 Outgoing email	This email from a communications officer with CNL to representatives of WTFN communities (including the Lands and Resources Consultation coordinator with Hiawatha FN) enclosed an action list.										√
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Hiawatha FN Chief enclosed a preliminary version of the 2020 EIS and an updated IER. This letter also asked for feedback in the following seven areas: • *Does Hiawatha First Nation have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Does Hiawatha First Nation have any members who currently live close or in reasonable proximity to the NPD site?* • *Does Hiawatha First Nation have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Does Hiawatha First Nation have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to Hiawatha First Nation near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.* This letter also indicated an interest in meeting with Hiawatha FN to discuss any interests or concerns.	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 19, 2020 Virtual meeting	This meeting between four representatives of different WTFN communities (specifically, Hiawatha FN's Land and Resources consultation workers, Alderville FN's lands and community engagement officer, Curve Lake FN's lands and resources consultation officer and Georgina Island FN's consultation coordinator attended) and six CNL representatives (including the Manager of Stakeholder Relations, the Manager of Regulatory Approvals for the NPD Closure Project and communications officers with CNL) included an interactive webinar overview presentation on the project with the opportunity for questions. Specific topics discussed included the following: • Project overview and components; • Timeline; • Waste inventory; • Monitoring; • VCs; • Species at risk; • Traditional land and resource use; • Effects on the environment. The Alderville FN representative had interests and questions with respect to the Chimney Swifts and the height of the ventilation stack in relation to its long-term maintenance.	√		√	√		√	√	√	√	
May 26, 2020 Outgoing email	This email from a communications officer with CNL to representatives of WTFN communities (including the Lands and Resources Consultation coordinator with Hiawatha FN) enclosed the follow-up information responding to all questions from the meeting on May 19, including the Hiawatha FN representative's questions (topics listed above). Three ACMRs and the archaeological assessment were enclosed.	√			√					√	
February 12, 2021 Outgoing email	This email from a communications officer with CNL to representatives of WTFN communities (including the Lands and Resources Consultation coordinator with Hiawatha FN) was an invitation to join Curve Lake First Nation's request of a monthly update on Canadian Nuclear Laboratories (CNL) environmental remediation projects, such as the NSDF Project and NPD Closure Project, as well as Port Hope Area Initiative (PHAI) activities in Port Hope and Port Granby. The monthly meeting will take place the last Wednesday of each month starting March 2021.									√	
March 31, 2021 Virtual meeting	This was the first of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. Representatives from CNL (in particular, a communications officer, the Manager of Stakeholder and Indigenous Relations with PHAI and the Manager of Regulatory Approvals for the NPD Closure Project) Curve Lake FN (including the Lands Resource Consultation Liaison, a consultant and the Lands and Resource Administrative Support Worker), Hiawatha FN (including a Lands and Resources Consultation Coordinator), Alderville FN (including the Lands and Resources Communications Officer), Rama FN (including the community consultation worker) and AECL (including the Director of Communications and Government Reporting) were in attendance. The focus was an overview on AECL and CNL as a corporation.			√	√						√
April 4, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√

November 01, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to all WTFN is to follow-up from the 2023 October monthly meeting. CNL noted for those who were unable to attend the meeting, an agenda item was tabled for discussion to move our monthly information sharing meeting to a quarterly meeting instead. The discussion result was an agreement (with those in attendance) to change to a quarterly meeting update if WTFN communities still received project updates/ milestones and/ or news in between meetings. I encourage you to provide feedback on this change. CNL also shared the GO-CO model presentation.										√
November 23, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to all WTFN is to follow-up from the 2023 November 01 email to all WTFN communities to confirm that the 2023 November 30 WTFN monthly meeting has been cancelled, and that the monthly meeting has been changed to a quarterly meeting series. The monthly meeting series has been cancelled. A quarterly meeting series has been setup, and the next meeting is on Wednesday, January 31, 2024.										√
January 31, 2024 Meeting	This meeting between CNL (including, Manager of Communications and Engagement, Communications Officers, HWP Manager of Indigenous Relations Communications, NPD Closure Project Director and Environmental and Decommissioning Specialist, Manager, HWP Environmental Management and Director, Indigenous Engagement) and WTFN (including, Alderville First Nation, Lands and Resources Consultation Officer, Curve Lake First Nation, Acting Consultation lead , Hiawatha First Nations Lands and Conservation Officer and Consultants) was to discuss CNL Updates and hear community updates. The NSDF and NPD project shared updates including the recent CNSC Decision on the NSDF and the NPD Revised Draft EIS submission date.										√

Table C-23 Record of Engagement with Mississaugas of Scugog Island First Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Mississaugas of Scugog Island First Nation (FN) Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5.1(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
October 24, 2016 Outgoing telephone call	This telephone call from a communications officer with CNL to the Scugog Island FN contact was to follow up on the July letter.										√
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Scugog Island FN Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Scugog Island FN's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Do the Mississaugas of Scugog Island First Nation have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of the Mississaugas of Scugog Island First Nation using the areas around the two projects?* • *Do you have any members of the Mississaugas of Scugog Island First Nation that currently live in close or reasonable proximity to either of the projects?* • *Do the Mississaugas of Scugog Island First Nation have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Do the Mississaugas of Scugog Island First Nation, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the FN and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
November 15, 2017 Outgoing email	This email from a communications officer with CNL to the Mississaugas of Scugog Island FN Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 17, 2017 Outgoing email	This email from a communications officer with CNL to the Mississaugas of Scugog Island FN Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: *"CNL would be pleased to update information in this current draft with input from your community."*	√	√	√	√	√	√	√	√	√	
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
April 09, 2020 Outgoing email	This email from a communications officer with CNL to Williams Treaties First Nations (including the Scugog Island FN consultation coordinator) was to propose a virtual webinar meeting on the NPD Closure Project and the NSDF.										√
April 17, 2020 Outgoing email	This email a CNL communications officer to the Scugog Island First Nation's Consultation Coordinator was to confirm the receipt of previous emails.										√
April 17, 2020 Outgoing email	This email from a communications officer with CNL to Williams Treaties First Nations (including the Scugog Island FN consultation coordinator) was to confirm the webinar, as well as offer to test the virtual meeting platform.										√
April 29, 2020 Outgoing email	This email from a communications officer with CNL to Williams Treaties First Nations (including the Scugog Island FN consultation coordinator) enclosed a copy of the overview presentations for the webinars.										√
May 04, 2020 Outgoing email	This email from a communications officer with CNL to Williams Treaties First Nations (including the Scugog Island FN consultation coordinator) enclosed an action list.										√
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Scugog Island FN Chief enclosed a preliminary version of the 2020 EIS and an updated IER. This letter also asked for feedback in the following seven areas: • *Does Scugog Island First Nation have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Does Scugog Island First Nation have any members who currently live close or in reasonable proximity to the NPD site?* • *Does Scugog Island First Nation have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Does Scugog Island First Nation have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to Scugog Island First Nation near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.* This letter also indicated an interest in meeting with Scugog Island FN to discuss any interests or concerns.	√	√	√	√	√	√	√	√	√

		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
August 26, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√
September 29, 2021 Incoming Email	This email from a Scugog Island FN consultant to Senior Communications Officer at CNL was to ask CNL to add their email to the mailing list to arrange the WTFN/CNL monthly meeting.										√
September 29, 2021 Outgoing Email	This email from a CNL Communications officer to a Scugog Island FN consultant was to follow up on the previous email to confirm the inclusion of their email to the mailing list to arrange CNL/WTFN monthly meetings. CNL also asked the Scugog FN consultant if they would like to participate in a meeting to discuss environmental assessment projects and to discuss ongoing engagement between CNL and WTFN so far. The Scugog Island FN consultant confirmed interest.										√
September 29, 2021 Virtual meeting	This was the seventh of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. Representatives from CNL (in particular, a communications officer, ERM Stakeholder Relations Manager and the Manager of Regulatory Approvals for the NPD Closure Project) Curve Lake FN (including the Lands and Resources Consultation Officer, consultants and the Lands and Resource Administrative Support Worker), Hiawatha FN (including a community consultation coordinator), Scugog Island (including a consultant) and AECL (including the Manager of Engagement and Communications) were in attendance. The focus was a discussion on CNL's responses to Curve Lake First Nation's review of the 2020 EIS.	√		√	√	√				√	√
October 05, 2021 Outgoing Email	This email from a CNL Communications officer to a Scugog Island FN consultant was to confirm the date of this proposed meeting (October 20). CNL also inquired whether Scugog Island FN would be interested in arranging a second meeting to discuss the Chalk River Projects (NPD Closure Project included). If time did not permit, CNL offered to briefly overview the Chalk River projects in the October 20th meeting.										√
October 07, 2021 Incoming Email	This email from a Scugog Island FN consultant suggested that the October 20, 2021 meeting focused on the Port Hope Area Initiative and that a future meeting for Chalk River projects, including the NPD Closure Project, be arranged in the near future.										√
October 27, 2021 Virtual meeting	This was the eight of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. Representatives from CNL (in particular, a communications officer and ERM Stakeholder Relations Manager) Curve Lake FN (including the Lands and Resources Consultation Officer, consultants and the Lands and Resource Administrative Support Worker), Hiawatha FN (including a community consultation coordinator), Scugog Island (including a consultant) and AECL (including the Manager of Engagement and Communications) were in attendance. The focus was a discussion on small modular reactor research and technology at Chalk River Laboratories. CNL also shared an update on the NPD Closure Project.										√
November 1, 2021 Outgoing email	This email from a CNL Senior Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 24, 2021 Virtual meeting	This was the eight of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. Representatives from CNL (in particular, a communications officer and ERM Stakeholder Relations Manager) Curve Lake FN (including the Lands and Resources Consultation Officer, consultants and the Lands and Resource Administrative Support Worker), Hiawatha FN (including a community consultation coordinator), Scugog Island (including a consultant) and AECL (including the Manager of Engagement and Communications) were in attendance. The focus was a discussion on the NSDF Project. CNL also shared an update on the NPD Closure Project.										√
January 17, 2022 Outgoing email	This email from a CNL Communications Officer to Curve Lake FN was to propose the next discussion topic on CNL's Cleanup Mission. This topic would look at CNL's company-wide approach to environmental remediation and specifically how it relates to Chalk River's future and the NSDF. As discussed at the November 2021 monthly meeting, CNL noted that they will send a list of key dates for the Projects over by the end of the week. CNL acknowledged that they may need to discuss if there are any further milestones that Curve Lake First Nation would like on that list of key dates.										√
January 21, 2022 Outgoing email	This email from a CNL Communications Officer to Curve Lake FN representatives enclosed some proposed key dates for PHAI, NPD and NSDF.										√
February 15, 2022 Outgoing email	This email from a CNL Communications Officer to Curve Lake FN representatives proposed a more open agenda for the meeting on February 23rd. CNL proposed discussing the three usual projects (NSDF, NPD and PHAI) but also a discussion around the NSDF Part 1 hearing.										√
March 8, 2022 Outgoing email	This email from Curve Lake FN to a CNL Communications Officer noted that Curve Lake FN would like to review the updated interest and concerns table before submission.									√	√
March 11, 2022 Incoming email	This email from Curve Lake FN to a CNL Communications Officer informed CNL that the meeting invitation for the next working group meeting was forwarded to a new member of the support team.										√
April 18, 2022 Outgoing email	Email invitation to Scugog FN to the CNL Industry Day at the Chalk River Laboratories on Thursday, June, 2, 2022 to promote the broader engagement between CNL's nuclear industry partners and our local supply chain.										√
April 25, 2022 Outgoing email	Email invitation to the April 27, 2022 Williams Treaties First Nations monthly meeting. The agenda items included the following on the NPD project: • NPD Project Updates • NPD Draft EAFMP								√		
April 27, 2022 Virtual Meeting	This was the ninth of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. Representatives from CNL (in particular, a Communications Officer and ERM Stakeholder Relations Manager) Curve Lake FN (including the Lands and Resources Consultation Officer, consultants and the Lands and Resource Administrative Support Worker), Hiawatha FN (including a community consultation coordinator), Scugog Island (including a consultant), Chippewas of Georgina Island First Nation (Invasive Species coordinator) and AECL (including the Manager of Engagement and Communications) were in attendance. The focus was a discussion on the NSDF Project. CNL also shared an update on the NPD Closure Project.								√		√

April 28, 2022 Outgoing email	This email from a CNL Senior Advisor of Indigenous Relations to the WTFN communities attached the presentation from the April 27, 2022 monthly meeting. CNL invited WTFN communities to the Industry Day at the Chalk River Laboratories on Thursday, June, 2, 2022 to promote the broader engagement between CNL's nuclear industry partners and our local supply chain.								√		
May 06, 2022 Outgoing email	Email invitation to Scugog FN to the CNL Industry Day at the Chalk River Laboratories on Thursday, June, 2, 2022 to promote the broader engagement between CNL's nuclear industry partners and our local supply chain. Scugog FN replied that the invitation had been shared internally.										√
May 13, 2022 Outgoing email	This email from ERM Stakeholder Relations to the WTFN communities provided a response to technical questions asked at the April 27, 2022 monthly meeting. Q1: Please provide a breakdown of how much tritium in the Ottawa River is naturally occurring versus anthropogenic (e.g. from weapons testing in the 1960s), including a graph showing the peak of tritium from weapons testing. Q2: Please provide further information on stack contamination and the remedial actions planned at the base of the stack, with respect to potential impacts on Chimney Swifts.								√		
June 06, 2022 Outgoing email	This email from a CNL Senior Advisor of Indigenous Relations to the WTFN communities sent a proposed agenda for the tenth monthly meeting planned for June 29, 2022. The meeting is planning to be held in-person at the Port Hope Area Initiative office. On the proposed agenda the NPD Project staff will provide an update on the project.										√
June 22, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the WTFN communities provided an updated agenda for the June 29, 2022 monthly meeting. A NPD Project update was included as an agenda item.										√
June 29, 2022 Meeting	This was the tenth of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. Representatives from CNL (in particular, a Communications Officer and ERM Stakeholder Relations Manager) Curve Lake FN (including the Chief, the Lands and Resources Consultation Officer, consultants and the Lands and Resource Administrative Support Worker), Hiawatha FN (including a community consultation coordinator), Alderville First Nation (Chief) and AECL (including the Manager of Engagement and Communications) were in attendance. The focus was a tour of the PHAI location. CNL also shared an update on the NPD Closure Project.										√
July 14, 2022 Outgoing email	Email from a CNL Senior Communications Officer to Curve Lake FN's Consultant proposed dates for a tour of the NSDF and NPD Facility. CNL proposed an online poll and asked for any additional dates needed. Curve Lake FN's Consultant replied and will provide alternative dates.										√
July 25, 2022 Outgoing email	Email from a CNL Senior Communications Officer to WTFN Communities sharing the agenda for the 11th monthly meeting on July 27, 2022. The agenda included a NPD project update.										√

The monthly meeting series has been cancelled. A quarterly meeting series has been setup, and the next meeting is on Wednesday, January 31, 2024.										√

Table C-24 Record of Engagement with Chippewas of Rama First Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Chippewas of Rama First Nation (FN) Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
October 24, 2016 Outgoing telephone call	This telephone call from a communications officer with CNL to representatives of the Chippewas of Rama FN was to follow up on the July letter.				√	√				√	
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Chippewas of Rama FN Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Rama FN's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Do the Chippewas of Rama First Nation have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of the Chippewas of Rama First Nation using the areas around the two projects?* • *Do you have any members of the Chippewas of Rama First Nation that currently live in close or reasonable proximity to either of the projects?* • *Do the Chippewas of Rama First Nation have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Do the Chippewas of Rama First Nation, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the FN and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
November 16, 2016 Incoming email	This email from the Chippewas of Rama FN community consultation coordinator to a communications officer with CNL acknowledged the previous letters and stated that the information had been sent to the Williams Treaties First Nations (WTFN) Process Coordinator. This email included contact details for the WTFN Process Coordinator.										√
November 15, 2017 Outgoing email	This email from a communications officer with CNL to the Chippewas of Rama FN Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a communications officer with CNL to the Chippewas of Rama FN Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: "CNL would be pleased to update information in this current draft with input from your community."	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

The monthly meeting series has been cancelled. A quarterly meeting series has been setup, and the next meeting is on Wednesday, January 31, 2024.										√

Table C-25 Record of Engagement with Chippewas of Georgina Island First Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Georgina Island First Nation (FN) Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
October 24, 2016 Outgoing telephone call	A CNL communications officer called Georgina Island FN to follow-up on the July letter.										√
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Georgina Island FN Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Georgina Island FN's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Does Georgina Island First Nation have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of Georgina Island First Nation using the areas around the two projects?* • *Do you have any members of Georgina Island First Nation that currently live in close or reasonable proximity to either of the projects?* • *Does Georgina Island First Nation have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does Georgina Island First Nation, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the FN and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
November 15, 2017 Outgoing email	This email from a communications officer with CNL to the Georgina Island FN Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 17, 2017 Outgoing email	This email from a communications officer with CNL to the Georgina Island FN Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: "*CNL would be pleased to update information in this current draft with input from your community.*"	√	√	√	√	√	√	√	√	√	
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
April 09, 2020 Outgoing email	This email from a communications officer with CNL to representatives of the WTFN (including the Consultation Coordinator with Georgina Island FN) was to propose a virtual webinar meeting on the NPD Closure Project and the NSDF Project.										√
April 09, 2020 Incoming email	This email from Georgina Island FN's Consultation Coordinator to a communications officer with CNL was to confirm attendance and date preference for the webinar.										√
May 04, 2020 Outgoing email	This email from a communications officer with CNL to representatives of the WTFN (including the Consultation Coordinator with Georgina Island FN) enclosed an action list.										√
May 05, 2020 Outgoing email	This email from a CNL communications officer to the Georgina Island FN's Community Consultation Coordinator was to follow-up on previous correspondence and propose a virtual meeting in May, focused on the NPD Closure Project.										√
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Georgina Island FN Chief enclosed a preliminary version of the 2020 EIS and an updated IER. This letter also asked for feedback in the following seven areas: • *Does Georgina Island First Nation have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Does Georgina Island First Nation have any members who currently live close or in reasonable proximity to the NPD site?* • *Does Georgina Island First Nation have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Does Georgina Island First Nation have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to Georgina Island First Nation near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.* This letter also indicated an interest in meeting with Georgina Island FN to discuss any interests or concerns.	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 19, 2020 Virtual meeting	This meeting between four representatives of different WTFN communities (specifically, Hiawatha FN's Land and Resources consultation workers, Alderville FN's lands and community engagement officer, Curve Lake FN's lands and resources consultation officer and Georgina Island FN's consultation coordinator attended) and six CNL representatives (including the Manager of Stakeholder Relations, the Manager of Regulatory Approvals for the NPD Closure Project and communications officers with CNL) included an interactive webinar overview presentation on the project with the opportunity for questions. Specific topics discussed included the following: • Project overview and components; • Timeline; • Waste inventory; • Monitoring; • VCs; • Species at risk; • Traditional land and resource use; • Effects on the environment.	√		√	√		√	√	√	√	
May 26, 2020 Outgoing email	This email from a communications officer with CNL to representatives of the WTFN (including the Consultation Coordinator with Georgina Island FN) enclosed the follow-up information responding to all questions from the meeting on May 19, including the Georgina Island FN representative's questions (topics listed above). Three ACMRs and the archaeological assessment were enclosed to support CNL's response.	√			√					√	
February 12, 2021 Outgoing email	This email from CNL staff to WTFN communities (including Georgina Island FN representatives) was an invitation to join Curve Lake First Nation's request of a monthly update on Canadian Nuclear Laboratories (CNL) environmental remediation projects, such as the NSDF Project and NPD Closure Project, as well as Port Hope Area Initiative (PHAI) activities in Port Hope and Port Granby. The monthly meeting will take place the last Wednesday of each month starting March 2021.									√	
April 4, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√
April 12, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Georgina Island FN Chief enclosed a preliminary list of commitments and indicated interest in meeting to discuss.										√
June 15, 2021 Outgoing email	This email from a communications officer with CNL to Georgina Island FN Consultation Coordinator was to follow-up on the April letter.										√
July 6, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√
August 26, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√

Environmental Impact Statement - NPD Closure Project

January 30, 2023 Outgoing email	This email from a CNL Communications Officer to Georgina Island First Nation's Invasive Species Coordinator with more information on the postponement of the submission date to May 2023 with links to additional resources.										√
March 01, 2023 Virtual Meeting	This was the 15th of the monthly meetings between CNL and the Williams Treaties First Nations communities, coordinated between Curve Lake First Nation and CNL and open to all. Representatives from CNL (in particular, a Communications Officer, Indigenous Engagement Coordinator, and ERM Stakeholder Relations, the Manager of ERM Licensing Support, the Manager of ERM Stakeholder Relations, NPD Regulatory Approvals, the Senior Advisor Indigenous Relations, and the Manager of Stakeholder and Indigenous Engagement) AECL (including the Manager of Engagement and Communications) and WTFN communities, (including, Mississaugas of Scugog Island First Nation Consultation Specialist, Georgina Island Invasive Species Coordinator, Hiawatha and Curve Lake First Nation Consultant, Curve Lake First Nation Elder, Three Fires Consulting, Hiawatha Lands and Resource Coordinator). CNL and WTFN discussed NPD project update, May 2023 in-person meeting, CNL Public disclosures, and the program for Engagement with Indigenous Nations, communities and organizations.										√
March 14, 2023 Outgoing email	This email from CNL Senior Communications Officer to WTFN with CNL's Indigenous Relations Procurement Strategy.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
March 29, 2023 Virtual Meeting	This was the 16th of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. This meeting was between CNL representatives (including Communications Officers, the Indigenous engagement coordinator, the Manager of Supply Chain, the Manager of ERM Licensing Support, Man the Manager of ERM Stakeholder Relations, the Manager of NPD Regulatory Approvals, the Senior Advisor Indigenous Relations) AECL (including the Manager of Engagement and Communications) and WTFN communities, (including Georgina Island First Nation's Invasive Species Coordinator, Mississaugas of Scugog Island First Nation Consultation Specialist, Hiawatha and Curve Lake First Nation Consultant, and Curve Lake Elder. CNL and the WTFN discussed CNL's Indigenous Procurement Strategy.									√
April 06, 2023 Outgoing email	This email from a CNL Communications Officer to Georgina Island First Nation's Invasive Species Coordinator with suggested next steps to finalize the commitments between CNL and the Mississauga's of Mississaugas of Scugog Island First Nation to ensure that all interests and concerns are addressed and tracked to resolution.										√
April 11, 2023 Outgoing email	This email from CNL Senior Communications Officer to WTFN with the agenda and presentation from the monthly meeting held on 2023 March 29. CNL also looked to confirm the dates of the 2023 April 26 monthly meeting.										√
June 09, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with an updated actions list from the 2023 May 31 Monthly Meeting.										√
June 28, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with an updated actions list from the 2023 June 28 Monthly Meeting.										√
July 11, 2023 Outgoing Email	This email from CNL Communications Officer to all WTFN communities is to request confirmation of attendance at the 2023 July monthly meeting being held in person in Hiawatha. Communities confirmed their attendance.										√
July 21, 2023 Outgoing Email	This email from CNL Communications Officer to all WTFN communities is to request confirmation of attendance at the 2023 July monthly meeting being held in person in Hiawatha. Communities confirmed their attendance.										√
July 27, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with the action list from the 2023 July 26 in person meeting.										√
October 26, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with the action list from the 2023 October 26 WTFN Monthly meeting.										√
November 01, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to all WTFN is to follow-up from the 2023 October monthly meeting. CNL noted for those who were unable to attend the meeting, an agenda item was tabled for discussion to move our monthly information sharing meeting to a quarterly meeting instead. The discussion result was an agreement (with those in attendance) to change to a quarterly meeting update if WTFN communities still received project updates/ milestones and/ or news in between meetings. I encourage you to provide feedback on this change. CNL also shared the GO-CO model presentation.										√
November 23, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to all WTFN is to follow-up from the 2023 November 01 email to all WTFN communities to confirm that the 2023 November 30 WTFN monthly meeting has been cancelled, and that the monthly meeting has been changed to a quarterly meeting series. The monthly meeting series has been cancelled. A quarterly meeting series has been setup, and the next meeting is on Wednesday, January 31, 2024.										√

Table C-26 Record of Engagement with Beausoleil First Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Beausoleil First Nation (FN) Chief introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Beausoleil FN Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Beausoleil FN's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Do the Beausoleil First Nation have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of the Beausoleil First Nation using the areas around the two projects?* • *Do you have any members of the Beausoleil First Nation that currently live in close or reasonable proximity to either of the projects?* • *Do the Beausoleil First Nation have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Do the Beausoleil First Nation, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the FN and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
November 15, 2017 Outgoing email	This email from a CNL communications officer to the Beausoleil FN Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a CNL communications officer to the Beausoleil FN Chief enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: *"CNL would be pleased to update information in this current draft with input from your community."*	√	√	√	√	√	√	√	√	√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
April 09, 2020 Outgoing email	This email from a CNL communications officer to representatives of the different WTFN communities (including the consultation coordinator for the Beausoleil FN) was to propose a virtual webinar meeting on the NPD Closure Project and the NSDF project.										√
April 17, 2020 Outgoing email	This email from a communications officer with CNL to the Consultation Coordinator for the Beausoleil FN was to follow-up on the previous invitations to the webinar meeting with CNL.										√
April 21, 2020 Incoming email	This email from the Beausoleil First Nation Consultation Coordinator to a communications officer with CNL was to confirm they would not be in attendance for the April webinar.										√
May 05, 2020 Outgoing email	This email from a CNL communications officer to the Beausoleil FN Consultation Coordinator was to inquire whether there was interest from Beausoleil FN in attending the WTFN virtual webinar meetings hosted by CNL for the NSDF and NPD Closure Project.										√
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Beausoleil FN Chief enclosed a preliminary version of the 2020 EIS and an updated IER. This letter also asked for feedback in the following seven areas: • *Does Beausoleil First Nation have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Does Beausoleil First Nation have any members who currently live close or in reasonable proximity to the NPD site?* • *Does Beausoleil First Nation have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Does Beausoleil First Nation have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to Beausoleil First Nation near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.* This letter also indicated an interest in meeting with Beausoleil FN to discuss any interests or concerns.	√	√	√	√	√	√	√	√	√	
May 12, 2020 Outgoing email	This email from a communications officer with CNL to the Beausoleil FN Chief and Consultation Coordinator was to inquire whether there was any interest in Beausoleil FN attending the WTFN webinar meetings hosted by CNL on the NPD Closure Project and NSDF Project.									√	
May 26, 2020 Outgoing email	This email from a CNL communications officer to the Beausoleil FN Chief was to follow-up on the registered letter sent on May 06.									√	
May 26, 2020 Outgoing email	This email from a CNL communications officer to representatives of the WTFN communities (including the Beausoleil FN Consultation Coordinator) enclosed the follow-up information responding to all questions from the meeting on May 19.	√			√					√	

Environmental Impact Statement - NPD Closure Project

		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 27, 2020 Outgoing email	This email from a CNL communications officer to representatives of the WTFN communities (including the Beausoleil FN Consultation Coordinator) enclosed the presentation from the previous meeting in May.	√		√	√		√	√	√	√	
February 12, 2021 Outgoing email	This email from a CNL communications officer to representatives of the WTFN communities (including the Beausoleil FN Consultation Coordinator) was an invitation to join Curve Lake First Nation's request of a monthly update on Canadian Nuclear Laboratories (CNL) environmental remediation projects, such as the NSDF Project and NPD Closure Project, as well as Port Hope Area Initiative (PHAI) activities in Port Hope and Port Granby. The monthly meeting will take place the last Wednesday of each month starting March 2021.									√	
April 4, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√
April 12, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Beausoleil FN Chief enclosed a preliminary list of commitments and indicated interest in meeting to discuss.										√
June 15, 2021 Outgoing email	This email from a communications officer with CNL to Beausoleil Consultation Coordinator was to follow-up on the April letter.										√
July 6, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√
August 25, 2021 Virtual Meeting	This was the six of the monthly meetings between CNL and the WTFN communities, coordinated between Curve Lake FN and CNL and open to all. Representatives from CNL (in particular, a communications officer, the Manager of Stakeholder and Indigenous Relations with PHAI and the Manager of Regulatory Approvals for the NPD Closure Project) Curve Lake FN (including the Lands and Resources Consultation Officer, a consultant and the Lands and Resource Administrative Support Worker), Hiawatha FN (including a community consultation coordinator), Beausoleil FN (including a consultation coordinator) and AECL (including the Director of Communications and Government Reporting) were in attendance. The focus was on Port Granby and a Project update was shared about the NPD Closure Project.										√
August 26, 2021 Incoming Email	This email from a Beausoleil FN consultant to a senior communications officer from CNL was to thank CNL for the latest virtual meeting and to inform CNL of new contact information for Beausoleil FN consultation moving forward, including the Chief of Beausoleil FN.										√
August 26, 2021 Outgoing email	This email from a CNL Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√
November 1, 2021 Outgoing email	This email from a CNL Senior Communications Officer to all the representatives of the William Treaties First Nations communities enclosing the agenda and presentation from the most recent monthly meeting.										√
April 25, 2022 Outgoing email	Email invitation to the April 27, 2022 Williams Treaties First Nations monthly meeting. The agenda items included the following on the NPD project: • NPD Project Updates • NPD Draft EAFMP								√		

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
April 28, 2022 Outgoing email	This email from a CNL Senior Advisor of Indigenous Relations to the WTFN communities attached the presentation from the April 27, 2022 monthly meeting. CNL invited WTFN communities to the Industry Day at the Chalk River Laboratories on Thursday, June, 2, 2022 to promote the broader engagement between CNL's nuclear industry partners and our local supply chain.								√		
May 13, 2022 Outgoing email	This email from ERM Stakeholder Relations to the WTFN communities provided a response to technical questions asked at the April 27, 2022 monthly meeting. Q1: Please provide a breakdown of how much tritium in the Ottawa River is naturally occurring versus anthropogenic (e.g. from weapons testing in the 1960s), including a graph showing the peak of tritium from weapons testing. Q2: Please provide further information on stack contamination and the remedial actions planned at the base of the stack, with respect to potential impacts on Chimney Swifts.								√		
June 06, 2022 Outgoing email	This email from a Senior Advisor of Indigenous Relations at CNL to the WTFN communities sent a proposed agenda for the tenth monthly meeting planned for June 29, 2022. The meeting is planning to be held in-person at the Port Hope Area Initiative office. On the proposed agenda the NPD Project staff will provide an update on the project.										√
June 22, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the WTFN communities provided an updated agenda for the June 29, 2022 monthly meeting. A NPD Project update was included as an agenda item.										√
July 14, 2022 Outgoing email	Email from a CNL Senior Communications Officer to Curve Lake FN's Consultant proposed dates for a tour of the NSDF and NPD Facility. CNL proposed an online poll and asked for any additional dates needed. Curve Lake FN's Consultant replied and will provide alternative dates.										√
July 25, 2022 Outgoing email	Email from a CNL Senior Communications Officer to WTFN Communities sharing the agenda for the 11th monthly meeting on July 27, 2022. The agenda included a NPD project update.										√
August 22, 2022 Outgoing/Incoming emails	Emails from a CNL Senior Communications Officer to WTFN consultation representatives coordinating dates for the tour of the NSDF and NPD Facility.										√
September 26, 2022 Outgoing email	Email from a Senior Communications Officer to WTFN communities sharing the agenda for the September 28 working group meeting. The agenda included an update on the NPD project.										√
October 04, 2022 Outgoing Letter	This letter addressed to Beausoleil First Nation's Chief from CNL's Director of Indigenous Relations provided a project update and the engagement status with BFN. CNL stated it is committed to incorporating Beausoleil's interests and concerns into the EIS. CNL provided an engagement status and next steps, including a site visit and establishing commitments to ensure that all interests and concerns are addressed and tracked to resolution. CNL sent an updated draft set of commitments for Beausoleil First Nation's review. CNL offered to discuss capacity and establish commitments before December 2022. CNL requested that Beausoleil First Nation respond confirming their agreement to proceed with the engagement activities, or modified engagement activities.									√	

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
October 26, 2022 Outgoing email	Email from a Senior Communications Officer to Beausoleil First Nation's Chief to follow-up on the October 4, 2022 letter.									√	
November 15, 2022 Outgoing email	This email from a CNL Senior Communications Officer to WTFN communities cancelled the December monthly meeting.										√
November 26, 2022 Outgoing email	Email from a Senior Communications Officer to the Beausoleil First Nation Consultation Coordinator to follow-up on the October 4, 2022 letter.									√	
November 26, 2022 Outgoing telephone call	Telephone call from a Senior Communications Officer to the Beausoleil First Nation Consultation Coordinator to discussed the October 4, 2022 letter. The Coordinator had not received the letter. CNL offer capacity for the review.									√	
November 28, 2022 Outgoing email	This email from a CNL Senior Communications Officer to WTFN communities sent the agenda for the November 30th, 2022 monthly meeting. The agenda included a NPD Project update, a discussion on 2023 engagement plans and a discussion on a year in review.										√
January 20, 2023 Outgoing email	This email a CNL Communications Officer to Beausoleil First Nation's Chief to inform of the decision to postpone the submission of the NPD Closure Project's draft Environmental Impact Statement (EIS) until 2023 May to allow for additional Indigenous input. CNL proposed the next steps would be to discuss the Beausoleil First Nation's interest and desired involvement in the NPD project to ensure that Beausoleil FN's interest and concerns are reflected in the EIS.									√	√
January 30, 2023 Outgoing email	This email CNL to Beausoleil First Nation to inform of the decision to postpone the submission of the NPD Closure Project's draft Environmental Impact Statement (EIS) until May 2023 to allow for additional Indigenous input.										√
April 11, 2023 Outgoing email	This email from CNL Senior Communications Officer to WTFN with the agenda and presentation from the monthly meeting held on 2023 March 29. CNL also looked to confirm the dates of the 2023 April 26 monthly meeting.										√
June 09, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with an updated actions list from the 2023 May 31 Monthly Meeting.										√
June 28, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with an updated actions list from the 2023 June 28 Monthly Meeting.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 11, 2023 Outgoing Email	This email from CNL Communications Officer to all WTFN communities is to request confirmation of attendance at the 2023 July monthly meeting being held in person in Hiawatha. Communities confirmed their attendance.										√
July 27, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with the action list from the 2023 July 26 in person meeting.										√
October 25, 2023 Meeting	This was the 20th of the monthly meetings between CNL (Including, Director and Manager of Communications and Engagement, Indigenous Engagement Coordinator, Communications Officers, HWP Manager of Indigenous Relations Communications, Environmental and decommissioning specialist), AECL (including the Director of AECL GO-CO Procurement Process) and the WTFN communities (including, Acting Consultation lead from CLFN, Consultant, Consultation Liaison for Beausoleil First Nation, Consultation Coordinator for Alderville First Nation, Hiawatha First Nations Lands and Conservation Officer, and Consultation Advisor for Scugog First Nation) coordinated between Curve Lake FN and CNL and open to all. This meeting was to discuss CNL Updates, WTFN updates, the Indigenous Relations Procurement Strategy, the GO-CO Procurement process and the format of WTFN monthly meetings.										√
October 26, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to WTFN is to provide WTFN with the action list from the 2023 October 26 WTFN Monthly meeting.										√
November 01, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to all WTFN is to follow-up from the 2023 October monthly meeting. CNL noted for those who were unable to attend the meeting, an agenda item was tabled for discussion to move our monthly information sharing meeting to a quarterly meeting instead. The discussion result was an agreement (with those in attendance) to change to a quarterly meeting update if WTFN communities still received project updates/ milestones and/ or news in between meetings. I encourage you to provide feedback on this change. CNL also shared the GO-CO model presentation.										√
November 23, 2023 Outgoing Email	This email from CNL Manager, Communications and Engagement to all WTFN is to follow-up from the 2023 November 01 email to all WTFN communities to confirm that the 2023 November 30 WTFN monthly meeting has been cancelled, and that the monthly meeting has been changed to a quarterly meeting series. The monthly meeting series has been cancelled. A quarterly meeting series has been setup, and the next meeting is on Wednesday, January 31, 2024.										√

WTFN - Mapping of Key Interests and Concerns

Table C-27 presents a mapping of how the key interests and concerns relate to detailed feedback and input from the WTFN, up to March 2024.

Table C-27 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-27 Mapping of WTFN Key Interests and Concerns

Topic	Key Interests and Concerns	Specific feedback provided by WTFN on this interest/concern (Validated)
Alderville First Nation		
1. Protection of Flora and Fauna	a) Species at Risk Alderville First Nation expressed general concern for the protection of the Chimney Swift as it is a species that uses the NPD site as habitat and could be impacted by the decommissioning. This is a project-specific concern.	Alderville Lands and Resources staff expressed general concern for the protection of the Chimney Swift (2020 May).
Curve Lake First Nation		
1. Aquatic environment	a) Protection of the aquatic environment As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected, and that the rights and interests of Curve Lake First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	In their July 2021 letter to CNL, enclosing review of the NPD Closure Project EIS, Curve Lake First Nation indicated that wetlands are sacred to Curve Lake First Nation, and requested an elaboration about why they are not assessed in the EIS. Also, in their July 2021 letter to CNL, Curve Lake First nation requested more information about the benthic invertebrate community in the Ottawa River
2. Archaeology and Cultural Heritage	a) Protection of burial sites Curve Lake First Nation wants to ensure that any archaeological discoveries at the NPD site are handled properly and respectfully to remain protective of Indigenous cultural rights. This is both a CNL-wide and project specific concern.	In its comments on the 2016 NPD Project Description, Curve Lake First Nation stated their concern for remains of their ancestors and pointed to obligations under the *Cemeteries Act*. Curve Lake identified that it had trained Archaeological and Environmental Liaisons available to participate in archaeological or environmental assessment (EA) activities. Curve Lake Lands and Resources staff continued to express interest in archaeological work at subsequent engagements on the project (2020 May).
3. Baseline Characterization	a) Tritium levels in the Ottawa River It is important to Curve Lake First Nation that baseline tritium levels in the Ottawa River, including soil and vegetation, are well understood for comparison of any potential impacts from the project. This is both a CNL-wide and project specific interest.	Curve Lake First Nation expressed concern about the tritium levels in the Ottawa River, including soil and vegetation, specifically what portion of tritium comes from natural sources versus anthropogenic sources (April 2022 draft follow-up monitoring plan discussion).
4. Engagement	(a) Funding for Participation in NPD EA process It is important to Curve Lake First Nation that there is meaningful engagement on the project, because the project is located within the traditional territory of Curve Lake First Nation. This is a project-specific interest.	Curve Lake First Nation has indicated their interest in capacity to support meaningful consultation, engagement, and participation in the NPD Closure Project (October 2020 letter).

Topic	Key Interests and Concerns	Specific feedback provided by WTFN on this interest/concern (Validated)
4. Engagement	(b) Holistic engagement with CNL (beyond the project-level) It is important to Curve Lake First Nation and Hiawatha First Nation to be engaging with CNL on an ongoing basis with a holistic approach that goes beyond the scope of an individual project so that Curve Lake First Nation's interests and rights can be incorporated in a meaningful way into CNL's activities. This is a CNL-wide concern.	During monthly meetings in September 2021, February 2022 and March 2022 Curve Lake First Nation indicated an interest in broader engagement with CNL as a whole and earlier involvement with planning for activities and projects at CNL.
4. Engagement	(c) Curve Lake First Nation expressed concern about the use of language within the NPD EIS and the perceived importance and priority of Indigenous engagement. This is both a CNL-wide and project-specific concern.	In their July 2021 letter to CNL, enclosing review of the NPD Closure Project EIS, Curve Lake First Nation noted several instances of colonial language in the EIS about Indigenous Engagement that are not reflective of meaningful engagement. Also the placement of the "Indigenous Engagement" section after the "Public Engagement" section gives the impression that Indigenous Engagement is a lower priority than Public engagement and does not reflect the priority of Indigenous People's rights as stated in the Constitution. In April 2021 and January 2022, Curve Lake First Nation also drew attention the characterization of nuclear as "clean" and how this did not resonate for Indigenous Peoples.
6. EA Process and Methodology	a) A request for more details on the effects assessment approach and identification of valued components It is important to Curve Lake First Nation that the VCs used for the project incorporate species important to traditional users of the land to ensure the effects on traditional land and resource use are adequately considered. This is a project-specific concern.	In their July 2021 letter to CNL, enclosing review of the NPD Closure Project EIS, Curve Lake First Nation requested a more detailed explanation of several categories of VCs: mushrooms, benthic invertebrates (how will effects be assessed) and why mussels are not identified as a VC.
7. End State, Site Restoration and Future Use of the Land	a) Engagement on Final Site Restoration It is important to Curve Lake to be engaged meaningfully about final site restoration. It is important to Curve Lake that the end state of the NPD site is safe for future land users and that the rights and interests of future Indigenous peoples are preserved. This is both a CNL-wide and project-specific concern.	In their July 2021 letter to CNL, enclosing review of the NPD Closure Project EIS, Curve Lake First Nation indicated that the discussion of final site restoration in the EIS gives the impression that Indigenous input will not be considered. During the April 27, 2022, meeting, CLFN also raised concerns about the contamination of the stack and requested confirmation that there is no contamination at the bottom of the stack and if there is, the associated plans in place to address and subsequently monitor the stack and area.
8. Protection of Flora and Fauna	(a) Curve Lake First Nation expressed general concern for the protection of Species at Risk and non-protected species. As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected in an interconnected way With respect to Species at Risk this is a project-specific concern. CNL's approach to biodiversity and the non-protected species is a CNL-wide concern.	Curve Lake Lands and Resources staff expressed interest in species at risk (May 2020 meeting) and May 2021 meeting on biodiversity Curve Lake First Nation raised concerns about protection for non-protected species and the importance of an interconnected approach to biodiversity and environmental protection work..
8. Protection of Flora and Fauna	(b) Potential impacts to Chimney Swifts from remedial and closure activities for the NPD ventilation stack. As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including biota, are protected. This is a project-specific concern.	Curve Lake First Nation requested further information on ventilation stack contamination and the remedial actions planned at the base of the stack. This interest was focused on potential impacts on Chimney Swifts (May 2020 meeting and April 2022 draft follow-up monitoring plan discussion). During the April 27, 2022 meeting, CLFN also raised concerns about the contamination of the stack and requested confirmation that there is no contamination at the bottom of the stack and if there is, the associated plans in place to address and subsequently monitor the stack and area.

Topic	Key Interests and Concerns	Specific feedback provided by WTFN on this interest/concern (Validated)
8. Protection of the Ottawa River	a) Protection of water, the surrounding environment and natural resources for all future generations. As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, is protected, and that the rights and interests of Curve Lake First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	In its comments on the NPD Project Description, Curve Lake First Nation shared its deep respect for the water and surrounding environment. Through engagement, CNL understands that protection of the environment, specifically the Ottawa River, is important to Curve Lake (2020 engagements).
9. Socio-economics	a) Curve Lake expressed concern about how community statistics from NPD's neighboring Indigenous Nations, communities and organizations are portrayed. Curve Lake First Nation wants to ensure that the effects of colonialism and the Indian Act on the socio-economic conditions of Indigenous Nations, communities and organizations are recognized. This is both a CNL-wide and project specific concern.	In their July 2021 letter to CNL, enclosing review of the NPD Closure Project EIS, Curve Lake First Nation noted that statistics on income and unemployment provided in the EIS about the closest First Nation to the NPD (Pikwàkanagàn First Nation) reflect the effects of colonialism and the *Indian Act*.
Hiawatha First Nation		
1. Aquatic environment	a) Protection of the aquatic environment As stewards of the lands and waters, it is important to Hiawatha First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected, and that the rights and interests of Hiawatha First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	Wetlands are sacred to the Michisaagiig people and a reason should be provided why they are not assessed in the EIS. At the July 2021 monthly meeting with WTFN, which was focused on a discussion of the summary tables of interests and concerns from the WTFN, Hiawatha First Nation concurred with this concern identified by Curve Lake First Nation in Curve Lake First Nation's EIS review. More information about the benthic invertebrate community in the Ottawa River should be provided. (Hiawatha First Nation concurred with this interest at the July 2021 monthly meeting, which was identified in the Curve Lake First Nation's review of the EIS.)
2. Engagement	(a) Holistic engagement with CNL (beyond the project-level) It is important to Curve Lake First Nation and Hiawatha First Nation to be engaging with CNL on an ongoing basis with a holistic approach that goes beyond the scope of an individual project so that Hiawatha First Nation's interests and rights can be incorporated in a meaningful way into CNL's activities. This is a CNL-wide concern.	During monthly meetings in September 2021 and February 2022 Hiawatha First Nation indicated an interest in broader engagement with CNL as a whole and earlier involvement with planning for activities and projects at CNL.
2. Engagement	(b) Hiawatha First Nation expressed concern about the use of language within the NPD EIS and the perceived importance and priority of Indigenous engagement. This is both a CNL-wide and project specific concern.	Several instances of primitive and colonial language occur in the EIS about Indigenous Engagement that are not reflective of meaningful engagement. Also the placement of the "Indigenous Engagement" section after the "Public Engagement" section gives the impression that Indigenous Engagement is a lower priority than Public engagement and does not reflect the priority of Indigenous People's rights as stated in the Constitution. (At the July 2021 monthly WTFN meeting, Hiawatha First Nation concurred with this concern, which was identified in Curve Lake First Nation's review of the EIS)
3. EA Process and Methodology	a) A request for more details on the effects assessment approach and identification of valued components It is important to Hiawatha First Nation that the VCs used for the project incorporate species important to traditional users of the land to ensure the effects on traditional land and resource use are adequately considered. This is a project-specific concern.	A more detailed explanation of several categories of VC is required: mushrooms, benthic invertebrates (how will effects be assessed) and why mussels are not identified as a VC. (Hiawatha First Nation concurred with this concern at the July 2021 monthly WTFN meeting identified in Curve Lake First Nation's review of the EIS.)

Topic	Key Interests and Concerns	Specific feedback provided by WTFN on this interest/concern (Validated)
4. End State, Site Restoration and Future Use of the Land	a) Engagement on Final Site Restoration It is important to Hiawatha that it is engaged meaningfully about final site restoration. It is important to Hiawatha that the end state of the NPD site is safe for future land users and that the rights and interests of future Indigenous peoples are preserved. This is both a CNL-wide and project-specific concern.	The discussion of final site restoration in the EIS gives the impression that Indigenous input will not be considered. (Hiawatha First Nation concurred with this concern identified in the July 16, 2021, letter from Curve Lake First Nation to CNL.)
5. Protection of Flora and Fauna	(a) Hiawatha expressed interest in CNL's plans for the NPD ventilation stack in relation to caretaking of the environment, and maintaining this habitat for the Chimney Swift with a secondary interest in the impact of a stack collapse and proximity of this structure to the Ottawa River. This is a project-specific interest.	At a meeting and discussion between the WTFN and CNL in 2020, the Hiawatha First Nation Lands and Resources staff expressed a particular interest in the NPD ventilation stack in particular its design life and stack collapse.
5. Protection of Flora and Fauna	(b) Hiawatha First Nation expressed concern about potential accumulation of contamination in large game animals. As stewards of the lands and waters, it is important to Hiawatha First Nation that the environment, including flora and fauna around the CRL and NPD sites is protected, to ensure the rights and interests of Hiawatha First Nation are upheld in relation to the environment (i.e., hunting). This is both a CNL-wide and project specific concern.	The Hiawatha First Nation Lands and Resources staff, at a meeting in March 2022, expressed concern about what deer (or other large game) might consume on CNL properties that might be subsequently consumed by hunters and whether there is an accumulation of contamination seen in large game.
6. Monitoring	a) Hiawatha First Nation expressed interest in the monitoring plans for the NPD site. This interest stems from the importance of environmental stewardship to Hiawatha First Nation. As stewards of the lands and waters, it is important to Hiawatha First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected, and that the rights and interests of Hiawatha First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific interest.	The Hiawatha First Nation Lands and Resources staff at a meeting in May 2020, expressed a particular interest in monitoring at the NPD site.
7. Socio-economics	a) Hiawatha (and Curve Lake) expressed concern about how community statistics from NPD's neighboring Indigenous Nations, communities and organizations are portrayed. Hiawatha First Nation wants to ensure that the effects of colonialism and the Indian Act on the socio-economic conditions of Indigenous Nations, communities and organizations are recognized. This is both a CNL-wide and project specific concern.	Statistics on income and unemployment provided in the EIS about the closest First Nation to the NPD (Pikwàkanagàn First Nation) reflect the effects of colonialism and the *Indian Act*. (Hiawatha First Nation concurred with this concern identified in the July 16 2021 letter from Curve Lake First Nation to CNL.)

Topic	Key Interests and Concerns	Specific feedback provided by WTFN on this interest/concern (Validated)
Chippewas of Rama First Nation		
1. Alternatives	a) Range of alternatives considered and overall suitability of the In-Situ Disposal concept Rama First Nation was concerned that CNL evaluate a range of options and that the design allows for reversibility if improved waste disposal options become available in the future. Rama wants to ensure that changes can be made in the future to ensure the environment remains protected. This is a project-specific concern.	The Rama First Nation consultation worker at a meeting in April 2023, was interested to understand what alternatives were considered for the project. Rama also asked about research into new waste disposal options and the retrievability of the waste.
1. Alternatives	b) Is In-Situ Disposal a Proven Technology Rama First Nation was interested in seeing examples of ISD used elsewhere and the performance of the technology. Rama wants confidence that this technology will protect humans and the environment. This is a project-specific concern.	The Rama First Nation legal counsel at a meeting in April 2023 was interested to know more about other sites that had used in-situ disposal.
2. End State, Site Restoration and Future Use of the Land	a) Long-term liability of the site beyond decommissioning. Rama is interested to know when the site will be safe for reuse. It is important to Rama that the end state of the NPD site is safe for future land users. This is a project-specific interest.	The Rama First Nation legal counsel at a meeting in April 2023 was interested to know when the site would be safe for re-use.
3. Long-term Safety	a) Long-term Integrity of the Concrete Cap and Engineered Barrier As long-term stewards and users of the land and waters, it is important to Rama First Nation that the design life of the protective layers for the proposed NPD Disposal Facility are sufficient over time to provide confidence that the environment is protected. This is a project-specific interest.	The Rama First Nation legal counsel at a meeting in April 2023 was interested to know how long it would take before the protective layer degrades.
4. Monitoring	a) Impacts from site operation Rama is interested to understand CNL's past environmental performance at the NPD site. Rama wishes to ensure the environment has not been impacted by past operations. This is a project-specific concern.	The Rama First Nation consultation worker at a meeting in April 2023, expressed a particular interest in historic monitoring data for the NPD site.
4. Monitoring	b) Design of follow-up monitoring It is important that Rama has an opportunity to review the monitoring plans to ensure transparency and promote confidence in these activities. This is project –specific interest.	The Rama First Nation consultation worker at a meeting in April 2023, expressed a particular interest in monitoring plans for the NPD site.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Williams Treaties First Nations (WTFN) – Summary of Interests and Concerns

Table C-28 below summarizes the key interests and concerns that the WTFN communities raised on the 2016 Project Description, participation in webinars in 2020, and through ongoing engagement with CNL up to March 2024.

Curve Lake First Nation submitted comments on the Project Description that can be found online: Curve Lake First Nation.

Table C-28 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS, this is also discussed;
- Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

Table C-28 WTFN Interests and Concerns

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
Alderville First Nation				
1) Protection of Flora and Fauna	a) Species at Risk Alderville First Nation expressed general concern for the protection of the Chimney Swift as it is a species that uses the NPD site as habitat and could be impacted by the decommissioning. This is a project-specific concern.	In May 2020, the WTFN and CNL met for a discussion and presentation sharing information on the NPD Closure Project. Species at risk was a key focus of the discussion and representatives of Curve Lake First Nation had a number of follow-up question after the meeting. In response, CNL provided the Chimney Swift TSD as well as specific answers to questions from Curve Lake First Nation, Hiawatha First Nation and Alderville First Nation on the ventilation stack and Chimney Swifts. At the May 2021 monthly project update and information sharing meeting between CNL and WTFN, an overview of CNL's biodiversity program was discussed. Additional opportunities: In May 2019, Indigenous Nations, communities and organizations and the public were invited to participate in the National Chimney Swift Roost Counts. Chimney Swifts were the focus topic of the June 2019 breakfast briefing to which Alderville First Nation was invited. In May 2020, Indigenous Nations, communities and organizations and the public were invited to NPD's virtual Chimney Swift count night. In May 2021, Indigenous Nations, communities and organizations and the public were invited to NPD's virtual Chimney Swift count night. CNL Response: Early in the NPD Closure Project, CNL undertook investigation of the viability of ventilation stack removal. It was decided that ventilation stack retention would mitigate the risk of roost abandonment by the Chimney Swift. CNL has applied for a species at risk permit from ECCC for the potential harm and harassment of chimney swifts during decommissioning activities. The draft conditions of that permit (mitigations for the protection of the Chimney Swift) are included in the EIS.	Where is this topic discussed in the EIS? **Section 9.6.3.2** of the EIS includes comprehensive mitigations to ensure effects on Chimney Swifts are minimized. What changes have been made (and where)? The EIS includes additional mitigations for Chimney Swifts that are aligned with the conditions in the draft permit from ECCC.	Status: Resolved CNL considers this concern has been addressed with the information shared to Alderville First Nation after the May 2020 webinar meeting. CNL remains committed to ongoing engagement with Alderville First Nation.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
Curve Lake First Nation				
1) Aquatic environment	a) Protection of the aquatic environment As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected, and that the rights and interests of Curve Lake First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	CNL has responded in writing to Curve Lake comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL offered a focused discussion on proposed groundwater monitoring activities and a dedicated session on the draft follow-up monitoring plans (including groundwater) was held in 2022 April. CNL provided a summary of the benthic invertebrate study that was conducted offshore of NPD in 2020, and NPD provided the complete report to Curve Lake First Nation. CNL responded to follow up questions on the benthic invertebrate study. Curve Lake First Nation visited the NPD site in 2022 October. The visit included a facility tour and walk to the river. <u>CNL Response:</u> CNL has studied and modelled groundwater flow at the NPD site. The groundwater source of the wetlands is not affected at all by groundwater from the NPD facility. Groundwater on the NPD site flows towards the Ottawa River, so groundwater that interacts with the NPD facility flows away from the wetland, towards the Ottawa River. CNL undertook baseline studies of benthic macroinvertebrate, sediment quality and water quality in the Ottawa River in the summer of 2020. Samples were taken upstream, downstream and adjacent to the NPD facility. This study sets the baseline that will be used for EA follow-up monitoring activities. The results of this study support the description of the baseline aquatic environment in the EIS. CNL's assessment addressed potential effects to VCs in the aquatic environment. The assessment covered the aquatic VCs of interest to Indigenous Nations, communities and organizations, including the fish species identified during Indigenous engagement activities. The assessment concluded that there are no adverse residual effects on the aquatic environment expected from the project.	<u>Where is this topic discussed in the EIS?</u> **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the aquatic environment. **Section 9.3.3.2** of the EIS provides a series of mitigation measures focused on protection of surface water and ultimately the aquatic environment. Mitigation measures for the protection of surface water have been updated and expanded from the 2017 draft EIS. The EIS does not predict any adverse residual effects on the aquatic environment (**Section 9.4.3.5**) as a result of the NPD Closure Project. <u>What changes have been made (and where)?</u> No changes have been made to the EIS.	<u>Status:</u> Resolution in Progress CNL considers this interest resolved by its responses to the July 2021 letter, sharing of the benthic invertebrate study, draft follow-up monitoring plan discussion and pending the completion of the next steps outlined below. CNL remains committed to ongoing engagement on this topic. <u>Next Steps:</u> CNL and Curve Lake First Nation to consider opportunities for CNL to build awareness of cultural keystone species for Curve Lake First Nation. CNL and Curve Lake First Nation to consider opportunities for future site visits (either to the NPD site or to the community) as part of ongoing engagement and relationship-building.
2) Archaeology and Cultural Heritage	a) Protection of burial sites Curve Lake First Nation wants to ensure that any archaeological discoveries at the NPD site are handled properly and respectfully to remain protective of Indigenous cultural rights. This is both a CNL-wide and project specific concern.	Curve Lake First Nation requested the archaeological report through comments on the Project Description. CNL shared the report with Curve Lake First Nation in February 2017. At that time Curve Lake First Nation had no comments on the archaeological assessment. In May 2020, CNL provided WTFN with an interactive webinar discussion and presentation sharing information on the NPD Closure Project. Key topic areas were: project overview and timeline, waste inventory, monitoring, VCs, species at risk, traditional land and resource use and effects on the environment. New representatives from Curve Lake First Nation attended and requested the archaeological assessment, which CNL also provided in May 2020. <u>CNL Response:</u> CNL has conducted a Stage 1 archaeological assessment and share the report with Curve Lake First Nation. No further archaeological work is planned for NPD. CNL includes in the proposed mitigation measures for the project an immediate stop work and engagement of appropriately licensed resources if archaeological resources are discovered. This is in line with CNL's procedure on Management of Cultural Resources.	<u>Where is this topic discussed in the EIS?</u> The NPD EIS includes a summary of the archaeological assessment (**Section 8.11.4**). CNL describes proposed mitigation measures that will be employed if undocumented archaeological resources (including burial sites) are discovered during the project in **Section 9.9.3.2** of the EIS. The EIS does not predict any adverse residual effects on the socio-economic environment (**Section 9.11.3.5**) or traditional land and resource use (**Section 9.9.3.5**) (encompassing archaeological resources). <u>What changes have been made (and where)?</u> In **Section 9.9.3.2** of the EIS, CNL added proposed mitigation measures that will be employed if undocumented archaeological resources are discovered during the project.	<u>Status:</u> Resolved CNL has received no further inquiries from Curve Lake on this topic and remains available to discuss the archaeology of the NPD site further with Curve Lake First Nation, if requested in the future.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
3) Baseline Characterization	a) Tritium levels in the Ottawa River It is important to Curve Lake First Nation that baseline tritium levels in the Ottawa River, including soil and vegetation, are well understood for comparison of any potential impacts from the project. This is both a CNL-wide and project specific interest.	CNL has responded in writing with information to address the questions on baseline tritium concentrations. CNL Response: Tritium is produced naturally from interactions of cosmic rays with gases in the upper atmosphere. Levels of naturally produced tritium in surface water are estimated to be between 0.24 and 1.18 Bq/L (depending on geographical area). The major source of anthropogenic tritium in surface water is from weapons testing in the 1960s. The specific percent of natural versus anthropogenic tritium (from weapons testing) in the Ottawa River is not available. For reference and to show the decay of anthropogenic tritium following weapons testing, CNL shared a graph of tritium concentrations in the Great Lakes showing the tritium peak from weapons testing in the 1960s with a subsequent decline in the years following the cessation of weapons testing. The tritium peak and subsequent decay would be similar for the Ottawa River. Tritium levels in the Ottawa River near NPD, measured upstream and downstream of NPD averaged approximately 2.5 Bq/L over the past five years, which indicates no measurable impact on tritium levels in the Ottawa River from NPD.	Where is this topic discussed in the EIS? Baseline conditions for surface water quality (including the Ottawa River) are found in **Section 8.3.4** of the EIS. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL believes this concern has been substantially addressed by the response and information shared that provides explanation of natural and anthropogenic sources of tritium. Continuing Next Steps: Curve Lake First Nation and CNL will continue sharing information about tritium levels in the Ottawa River and the local environment including soil and vegetation. This information sharing will support an improved understanding of natural and anthropogenic sources of tritium, including historic anthropogenic sources.
4) Engagement	(a) Funding for Participation in NPD EA process It is important to Curve Lake First Nation that there is meaningful engagement on the project, because the project is located within the traditional territory of Curve Lake First Nation. This is a project-specific interest.	CNL met with Curve Lake First Nation in November and December 2020 and January 2021 to discuss capacity and establishing a contribution agreement to support Curve Lake First Nation's participation in CNL's Environmental Remediation Projects, including the NPD Closure Project. A letter was sent to Curve Lake First Nation in April 2021 to provide a summary of CNL commitments, including discussions on a contribution agreement, made to Curve Lake First Nation through engagement on the NPD Closure Project. CNL has not received any feedback from Curve Lake on the commitments. Monthly meetings (including a project update) between CNL and Curve Lake First Nation (and other WTFN communities) began in March 2021. The contribution agreement between CNL and Curve Lake First Nation was entered into in November 2021 and remains in effect. CNL Response: CNL has committed to open, transparent and continuing engagement with Curve Lake First Nation. CNL and Curve Lake First Nation worked together to put in place a contribution agreement that provides capacity to Curve Lake First Nation for their participation in the NPD EA Process. As part of this contribution agreement CNL and Curve Lake (and other WTFN) meet monthly for a project update and discussion. Curve Lake has requested and CNL has made specific presentations and had various subject matter experts available to discuss the topics of interest identified by Curve Lake (and other WTFN).	Where is this topic discussed in the EIS? **Section 6.2.10.2** of the EIS summarizes CNL engagement with Curve Lake First Nation to date. What changes have been made (and where)? CNL has updated **Section 6.2.4.10 and 6.5** of the EIS to reflect new and planned engagement activities to support Curve Lake's meaningful participation in the environmental assessment (EA) process.	Status: Resolved CNL believes this concern is substantially addressed by the signing of the contribution agreement that supports meaningful participation of Curve Lake First Nation on the NPD Closure Project EA.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
4) Engagement	(b) Holistic engagement with CNL (beyond the project-level) It is important to Curve Lake First Nation and Hiawatha First Nation to be engaging with CNL on an ongoing basis with a holistic approach that goes beyond the scope of an individual project so that Curve Lake First Nation's interests and rights can be incorporated in a meaningful way into CNL's activities. This is a CNL-wide concern.	In 2022 October, CNL (NPD representatives and others) were invited to visit Curve Lake First Nation. CNL's visit to the community was a day of listening and experiencing the cultural values of the community; CNL visited and observed the historic and sacred Petroglyphs site, shared in a smudging ceremony. The group congregated at the Curve Lake Community Centre and met with the Chief and council. Also in 2022 October, Curve Lake First Nation visited the NPD site. The visit included a facility tour and walk to the river. CNL Response: CNL is committed to open, transparent and continuing engagement with Curve Lake First Nation. CNL has expanded its engagement with Curve Lake First Nation through monthly meetings that are focused on topics chosen by the WTFN community representatives. Meeting focuses have included the Small Modular Reactor (SMR) Program and Siting at CNL, the Cleanup Mission and the Approach to Biodiversity at CNL. CNL is committed to engaging at a broader level with Curve Lake First Nation in the way the community wishes to be engaged. This includes beginning to incorporate in-person meetings at CNL-managed sites, where there is interest from Curve Lake First Nation or any of the other WTFN communities. CNL will continue to engage with Curve Lake First Nation at a corporation to First Nation level, on interests beyond individual projects.	Where is this topic discussed in the EIS? Not applicable. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolution in Progress Next Steps: CNL and Curve Lake First Nation to consider opportunities for: • CNL to build awareness of cultural keystone species for Curve Lake First Nation. • Site assessment, sampling and monitoring activities to gather baseline Indigenous and local knowledge. • Future site visits (either to the NPD site or to the community) as part of ongoing engagement and relationship-building.
4) Engagement	(c) Curve Lake First Nation expressed concern about the use of language within the NPD EIS and the perceived importance and priority of Indigenous engagement. This is both a CNL-wide and project-specific concern.	Phrases in the EIS with colonial language were replaced with phrases that emphasize the importance and priority of Indigenous engagement and the revised text shared with Curve Lake First Nation. The order of the Indigenous Engagement Section and the Stakeholder Engagement Section has been switched. CNL Response: CNL appreciates the feedback from Curve Lake First Nation on its EIS language and its use of culturally relevant language when engaging with First Nations. CNL is committed to continuously improving its relationship with Indigenous peoples and progressing reconciliation. Specifically, CNL is working on a company-wide Reconciliation Action Plan.	Where is this topic discussed in the EIS? Indigenous Engagement is discussed in **Section 6** of the EIS. What changes have been made (and where)? CNL has revised its EIS to remove the colonial language and aspects identified by Curve Lake to appropriately reflect the importance of meaningful engagement. The Indigenous Engagement Section is now Section 6 and the Stakeholder Engagement section is now Section 7.	Status: Resolved CNL considers this interest resolved by changes in the order of EIS sections and revised wording. It is noted that this topic extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project.
5) EA Process and Methodology	a) A request for more details on the effects assessment approach and identification of valued components It is important to Curve Lake First Nation that the VCs used for the project incorporate species important to traditional users of the land to ensure the effects on traditional land and resource use are adequately considered.	CNL has responded in writing to Curve Lake comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL has provided an explanation about the broad categories of VCs, which encompass several species (e.g. the "mushroom" VC include all mushroom species, and the "benthic invertebrates" VC includes mussels.) A summary of the benthic invertebrate study was provided to Curve Lake First Nation, noting that the benthic invertebrate study will be repeated once after decommissioning activities are complete to test the EIS prediction of no adverse effects to benthic invertebrates. CNL has shared the complete benthic study report with Curve Lake First Nation and has responded to follow up questions this topic.	Where is this topic discussed in the EIS? The EIS does not predict any adverse residual effects on the aquatic environment (**Section 9.4.3.3**) or the terrestrial environment (**Section 9.6.3.3**). CNL has developed mitigation measures and monitoring plans for the protection of the Ottawa River (**Sections 9.3.3.2 and 12.3** of the EIS) and for the protection of valued component species (**Sections 9.4.3.2, 9.6.3.2 and 12.3** of the EIS**).** What changes have been made (and where)?	Status: Resolution in Progress CNL considers this interest resolved by its responses to the July 2021 letter, sharing of the benthic invertebrate study and summary of this work. CNL remains committed to ongoing engagement on this topic. Next Steps:

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	This is a project-specific concern.	Curve Lake First Nation visited the NPD site in 2022 October. The visit included a facility tour and walk to the river. CNL Response: CNL undertook baseline studies of benthic macroinvertebrate, sediment quality and water quality in the Ottawa River in the summer of 2020. Samples were taken upstream, downstream and adjacent to the NPD facility. This study sets the baseline that will be used for EA follow-up monitoring activities. The results of this study support the description of the baseline aquatic environment in the EIS. CNL's assessment addressed potential effects to VCs in the aquatic and terrestrial environments. The assessment covered the aquatic and terrestrial VCs of interest to Indigenous Nations, communities and organizations, including mushrooms and mussels. The assessment concluded that there are no adverse residual effects on the aquatic or terrestrial environment expected from the project.	No changes have been made to the EIS.	Further follow-up discussion on VC identification, if requested, by Curve Lake First Nation. CNL and Curve Lake First Nation to consider opportunities for future site visits (either to the NPD site or to the community) as part of ongoing engagement and relationship-building.
6) End State, Site Restoration and Future Use of the Land	a) Engagement on Final Site Restoration It is important to Curve Lake to be engaged meaningfully about final site restoration. It is important to Curve Lake that the end state of the NPD site is safe for future land users and that the rights and interests of future Indigenous peoples are preserved. This is both a CNL-wide and project-specific concern.	CNL has responded in writing to Curve Lake comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL Response: Future land use is a discussion topic that requires the participation of AECL as the owner of the NPD site, in consultation with Indigenous Nations, communities, and organizations, the public, as well as industry and government. As the licensee, CNL is committed to engagement and consultation with Curve Lake First Nation on future end state and land use. Future land use and land transfer are beyond the scope of the EA for the NPD Closure Project. CNL recognizes that the importance of this matter to Curve Lake First Nation, and therefore CNL has committed to sharing the draft site restoration plan with Curve Lake First Nation for feedback.	Where is this topic discussed in the EIS? General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL considers this interest resolved via clarification of EIS wording with Curve Lake First Nation and pending the completion of the next steps outlined below. CNL remains committed to ongoing engagement with the Curve Lake First Nation. Next Steps: CNL will share the draft restoration plan with Curve Lake First Nation and other Indigenous Nations, communities and organizations once it is complete.
7) Protection of Flora and Fauna	(a) Curve Lake First Nation expressed general concern for the protection of Species at Risk and non-protected species. As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected in an interconnected way With respect to Species at Risk this is a project-specific concern. CNL's approach to biodiversity and the non-protected species is a CNL-wide concern.	In May 2020, the WTFN and CNL met for a discussion and presentation sharing information on the NPD Closure Project. Species at risk was a key focus of the discussion and representatives of Curve Lake First Nation had a number of follow-up question after the meeting. In response, CNL provided the Chimney Swift TSD as well as specific answers to questions from Curve Lake First Nation, Hiawatha First Nation and Alderville First Nation on the ventilation stack and Chimney Swifts. At the May 2021 monthly project update and information sharing meeting between CNL and WTFN, an overview of CNL's biodiversity program was discussed. Curve Lake First Nation visited the NPD site in 2022 October. The visit included a facility tour and walk to the river. Additional opportunities: In May 2019, Indigenous Nations, communities and organizations and the public were invited to participate in the National Chimney Swift Roost Counts.	Where is this topic discussed in the EIS? Collectively, mitigation measures for the protection of flora and fauna, specifically species at risk are outlined in **Section 9.6.3.2** (Terrestrial Environment). No residual effects for the terrestrial environment are predicted (**Section 9.6.3.5**). What changes have been made (and where)? As a result of feedback, monarch butterflies were added as a VC (see **Appendix B** of the EIS). Habitat effects on the monarch butterfly are considered and mitigations are outlined in **Section 9.6.3.2** of the EIS. The EIS includes additional mitigations related to milkweed (important habitat for monarch butterflies), migratory birds, bats, chimney swifts and milksnakes.	Status: Resolved CNL considers this concern has been addressed with the information shared to Curve Lake First Nation as there were no further follow-up questions related to specific species at risk. CNL remains committed to ongoing engagement with Curve Lake First Nation on non-protected species. Next Steps: CNL and Curve Lake First Nation to consider opportunities for CNL to build awareness of cultural keystone species for Curve Lake First Nation.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		Chimney Swifts were the focus topic of the June 2019 breakfast briefing to which the Curve Lake First Nation was invited. In May 2020, Indigenous Nations, communities and organizations and the public were invited to NPD's virtual Chimney Swift count night. In May 2021, Indigenous Nations, communities and organizations and the public were invited to NPD's virtual Chimney Swift count night. <u>CNL Response:</u> CNL is committed to the protection of species at risk and has and will apply for any necessary permits from ECCC. In its effects assessment, when considering species at risk, CNL considers impacts to an individual and not just the overall population. Several species at risk have been identified at the NPD site and key aspects of CNL's plan to protect these species are included below. Early in the NPD Closure Project, CNL undertook investigation of the viability of ventilation stack removal. It was decided that ventilation stack retention would mitigate the risk of abandonment by the Chimney Swift. CNL has applied for a species at risk permit from ECCC for the potential harm and harassment of chimney swifts during decommissioning activities. The draft conditions of that permit (mitigations for the protection of the Chimney Swift) are included in the EIS. In response to observations of milkweed at the NPD site, monarch butterfly has been added as a valued component to the EIS and mitigations are in place to preserve and reseed with milkweed (critical habitat). CNL does not predict any adverse residual effects to the chimney swift, monarch and other species at risk.		CNL and Curve Lake First Nation to consider opportunities for future site visits (either to the NPD site or to the community) as part of ongoing engagement and relationship-building.
7) Protection of Flora and Fauna	(b) Potential impacts to Chimney Swifts from remedial and closure activities for the NPD ventilation stack. As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including biota, are protected. This is a project-specific concern.	CNL responded in writing with additional information on the planned modifications to the ventilation stack. <u>CNL Response:</u> The ventilation stack at NPD is 46 m in height. Chimney Swifts spend the spring and summer months in the area. They arrive in early May and migrate south at the end of August. At the NPD site, swifts roost in the top few metres of the stack. The swifts don't build nests in the stack; swifts that are ready to nest leave the stack and live in the forest during the breeding season (June-July) The level of contamination in the concrete at the top of the stack (where the swifts roost) was measured in 2014 using thermoluminescent dosimeters and the dose was at background levels. CNL is planning to empty water/sludge from the base of the stack to enable inspection of the stack base. This work is planned to take place within the next few months. Pumping out of the water/sludge will take place at a time when swifts are not in the stack. The sludge is composed of rainwater and biological waste from the swifts. It contains tritium and gross beta radioactivity due to contact with the stack concrete. CNL will prepare an "environmental review" document for this activity which will outline the timing restrictions to the work to ensure minimal impact to chimney swifts, and outline other measures that must be taken to prevent adverse	<u>Where is this topic discussed in the EIS?</u> General plans for the ventilation stack are described in **Section 4.3.1.6** of the EIS. **Section 9.6.3.2** of the EIS includes comprehensive mitigations to ensure effects on Chimney Swifts are minimized. <u>What changes have been made (and where)?</u> No changes have been made to the EIS.	<u>Status:</u> Resolution in Progress CNL believes this concern has been substantially addressed by the response and information shared on plans for the ventilation stack. <u>Next Steps:</u> CNL will continue sharing information with CLFN as project activities progress with the NPD ventilation stack and provide opportunities to participate in the activities where safe to do so.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		impacts to the environment (e.g. preventing spills from vehicles). This waste will be managed at the Sewage Treatment Plant at the Chalk River Laboratories site. Once the proposed in-situ decommissioning is complete, the ground level around the ventilation stack will be higher due to the engineered barrier that is proposed to cover the facility. CNL plans to grout the base of the ventilation stack up to a level approximately 8-10 feet above the current ground level. This will isolate the ventilation stack from the rest of the NPD facility and create a new higher "bottom" of the ventilation stack. Several holes will be cored in the stack at the level of the new base to allow the draining of any rain and melt water that might enter the stack from the opening at the top, and to allow for periodic camera inspections of the interior, if required. The holes will also help induce an airflow up the ventilation stack, due to stack effect, that is intended to mimic the current passive airflow present in the ventilation stack. Animal-resistant louvers are proposed to be placed over the drain holes, to ensure free drainage of water while denying animals access to the stack interior. The ventilation stack will be inspected periodically for signs of degradation and will be removed when no longer structurally suitable for continued use as a chimney swift roost. For planning purposes, this is assumed to be 50 years following completion of decommissioning.		
8) Protection of the Ottawa River	a) Protection of water, the surrounding environment and natural resources for all future generations. As stewards of the lands and waters, it is important to Curve Lake First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, is protected, and that the rights and interests of Curve Lake First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	In May 2020, CNL provided WTFN with an interactive webinar discussion and presentation sharing information on the NPD Closure Project. Key topic areas were: project overview and timeline, waste inventory, monitoring, VCs, species at risk, traditional land and resource use and effects on the environment. Curve Lake First Nation attended. Based on questions and comments from Curve Lake First Nation CNL understands that protection of the Ottawa River is important to Curve Lake First Nation. CNL Response: CNL has assessed in situ disposal of the waste at as safe for the public and the environment, particularly the Ottawa River, over both short and long-term periods (e.g., 100,000 years). If the facility is approved, the CNSC will require CNL to monitor and control access to the site during the Institutional Control period currently proposed for a minimum of 100 years. Once the regulator allows for Institutional Controls to cease, there will be no requirement for future monitoring or maintenance as the in-design features or passive barriers of the disposal facility, such as the grout, will help protect the public and the environment from radioactive and non-radioactive wastes.	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment including the Ottawa River. **Section 9.3.3.2** of the EIS provides a series of mitigation measures focused on protection of surface water (including the Ottawa River). Mitigation measures for the protection of surface water have been updated and expanded from the 2017 draft EIS. The EIS (**Section 9.3.3.5**) does not predict any adverse residual effects on the surface water environment (encompassing the Ottawa River). What changes have been made (and where)? Note that this concern was raised at the Project Description stage and therefore no changes were made to the EIS as the above assessment has been present since the initial draft.	Status: Resolved CNL considers this concern addressed by the revisions to the EIS. CNL remains committed to ongoing engagement with Curve Lake First Nation.
9) Socio-economics	a) Curve Lake expressed concern about how community statistics from NPD's neighboring Indigenous Nations, communities and organizations are portrayed. Curve Lake First Nation wants to ensure that the effects of colonialism and the Indian Act on the socio-economic conditions of Indigenous Nations, communities and organizations are recognized.	CNL has responded in writing to Curve Lake comments on this topic, citing relevant sections of the EIS as part of the comment responses. CNL understands Curve Lake's concern and has communicated to Curve Lake First Nation that CNL is working directly with AOPFN on EIS content and Algonquin perspective. CNL Response: CNL acknowledges that economic challenges faced by some Indigenous Nations, communities and organizations are likely related to legacies of colonialism and the	Where is this topic discussed in the EIS? **Sections 8.10 and 9.10** of the EIS focus on Indigenous socio-economic conditions, including economy and employment. **Section 8.10** summarizes current economic and employment conditions, and **Section 9.10** assesses potential effects and discusses CNL's plan to fully realize the potential for economic and employment benefits to Indigenous Nations, communities and organizations.	Status: Resolved CNL considers this interest resolved via clarification of the basis for inclusion of Indigenous socio-economic content within the EIS. It is noted that this topic extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	This is both a CNL-wide and project specific concern.	*Indian Act*. CNL has and continues to want to offer opportunities and benefits to Indigenous individuals and communities that will enhance their economic well-being. CNL clarified that the inclusion of socio-economic information was in response to comments on the 2017 draft EIS from Indigenous Nations, communities and organizations.	What changes have been made (and where)? No changes have been made to the EIS.	
Hiawatha First Nation				
1) Aquatic environment	a) Protection of the aquatic environment As stewards of the lands and waters, it is important to Hiawatha First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected, and that the rights and interests of Hiawatha First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific concern.	CNL has responded in writing to Curve Lake comments on this topic and shared these responses with Hiawatha First Nation, citing relevant sections of the EIS as part of the comment responses. CNL offered a focused discussion on proposed groundwater monitoring activities. CNL provided a summary of the benthic invertebrate study that was conducted offshore of NPD in 2020, and NPD provided the complete report to Hiawatha (and Curve Lake) First Nations. CNL responded to follow up questions on the benthic invertebrate study. Hiawatha First Nation visited the NPD site in 2022 October. The visit included a facility tour and walk to the river. CNL Response: CNL has studied and modelled groundwater flow at the NPD site. The groundwater source of the wetlands is not affected at all by groundwater from the NPD facility. Groundwater on the NPD site flows towards the Ottawa River, so groundwater that interacts with the NPD facility flows away from the wetland, towards the Ottawa River. CNL undertook baseline studies of benthic macroinvertebrate, sediment quality and water quality in the Ottawa River in the summer of 2020. Samples were taken upstream, downstream and adjacent to the NPD facility. This study sets the baseline that will be used for EA follow-up monitoring activities. The results of this study support the description of the baseline aquatic environment in the EIS. CNL's assessment addressed potential effects to VCs in the aquatic environment. The assessment covered the aquatic VCs of interest to Indigenous Nations, communities and organizations , including the fish species identified during Indigenous engagement activities. The assessment concluded that there are no adverse residual effects on the aquatic environment expected from the project.	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the aquatic environment. **Section 9.3.3.2** of the EIS provides a series of mitigation measures focused on protection of surface water and ultimately the aquatic environment. Mitigation measures for the protection of surface water have been updated and expanded from the 2017 draft EIS. The EIS does not predict any adverse residual effects on the aquatic environment (**Section 9.4.3.5**) as a result of the NPD Closure Project. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolution in Progress CNL considers this interest resolved by its responses to the July 2021 letter, sharing of the benthic invertebrate study and summary of this work. CNL remains committed to ongoing engagement on this topic. Next Steps: Focused follow-up discussion on proposed groundwater monitoring activities. CNL and Hiawatha First Nation to consider opportunities for future site visits (either to the NPD site or to the community) as part of ongoing engagement and relationship-building.
2) Engagement	(a) Holistic engagement with CNL (beyond the project-level) It is important to Curve Lake First Nation and Hiawatha First Nation to be engaging with CNL on an ongoing basis with a holistic approach that goes beyond the scope of an individual project so that Hiawatha First Nation's interests and rights can be incorporated in a meaningful way into CNL's activities. This is a CNL-wide concern.	Hiawatha First Nation visited the NPD site in 2022 October. The visit included a facility tour and walk to the river. A CNL visit to Hiawatha First Nation is planned for summer 2023. CNL Response: CNL is committed to open, transparent and continuing engagement with Hiawatha First Nation. CNL has expanded its engagement with Hiawatha First Nation through monthly meetings that are focused on topics chosen by the WTFN community representatives. Meeting focuses have included the Small Modular Reactor (SMR)	Where is this topic discussed in the EIS? Not applicable. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolution in Progress Next Steps: CNL and Hiawatha First Nation to consider opportunities for: • CNL community visit to Hiawatha First Nation for a cultural awareness session and community engagement session, as well as future visits to the NPD site.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		Program and Siting at CNL, the Cleanup Mission and the Approach to Biodiversity at CNL. CNL is committed to engaging at a broader level with Hiawatha First Nation in the way the community wishes to be engaged. This includes beginning to incorporate in-person meetings at CNL-managed sites, where there is interest from Hiawatha First Nation or any of the other WTFN communities. CNL will continue to engage with Hiawatha First Nation at a corporation to First Nation level, on interests beyond individual projects.		• CNL and Hiawatha First Nation to seek opportunities for site assessment, sampling and monitoring activities to gather baseline Indigenous and local knowledge.
2) Engagement	(b) Hiawatha First Nation expressed concern about the use of language within the NPD EIS and the perceived importance and priority of Indigenous engagement. This is both a CNL-wide and project specific concern.	Phrases in the EIS with colonial language were replaced with phrases that emphasize the importance and priority of Indigenous engagement and the revised text shared with Hiawatha First Nation. The order of the Indigenous Engagement Section and the Stakeholder Engagement Section has been switched. <u>CNL Response:</u> CNL appreciates the feedback from Hiawatha (and Curve Lake) First Nations on its EIS language. CNL is committed to continuously improving its relationship with Indigenous peoples and progressing reconciliation. Specifically, CNL is working on a company-wide Reconciliation Action Plan.	<u>Where is this topic discussed in the EIS?</u> Indigenous Engagement is discussed in **Section 6** of the EIS. <u>What changes have been made (and where)?</u> CNL has revised the EIS language and aspects identified by Hiawatha (and Curve Lake) to appropriately reflect the importance of meaningful engagement. The Indigenous Engagement Section is now Section 6 and the Stakeholder Engagement section is now Section 7.	<u>Status:</u> Resolved CNL considers this interest resolved by changes in the order of EIS sections and revised wording. It is noted that this topic extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project.
3) EA Process and Methodology	a) A request for more details on the effects assessment approach and identification of valued components It is important to Hiawatha First Nation that the VCs used for the project incorporate species important to traditional users of the land to ensure the effects on traditional land and resource use are adequately considered. This is a project-specific concern.	CNL has responded in writing to Curve Lake comments on this topic and shared these responses with Hiawatha, citing relevant sections of the EIS as part of the comment responses. CNL has provided an explanation about the broad categories of VCs, which encompass several species (e.g. the “mushroom” VC include all mushroom species, and the “benthic invertebrates” VC includes mussels.) A summary of the benthic invertebrate study was provided to Hiawatha (and Curve Lake) First Nations, noting that the benthic invertebrate study will be repeated once after the decommissioning activities are complete to test the EIS prediction of no adverse effects to benthic invertebrates. CNL has shared the complete benthic study report with Hiawatha (and Curve Lake) First Nations and has responded to follow up questions this topic. <u>CNL Response:</u> CNL undertook baseline studies of benthic macroinvertebrate, sediment quality and water quality in the Ottawa River in the summer of 2020. Samples were taken upstream, downstream and adjacent to the NPD facility. This study sets the baseline that will be used for EA follow-up monitoring activities. The results of this study support the description of the baseline aquatic environment in the EIS. CNL’s assessment addressed potential effects to VCs in the aquatic and terrestrial environments. The assessment covered the aquatic and terrestrial VCs of interest to Indigenous Nations, communities and organizations , including mushrooms and mussels. The assessment concluded that there are no adverse residual effects on the aquatic or terrestrial environment expected from the project.	<u>Where is this topic discussed in the EIS?</u> The EIS does not predict any adverse residual effects on the aquatic environment (**Section 9.4.3.5**) or the terrestrial environment (**Section 9.6.3.5**). CNL has developed mitigation measures and monitoring plans for the protection of the Ottawa River (**Sections 9.3.3.2 and 12.3** within the EIS) and for the protection of valued component species (**Sections 9.4.3.2 and 9.6.3.2 and 12.3** within the EIS**).** <u>What changes have been made (and where)?</u> No changes have been made to the EIS.	<u>Status:</u> Resolution in Progress CNL considers this interest resolved by its responses to the July 2021 letter, sharing of the benthic invertebrate study and summary of this work. CNL remains committed to ongoing engagement on this topic. <u>Next Steps:</u> Further follow-up discussion on VC identification, if requested, by Hiawatha FN. Coordinate a visit to the NPD site for Hiawatha FN representatives, as requested, to verify that there are no impacts to rights. Future visits to the community can also be planned for as part of ongoing engagement and relationship-building.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
4) End State, Site Restoration and Future Use of the Land	a) Engagement on Final Site Restoration It is important to Hiawatha that it is engaged meaningfully about final site restoration. It is important to Hiawatha that the end state of the NPD site is safe for future land users and that the rights and interests of future Indigenous peoples are preserved. This is both a CNL-wide and project-specific concern.	CNL has responded in writing to Curve Lake comments on this topic and shared the responses with Hiawatha, citing relevant sections of the EIS as part of the comment responses. CNL Response: Future land use is a discussion topic that requires the participation of AECL as the owner of the NPD site, in consultation with Indigenous Nations, communities, and organizations, the public, as well as industry and government. As the licensee, CNL is committed to engagement and consultation with Hiawatha First Nation on future end state and land use. Future land use and land transfer are beyond the scope of the EA for the NPD Closure Project. CNL recognizes that the importance of this matter to Hiawatha First Nation, and therefore CNL has committed to sharing the draft site restoration plan with Hiawatha First Nation for feedback.	Where is this topic discussed in the EIS? General plans for restoration and end state are described in **Section 4.3.1.9** of the EIS. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL considers this interest resolved via clarification of EIS wording with Curve Lake and Hiawatha FN. CNL remains committed to ongoing engagement with the Hiawatha First Nation. Next Steps: CNL will share the draft restoration plan with Hiawatha First Nation and other Indigenous Nations, communities and organizations once it is complete.
5) Protection of Flora and Fauna	(a) Hiawatha expressed interest in CNL's plans for the NPD ventilation stack in relation to caretaking of the environment, and maintaining this habitat for the Chimney Swift with a secondary interest in the impact of a stack collapse and proximity of this structure to the Ottawa River. This is a project-specific interest.	In May 2020, the WTFN and CNL met for a discussion and presentation sharing information on the NPD Closure Project. Species at risk was a key focus of the discussion and representatives of Curve Lake First Nation had a number of follow-up question after the meeting. In response, CNL provided the Chimney Swift TSD as well as specific answers to questions from Curve Lake First Nation, Hiawatha First Nation and Alderville First Nation on the ventilation stack and Chimney Swifts. At the May 2021 monthly project update and information sharing meeting between CNL and WTFN, an overview of CNL's biodiversity program was discussed. CNL Response: CNL undertook investigation of the viability of ventilation stack removal. It was decided that ventilation stack retention would mitigate the risk of abandonment by the chimney swift. CNL has applied for a species at risk permit from ECCC for the potential harm and harassment of chimney swifts during decommissioning activities. CNL examines the probability of a stack collapse in the Decommissioning Safety Assessment (DecomSA) TSD (Section 9.6.6) focusing on 3 potential causes: earthquake, tornado and heavy equipment operation. The DecomSA TSD also presents the maximum dose to a receptor resulting from a potential collapse of the Ventilation stack. Should the stack collapse, its height (of 45 m) means that it would land on the main terrace where the facility is located. For reference the base of the stack is about 140 m away from the shore of the Ottawa River. CNL has a surveillance plan in place at current that will continue for as long as the stack is maintained whereby periodic inspections of the stack are performed to ensure it remains in satisfactory condition.	Where is this topic discussed in the EIS? **Section 9.6.3.2** of the EIS includes comprehensive mitigations to ensure effects on Chimney Swifts are minimized. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL considers this concern has been addressed with the information shared to Hiawatha First Nation. CNL remains committed to ongoing engagement with Hiawatha First Nation.
5) Protection of Flora and Fauna	(b) Hiawatha First Nation expressed concern about potential accumulation of contamination in large game animals. As stewards of the lands and waters, it is important to Hiawatha First Nation that the environment, including flora and fauna around the CRL	CNL's Environmental Protection experts responded directly to the question about large game animals during the monthly meeting. CNL Response: For the CRL site, samples of large game like deer, moose, and black bear are obtained from animals who succumbed as a result of vehicle collisions on the CRL	Where is this topic discussed in the EIS? The draft follow-up monitoring plans for the NPD Closure project are included in **Section 12** of the EIS. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolution in Progress CNL considers this concern has been addressed with the information shared to Hiawatha First Nation. CNL remains committed to ongoing engagement with Hiawatha First Nation.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	and NPD sites is protected, to ensure the rights and interests of Hiawatha First Nation are upheld in relation to the environment (i.e., hunting). This is both a CNL-wide and project specific concern.	site and from harvested animals (donated by local hunters) from areas within 25 km of CRL. The samples are analyzed for radioactivity and a dose from consumption is calculated. Although radioactivity in large game animals is slightly higher on and within 25 km of the Chalk River site than beyond it, the dose from consuming game animals from on or around the CRL site is a small fraction of the public dose limit of 1 millisieverts/year, indicating a very low risk. Game animals are not sampled around the NPD site because the low emissions to the environment from NPD do not warrant a sampling campaign. The Postclosure Safety Assessment (PostSA) technical supporting document (TSD) addresses potential concerns about food safety. The PostSA and EIS (and other supporting studies) demonstrate that, there are no concerns about the accessibility or safety of the NPD site in the long term based on several different future use scenarios, including self-sufficient Indigenous receptors (encompassing hunting). The proposed NPD Closure Project activities will result in an enhancement of current conditions at the NPD site and will improve the ability to practice traditional activities in the area surrounding the NPD site. These findings, which will be confirmed by monitoring, may reduce concerns about food safety. The follow-up monitoring program for the NPD Closure Project will monitor the environmental pathways whereby contamination may be accessible to biota (e.g., surface water).		It is noted that this topic extends beyond the scope of the NPD Closure Project.
6) Monitoring	a) Hiawatha First Nation expressed interest in the monitoring plans for the NPD site. This interest stems from the importance of environmental stewardship to Hiawatha First Nation. As stewards of the lands and waters, it is important to Hiawatha First Nation that the environment around the site of the NPD Closure Project including the Ottawa River, are protected, and that the rights and interests of Hiawatha First Nation are upheld in relation to the environment (i.e., hunting, trapping, gathering, fishing and cultural ceremonies). This is a project-specific interest.	In May 2020, the WTFN and CNL met for a discussion and presentation sharing information on the NPD Closure Project. Key focus areas were: project overview and timeline, waste inventory, monitoring, VCs, species at risk, traditional land and resource use and effects on the environment. Hiawatha First Nation participated in this webinar and shared a number of questions with CNL related to environmental monitoring. CNL followed up with specific answers to questions from the Hiawatha Lands and Resources staff monitoring, as well as three Annual Compliance and Monitoring reports from 2016, 2017 and 2018. CNL Response: The follow up monitoring program is described at a high level in Section 12 of the EIS with significant details developed compared to the 2017 draft EIS. These details come through the development of the 3 draft follow-up monitoring plans for effluent, environment and groundwater. CNL is seeking to work together with Indigenous Nations, communities and organizations, the public and stakeholders regarding their feedback before finalizing the EA Follow-up Program (**Section 12** of the EIS). CNL has indicated that it is willing to involve all Indigenous Nations, communities and organizations in its monitoring programs.	Where is this topic discussed in the EIS? The draft follow-up monitoring plans for the NPD Closure project are included in **Section 12** of the EIS. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL considers this concern has been addressed with the information shared to Hiawatha First Nation. CNL remains committed to ongoing engagement with Hiawatha First Nation. CNL is planning workshops to gather feedback on the draft follow-up monitoring plans for summer 2023.
7) Socio-economics	a) Hiawatha (and Curve Lake) expressed concern about how community statistics from NPD's neighboring Indigenous Nations, communities and organizations are portrayed.	CNL has responded in writing to Curve Lake comments on this topic and shared these responses with Hiawatha First Nation, citing relevant sections of the EIS as part of the comment responses. CNL has communicated to Hiawatha First Nation that is working directly with AOPFN on EIS content and Algonquin perspective.	Where is this topic discussed in the EIS? **Sections 8.10 and 9.10** of the EIS focus on Indigenous socio-economic conditions, including economy and employment. **Section 8.10** summarizes current economic and employment conditions, and **Section 9.10** assesses potential effects and	Status: Resolved CNL considers this interest resolved via clarification of the basis for inclusion of Indigenous socio-economic content within the EIS.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	Hiawatha First Nation wants to ensure that the effects of colonialism and the Indian Act on the socio-economic conditions of Indigenous Nations, communities and organizations are recognized. This is both a CNL-wide and project specific concern.	CNL Response: CNL acknowledges that economic challenges faced by some Indigenous Nations, communities and organizations are likely related to legacies of colonialism and the *Indian Act*. CNL understands this concern and continues to want to offer opportunities and benefits to Indigenous individuals and communities that will enhance their economic well-being. CNL clarified that the inclusion of socio-economic information was in response to comments on the 2017 draft EIS from Indigenous Nations, communities and organizations.	discusses CNL's plan to fully realize the potential for economic and employment benefits to Indigenous Nations, communities and organizations. What changes have been made (and where)? No changes have been made to the EIS.	It is noted that this topic extends beyond the scope of *CEAA* (2012) and the EA for the NPD Closure Project.
Chippewas of Rama First Nation				
1. Alternatives	a) Range of alternatives considered and overall suitability of the In-Situ Disposal concept. Rama First Nation was concerned that CNL evaluate a range of options and that the design allows for reversibility if improved waste disposal options become available in the future. Rama wants to ensure that changes can be made in the future to ensure the environment remains protected. This is a project-specific concern.	CNL provided an overview of the alternatives and indicated that ISD is meant to be a permanent solution and that there is no intention to retrieve waste in the future. This response was provided verbally to Rama during a project update in April 2023. CNL Response: The waste at NPD has been there for over 55 years. CNL is reducing the waste liability by converting the waste into a form that provides safe, permanent waste disposal. CNL has assessed the suitability of ISD for NPD, and the EIS demonstrates that such disposal is safe for human health and the environment in the short term and long term. CNL has considered national and international standards and guidelines and continues to believe that the NPD facility has characteristics that support ISD.	Where is this topic discussed in the EIS? The in-situ disposal approach is described in **Section 3.2** of the EIS. Alternative means are discussed in the **Alternative Means Assessment TSD** (64-509200-ASD-002 Revision 1) and **Section 4.2** of the EIS. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL considers this concern has been addressed with the information shared to Rama First Nation. CNL remains committed to ongoing engagement with Rama First Nation through the William's Treaty First Nations monthly update.
1. Alternatives	b) Is In-Situ Disposal a Proven Technology Rama First Nation was interested in seeing examples of ISD used elsewhere and the performance of the technology. Rama wants confidence that this technology will protect humans and the environment. This is a project-specific concern.	CNL shared its report summarizing worldwide examples of In-situ disposal as a follow-up to the 2023 April project update meeting. CNL Response: CNL has written a report that summarizes facilities worldwide that use In-situ Disposal. The report is not limited to nuclear reactors or processing facilities but includes mines and hazardous waste sites. The report also describes what each of the facilities have in common, why in-situ disposal is the preferred approach and how it applies to NPD. 16 projects are described, the majority of the examples are reactors and all are permanent disposal solutions. CNL has assessed the suitability of ISD for NPD, and the EIS demonstrates that such disposal is safe for human health and the environment in the short term and long term. CNL has considered national and international standards and guidelines and continues to believe that the NPD facility has characteristics that support ISD.	Where is this topic discussed in the EIS? **Section 11.2** of the EIS confirms that in-situ disposal is a proven technology in use for over 50 years. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL considers this concern has been addressed with the information shared to Rama First Nation. CNL remains committed to ongoing engagement with Rama First Nation through the William's Treaty First Nations monthly update.
2. End State, Site Restoration and Future Use of the Land	a) Long-term liability of the site beyond decommissioning. Rama is interested to know when the site will be safe for reuse. It is	CNL summarized the range of scenarios considered and that the results that the site is safe for a variety of uses following the Institutional Control period. This response was provided verbally to Rama during a project update in April 2023.	Where is this topic discussed in the EIS? **Sections 9.8 and 9.10** of the EIS include a summary of the results of the PostSA TSD and the potential impacts of the project on human and more specifically Indigenous health.	Status: Resolved CNL considers this concern has been addressed with the information shared to Rama First Nation.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	important to Rama that the end state of the NPD site is safe for future land users. This is a project-specific interest.	CNL Response: CNL acknowledges Rama's interest in being able to reuse the site in the future. The Postclosure Safety Assessment (PostSA) technical supporting document (TSD) demonstrates that the impact beyond the Institutional Controls period on the public, Indigenous and the environment is negligible under all scenarios. CNL notes that the final end state is the only time when changes to access will occur; the final end state of the NPD site will be an improvement from current conditions. To instill confidence in the EIS findings and the effectiveness of the follow-up monitoring, CNL will involve Indigenous Nations, communities and organizations in the monitoring program, which aims to confirm the predictions of the EIS.	What changes have been made (and where)? No changes have been made to the EIS.	CNL remains committed to ongoing engagement with Rama First Nation through the William's Treaty First Nations monthly update.
3. Long-term Safety	a) Long-term integrity of the concrete cap and engineered barrier As long-term stewards and users of the land and waters, it is important to Rama First Nation that the design life of the protective layers for the proposed NPD Disposal Facility are sufficient over time to provide confidence that the environment is protected. This is a project-specific interest.	CNL and Rama First Nation had initial discussions on this topic during the April 2023 project update meeting. CNL is happy to share the Institutional Control Surveillance Plan and additional high-level information about the concrete cap and engineered barrier with Rama First Nation if needed during the WTFN monthly meetings. CNL Response: The proposed NPD Disposal Facility is designed to hold the radionuclides within the facility as long as possible so that they have time to decay away. This is achieved by the use of multiple barriers and defense in depth. The main features containing the radionuclides, are the thick concrete walls of the facility and the fact that the majority of the radioactivity is present within the matrix of steels and zircaloy that will corrode very slowly in the chemical environment of the decommissioned facility. For example, steels in the reactor are predicted to take 30,000 years to corrode due to the alkaline conditions in the facility. The grout backfill is also a contributor to safety. The grout and concrete constrain water flow and also limits the mobility of the waste as the waste will sorb to the grout. Even once the concrete and grout has degraded such that its structural properties are no longer effective, the alkaline environment provided by the cement will remain in place for thousands of years. A reinforced concrete cap will be placed over the Nuclear Area of the facility as a barrier following the completion of grouting. The concrete cap is designed to support the loads of the Engineered Barrier and its construction. The cap has a thickness of 0.40 m (1'-4") at the edge, and rises to a thickness of 0.71 m (2'-4") at the center. The area of the cap is approximately 600 m^2 (6430 ft^2), and it is dowelled to the foundation walls of the existing structure for anchorage. A multi-layered engineered cover will be placed over the grouted facility, following placement of the concrete cap. The engineered cover consists of a compacted layer of select fill at the bottom a minimum of 1.2 m thick. This bottom layer is overlain by a very low permeability membrane called a geosynthetic clay liner (GCL) and a geogrid, and covered by a 0.15 m thick sand cushion supporting a 0.15 m thick layer of clear stone. The GCL is designed to intercept water percolating through the top of the engineered cover and direct the water to the outside of the engineered cover where it can drain away. The clear stone serves as a drainage layer while the sand	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the proposed NPD Disposal Facility to ensure protection of the surrounding environment. **Section 4.3.1** of the EIS describes the Concrete Cap and Engineered Cover and Long Term Care and Maintenance. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback (received May 2023).	Status: Resolved CNL considers this concern has been addressed with the information shared to Rama First Nation. CNL remains committed to ongoing engagement with Rama First Nation through the William's Treaty First Nations monthly update.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		cushion also provides some drainage capability and acts as a protective layer to the GCL. Over the clear stone, a geotextile will be placed and covered by a 0.3 m thick layer of select fill, upon which 0.15 m of topsoil is placed and seeded, to form a shallow-rooted vegetative cover at the top of the engineered cover. The design life of the cap and cover system is 100 years. The Institutional Control Surveillance Plan has been developed to verify the integrity of accessible passive barriers and support structures, and to enable the prompt identification of conditions that may lead to a migration or release of radionuclides or other contaminants to the environment. The plan outlines the maintenance program to be executed to ensure accessible features of the new disposal facility are maintained (e.g. periodic inspection of the cover and maintenance when required) over the Institutional Control period. The only mechanism that would require the replacement of the cover would be a catastrophic failure of both the GCL and the geotextile membrane in conjunction with levels of tritium released in excess of acceptance criteria. Disruptive events beyond 100 years were not dismissed. The PostSA TSD examines scenarios and calculations developed systematically using FEPs (Features, Events and Processes) where 200 FEPs were compiled and categorized by potential consequences and probabilities. The PostSA shows that the decommissioned facility can be expected to contain the dominant radionuclides effectively. Even after 50,000 years, more than 96% of the remaining radioactivity is still contained within the proposed NPD Disposal Facility. CNL's technical assessment shows that there are no long-term effects resulting from the NPD Closure Project as shown through the use of multiple barriers and defense in depth. Continued engagement with Rama First Nation may result in additional commitments that will enhance confidence and trust in CNL's assessment. CNL remains committed to ongoing engagement with Rama First Nation within CNL's role as the project proponent.		
4. Monitoring	a) Impacts from site operation Rama is interested to understand CNL's past environmental performance at the NPD site. Rama wishes to ensure the environment has not been impacted by past operations. This is a project-specific concern.	CNL shared a link to the annual summary or environmental performance as a follow-up to the 2023 April project update meeting. CNL would be pleased to share any other historic monitoring data as requested by Rama. <u>CNL Response:</u> CNL conducts a rigorous monitoring program and is committed to ensuring that the environment around the NPD site, including the Ottawa River, is protected. Monitoring of the environment (a) Ottawa River water: Radioactivity measured in the Ottawa River upstream and downstream of the NPD site are very low (<0.01% of the derived release limit). (b) Surface soil and Vegetation: Tritium in soil and vegetation on the NPD site is very low (< 0.01% of the derived release limit). The results demonstrate that the public and the environment around the NPD site continues to be protected.	<u>Where is this topic discussed in the EIS?</u> Historic environmental monitoring is summarized in the description of the existing environment (**Section 8**) of the EIS. Specifically, EIS **Sections 8.2** – Atmospheric Environment, **8.3** Surface Water Environment, **8.5.6** Groundwater Quality and **8.7** Ambient Radioactivity. <u>What changes have been made (and where)?</u> No changes have been made to the EIS.	<u>Status:</u> Resolved CNL considers this concern has been addressed with the information shared to Rama First Nation. CNL remains committed to ongoing engagement with Rama First Nation through the William's Treaty First Nations monthly update.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		In addition to the CNL monitoring program, the CNSC leads an Independent Environmental Monitoring Program (IEMP) designed to verify that the public and the environment around licensed nuclear facilities are protected. As part of its IEMP, the CNSC samples and analyzes surface water upstream and downstream of the NPD site (including sampling for non-radiological parameters). The CNSC IEMP results confirm that the public and the environment around the NPD site are protected and that there are no expected health impacts.		
4. Monitoring	b) Design of follow-up monitoring It is important that Rama has an opportunity to review the monitoring plans to ensure transparency and promote confidence in these activities. This is project –specific interest.	CNL shared the draft monitoring plans with Rama First Nation as a follow-up to the 2023 April project update meeting. CNL Response: The follow up monitoring program is described at a high level in Section 12 of the EIS with significant details developed compared to the 2017 draft EIS. These details come through the development of the 3 draft follow-up monitoring plans for effluent, environment and groundwater. CNL is seeking to work together with Indigenous Nations, communities and organizations, the public and stakeholders regarding their feedback before finalizing the EA Follow-up Program (**Section 12** of the EIS). CNL has indicated that it is willing to involve all Indigenous Nations, communities and organizations in its monitoring programs.	Where is this topic discussed in the EIS? The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. What changes have been made (and where)? No changes have been made to the EIS.	Status: Resolved CNL considers this concern has been addressed with the information shared to Rama First Nation. CNL remains committed to ongoing engagement with Rama First Nation through the William's Treaty First Nations monthly update.

Appendix C.6– Record of Engagement and Tables of Interests and Concerns for the Algonquin Nation Secretariat

This appendix provides a complete record of all engagement between CNL and Algonquin Nation Secretariat from June 2016 to March 2024 (Table C-29). Table C-29 includes the date and method of the communication/engagement, the topics discussed and participants. The table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Section 6.2.4.16.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and the Algonquin Nation Secretariat.

Table C-29 Record of Engagement with the Algonquin Nation Secretariat

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Algonquin Nation Secretariat's Director General introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
October 24, 2016 Outgoing telephone call	This was a telephone call from a communications officer with CNL to the office of the Director General of the Algonquin Nation Secretariat.										√
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Algonquin Nation Secretariat Director General inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Algonquin Nation Secretariat's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Does the Algonquin Nation Secretariat have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of Algonquin Nation Secretariat using the areas around the two projects?* • *Do you have any members of the Algonquin Nation Secretariat that currently live in close or reasonable proximity to either of the projects?* • *Does the Algonquin Nation Secretariat have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does the Algonquin Nation Secretariat, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the Algonquin Nation Secretariat and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
November 15, 2017 Outgoing email	This email from a communications officer to the Algonquin Nation Secretariat Director General enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√	
November 17, 2017 Outgoing email	This email from a communications officer with CNL to the Algonquin Nation Secretariat Director General enclosed the draft Aboriginal Engagement Report for the NPD Closure Project and stated, per CEAA, 2012 requirements: "CNL would be pleased to update information in this current draft with input from your community."	√	√	√	√	√	√	√	√	√	
In March 2020, the COVID-19 pandemic impacted in-person engagement activities. CNL adapted to the restrictions providing online platforms for virtual meetings, workshops, webinars, Project updates and open houses.											
May 06, 2020 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Algonquin Nation Secretariat Director General enclosed a preliminary version of the 2020 EIS and an updated IER. This letter also asked for feedback in the following seven areas: • *Does Algonquin Nation Secretariat have additional information that they would like to provide in the context of traditional territory near the NPD site?* • *Does Algonquin Nation Secretariat have any members who currently live close or in reasonable proximity to the NPD site?* • *Does Algonquin Nation Secretariat have historical and/or current traditional practices near the NPD site, specifically we are interested in members' traditional uses such as trapping (traditional or commercial), hunting, fishing (traditional or commercial), gathering and practicing cultural ceremonies?* • *Does Algonquin Nation Secretariat have sites of ceremonial significance in close proximity or more generally any cultural activities near the NPD site?* • *Tell us about any important resources, uses, activities, values and interests to Algonquin Nation Secretariat near the NPD site.* • *If there is use in close proximity to the NPD site, is current community use different than historic use and can a description of those difference be provided?* • *Let us know of any potential concerns you have with respect to effects and any potential impacts on rights.* This letter also indicated an interest in meeting with Algonquin Nation Secretariat to discuss any interests or concerns.	√	√	√	√	√	√	√	√	√	
May 26, 2020 Outgoing email	This email from a communications officer with CNL to the Algonquin Nation Secretariat Director General was to follow-up on the registered letter sent on May 06.										√
May 26, 2020 Incoming email	This email from the former Algonquin Nation Secretariat Director General to a communications officer with CNL was to advise of the new Algonquin Nation Secretariat Director General and share their contact information.										√
May 26, 2020 Outgoing email	This email from a communications officer with CNL to the new Algonquin Nation Secretariat Director General enclosed the letter from May 06, 2020 and offered a meeting.	√	√	√	√	√	√	√	√	√	
April 12, 2021 Outgoing letter	This letter from CNL's Manager of Stakeholder Relations to the Director General of the Algonquin Nation Secretariat enclosed a preliminary list of commitments and indicated interest in meeting to discuss.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
June 15, 2021 Outgoing email	This email from a communications officer with CNL to the Director General of the Algonquin Nation Secretariat was to follow-up on the April letter.										√
April 18, 2022 Outgoing email	This email from a Communications officer at CNL to Algonquin Nation Secretariat consultation was to inform Algonquin Nation Secretariat about Industry Day on June 2, 2022 at CRL.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Algonquin Nation Secretariat – Summary of Interests and Concerns

Algonquin Nation Secretariat has not submitted any written comments on the NPD Project Description or the 2017 draft EIS, or provided any comments verbally. As such, CNL has not included an interests and concerns table. CNL has attempted to engage with the Algonquin Nation Secretariat on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to ongoing engagement with Algonquin Nation Secretariat.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Appendix C.6.1 – Record of Engagement and Tables of Interests and Concerns for Wolf Lake First Nation

This appendix provides a complete record of all engagement between CNL and Wolf Lake First Nation (a member nation of Algonquin Nation Secretariat) from June 2022 to March 2024 (Table C-30). Communications with Wolf Lake First Nation (WLFN) between June 2016 and June 2022 were via the Algonquin Nation Secretariat (Table C-29). At the NSDF Hearing in 2022 June, CNL heard that the individual rights bearing communities needed to be engaged independently from the Algonquin Nation Secretariat, regarding CNL related projects and activities.

Table C-30 includes the date and method of the communication/engagement, the topics discussed and participants. This table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Following the record of engagement is a mapping of how the summary of interests and concerns were compiled (Table C-31), as well as a summary of interests and concerns raised by WLFN (Table C-32).

Section 6.2.4.17.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and WLFN.

Table C-30 Record of Engagement with the Wolf Lake First Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 12, 2022 Outgoing email	This email from a CNL Communications Officer to the WLFN's Chief was to inquire if WLFN would be interested in meeting CNL and acknowledging WLFN's intervention for the NSDF licensing hearing. CNL asked WLFN to confirm the appropriate contact for engagement and asked how WLFN would like to engage CNL moving forward.										
May 24, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the WLFN's Chief was follow-up on the previous email and to inquire whether there was interest in meeting CNL.										√
June 22, 2022 Outgoing email	This email from CNL's Indigenous Relations Director to the WLFN Chief stated an interest in engagement and meeting with WLFN.										√
June 22, 2022 Outgoing email	This email from CNL's Indigenous Relations Director to the WLFN's Legal Counsel stated an interest in engagement (including the NPD project) and meeting with WLFN to discuss WLFN's interest in the NSDF project.										√
June 22, 2022 Outgoing Telephone call	CNL's Indigenous Relations Director called the WLFN Chief and left a voicemail asking the Chief to get in touch by email for phone to set up a meeting.										√
June 23, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the Chiefs of ABL, TFN and WLFN was to indicate CNL's interest in meeting with each community either collectively or together and to share information on CNL's activities and projects including the NPD project.										√

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
June 24, 2022 Incoming letter	This letter from WLFN's Legal Counsel to CNL's Director of Indigenous Relations. The letter requests that CNL assess the strength of WLFN's Aboriginal rights and title assertion in proximity to the NSDF project. Of importance to the NPD project, the letter discussed CNL's lack of engagement and consultation with WLFN and the duty to consult. The letter references previous correspondence with the federal government.										√
June 24, 2022 Incoming email	This email from WLFN's Chief to CNL's Director of Indigenous Relations offered a meeting to discuss the relationship.										√
June 24, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the WLFN Chief thanked WLFN for the letter and indicated interest in an initial meeting in August.										√
July 07, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the WLFN Chief indicated CNL was reviewing and would be responding to the letter of June 24, 2022 and indicated an interest in setting a meeting date for August in the meantime.										√
July 20, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the WLFN Legal Counsel requested assistance in setting up a meeting between CNL and WLFN.										√
July 25, 2022 Incoming email	This email from the WLFN Legal Counsel to CNL's Director of Indigenous Relations stated they would be reaching out to the WLFN to coordinate. CNL confirmed receipt.										√
July 28, 2022 Outgoing letter	This letter from CNL's Director of Indigenous Relations to the WLFN Legal Counsel responded to WLFN's letter of June 24. This letter articulated that CNL was not the Crown and did not have the duty to consult in the case of the NSDF project. This letter also stated an interest in engagement, working together and meeting in the near term to discuss interests. This letter speaks to the relationship between CNL and WLFN and is important for engagement related to the NPD project.										√
August 05, 2022 Incoming email	This email from the WLFN Legal Counsel to CNL's Director Indigenous Relations confirmed that WLFN would meet with CNL on August 10 to discuss WLFN's assertions. The email also requested CNL correspond directly with WLFN and not the Algonquin Nation Secretariat.										√
August 05, 2022 Incoming email	This email from the WLFN Legal Counsel to CNL's Director Indigenous Relations gave a final specific meeting place in Ottawa.										√
August 05, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the WLFN Legal Counsel confirmed CNL's attendance for the August 10 meeting. CNL also confirmed that all future correspondence will be sent the Chief at WLFN, and not Algonquin Nation Secretariat.										√
August 09, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the WLFN's Chief provided details about the August 10, 2022 meeting logistics.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
August 10, 2022 Meeting	This meeting between WLFN (including the WLFN Chief and Legal Counsel), CNL (including the Director of Indigenous Relations, Manager of ERM Stakeholder Relations and the NSDF project staff), and AECL (including the Vice-President, Decommissioning and Waste Management Oversight) was to discuss the CNL and WLFN relationship and the NPSD project. CNL provided information on the NPD project.										√
August 17, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the WLFN's Chief thanked WLFN for the opportunity to meet and share information on the NSDF and NPD projects. CNL enclosed information in follow-up to the meeting.										√
October 03, 2022 Outgoing letter	This letter addressed to the WLFN's Chief from CNL's Director of Indigenous Relations provided a project update and the engagement status with the WFLF, CNL noted that the next step is a meeting to discuss enabling capacity funding for WLFN's involvement in the NPD and NSDF projects. CNL also sent a draft Contribution Agreement template.									√	√
October 26, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the WLFN's Chief was to follow-up on the October 3, 2022 letter.									√	√
November 13, 2022 Incoming email	This email from the WLFN Legal Counsel is in response to a CNL Senior Communications Officer to schedule a zoom call to discuss options for capacity funding to address CNL's outstanding projects. WLFN requested capacity funding to specifically hire a third party to review both the technical requirements of the project(s) and a review of the environmental assessment report. Once those reviews have been completed WLFN will be able to provide its comments and request any accommodation that may be required to ensure its asserted Aboriginal and title rights are not impacted.									√	√
November 18, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the WLFN Legal Counsel requesting a few dates and times that would work for WLFN for a virtual meeting to discuss CNL project(s).									√	√
November 30, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the WLFN Legal Counsel following up on email sent November 18 requesting a few dates and times that would work for WLFN for a virtual meeting to discuss CNL project(s), including the NPD project.									√	√
November 30, 2022 Incoming email	This email from the WLFN Legal Counsel is in response to a CNL Senior Communications Officer confirmed receipt of meeting request and will confirm the meeting soon.									√	√

December 09, 2022 Incoming Email	This email from the WLFN Legal Counsel in response to CNL Senior Communications Officer to confirm that WLFN Legal Counsel has successfully downloaded the Environmental Impact Statement (EIS) document.										√
December 12, 2022 Virtual Meeting	This meeting between representative of Wolfe Lake FN (including the chief and legal counsel) and CNL (NPD project staff, NSDF project staff, ERM Stakeholder Relations, CNL legal counsel and Director of Indigenous Relations) to discuss Federal Environmental Assessments for NSDF and NPD. CNL and WLFN also discussed a Contribution Agreement.										√
December 13, 2022 Incoming Email	This email from the WLFN Legal Counsel to a CNL Senior Communications Officer requesting CNL provides WLFN with the other third-party environmental reviews.										√
December 15, 2022 Outgoing Email	This email from a CNL Senior Communications Officer to WLFN Legal Counsel containing links to third-party environmental reviews.										√
December 16, 2022 Incoming Email	This email from the WLFN Legal Counsel to CNL containing quotes for the draft budget in the Capacity Funding Agreement.										√
December 16, 2022 Outgoing Email	This email from CNL Legal Counsel to WLFN Legal Counsel containing comments for consideration on the draft Capacity Funding Agreement.										√
December 20, 2022 Incoming Email	This email from WLFN Legal Counsel to CNL Legal Counsel confirming there are no further comments on the draft Capacity Funding Agreement so CNL can proceed with signatures and finalization of the document before office holiday closure.										√
December 20, 2022 Outgoing Email	This email from CNL Legal Counsel to WLFN Legal Counsel confirming there will be no further comments at this time for the draft Capacity Funding Agreement.										√
December 20, 2022 Incoming Email	This email from the WLFN Legal Counsel to CNL Legal Counsel containing a copy of the Capacity Funding Agreement signed by the Wolf Lake First Nation Chief.										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
December 20, 2022 Outgoing Email	This email from CNL Legal Counsel to WLFN Legal Counsel requesting the documents used to create the execution version of the Capacity Funding Agreement.										√
December 20, 2022 Incoming Email	This email from the WLFN Legal Counsel to CNL containing the documents requested by CNL in an earlier email on 2022 December 20.										√
December 21, 2022 Outgoing Email	This email from CNL Legal Counsel to WLFN Legal Counsel with an attached copy of the fully executed Capacity Funding Agreement between Wolf Lake First Nation and CNL.										√
December 20, 2022 Incoming Email	This email from WLFN Legal Counsel to CNL legal counsel confirming receipt of the fully executed copy of the Capacity Funding Agreement between Wolf Lake First Nation and CNL.										√
January 17, 2023 Incoming Email	This email from WLFN Legal Counsel to a Communications Officer at CNL and confirming the submission date of 2023 January 20 for comments on the Environmental Impact Statement (EIS) for the NPD Closure Project.										√
January 18, 2023 Outgoing Email	This email from CNL Senior Communications Officer to WLFN Legal Counsel confirming the decision to postpone the NPD Environmental Impact Statement (EIS) submission and provided a new date of 2023 May.										√
January 18, 2023 Incoming Email	This email from the WLFN Legal Counsel to a CNL Senior Communications Officer requesting additional time to further refine its submission of the NPD EIS.										√
January 18, 2023 Outgoing Email	This email from a CNL Senior Communications Officer to WLFN Legal Counsel suggesting a feedback submission for the end of February 2023 in the interest of working together for the 2023 May submission.										√
January 18, 2023 Incoming Email	This email from WLFN Legal Counsel to CNL Communications Officer confirming a date of 28 February 2023 to submit any feedback on the Environmental Impact Statement (EIS).										√

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
January 18, 2023 Outgoing Email	This email from CNL to Senior Communications Officer to WLFN Legal Counsel suggesting a feedback submission for the end of 2023 February in the interest of working together for the 2023 May submission.										√
January 20, 2023 Outgoing Email	This email from CNL Communications Officer to WLFN Legal Counsel to inform of the decision to postpone the submission of the NPD Closure Project's draft Environmental Impact Statement (EIS) until 2023 May to allow for additional Indigenous input. CNL proposed the next step would be receiving the EIS comments in February 2023.										√
January 28, 2023 Emails between WLFN and CNL (2 emails)	This email from WLFN Legal Counsel to CNL in follow-up and response to the email sent from CNL to WLFN on 2023 January 18. WLFN emailed CNL with a request to extend the submission date of the Wolf Lake First Nation's submissions on the EIS for the NPD Closure Project to 2023 March 02. CNL confirmed that a submission date of 2023 March 08 is acceptable.										√
March 03, 2023 Incoming Email	This email from WLFN Legal Counsel to a CNL Senior Communications Officer indicating that they will deliver the Wolf Lake FN submission to CNL on 2023 March 08 instead of 2023 March 02.										√
March 08, 2023 Incoming Email	This email from WLFN's Legal Counsel to a CNL Senior Communications Officer providing Wolf Lake's final submission on the NPD Closure Project EIS. CNL confirmed receipt.	√	√	√	√	√	√	√	√	√	√
March 14, 2023 Outgoing Email	This email from a CNL Senior Communications Officer to WLFN's Chief sharing CNL's Indigenous Relations Procurement Strategy.										√
March 22, 2023 Outgoing Email	Emails between CNL and WLFN concerning WLFN comments on the Near Surface Disposal Facility (NSDF) project and NPD Closure project Environmental Impact Statements (EIS). CNL requested a meeting virtually to discuss the next steps for each of the two projects before the 2023 July Environmental Impact Statement draft submission date.										√
April 13, 2023 Outgoing Email	This email from CNL Senior Communications Officer to WLFN looking to follow up on an email sent on 2023 March 22, to possibly coordinate a time to meet virtually.										√
April 13, 2023 Emails between CNL and WLFN (3 Emails)	Emails between CNL Senior Communications Officer and WLFN concerning an upcoming virtual meeting and questions regarding CNL's capacity to cover these types of meetings under the capacity agreement.										√

		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
May 04, 2023 Outgoing Email	These emails between CNL Senior Communication Officer and WLFN concerning an upcoming in-person meeting to be held at Wolf Lake or in Ottawa. CNL confirmed their interest in going to an in-person meeting in the community and wanted to confirm if Wolf Lake was interested in an NSDF and NPD update. Wolf Lake confirmed they would like to hear updates for both NSDF and NPD. CNL proposed possible dates in 2023 May.										√
May 16, 2023 Outgoing Email	This email from a CNL Senior Communication Officer to WLFN is to follow up on a previous email sent on 2023 May 04 concerning an upcoming in-person meeting to be held at Wolf Lake or in Ottawa and possible dates for the meeting.										√
June 07, 2023 Outgoing Email	This email from a CNL Communications Officer to WLFN providing responses to the comments and recommendations from WLFN on the EIS. CNL shared that they are looking to confirm that CNL accurately recorded the interests and concerns of WLFN related to the NPD Closure Project. CNL shared the current version of the WLFN Interests and Concerns Table (WLFN I&C) for WLFN verification. CNL also included a mapping table that indicates where/how the interest was received (WLFN Mapping). CNL requested WLFN verify its completeness and accuracy by 2023 June 20.	√	√	√	√	√	√	√	√	√	
June 29, 2023 Outgoing Email	This email from CNL Communications Officer to WLFN is to follow up on the email from CNL sent on 2023-06-06 to confirm with WLFN that CNL accurately recorded the interests and concerns of WLFN related to the NPD Closure Project.										√
July 20, 2023 Outgoing Email	This email from CNL Communications Officer to WLFN is to follow up on the email from CNL sent on 2023-06-06. CNL noted their continued interest in meeting with WLFN to discuss both the NSDF and NPD Closure projects.										√
October 17, 2023 Outgoing Email	This email from CNL Manager of Communications and Engagement to Wolf Lake FN is to provide an invite to the 2023 October 20 Career Fair being held In Pembroke.										√

WLFN - Mapping of Key Interests and Concerns

Table C-31 presents a mapping of how the key interests and concerns relate to detailed feedback and input from Wolf Lake First Nation (WLFN), up to March 2024.

Table C-31 has 3 columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 presents details of the key interest or concern that the Indigenous Nation, community or organization has identified formally in writing and/or verbally to CNL.

Table C-31 Mapping of WLFN Key Interests and Concerns

Topic	Project Aspects of Interest/Concern	Specific feedback provided by WLFN on this interest/concern
1. Aquatic Environment	(a) Importance of wetlands WLFN highlights that wetlands are significant in facilitating organic decay, filtration of water and contaminants and every effort should be made to not disturb them. Wetlands are connected to surface waters that are significant to WLFN, including the Ottawa River. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN highlighted that the importance of wetlands cannot be overstated. They are significant in facilitating organic decay, filtration of water and contaminants and every effort should be made as to not disturb them. There are surface waters within their traditional territory that are significant to WLFN, including the Ottawa River. The water provides not only life, but the waterways were major transportation routes to visit family, access trade goods and resources.
2. Baseline Characterization	(a) Characterization of aquatic and terrestrial biota. It is important to WLFN that baseline conditions in the Ottawa River are accurate, well understood and protected in order to adequately assess potential impacts to WLFN rights and traditional land and resource uses. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN requested that CNL include fish tissue sampling within their monitoring programs. WLFN was concerned that proper baseline studies of contaminants in the Ottawa River be completed.
2. Baseline Characterization	(b) Contamination of the aquatic environment WLFN is concerned about radioactivity/bioaccumulation of radionuclides in fish and within the plant communities in the near shore of the Ottawa River. An education and awareness strategy would help achieve greater understanding of baseline values for the NPD site. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN recommended that CNL and WLFN build on an education and awareness strategy aimed at mutual understating of baseline values for radioactivity/bioaccumulation of radionuclides in fish, and within the plant communities in the near shore of the Ottawa River.
3. Engagement	(a) Long-term relationship building WLFN is concerned that the EIS assumes that Algonquin communities on the Quebec side of the river have a similar perspective to Ontario communities. WLFN is interested in obtaining capacity to support a long-term relationship with CNL. This is a project-specific concern.	In their comments on the draft EIS, received March 2023 WLFN was concerned with CNL's statement that "the EIS assumes that Algonquin communities on the Quebec side of the river have a similar perspective". WLFN commits to building a longer-term relationship with CNL provided that capacity resources are available. This is an important matter to WLFN, its citizens and CNL as engagement continues to expand.
3. Engagement	(b) Continued meaningful engagement using best practices. It is important to WLFN that its members be meaningfully engaged on the project, because the project is located within WLFN traditional territory This is a project-specific concern.	In their comments on the draft EIS, received March 2023 WLFN recommended CNL and WLFN continue to work on building a relationship founded on trust that ensures information, data, results, and findings are shared. Any anomalies or concerns will be discussed and remediated to ensure uncertainties are addressed.
4. Environmental Effects and Mitigations	(a) Accommodation and compensation measures WLFN are interested in discussing accommodations and compensatory measures with CNL in the event that WLFN's valued components are found to be impacted by the proposed project. This is a project-specific concern.	In their comments on the draft EIS, received March 2023 WLFN requested support and funding for WLFN to complete a land use & occupancy study that would include their value components identified and further protect traditional, cultural and heritage sites for future generations. It is understood there will be overlapping values with other First Nations, and this can be key to identifying the significant and true value of the value components in question. WLFN is also interested to understand how First Nations are accommodated if values are impacted.

Topic	Project Aspects of Interest/Concern	Specific feedback provided by WLFN on this interest/concern
5. Impacts to Rights	(a) Concerns about assessment of impacts to rights and traditional land and resource use Fish and wildlife represent the expression of WLFN's rights and their ability to exercise their Aboriginal right to hunt, fish, and trap. The ecosystem as a whole should be considered in making decisions that may potentially impact Aboriginal rights and lead to uncertainties and fear for using staple food sources. This is a project-specific concern.	In their comments on the draft EIS, received March 2023 WLFN expressed concern that Fish and Wildlife do not recognize borders and migrate through the lands and waters owned by CNL, which represent the expression on WLFN's rights and their ability to exercise their Aboriginal right to hunt, fish, and trap. Traditional land use occurs on what are known by the federal and provincial governments as Crown Lands, or with permission, on privately owned land. The ecosystem as a whole should be considered in making decision that may potentially impact Aboriginal rights. Cumulative effects impact and impede on the exercising of rights by First Nations by affecting their staple food sources, following traditional teachings and leading to uncertainties, feeding fear- resulting in avoidance of the areas. Further, WLFN recommended that CNL and WLFN work together on measures that ensure impacts are not infringing the rights of WLFN; and impacts are minimized and WLFN's interests accommodated. Measures are also required that consider cumulative impacts and ensure that they will not result in food security issues or concerns. Sufficient and continued resources are required to maintain a healthy way of life. There are concerns about contamination of the land, water, flora and fauna.
6. Long-term Safety	(a) Long-term site integrity WLFN is concerned about the long-term management and monitoring of legacy radioactive contamination sites such as NPD. WLFN is looking to ensure the vault safety and durability, as well as understand how the landscape will respond to external forces present a few thousand years after disposal. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN expressed concern about long-term vault safety and durability. The facility should have a post closure environmental safety case that includes a detailed analysis and modelling of a geological environment that contemplates significant, ongoing, projected changes. There also needs to be an assessment of the human health and environmental impacts. WLFN is also concerned that there are significant geological processes interacting with the surface environment and the potential waste site. It is critical to understand the disposal system in terms of both short and long-term performance. WLFN suggests that understanding landscape responses to external forces and further research is needed to have a detailed model of the first few thousand years after disposal. This is significant to the long-term management of legacy radioactive contamination sites.
7. Monitoring	(a) Involvement in additional monitoring and information sharing WLFN are interested in being involved in follow up monitoring and sharing of reported results for the NPD Closure Project in order to minimize fear and uncertainty for those who may resume using the site for a range of uses in the future. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN highlighted that follow-up monitoring and sharing of reported results will be a key element in changing public perceptions. Uncertainties bring fear to people who are not aware or educated on this proposed project.
7. Monitoring	(b) Comprehensive baseline monitoring WLFN is interested in beginning an enhanced information sharing protocol to better understand the landscape from both world perspectives: "Western Science & Traditional Knowledge" to allow a more comprehensive baseline monitoring to take place for the NPD Closure Project. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN recommended that CNL and WLFN develop an enhanced information sharing protocol to better understand the landscape from both world perspectives: "Western Science & Traditional Knowledge". This would allow a more comprehensive baseline monitoring to take place for the NPD Closure Project.
7. Monitoring	(c) Periodic review of the proposed NPD Closure Project every 5 years WLFN has requested to be included in a periodic review of the proposed project following the final closure- as part of the long-term relationship building. This will ensure that WLFN traditional territory is not negatively impacted, and that they uphold their sacred responsibility to Mother Earth and her gifts (the land, water, fish, wildlife, plants, trees), thus protecting the health and well-being of citizens and the environment that sustains them. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN requested to be included in the periodic review, every 5 years, following the final closure- as part of the long-term relationship building. WLFN's primary concern is that their traditional territory is not negatively impacted, and that they uphold their sacred responsibility to Mother Earth and her gifts, (the land, water, fish, wildlife, plants, trees), thus protecting the health and well-being of citizens and the environment that sustains them. The citizens of WLFN have a connection with all the Algonquin Nations in both Ontario and Quebec.
8. National Policy	(a) Modernization of Canada's nuclear waste policy WLFN are of the view that the Auditor General's nuclear waste management audit and NRCan's policy modernization process should conclude before the NPD facility is decommissioned.	In their comments on the draft EIS, received March 2023, WLFN requested that the Auditor General's nuclear waste management audit and NRCan's policy modernization process should conclude before the NPD facility is decommissioned. Findings from the audit and hearings may help prevent the proposed project from becoming a

Topic	Project Aspects of Interest/Concern	Specific feedback provided by WLFN on this interest/concern
	This concern is out of scope for the NPD Closure Project	financial and environmental disaster that has the potential to impact the Ottawa River and traditional territory of WLFN.
9. Protection of the Ottawa River	(a) Radioactive waste should not be present near the vicinity of water bodies, like the Ottawa River and St. Lawrence River Basin WLFN is concerned about perceived contamination due to the project's proximity to the Ottawa River, which has great importance to WLFN This is a project-specific and a broader concern.	In their comments on the draft EIS, received March 2023, WLFN requested that the principle of no radioactive waste near the vicinity of water bodies, like the Ottawa River and St. Lawrence River Basin be followed.
10. Technical	(a) WLFN is interested in knowing the point source for contamination exceedances in sediment This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN expressed concern with the recorded high concentration levels of several metals found in the sediment samples. The EIS identifies these levels as baseline conditions however WLFN remains concerned that this contamination is occurring from the NPD site. WLFN wishes to better understand where CNL believes this contamination occurred from, as the sediment contamination exceedances must have a point source?
10. Technical	(b) Emissions and discharges It is important to WLFN that emissions to and contaminants within the atmospheric environment are properly assessed, and are mitigated and monitored as appropriate. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN requested that reports from the air monitoring stations within the Regional Study Area be shared with WLFN to demonstrate compliance with regulatory requirements and that there is no evidence of cumulative impacts that affects the traditional territory of WLFN.
10. Technical	(c) Transport of contaminants in groundwater WLFN is concerned about groundwater intrusion that will eventually saturate the grout and come in contact with contamination, and the dissolved contaminates will reach the Ottawa River. There are some uncertainties about the impacts to surface water quality. Long-term exposure to contaminants is unacceptable even in small doses that do not exceed the acceptance criteria. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN expressed concern about the transport of contaminants through groundwater and ultimately to the Ottawa river. WLFN highlighted, that in relation to the vault, there will be groundwater intrusion that will eventually saturate the grout and come in contact with contamination, and the dissolved contaminants will reach the Ottawa River. When the vault is completely saturated with groundwater, the infrastructure will be compromised and will transport contaminated groundwater to the Ottawa River. Further WLFN has identified that long-term exposure to contaminants is unacceptable even in small doses that do not exceed the acceptance criteria.
11. Traditional Land and Resource Use and Cultural Impacts	(a) Safety of harvested and gathered foods WLFN are concerned about the accumulated effects and impacts to First Nations who are using the area for hunting and gathering during the postclosure period. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN recommended that CNL share the results and findings and ensure that citizen uncertainties are addressed through education and awareness that continues from generation to generation for an anticipated 550-year project life span. Further, WLFN recommended that CNL and WLFN work collaboratively to avoid and mitigate impacts to value components identified by WLFN.
11. Traditional Land and Resource Use and Cultural Impacts	(b) Impact of perceived contamination in the Ottawa River and the environment on the inherent and protected rights of WLFN citizens The NPD site is important to WLFN since its citizens use these lands and waters. WLFN traditional territory must be protected from legacy, present and future contamination. Perceived contamination plays a key role in the way First Nations practice harvesting activities that can influence the safety and acceptability of the proposed project. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN identified that perceived contamination plays a key role in the way First Nations practice harvesting activities that can influence the safety and acceptability of the proposed project. WLFN is not certain that their traditional territory is protected from legacy, present and future contamination, which is impacting the way WLFN citizens are exercising their inherent and protected rights. Language used within the EIS does not make the First Nation confident that their traditional territory, and flora and fauna that is relied upon, is not going to be impacted. WLFN cannot positively support the project when statements like "reasonably achievable measures' or "prevent or minimize harm to workers, the public and the environment" are being stated in the reports. These statements assume that impact or influence, that will or may occur, is acceptable provided it is in small doses. Further, the NPD Closure project is significant to WLFN. The proposed project is located on federally owned lands situated on the Ottawa River. Directly North and East across the River is Quebec that consists of gently

Topic	Project Aspects of Interest/Concern	Specific feedback provided by WLFN on this interest/concern
		rolling hills interspaced with many small lakes. WLFN citizens in both Ontario and Quebec use these lands and waters, which have the potential to be impacted by the proposed project. This is especially challenging for WLFN, given negotiations for their reserve land base have yet to be resolved. Despite no resolution in the negotiations, Canada continues to decide on projects that have the potential to contaminate the traditional territory of WLFN. Such conduct is not supportive of reconciliation efforts being promoted by both Federal and Provincial governments.
11. Traditional Land and Resource Use and Cultural Impacts	(c) Algonquin traditional knowledge should be collected and incorporated into the EIS WLFN is interested in documenting traditional knowledge, land use, occupancy, and values to demonstrate how the proposed project may impact WLFN's land use, occupancy, rights, traditional food harvesting, and citizens. This includes collaborating to take an inventory of the areas of significance. This is important to WLFN citizens who historically and currently continue to use the lands and waters around the proposed NPD Closure Project and other CNL sites. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN recommended that CNL support WLFN in completing a Diet and Harvesting Study that will look at the importance of traditional food harvesting and the way of life from WLFN's perspective. Further, WLFN recommends using the same research parameters as WLFN's previous Land Use Study which has specific community data standards that are kept consistent and can be used in future data sharing if required between Nations, and CNL. WLFN looks at potentially keeping the 50 km radius from the site of the proposed NPD Closure Project; including the Kichi-Sìbì (Ottawa River) and a good representation for the Quebec region. WLFN does maintain land use, occupancy and values that are in both the provinces of Ontario and Quebec. WLFN has also recommended that CNL support WLFN in establishing a process that will document traditional knowledge, land use, occupancy, and values within a site radius to be determined by WLFN. WLFN citizens historically and currently continue to use the lands and waters around the proposed NPD Closure Project and other CNL sites. WLFN and CNL to collaborate and take an inventory of the areas of significance, use and occupancy, using a proximity of 50km. This study must be in line with data collected. Data sharing with and among First Nations in the future may be significant if rights are impacted by the project.
12. Valued Components	(a) Engagement, input and participation in VC selection WLFN requires the opportunity to provide values identified by the community. A priority concern is any potential changes in local fishery species as they are an important and significant indicator of understanding the potential and cumulative effects on inherent rights for harvesting natural resources, fish and wildlife species, and medicine. This is a project-specific concern.	In their comments on the draft EIS, received March 2023, WLFN highlighted that WLFN needs an opportunity to provide values identified by the community. Some values that are very similar have been identified by other First Nations. A priority concern is any potential changes in local fishery species; as they are an important and significant indicator of understanding the potential effects and cumulative effects on inherent and protected rights from the proposed NPD Closure Project. WLFN has also highlighted that First Nations have traditional harvesting, and intercommunity harvesting protocols that need to be taken into account. Many of the species at risk listed within the valued components have a connection to WLFN where knowledge and stories that reflect the natural operations of various ecosystems, are held.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Wolf Lake First Nation – Summary of Interests and Concerns

Table C-32 below summarizes the key interests and concerns that Wolf Lake First Nation (WLFN) raised on the NPD Closure Project, up to March 2024.

Table C-32 has five columns:

- Column 1 identifies the topic, i.e., the subject area the key interest(s) or concern(s) falls under.
- Column 2 presents a key interest or concern, why it is important to the Indigenous Nation, community or organization, and connects it to a project aspect or an Aboriginal or treaty right wherever possible. This may be a summary of multiple related interests or concerns that have been expressed by the Indigenous Nation, community or organization.
- Column 3 summarizes CNL's response or conclusions as well as CNL's efforts to address this key interest or concern
- Column 4 identifies where in the EIS the key interest or concern is addressed, and whether any changes were made to the EIS in response to the interest/concern. If these changes resulted in a different outcome in the EIS, this is also discussed;
- Column 5 summarizes the "Status" of the key interest or concern and the anticipated Next Steps towards achieving resolution of the key interest or concern. Not all concerns can be quickly or easily resolved, as some concerns go beyond the scope of the EA process, or there may divergent perspectives on certain interests or concerns. Note: this column does not, unless specifically confirmed by the Indigenous Nation, community or organization, mean that they have verified that the interest or concern has been dealt with to their satisfaction.

Table C-32 Wolf Lake First Nation Interests and Concerns

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
1. Aquatic Environment	(a) Importance of wetlands WLFN highlights that wetlands are significant in facilitating organic decay, filtration of water and contaminants and every effort should be made to not disturb them. Wetlands are connected to surface waters that are significant to WLFN, including the Ottawa River. This is a project-specific concern.	CNL Response The potential for contamination to reach the Ottawa River is assessed in the EIS and is supported by detailed groundwater modelling and long term performance modelling for the proposed disposal facility. The groundwater source of the wetlands is not affected at all by groundwater from the NPD facility. Groundwater on the NPD site flows towards the Ottawa River, so groundwater that interacts with the NPD facility flows away from the wetlands onsite, towards the Ottawa River. The EIS predicts no effects to surface water (including the Ottawa River). To verify that the engineered barriers are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. CNL is interested in engagement with WLFN to gain a greater understanding of their concerns about watershed sustainability related to the NPD Closure Project.	Where is this topic discussed in the EIS? **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the proposed NPD Disposal Facility to ensure protection of the surrounding environment including the Ottawa River. Mitigation measures for the protection of surface water (**Section 9.3.3.2**) (including the Ottawa River) have been updated and expanded from the 2017 draft EIS. The EIS does not predict any adverse residual effects on the aquatic environment (**Section 9.4.3.5**) as a result of the NPD Closure Project. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
2. Baseline Characterization	(a) Characterization of aquatic and terrestrial biota. It is important to WLFN that baseline conditions in the Ottawa River are accurate, well understood and protected in order to adequately assess potential impacts to WLFN rights and traditional land and resource uses. This is a project-specific concern.	CNL Response Species detected as part of baseline biodiversity surveys within a 200 m area beyond the perimeter of the project footprint have been included as Valued Components for the NPD Closure Project, and mitigation measures, including buffers, have been developed for protection. To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020. CNL is happy to provide the report to WLFN.	Where is this topic discussed in the EIS? **Appendix B** and **Section 8.6** of the EIS indicate which species have been observed on the NPD site. Historic environmental monitoring is summarized in the description of the existing environment (**Section 8**) of the EIS. Specifically, EIS **Sections 8.2** – Atmospheric Environment, **8.3** Surface Water Environment, **8.5.6** Groundwater Quality and **8.7** Ambient Radioactivity.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		The study determined that the Ottawa River benthic invertebrate community near the NPD site is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. This study can be repeated when decommissioning is complete, to verify if the project has had an impact. CNL is planning to regularly monitor the Ottawa River water quality before the project begins. CNL is willing to discuss fish tissue sampling with WLFN and review past studies of fish tissue in the NPD area.	What changes have been made (and where)? No changes have been made to the EIS in response to this feedback	Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
2. Baseline Characterization	(b) Contamination of the aquatic environment WLFN is concerned about radioactivity/bioaccumulation of radionuclides in fish and within the plant communities in the near shore of the Ottawa River. An education and awareness strategy would help achieve greater understanding of baseline values for the NPD site. This is a project-specific concern.	In response to comments from Indigenous Nations, communities and organizations, CNL completed sediment and benthic invertebrate sampling and fish habitat surveys to establish the baseline for follow-up monitoring. CNL is happy to provide the report to WLFN. CNL is open and willing to work together with WLFN to build an education and awareness strategy aimed at mutual understanding of baseline values for the NPD site. CNL Response: To supplement baseline data, a study of sediment, benthic invertebrates and fish habitat features was undertaken upstream, adjacent to and downstream of the NPD site in 2020. The study determined that the Ottawa River benthic invertebrate community near the NPD site is healthy and typical of what is observed in many large, soft-bottomed, relatively deep river systems. This study can be repeated when decommissioning is complete, to verify if the project has had an impact. CNL is planning to regularly monitor the Ottawa River water quality before the project begins. CNL is willing to discuss fish tissue sampling with WLFN and review past studies of fish tissue in the NPD area. Species detected as part of baseline biodiversity surveys within a 200m area beyond the perimeter of the project footprint have been included as Valued Components for the NPD Closure Project, and mitigation measures, including buffers, have been developed for protection. As shown in the EIS, there are no adverse impacts from the project on the Ottawa River shoreline or on any fish, wildlife or plants within the riparian and aquatic ecosystems. CNL is continuing its efforts to address these concerns by involving the Indigenous Nations, communities and organizations in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help build confidence that the decommissioning strategy and mitigation measures are effective. The development of risk communication tools is also important to achieve a greater understanding of the NPD Closure Project.	Where is this topic discussed in the EIS? **Appendix B** and **Section 8.6** of the EIS indicate which species have been observed on the NPD site. Historic environmental monitoring is summarized in the description of the existing environment (**Section 8**) of the EIS. Specifically, EIS **Sections 8.2** – Atmospheric Environment, **8.3** Surface Water Environment, **8.5.6** Groundwater Quality and **8.7** Ambient Radioactivity. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
3. Engagement	(a) Long-term relationship building WLFN is concerned that the EIS assumes that Algonquin communities on the Quebec side of the river have a similar perspective to Ontario communities. WLFN is interested in obtaining capacity to support a long-term relationship with CNL. This is a project-specific concern.	Summary of Engagement: In December 2022, WLFN requested to review the NPD EIS. On December 20, 2022, a Capacity Funding Agreement was signed by WLFN and CNL to support WLFN's involvement in the Environmental Assessment (EA) process for the NPD Closure Project. In March 2023, WLFN provided their comments to CNL on the NPD EIS. CNL Response CNL is committed to collaborative, two-way engagement with the WLFN on the NPD Closure Project in the means that WLFN would like to be engaged. CNL has much to learn and hopes to build trust and seek guidance from WLFN. Through meaningful engagement activities, CNL is happy to share information, data, results, and findings, as well as discuss and address issues and concerns with WLFN. CNL has heard WLFN's request to establish a longer-term relationship. As a starting point, CNL is very interested in working together with WLFN to develop a work plan and capacity for NPD specific activities.	Where is this topic discussed in the EIS? CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
3. Engagement	(b) Continued meaningful engagement using best practices. It is important to WLFN that its members be meaningfully engaged on the project, because the project is located within WLFN traditional territory This is a project-specific concern.	Summary of Engagement: In December 2022, WLFN requested to review the NPD EIS. On December 20, 2022, a Capacity Funding Agreement was signed by WLFN and CNL to support WLFN's involvement in the EA process for the NPD Closure Project. In March 2023, WLFN provided their comments to CNL on the NPD EIS. An in-person discussion of WLFN recommendations is planned in community in 2023 June. CNL Response CNL is committed to collaborative, two-way engagement with the WLFN on the NPD Closure Project in the means that WLFN would like to be engaged. CNL has much to learn and hopes to build trust and seek guidance from WLFN. Through meaningful engagement activities, CNL is happy to share information, data, results, and findings, as well as discuss and address issues and concerns with WLFN.	Where is this topic discussed in the EIS? CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. What changes have been made (and where)? Engagement activities with WLFN has been added to **Section 6.2.4.17** of the EIS.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
4. Environmental Effects and Mitigations	(a) Accommodation and compensation measures WLFN are interested in discussing accommodations and compensatory measures with CNL in the event that WLFN's valued components are found to be impacted by the proposed project.	CNL Response CNL acknowledges WLFN's concerns about the potential impacts on the rights of the WLFN to practice traditional activities on, and in the vicinity of, the NPD site. CNL recognizes that, while we don't have the full historical records, we know that the NPD site was very likely	Where is this topic discussed in the EIS? CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. The EIS includes a section on Indigenous engagement related to VC selection (**Section 6.3.1.1**)	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	This is a project-specific concern.	established without consulting Indigenous Peoples. As the licensee for AECL owned sites, CNL is working to understand all of the considerations around the future of the sites, including considerations for Indigenous consultations through engagements with Indigenous Peoples. While we can't change the past, we can look forward and work to establish positive and mutually beneficial relationship with the WLFN. CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. Ultimately, the decision of impacts to rights rests with the CNSC. If the CNSC finds any potential impacts to WLFN's Indigenous and/or treaty rights, CNL remains committed to understanding these rights and working collaboratively to ensure that they are appropriately mitigated to the greatest extent possible. CNL is very interested in continuing dialogue with the WLFN to foster a greater understanding of concerns on lost use and occupancy of the land. We look forward to continued engagement to enable the development of both project-specific and CNL commitments. CNL is very interested in working together with the WLFN to identify WLFN valued components and develop mitigation measures to address interests and concerns related to VCs.	What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
5. Impacts to Rights	(a) Concerns about assessment of impacts to rights and traditional land and resource use Fish and wildlife represent the expression of WLFN's rights and their ability to exercise their Aboriginal right to hunt, fish, and trap. The ecosystem as a whole should be considered in making decisions that may potentially impact Aboriginal rights and lead to uncertainties and fear for using staple food sources. This is a project-specific concern.	As part of CNL's engagement activities, we seek to understand the interests and concerns of Indigenous Nations, communities and organizations while building awareness and understanding of NPD Closure Project activities. CNL seeks to develop a mutual understanding of the perceived effects of NPD Closure Project activities on the environment and any potential negative impacts on Aboriginal and/or treaty rights. This includes, but is not limited to, rights to trap, hunt, fish, gather, or harvest as well as the continuation and uninterrupted access to cultural and spiritual activities on the lands and waters. CNL Response: CNL acknowledges WLFN's concerns about assessment of impacts to rights and traditional land and resource use, driven by distrust in the safety of the land and water. CNL is open to increased engagement, education and participatory involvement in monitoring activities at its sites to address these concerns. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and	Where is this topic discussed in the EIS? CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. The EIS notes in **Table 6.2-2** that the NPD site is located within the vicinity of known traditional territory. The EIS does not predict any adverse residual effects to traditional land and resource use (**Section 9.9.3.5**). What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		isolated from the environment, ensuring public safety. This solution has the potential to result in additional lands being freed up for traditional harvest or other uses by Indigenous peoples or the public. CNL stands by its conclusion that the project will not interfere with traditional activities or have a negative impact on the biological resources on which they are dependent. Ultimately, the decision of impacts to rights rests with the CNSC. If the CNSC finds any potential impacts to WLFN's Indigenous and/or treaty rights, CNL remains committed to understanding these rights and working collaboratively to ensure that they are appropriately mitigated to the greatest extent possible.		
6. Long-term Safety	(a) Long-term site integrity WLFN is concerned about the long-term management and monitoring of legacy radioactive contamination sites such as NPD. WLFN is looking to ensure the vault safety and durability, as well as understand how the landscape will respond to external forces present a few thousand years after disposal. This is a project-specific concern.	CNL is open and willing to discuss some of the geologic and site investigation undertaken to support the project during a dedicated meeting with WLFN. CNL is also willing to share the Geosynthesis report for the project. <u>CNL Response:</u> CNL acknowledges WLFN's concerns about the long-term safety of the NPD site. CNL has assessed the probabilities and potential impacts of flooding, seismic activity, above-ground natural hazards and extreme temperature change through all project phases (Decommissioning Execution, Institutional Controls and Post-Institutional Controls), and has concluded that these events will have no undue effects on people or the environment around the site. CNL models several scenarios in its Postclosure Safety Assessment (PostSA) technical supporting document (TSD) which take into account how accidents and natural hazards could affect the facility. These scenarios are called disruptive events. One such case models severe erosion (flood) while another models extreme degradation of the facility (the concrete structure and the grout). In both of these cases the predicted doses to receptors are still well below the dose criterion. In 2018/19, CNL undertook a geoscientific fieldwork campaign to sample and characterize the bedrock around the NPD facility. The fieldwork included coring of 10 boreholes to a depth of 50 meters into bedrock and several overburden boreholes, with installation of wells for sampling and hydraulic property determinations. The Geoscientific Characterization Report was used to revise the Geosynthesis report and the various models (i.e., Groundwater Model, Resaturation Model). The results of these reports were incorporated into the PostSA TSD enabling CNL to assess potential effects to valued components (VC) in the aquatic and terrestrial ecosystems. The additional field investigations	<u>Where is this topic discussed in the EIS?</u> **Section 8.5** of the EIS presents the geological baseline data. **Section 8.12** of the EIS discusses the relevant natural disasters to which NPD may be exposed. **Section 9.14** of the EIS discusses the potential effects on the project of climate change, forest fires, floods, earthquakes, severe weather such as tornados, lightning strikes, ice storms, and changes to the Ottawa River. The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. Additional details and a range of scenarios that encompass the potential impacts from extreme weather and natural hazards are examined in the DecomSA TSD and the PostSA TSD. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback.	<u>Status</u>: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. <u>Next Steps:</u> CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		and updated models support the conclusion that the NPD Closure Project is protective of human health and the environment. CNL acknowledges that, as the licensee, it is responsible for the long-term management of the site during the Institutional Controls period, which will last a minimum of 100 years and will be extended as long as is necessary to ensure protection of people and the environment. The EIS predicts no effects to surface water (including the Ottawa river); CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS.		
7. Monitoring	(a) Involvement in additional monitoring and information sharing WLFN are interested in being involved in follow up monitoring and sharing of reported results for the NPD Closure Project in order to minimize fear and uncertainty for those who may resume using the site for a range of uses in the future. This is a project-specific concern.	CNL is open and willing to have a dedicated discussion with WLFN on their desired level of involvement in monitoring. CNL is happy to share technical reports that are available for the project. CNL Response: CNL acknowledges WLFN's concerns about the long-term safety of the NPD site and the potential impacts on the rights of the WLFN and other Indigenous Nations, communities and organizations to practice traditional activities around the NPD site. The PostSA TSD demonstrates that the impact beyond the Institutional Controls period on the public, Indigenous and the environment is negligible under all scenarios. The proposed NPD Closure Project has the potential to help reduce concerns of alienation and/or fears. The proposed project involves a long-term solution to ensure the waste that currently resides at the NPD site is effectively contained and isolated from the environment, ensuring public safety. This solution has the potential to result in additional lands being freed up for traditional harvest or other uses by Indigenous peoples or the public. At the project level, follow-up monitoring for the NPD Closure Project will include monitoring of environmental components critical to WLFN such as monitoring of surface water, groundwater and air quality. CNL will conduct monitoring for as long as necessary to verify the results of the assessment in the EIS. CNL is continuing its efforts to address these concerns by: (i) Involving Indigenous Nations, communities and organizations, in monitoring activities that will confirm the conclusions of the EIS. An Indigenous-driven monitoring program can help to reduce fear or anxiety associated with traditional uses occurring adjacent to and near CNL operated sites	Where is this topic discussed in the EIS? CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. The EIS does not predict any adverse residual effects to traditional land and resource use (**Section 9.9.3.5**). The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		and build confidence that the decommissioning strategy and mitigation measures are effective. (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project to promote understanding of the EIS results and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern.		
7. Monitoring	(b) Comprehensive baseline monitoring WLFN is interested in beginning an enhanced information sharing protocol to better understand the landscape from both world perspectives: "Western Science & Traditional Knowledge" to allow a more comprehensive baseline monitoring to take place for the NPD Closure Project. This is a project-specific concern.	In response to WLFN's EIS comments, CNL will share a link to the annual summary of environmental performance available on CNL's website. CNL would be pleased to share any other historic monitoring data as requested by WLFN. CNL is open and willing to work together with WLFN to incorporate Traditional Knowledge into its Western Science practices. CNL Response: CNL conducts a rigorous monitoring program and is committed to ensuring that the environment around the NPD site, including the Ottawa River, is protected. Monitoring of the environment (a) Ottawa River water: Radioactivity measured in the Ottawa River upstream and downstream of the NPD site are very low (<0.01% of the derived release limit). (b) Surface soil and Vegetation: Tritium in soil and vegetation on the NPD site is very low (< 0.01% of the derived release limit). The results demonstrate that the public and the environment around the NPD site continues to be protected. In addition to the CNL monitoring program, the CNSC leads an Independent Environmental Monitoring Program (IEMP) designed to verify that the public and the environment around licensed nuclear facilities are protected. As part of its IEMP, the CNSC samples and analyzes surface water upstream and downstream of the NPD site (including sampling for non-radiological parameters). The CNSC IEMP results confirm that the public and the environment around the NPD site are protected and that there are no expected health impacts.	Where is this topic discussed in the EIS? The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
7. Monitoring	(c) Periodic review of the proposed NPD Closure Project every 5 years WLFN has requested to be included in a periodic review of the proposed project following the final closure- as part of the long-term relationship building. This will ensure that WLFN traditional territory is not negatively impacted, and that they uphold their sacred responsibility to Mother	CNL Response CNL is open to working with WLFN to ensure WLFN involvement in reviewing the draft follow-up monitoring plans and recognizes how such a review can support long-term monitoring programs. CNL invites WLFN for further engagement with CNL on this topic.	Where is this topic discussed in the EIS? The EIS update includes additional detail on the VC-related engagement process and how Indigenous interests have been incorporated into the VCs selected for the NPD Closure Project.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
	Earth and her gifts (the land, water, fish, wildlife, plants, trees), thus protecting the health and well-being of citizens and the environment that sustains them. This is a project-specific concern.	CNL is willing to involve WLFN and other Indigenous Nations, communities and organizations in the monitoring program, which will help ensure transparency and lend confidence to monitoring activities and results. The aim of monitoring activities are to confirm the accuracy of the EIS predictions around potential effects and develop mitigation measures as needed.	Mitigation measures for Indigenous Land and Resource Use are presented in **Section 9.9.3.2** and for Indigenous Socio-Economic and Health in **Section 9.10.1.3.2**. **Section 12** of the EIS summarizes the follow-monitoring plans developed for the project. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
8. National Policy	(a) Modernization of Canada's nuclear waste policy WLFN are of the view that the Auditor General's nuclear waste management audit and NRCan's policy modernization process should conclude before the NPD facility is decommissioned. This concern is out of scope for the NPD Closure Project.	CNL Response: This interest is generally beyond the scope of the project. The proposal to create a disposal facility on the NPD reactor site through in-situ decommissioning has been chosen as a safe and immediate decommissioning option for the NPD reactor with respect to the environment, workers and the public. It is important to highlight that this closure will reduce historic nuclear liabilities for Canada and, at the same time, reduce the footprint of the NPD site.	Where is this topic discussed in the EIS? **Section 3.5** of the EIS summarizes the regulatory framework for the NPD Closure Project. **Section 6.4** outlines CNL's approach and commitment to reconciliation. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
9. Protection of the Ottawa River	(a) Radioactive waste should not be present near the vicinity of water bodies, like the Ottawa River and St. Lawrence River Basin. WLFN is concerned about perceived contamination due to the project's proximity to the Ottawa River, which has great importance to WLFN. This is a project-specific and a broader concern.	CNL Response: The potential for contamination to reach the Ottawa River is assessed in the EIS and is supported by long term modelling and detailed groundwater modelling. The EIS predicts no effects to surface water (including the Ottawa river). CNL is open and willing to have a dedicated discussion with WLFN on its conclusion of no adverse impacts on the Ottawa River. CNL has added information to the EIS about the washout pit and historic water discharges from the wells area sump. Monitoring results capture the effects of historic activities. Groundwater modelling was conducted for the NPD site. The PostSA TSD incorporates the results of groundwater modelling and, where necessary, uses conservative assumptions, (e.g., the tile drains remain functional and	Where is this topic discussed in the EIS? **Section 8.5** of the EIS presents the geological baseline data. The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		serve as a faster pathway to the Ottawa River), and considers the tile drains to have failed (so that the facility resaturates more quickly). The PostSA concludes that no residual effects are expected from potential contaminant migration in groundwater. Follow up monitoring will be implemented to confirm the predictions presented in the EIS. To verify that the engineered barriers as a whole are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor groundwater quality after it interacts with the facility and before it reaches the Ottawa River.		Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
10. Technical	(a) WLFN is interested in knowing the point source for contamination exceedances in sediment This is a project-specific concern.	In response to WLFN's EIS comments, CNL will share a link to the annual summary of environmental performance available on CNL's website. CNL would be pleased to share any other historic monitoring data as requested by WLFN. However, CNL notes that impacts from past operations are out of scope of this EA. CNL Response: CNL conducts a rigorous monitoring program and is committed to ensuring that the environment around the NPD site, including the Ottawa River, is protected. The results demonstrate that the public and the environment around the NPD site continues to be protected. In addition to the CNL monitoring program, the CNSC leads an Independent Environmental Monitoring Program (IEMP) designed to verify that the public and the environment around licensed nuclear facilities are protected. As part of its IEMP, the CNSC samples and analyzes surface water upstream and downstream of the NPD site (including sampling for non-radiological parameters). The CNSC IEMP results confirm that the public and the environment around the NPD site are protected and that there are no expected health impacts.	Where is this topic discussed in the EIS? Historic environmental monitoring is summarized in the description of the existing environment (**Section 8**) of the EIS. Specifically, **Sections 8.2** – Atmospheric Environment, **8.3** Surface Water Environment, **8.5.6** Groundwater Quality and **8.7** Ambient Radioactivity. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
10. Technical	(b) Emissions and discharges. It is important to WLFN that emissions to and contaminants within the atmospheric environment are properly assessed, and are mitigated and monitored as appropriate. This is a project-specific concern.	In response to WLFN's EIS comments, CNL will share a link to the annual summary of environmental performance available on CNL's website. CNL would be pleased to share any other historic monitoring data as requested by WLFN. CNL Response: CNL conducts a rigorous monitoring program and is committed to ensuring that the environment around the NPD site, including the Ottawa River, is protected. The results demonstrate that the public and the environment around the NPD site continues to be protected.	Where is this topic discussed in the EIS? The follow-up monitoring program is described at a high level in **Section 12** of the EIS, details of which derive from the development of the effluent, environment and groundwater draft follow-up monitoring plans. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		Air releases of substances that will not be removed from the facility prior to decommissioning are assessed in the DecomSA TSD and are below relevant criteria. Monitoring of the environment (a) Ottawa River water: Radioactivity measured in the Ottawa River upstream and downstream of the NPD site are very low (<0.01% of the derived release limit). (b) Surface soil and Vegetation: Tritium in soil and vegetation on the NPD site is very low (< 0.01% of the derived release limit). In addition to the CNL monitoring program, the CNSC leads an Independent Environmental Monitoring Program (IEMP) designed to verify that the public and the environment around licensed nuclear facilities are protected. As part of its IEMP, the CNSC samples and analyzes surface water upstream and downstream of the NPD site (including sampling for non-radiological parameters). The CNSC IEMP results confirm that the public and the environment around the NPD site are protected and that there are no expected health impacts. The EIS does not predict any adverse residual effects on the aquatic or terrestrial environment as a result of potential emissions during the NPD Closure Project.		<u>Next Steps:</u> CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
10. Technical	(c) Transport of contaminants in groundwater WLFN is concerned about groundwater intrusion that will eventually saturate the grout and come in contact with contamination, and the dissolved contaminates will reach the Ottawa River. There are some uncertainties about the impacts to surface water quality. Long-term exposure to contaminants is unacceptable even in small doses that do not exceed the acceptance criteria. This is a project-specific concern.	<u>CNL Response</u> The potential for contamination to reach the Ottawa River is assessed in the EIS and is supported by long term modelling and detailed groundwater modelling. The EIS predicts no effects to surface water (including the Ottawa river) and follow up monitoring will be implemented to confirm these predictions. Groundwater modelling was conducted for the NPD site. The PostSA TSD incorporates the results of groundwater modelling and, where necessary, uses conservative assumptions, (e.g., the tile drains remain functional and serve as a faster pathway to the Ottawa River), and considers the tile drains to have failed (so that the facility resaturates more quickly). The PostSA concludes that no residual effects are expected from potential contaminant migration in groundwater. The tile drain system is expected to fail at some point during the Institutional Controls phase. To verify that the engineered barriers as a whole are performing as expected/designed, CNL will monitor groundwater. Groundwater wells will be located between the NPD facility and the Ottawa River in order to monitor	<u>Where is this topic discussed in the EIS?</u> **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the Ottawa River. **Section 4.3** of the EIS describes the project activities and presents CNL's plans with respect to surface drainage. **Section 4.5** of the EIS describes CNL's plans for handling project-related liquid releases. **Sections 9.3 and 9.5** of the EIS presents the assessment of potential impacts to surface water and groundwater respectively. Mitigation measures for the protection of surface water and groundwater are provided, including CNL's process for non-routine discharges. No un-assessed liquid effluent releases are permitted. The EIS does not predict any adverse residual effects on the surface water or groundwater environments. **Section 12** of the EIS summarizes the Monitoring Plans developed for the project.	<u>Status</u>: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. <u>Next Steps:</u> CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		groundwater quality after it interacts with the facility and before it reaches the Ottawa River.	What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	
11. Traditional Land and Resource Use and Cultural Impacts	(a) Safety of harvested and gathered foods WLFN are concerned about the accumulated effects and impacts to First Nations who are using the area for hunting and gathering during the postclosure period. This is a project-specific concern	CNL Response CNL acknowledges WLFN's concern about the effects on the Kichi-Sìbì and NPD site from various activities in the past, present and future. CNL has assessed potential effects related to the safety of harvesting and consuming local foods, and no significant adverse effects were identified in the assessment. CNL suggests a dedicated conversation to review the Indigenous receptor evaluated as part of the EA for the project.	Where is this topic discussed in the EIS? The EIS presents the PostSA results for the Indigenous receptor group in **Section 9.10.2.** **Section 9.13** of the EIS describes the process for evaluating cumulative effects and presents CNL's assessment of cumulative effects for the NPD Closure Project. What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
11. Traditional Land and Resource Use and Cultural Impacts	(b) Impact of perceived contamination in the Ottawa River and the environment on the inherent and protected rights of WLFN citizens The NPD site is important to WLFN since its citizens use these lands and waters. WLFN traditional territory must be protected from legacy, present and future contamination. Perceived contamination plays a key role in the way First Nations practice harvesting activities that can influence the safety and acceptability of the proposed project. This is a project-specific concern.	Summary of Engagement: In December 2022, WLFN requested to review the NPD EIS, and a meeting was held to discuss drafting a Contribution Agreement for WLFN's involvement in the EA process for the NPD Closure Project. On December 20, 2022, a Capacity Funding Agreement was signed by WLFN and CNL. In March 2023, WLFN provided their comments to CNL on the NPD EIS. CNL Response CNL acknowledges WLFN's concerns about perceived effects from the NPD site. CNL has assessed potential nuisance effects related to dust and noise, loss of connection to the land, safety of harvesting and consuming local foods, and changes to access to the land; no significant adverse effects were identified in the assessment. The potential for contamination to reach the Ottawa river is assessed in the EIS and is supported by long term modelling and detailed groundwater modelling. The EIS predicts no effects to surface water (including the Ottawa river) and follow up monitoring will be implemented to confirm these predictions.	Where is this topic discussed in the EIS? **Section 3.5** of the EIS summarizes the regulatory framework for the NPD Closure Project. **Section 6.4** outlines CNL's approach and commitment to reconciliation. **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the Ottawa River. CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. **Section 8.9** of the EIS presents information about traditional land and resource use. **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs. The EIS discusses concerns about potential loss of connection to land and water (e.g., feeling of discomfort or concern), and loss of land and water use in **Section 9.9.5**.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL stands by its conclusion that the project will not interfere with traditional activities nor impact biological resources upon which they are dependent. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that in the future there is an interest to re-establish traditional use activities on the NPD site. CNL is attempting to address these concerns by: (i) Involving the Indigenous Nations, communities and organizations in monitoring activities that will confirm the conclusions of the EIS and that the decommissioning strategy and mitigation measures are effective; and (ii) Developing an Indigenous-driven risk-informed communications program for the NPD Closure Project, to promote understanding of the EIS results, and to help alleviate the concerns related to negative perceptions and feelings of discomfort and concern. CNL is committed to building positive long-term relationships with Indigenous Nations and communities who have treaty and Aboriginal rights on the lands for the proposed NPD disposal facility, as well as working with other interested Indigenous Nations, communities and organizations. It is important to CNL that we continue our efforts to build a relationship with WLFN through meaningful engagement to address any potential issues and concerns on the proposed project.	The follow-up monitoring program is described at a high level in **Section 12** of the EIS. What changes have been made (and where)? Engagement activities with WLFN has been added to **Section 6.2.4** of the EIS.	
11. Traditional Land and Resource Use and Cultural Impacts	(c) Algonquin traditional knowledge should be collected and incorporated into the EIS WLFN is interested in documenting traditional knowledge, land use, occupancy, and values to demonstrate how the proposed project may impact WLFN's land use, occupancy, rights, traditional food harvesting, and citizens. This includes collaborating to take an inventory of the areas of significance. This is important to WLFN citizens who historically and currently continue to use the lands and waters around the proposed NPD Closure Project and other CNL sites. This is a project-specific concern.	CNL Response CNL agrees that traditional knowledge from WLFN and other Indigenous Nations, communities and organizations should be integrated into the EIS. The Near Surface Disposal Facility (NSDF) and NPD Projects have provided capacity to the Algonquin community closest to the NPD site (the AOPFN). AOPFN also completed a Traditional Knowledge and Land Use Study (AKLUS) and a Culture and Rights Study. CNL is open and willing to discuss this topic further with WLFN to fully understand WLFN-specific interests. The EIS and supporting studies have assumed that traditional uses do occur adjacent to the NPD site, whether on the Ottawa River or outside the restricted/fenced area. CNL has also assumed that there will be future interest in re-establishing traditional use activities on the NPD site.	Where is this topic discussed in the EIS? CNL presents its record of engagement with all Indigenous Nations, communities and organizations in **Section 6.2.4** of the EIS. **Appendix B** and **Section 8.6** of the EIS indicate which species have been observed on the NPD site. **Section 8.9** of the EIS presents information about traditional land and resource use. **Section 9.9** of the EIS assesses risk to traditional land and resource use VCs, including new VCs (**Sections 6.3 and 9.9** of the EIS). What changes have been made (and where)? No changes have been made to the EIS in response to this feedback.	Status: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. Next Steps: CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to

Topic	Key Interests and Concerns	Response to the interest/concern	Changes to the EIS and/or EA process	Status of the Concern
		CNL understands the importance of establishing a unique relationship with WLFN to ensure that they may bring forward any concerns or interest they have specific to the rights held collectively by the Nation. CNL is committed to building positive long-term relationships with Indigenous Nations and communities who have treaty and Aboriginal rights on the lands for the proposed NPD disposal facility, as well as working with other interested Indigenous Nations, communities and organizations.		work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.
12. Valued Components	(a) Engagement, input and participation in VC selection WLFN requires the opportunity to provide values identified by the community. A priority concern is any potential changes in local fishery species as they are an important and significant indicator of understanding the potential and cumulative effects on inherent rights for harvesting natural resources, fish and wildlife species, and medicine. This is a project-specific concern.	<u>CNL Response</u> CNL is open and willing to discuss capacity support and funding with WLFN to seek input on VCs and incorporate WLFN's VCs into the NPD Closure Project. The EIS outlines how Indigenous engagement and input has influenced the VCs used in the assessment. The EIS addressed potential effects to VCs in the aquatic environment. The assessment covered the aquatic VCs of interest to Indigenous Nations, communities and organizations, including the fish species identified during Indigenous engagement activities. The assessment concluded that there are no adverse residual effects on the aquatic environment expected from the project. CNL is interested in working together with the WLFN to identify WLFN valued components, address interests and concerns related to VCs, and develop project commitments.	<u>Where is this topic discussed in the EIS?</u> The EIS now includes a section on Indigenous engagement related to VC selection (**Section 6.3.1.1**). **Section 4.1** of the EIS highlights the in-design mitigation measures that act to isolate and contain the waste inventory within the NPD Disposal Facility to ensure protection of the surrounding environment, including the aquatic environment. **Section 9.3.3.2** of the EIS provides a series of mitigation measures focused on protection of surface water and ultimately the aquatic environment. Mitigation measures for the protection of surface water have been updated and expanded from the 2017 draft EIS. The EIS does not predict any adverse residual effects on the aquatic environment (**Section 9.4.3.5**) as a result of the NPD Closure Project. <u>What changes have been made (and where)?</u> No changes have been made to the EIS in response to this feedback.	<u>Status</u>: CNL received EIS comments and recommendations from WLFN on March 7, 2023. CNL sent responses to WLFN comments and recommendations and sent a draft I&C table (and mapping table) on June 7, 2023. No response has been received from WLFN. CNL has attempted to engage with the WLFN on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to engagement with WLFN within CNL's role as the project proponent to support WLFN's meaningful participation in the EA process. <u>Next Steps:</u> CNL wishes to continue discussions with WLFN to better understand the community's perspective, values, or concerns associated with the NPD site. CNL proposes to work together with WLFN to develop a work plan and capacity for future activities related to the NPD Closure Project.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Appendix C.6.2 – Record of Engagement and Tables of Interests and Concerns for Timiskaming First Nation

This appendix provides a complete record of all engagement between CNL and Timiskaming First Nation (a member nation of Algonquin Nation Secretariat) from June 2022 to March 2024 (Table C-33). Communications with Timiskaming First Nation between June 2016 and June 2022 were via the Algonquin Nation Secretariat (Table C-29). At the NSDF Project Hearing in 2022 June, CNL heard that the individual rights bearing communities needed to be engaged independently from the Algonquin Nation Secretariat, regarding CNL related projects and activities.

Table C-33 includes the date and method of the communication/engagement, the topics discussed and participants. This table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Table C-33 Record of Engagement with the Timiskaming First Nation

Date/Method	Details	Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
June 09, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the Timiskaming First Nation Chief offered to meet with TFN to discuss any concerns about the NSDF project or CNL's other projects. This offer was a result of the of interest CNL heard from other communities associated with the Algonquin Nation Secretariat at the Canadian Nuclear Safety Commission for the hearing on Canadian Nuclear Laboratories' (CNL's) proposed Near Surface Disposal Facility (NSDF).										√
June 16, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the TFN General Director was to inquire who the appropriate contact was for TFN.										√
June 23, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to the TFN Chief was to indicate CNL's interest in meeting to share information on CNL's activities and projects including the NPD project.										√
June 24, 2022 Outgoing email	This email from CNL's Director of Indigenous Relations to an Algonquins of Barriere Lake consultant was to coordinate meetings with Algonquins of Barriere Lake, Timiskaming First Nation and Wolf Lake First Nation.										√
June 30, 2022 Incoming email	This email from an Algonquins of Barriere Lake consultant to CNL's Director of Indigenous Relations suggested CNL contact the Chief and Council at TFN.										√
August 04, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the TFN Chief was a follow up and email sent to inquire if TFNL would be interested in meeting CNL to discuss CNL activities, including the NPD project.										√
October 03, 2022 Outgoing email	This letter addressed to the TFN's Chief from CNL's Director of Indigenous Relations provided a project update and the engagement status with the TFN, CNL noted that the next step is a meeting to discuss enabling capacity funding for TFN's involvement in the NPD and NSDF projects.										√
October 26, 2022 Outgoing email	This email from a CNL Senior Communications Officer to the TFN Chief was to follow-up on the October 3, 2022 email.										√

Date/Method	Details	Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
January 20, 2023 Outgoing Email	This email from a CNL Communications Officer to TFN's Chief to inform of the decision to postpone the submission of the NPD Closure Project's draft EIS until 2023 May to allow for additional Indigenous input. CNL proposed the next step would be to discuss TFN's interest and desired involvement in the NPD project.										√
March 14, 2023 Outgoing Email	This email from CNL Senior Communications Officer to TFN's Chief sharing CNL's Indigenous Relations Procurement Strategy.										√
September 20, 2023 Incoming Email	This email from ATFN Executive Secretary to CNL Indigenous Engagement Coordinator is to provide CNL with the new emails for the Chief and Vice Chief of Timiskaming First Nation Council										√
October 17, 2023 Outgoing Email	This email from CNL Indigenous Engagement Coordinator to ATFN is to provide an invite to the 2023 October 20 Career Fair being held In Pembroke.										√
October 19, 2023 Incoming Email	This email from ATFN Chief to CNL Indigenous Engagement Coordinator is to inform CNL of ATFN change in leadership. CNL thanks ATFN and noted looking forward to receiving ATFN feedback.										√

Timiskaming First Nation – Summary of Interests and Concerns

Timiskaming First Nation has not submitted any written comments on the NPD Closure Project. As such, CNL has not included an interests and concerns table. CNL has attempted to engage with Timiskaming First Nation on multiple occasions through a variety of means (i.e., emails, letters, telephone, and webinar invites). CNL remains committed to ongoing engagement with Timiskaming First Nation.

Environmental Impact Statement - NPD Closure Project

Appendix C: Record of Engagement and Tables of Interests and Concerns

Appendix C.6.3 – Record of Engagement and Tables of Interests and Concerns for the Algonquins of Barriere Lake

This appendix provides a complete record of all engagement between CNL and the Algonquins of Barriere Lake (a member nation of Algonquin Nation Secretariat) from June 2022 to March 2024 (Table C-34). Communications with Algonquins of Barriere Lake between June 2016 and June 2022 were via the Algonquin Nation Secretariat (Table C-29). At the NSDF Project Hearing in 2022 June, CNL heard that the individual rights bearing communities needed to be engaged independently from the Algonquin Nation Secretariat, regarding CNL related projects and activities.

Table C-34 includes the date and method of the communication/engagement, the topics discussed and participants. This table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Table C-34 Record of Engagement with the Algonquins of Barriere Lake

Algonquins of Barriere Lake – Summary of Interests and Concerns

Algonquins of Barriere Lake has not submitted any written comments on the NPD Project Description or the 2017 draft EIS, or provided any comments verbally. As such, CNL has not included an interest and concerns table. CNL has attempted to engage with Algonquins of Barriere Lake on multiple occasions through a variety of means (i.e., emails, letters, telephone, and webinar invites). CNL remains committed to ongoing engagement with Algonquins of Barriere Lake.

Appendix C.7 – Record of Engagement and Tables of Interests and Concerns for the Anishinabek Nation

This appendix provides a complete record of all engagement between CNL and the Anishinabek Nation from June 2016 to March 2024 (Table C-35). Table C-35 includes the date and method of the communication/engagement, the topics discussed and participants. The table also highlights engagements where key EA topics were discussed. The key EA topics align with "Generic Guidelines for Preparation of an Environmental Impact Statement Pursuant to the *Canadian Environmental Assessment Act*, 2012" as well as the requirements of REGDOC 3.2.2 "Indigenous Engagement" and guidance specific to NPD provided by the CNSC in January 2021 (e-doc # 6467843).

Section 6.2.4.18.1 of the EIS summarizes the engagement activities that have taken place to date between CNL and the Anishinabek Nation.

Table C-35 Record of Engagement with the Anishinabek Nation

Date/Method	Details	Key EA Topics									
		Baseline Conditions	Alternative Means	Project components and related activities	Effects assessment, incl. VC and spatial and temporal boundaries for the assessment	Impacts to rights	Proposed Mitigation Measures	Residual Effects	Follow-up Monitoring Program	Specific Interests and Concerns of the Community	General Communications
July 15, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Grand Chief of the Anishinabek Nation introduced the project and requested community input on any potential adverse impacts from project activities. To demonstrate requirements of CEAA, 2012 Section 5(1)(c), the letter requested meaningful feedback on the following: • *Whether the project may have environmental effect on any lands and/or resources currently used by Aboriginal peoples for traditional purposes;* • *Whether the project may have any perceived impacts on Aboriginal and Treaty Rights;* • *Whether local and traditional knowledge can assist in describing the existing environment; and,* • *The view of Aboriginal communities on proposed valued ecosystems components (environmental attributes) that have been identified for the assessment.*				√	√				√	
August 02, 2016 Outgoing telephone call	This telephone call was from CNL communications staff to the office of the Grand Chief of the Anishinabek Nation to follow-up on the July letter.										√
November 10, 2016 Outgoing letter	This letter from CNL's Director of Corporate Communications to the Anishinabek Nation (then known as the Union of Ontario Indians or UOI) Grand Chief inquired about asserted rights and traditional activities in the region around CRL. To demonstrate requirements of CEAA 2012 Section 5(1)(c), the letter requested a better understanding of Anishinabek Nation's historic and/or modern day use of lands in and/or near both of the projects and asked the following questions: • *Does the Union of Ontario Indians have traditional territory or reserve lands near the NSDF and/or NPD Closure Project?* • *What is the history of the Union of Ontario Indians using the areas around the two projects?* • *Do you have any members of the Union of Ontario Indians that currently live in close or reasonable proximity to either of the projects?* • *Does the Union of Ontario Indians have any members that currently practice traditional activities such as, trapping, hunting, fishing and/or gathering, near the two projects?* • *Does the Union of Ontario Indians, or any members, have sites of ceremonial significance in close proximity to either of the two sites, or more generally, any cultural activities near either of the two sites?* CNL also indicated interested in learning more about the community and any asserted rights, interests or activities members might undertake in the local or regional areas in proximity to the project.				√	√				√	
November 15, 2017 Outgoing email	This email from a communications officer with CNL to the Anishinabek Nation Grand Chief enclosed links to the full draft EIS, an interactive "public-friendly" executive summary of the draft EIS, the CNSC's public notice, a short overview of the project and environmental assessment, as well as detailed information on the timing of the EA process and how to participate in the public comment period.	√	√	√	√	√	√	√	√	√

July 15, 2023 Incoming Email	This email from Anishinabek Nation Administrative Coordinator to CNL Manager, Communications and Engagement is to see if CNL has any sponsorship places for the NWDER conference being held in Niagara Falls, ON. Anishinabek Nation noted that the conference coordinators mentioned CNL might have places. CNL informed Anishinabek Nation that unfortunately CNL doesn't have any places, and that the conference registration is now full.										√
September 20, 2023 Incoming Email	This email from Deputy Grand Council Chief to CNL cc'd is to request staff to publicize the CNL Indigenous Relations Director role.										√
October 17, 2023 Outgoing Email	This email from CNL Manager of Communications and Engagement to Anishinabek Nation is to provide an invite to the 2023 October 20 Career Fair being held In Pembroke										√

Anishinabek Nation – Summary of Interests and Concerns

Anishinabek Nation has not submitted any written comments on the NPD Project Description or the 2017 draft EIS or provided any comments verbally. As such, CNL has not included an interests and concerns table. CNL has attempted to engage with the Anishinabek Nation on multiple occasions through a variety of means (i.e., emails, letters, telephone, webinars, meetings). CNL remains committed to ongoing engagement with Anishinabek Nation.

Executive Summary

Canadian Nuclear Laboratories (CNL) has completed a draft Environmental Impact Statement (EIS) for the Nuclear Power Demonstration decommissioning project (NPD), which is undergoing an environmental assessment under the Canadian Nuclear Safety Commission (CNSC). CNL's draft EIS included an Alternative Means Assessment (AMA), which identified and evaluated all the technically and economically feasible alternative means by which CNL could complete its decommissioning goals. From this AMA, CNL determined its preferred decommissioning strategy to be In-Situ Disposal.

The Algonquins of Pikwàkanagàn First Nation (AOPFN) AMA for the NPD was borne out of extensive concerns raised by AOPFN about the approach used by CNL in its Alternative Means Assessment. In Fall 2021, CNL provided funding for AOPFN to conduct its own AMA, to bring forward AOPFN perspectives on what alternative means to decommission the NPD is preferable from an Algonquin perspective.

AOPFN's AMA was developed by working with the AOPFN Advisory Committee (AAC), with support from an AOPFN technical team of staff and consultants. Across three meetings in late 2021/early 2022, the AAC identified eight values, value statements, guiding questions, and weighting by which three of four alternatives CNL identified would be ranked[1]. The eight AOPFN values used in this AMA were:

1. Water, Wildlife and Vegetation;
2. AOPFN Access to and Use of Land and Waters;
3. Algonquin Culture, Spirituality and Knowledge;
4. Future Generations;
5. Sustainable AOPFN Economy;
6. AOPFN Governance and Stewardship;
7. Worker and Transportation Risk; and

[1] Alternative #1 (Continued Storage with Surveillance) was determined by the AAC not to be a viable alternative for this project, and was not ranked. This was on the basis of this alternative not being a permanent solution, and associated concerns of burdening future generations with decision-making, and perpetuating the current state of contamination.

8. Risk to Other Populations Outside of Algonquin Territory (including non-human).

Following ranking on a value-by-value basis, an overall ranking of technically and economically feasible alternatives, found that Alternative 3 (Full Removal) was AOPFN's preferred alternative for the NPD Decommissioning Project. In addition to the group ranking and scoring process, each of the AAC members who identified a preferred alternative means chose Alternative 3 (Full Removal).

Alternative 3 (Full Removal) fit best with AOPFN identified preferences for decommissioning the NPD site, including preference for an alternative means that:

- Minimize the number of permanent hazardous waste disposal facilities in Algonquin territory;
- Supports the healing of the land to a natural condition as quickly as possible;
- Will allow for the greatest chance for meaningful reconnection of AOPFN members to the NPD site in the future, for cultural and traditional use purposes;
- Reduces fear, stigma and perceived risk for AOPFN members;
- Provides the maximum real and perceived protection for the Ottawa River;
- Does not pass risks in Algonquin territory on to future generations to handle;
- Maximizes the flexibility of future AOPFN land use for economic purposes;
- Is a permanent rather than temporary site solution at NPD;
- Has acceptable and well understood and well managed worker and transportation risks, and can be completed safely; and
- Is endorsed by AOPFN through a Free, Prior and Informed Consent decision.

In addition to identifying a preferred alternative, the AAC flagged the importance of the inclusion of AOPFN's Algonquin perspective into all decision-making processes within the Algonquin territory, weighing environmental or social impacts over financial costs, as well as the inclusion of AOPFN in ongoing monitoring of the project site.

Ultimately, from this report, AOPFN recommends:

(1) CNL reconsider their conclusions from their AMA based on AOPFN's preferred alternative (#3 - Full Removal);

(2) Early and comprehensive consultation and engagement of AOPFN in all future AMAs in or impacting on Algonquin territory;

(3) Adequate funding from CNL to perform fulsome Algonquin knowledge-based monitoring of the NPD site and its surroundings through the AOPFN Guardians monitoring program, for the life of the Project;

(4) Limiting the number of radioactive waste storage sites in Algonquin territory;

(5) The movement of radioactive wastes into, across and out of AOPFN territory be subject to written AOPFN permissions; and

(6) AECL and CNL consult with AOPFN about compensatory/accommodation measures for over 60 years of lost use and occupancy by AOPFN members of the area at and around the NPD site.

1. Introduction

1.1 About the Algonquins of Pikwàkanagàn First Nation

The Algonquins of Pikwàkanagàn First Nation (AOPFN) is an Algonquin community that has, since time immemorial, exercised their rights to hunt, trap, gather, and practice other cultural activities in an area adjacent to the Kichi-Sìbì (Ottawa River). AOPFN's Algonquin ancestors have occupied the length of the Kichi-Sìbì for over 9,000 years (Taylor et al. 2021). Our Algonquin ancestors had full access and control to their unceded territory before the fur trade was established by Europeans in the 1630s (Malone et al. 2021). During this time, they controlled the Kichi-Sìbì and the trade that was dependent on it.

Since contact, lands used by AOPFN have been developed without the consent of the Nation. Crown policy and governance has interfered with AOPFN traditions of

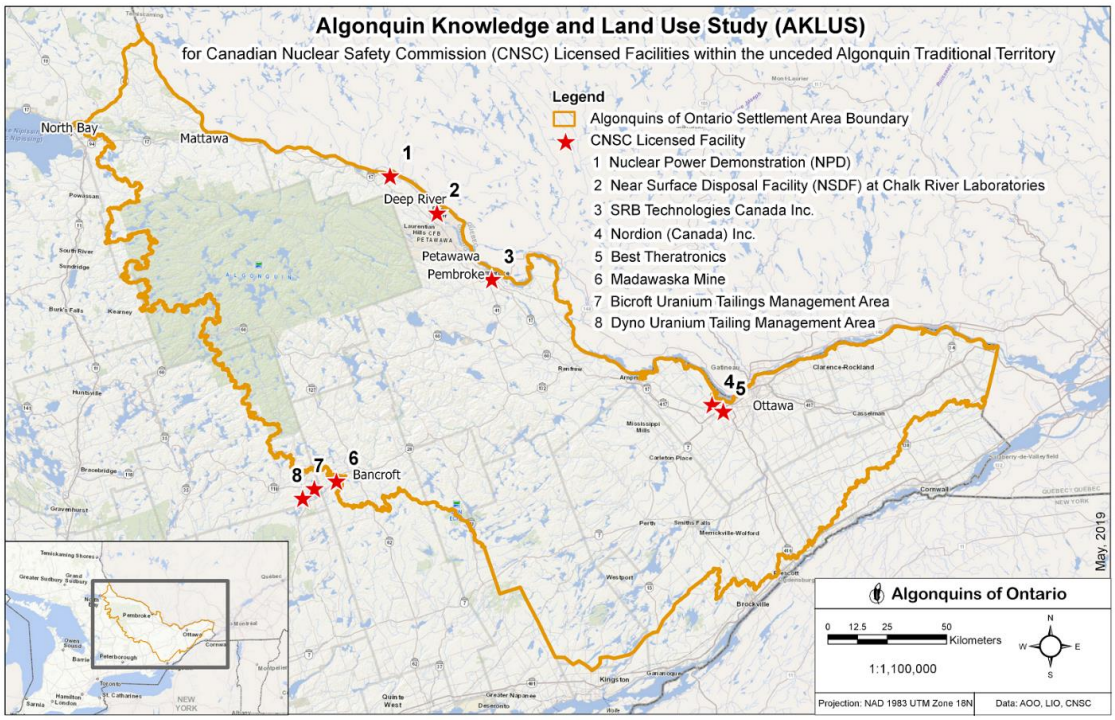

Figure 1 CNSC Facilities in unceded Algonquin Traditional Territory. From the Algonquin Knowledge and Land Use Study (Taylor et al., 2021)

stewardship and decision-making frameworks. Since the mid-1990s, Canada has placed nuclear facilities in and adjacent to Algonquin territory. The map below shows Algonquin territory and nuclear facilities now licensed by the Canadian Nuclear Safety Commission (Taylor et al., 2021). Today, AOPFN has been involved in a number of environmental and regulatory processes regarding these facilities, including the Nuclear Power Demonstration Project site, which is the subject of this report.

1.2 NPD Site Decommissioning and Alternative Means Assessment

Canadian Nuclear Laboratories (CNL) is working to complete the closure of the Nuclear Power Demonstration (NPD) Site outside of Rolphton, Ontario on the west bank of the Kichi-Sìbì in Algonquin territory. The site and its nuclear liabilities are owned by Atomic Energy of Canada Ltd. (AECL), a federal Crown corporation. CNL acts as the caretaker of the NPD site as a contractor to AECL. Currently, the reactor building contains low-level and intermediate-level radioactive materials that must be monitored. The stated goal of the NPD closure project is to permanently dispose of these materials so they pose less risk to the environment and require less monitoring over time.

CNL has completed a draft Environmental Impact Statement (EIS) for this project, which is undergoing an environmental assessment under the Canadian Nuclear Safety Commission. The draft EIS included – from CNL's perspective - the identification of all the technically and economically feasible alternative means by which CNL could complete its decommissioning goals. As a requirement of the environmental assessment CNL must include an evaluation of each alternative means and provide rationale for the alternative[2] chosen. This is called an Alternative Means Assessment (AMA). CNL identified that there were four technically and economically feasible alternatives available to them:

[2] The terms "alternative means" and "alternative" are used synonymously throughout this report.

1. **Continued Storage with Surveillance** (which would require decommissioning in the future but would do nothing to remove or otherwise contain materials now);
2. **Partial Dismantling and Removal** of the reactor components and buildings;
3. **Full Removal** of the reactor components and buildings; and
4. Disposal at the site (called **In-situ Disposal**), by pouring grout into the existing concrete enclosed underground works, encapsulating the reactor components, removal of all buildings, and covering the underground works with a concrete cap.

Appendix 1 of this report outlines each of these alternative means in more detail. All the information was provided by CNL to AOPFN. More information can be found in CNL's draft EIS.

1.3 AOPFN AMA: Development and Purpose

The Algonquins of Pikwàkanagàn have raised extensive concerns about the approach used by CNL in its Alternative Means Assessment (for example in comments on the draft EIS, dated July 16, 2020 – Two-Axe Kohoko 2020). Among these concerns was that the criteria included in the CNL AMA and the scoring method were based only on technical measurements and did not meaningfully attempt to gather or account for Algonquin perspectives. AOPFN was not engaged by CNL for the identification of values, criteria, weighting or scoring of alternatives. As a result, AOPFN was not satisfied with the process by which the CNL AMA was conducted.

For example, AOPFN members have strong concerns about the continued presence of radioactive waste in their territory and the measurable, observable, and perceived risks it poses to current and future generations. Despite this, CNL did not credibly consider how the continued presence (or full or partial removal, under different alternative means) of reactor components and other radioactive materials at the NPD site would affect how AOPFN members could or would use the land for rights-based activities in the future. AOPFN has consistently held that these issues must be substantively addressed – including direct inputs from the impacted Indigenous peoples themselves - in any full and proper alternative means assessment.

CNL reviewed AOPFN's comments and, while CNL did not commit to changing their AMA, in the fall of 2021 CNL provided funding for AOPFN to conduct its own AMA, to bring forward AOPFN perspectives on what alternative means to decommission the NPD is preferable from an Algonquin perspective. AOPFN Chief and Council determined that the AOPFN Advisory Committee (AAC), a body composed of AOPFN community members and acting as a reflection of community perspectives, was the most appropriate group to carry out the AMA. The AAC, with support from an AOPFN technical team of staff and consultants,[3] identified evaluation criteria from a foundation of the AOPFN worldview and conducted an alternative means assessment that reflects AOPFN understanding of acceptable risk and duration of impacts. This report is the result of the AOPFN AMA process and has been verified by both the AAC and AOPFN Chief and Council.

It is expected that the AOPFN AMA will inform further engagement with CNL and consultation with AECL on a preferred alternative means to decommission the NPD Project. The AOPFN AMA may be a necessary part of AOPFN's final submission to the Canadian Nuclear Safety Commission for the environmental assessment of CNL's preferred In-Situ Disposal alternative. Additionally, the AOPFN AMA will inform the AOPFN leadership's required decision on whether they consent to the proposed In-Situ Disposal project. AOPFN has identified in its engagement with CNL and its consultation with the AECL and CNSC that AOPFN Free, Prior and Informed Consent as per the United Nations Declaration of the Rights of Indigenous Peoples (UNDRIP) is required for any permanent solution to decommission the NPD site. Article 29.2 of UNDRIP asserts:

> *States shall take effective measures to ensure that no storage or disposal of hazardous materials shall take place in the lands or territories of indigenous people without their free, prior and informed consent.*

[3] The AOPFN technical team consisted of Lucas Bramberger, Projects Coordinator for AOPFN and lead facilitator with the AAC, and three members of Firelight Research Inc. – Alistair MacDonald, Rachel Ford, and Dr. Justin Page. Mr. MacDonald has prior experience conducting Alternative Means Assessments with Indigenous groups. The function of the AOPFN technical team was to facilitate and report on, rather than guide, the AAC's deliberations.

The AOPFN Alternative Means Assessment will also inform engagement in a rights impact assessment conducted by AOPFN with the CNSC.

1.4 Steps and Methods for the AOPFN AMA

The AOPFN AMA was carried out through a series of three meetings with the AAC, led by the AOPFN technical team. Each meeting was held virtually through a video conference platform (Zoom) and the proceedings were recorded. A transcript of the recording was produced for accuracy of information collection and analysis. A transcript of the written 'chat' function during each session was saved for the same purpose. The meetings consisted of facilitated conversations, where members of the technical team asked open-ended questions and recorded the responses in real time using a Google Jam Board and Google Sheets. AAC members were therefore able to see how their information was being collected by the technical team and could add to and adjust their inputs in real time.

The primary focus of the first meeting, held on December 8, 2021, was to identify AOPFN values, value statements and guiding questions for the AMA. The secondary focus was to discuss how values should be weighted for the analysis. During this first meeting, the AAC identified many values, discussed areas of overlap and where values could be combined. The AAC also contemplated how weights could be applied to those values, a topic for which consensus was later reached in the second meeting.

The technical team utilized notes, transcripts, and the Google Jam board to compile the information discussed at the first meeting. Based on that information, the technical team created a list of eight potential values with guiding questions to help evaluate the alternatives against those values. The technical team also constructed different scoring and weighting options for the AAC to finalize in the second meeting. Prior to the second meeting, AAC members were given an information packet explaining each of the alternatives in detail using information provided by CNL, a list of the eight potential values and associated guiding questions, and information on the weighting and scoring options available to them.

The primary focus of the second meeting, held on January 26, 2022, was to verify the list of eight values, determine the preferred scoring method, and then evaluate the

alternatives based on the final values by using the guiding questions. The AAC members confirmed that the eight values compiled by the technical team reflected their perspectives and the discussion from the first meeting (see Section 2). The AAC then chose weights for each value using a Google Sheet exercise (see Section 3) and adopted a scoring approach (see Section 4). Finally, the AAC, again in a facilitated discussion with a live Google Sheet to record results, conducted the exercise of comparing each alternative means on an AOPFN value-by-value basis (see section 4).

The technical team utilized notes, transcripts, and the Google sheets to compile the information discussed at the second meeting and develop a draft of this report. The draft included scoring for each Alternative on a value-by-value basis and an overall score for each Alternative based on the weighting system chosen. Prior to the third meeting, AAC members were given a draft AMA report and an information packet provided by CNL on specific technical questions posed by the AAC during the second meeting.

The technical team presented the draft report to the AAC at the third meeting, held on February 22, 2022. The focus of this meeting was to verify the findings of the report, to provide clarification, and to revisit topics that were not fully discussed at the second meeting. Finally, at the end of the meeting, the technical team asked each AAC member to give their own individual overall rank for each of the Alternative Means. The findings were presented to, and endorsed by, Chief and Council on March 31, 2022.

1.5 Principles Underlying the AOPFN AMA

The following principles underlie the AOPFN Alternative Means Assessment:

1. Only Indigenous peoples can identify the rights, interests and values, and how they are measured, when conducting an alternative means assessment that includes "Indigenous" considerations.
2. Only AOPFN can accurately gauge impacts on AOPFN values such as access to and willingness to use lands and waters, culture, or governance and stewardship.

3. AOPFN gauge both beneficial and adverse effects when looking at the benefits and risks of different alternative means to their values.
4. AOPFN considers scientifically measurable data when assessing alternative means but is not wholly reliant on Western science in determining impacts and benefits of alternative means.
5. Algonquin Knowledge is not uniform, or static, it is fluid, cumulative, and its holders have been influenced by other knowledge frameworks (i.e., Western science, Two-eyed seeing, and legacy of colonialism).
6. AOPFN does not limit its alternative means assessment to changes versus a current, "damaged" baseline set of conditions, but also considers past

Presentation of Factual Information about the Alternative Means

Especially for the second meeting, extensive information was provided to the AAC about the four alternative means considered. The technical team was sensitive to provide factual information only about the different alternative means. In addition to providing information from CNL about the four alternative means to the AAC directly and without revisions, technical team members identified explicitly that all four of the alternative means – according to CNL – can be undertaken from a technical and economic perspective, and all four can be undertaken safely. The technical team was also explicit in identifying that current conditions at the site and likely future conditions at the site, even in an extreme failure mode, for all four alternative means, are not likely – from a scientific perspective – to create a large or unmanageable radioactive incident. This too is based on information proved by CNL. The technical team also noted that the amount of radioactive waste left at the site at this time is not a large amount and was careful to share factual information about current and likely future dose amounts at the site and in wildlife, vegetation and water at and around the site, are unlikely to cause extensive harm to AOPFN "receptors". The provision of this factual information was important both to AAC decision-making and to an AOPFN commitment to avoid unnecessarily exacerbating already "socially amplified" perception of risk associated with the NPD site.

conditions before the site was impacted, and desired future conditions for AOPFN members.

1.6 Limitations of the AOPFN Alternative Means Assessment

The alternative means assessment conducted by AOPFN has the following limitations:

- Not every member of the AAC was available for each meeting. Attendance was as follows:
    - First Meeting: 11 members
    - Second Meeting: 12 members
    - Third Meeting: 11 members
- The AAC is a strong cross-section of AOPFN community perspectives but is not wholly representative. The AAC has 13 members in total, which cannot fully represent the perspectives of over 2000 AOPFN members. Complete community engagement would require additional costs and time, which the AOPFN did not have. This, combined with decades of dispossession of land, culture and Algonquin knowledge, means that not all Algonquin values relevant to this area may have been identified, explored, or ranked.
- This report is based on the understanding and analyses of the AOPFN and reflective of the values and knowledge shared by the AAC members. It is **not intended as a complete depiction of the dynamic way of life and living system of use and knowledge maintained by AOPFN members.**
- The conversations had by the AAC reflected their holistic understanding of the world, which recognizes that all things are connected. This AMA attempted to evaluate each alternative as it would affect eight discrete values, which are in fact, highly interrelated and overlapping. AOPFN decision-making is based on a balance of factors and not on an understanding of an effect to one value. To acknowledge this truth, after all Alternatives were scored on a value-by-value basis, each member of the AAC was asked to give an individual overall ranking for each Alternative. The results of this secondary exercise are provided in Section 5.

2. AOPFN Values Used in the NPD AMA

AAC members identified the following values for the AOPFN NPD AMA process. They are examined in further detail in the sub-sections below.

Table 1 AOPFN Values Used in the NPD AMA

AOFPN Value
1. Water, wildlife and vegetation: habitat and quality
2. AOPFN access to and use of land and waters
3. Algonquin culture, spirituality and knowledge
4. Future generations
5. Sustainable AOPFN economy
6. AOPFN governance and stewardship
7. Worker and transportation risk
8. Risks to other populations outside of Algonquin territory

AAC members agreed that this list of values fully communicated their priority values for assessing preferred alternative means by which the NPD Project could be decommissioned. In other words, these are the values most likely to be beneficially or adversely impacted by different futures in relation to the NPD site that may occur under alternative decommissioning scenarios. This list of values is not a full list of AOPFN values, rights or interests in relation to the NPD site, its surroundings, or AOPFN's traditional territory.

2.1 Water, Wildlife, and Vegetation: Habitat and Quality

Value Statement: AOPFN members rely on wildlife and vegetation to live. Wildlife and vegetation are valuable in and of themselves as part of nature. Land and water will be restored over time and risks to wildlife individual and population health will be avoided.

The health of water and the land was identified as a critical value to consider for this alternative means assessment. One AAC member stated the importance of both elements to AOPFN:

> "I just wanted to reiterate how water means life to us. So, it is very important in all of our being. So, it's not just monitoring water, water is life. And it's our role to monitor water. Also, any environmental impact it has on our land." (December 8, 2021).[4]

AAC members discussed the recovery or revitalization of the land as an important part of this value. A member noted that the state of the land is tied to access and use of the land:

> "You can't use the land if the land is not revitalized." (December 8, 2021).

In the 2021 AOPFN Diet and Harvest Study (Fediuk et al., 2021, pg. 37), 94 per cent of AOPFN families reported eating Algonquin foods in the past year: fish (87%), land animals (87%), birds (46%), berries (40%), greens/leaves/roots (38%), and mushrooms (23%)). As noted in that study, "this high usage affirms the ongoing relationship to and intrinsic value of Algonquin foods and medicines."

The value of land and water revitalization is grounded in a concern for the wildlife and plant life, in and around the site. One AAC member stated that they have a lot of concern about the species at risk affect by the site, specifically, "milk snakes, other birds, turtles, fish…" (December 8, 2021). Another AAC member talked about the health of plant medicines as a critical element of this value:

> "And also plant medicines. You know, I pick plant medicines for myself, my clients and my family. And that's huge like how many of these plant medicines have been destroyed in that process [construction of the NPD site]… the last thing I want to do is to, you know, for example… potentially pick some plant medicines from that area, if is available and you know that that plant has

[4] All quotes are from AAC members. They are not attributable to any individual and AOPFN does not use the names of AAC members to protect confidentiality.

> gotten sick. And that I am giving that to my family. Whether it is, you know, in years to come or..." (December 8, 2021).

The technical team compiled the values of health of the land and water, revitalization of land, and health of wildlife and plants into the single value of Water, Wildlife, and Vegetation: Habitat and Quality.

2.2 AOPFN Access to and Use of Land and Waters

Value Statement 1: AOPFN members have the right to access and harvest from lands and waters in Algonquin territory based on long-term residency, governance and stewardship. Access includes physical access and willingness to use (trust in) an area.

Value Statement 2: Water is life. Water must be clean and trusted by AOPFN members.

The AAC made it clear that AOPFN members' access to and use of land and waters in their territory was a very important value. Accessing land and water is imperative for traditional harvesting, occupancy of the land, and the continuation of cultural practices, including ceremony, stewardship, and the transfer of Algonquin Knowledge. Use of the Kichi-Sìbì is especially important as it is a defining element of the AOPFN people.

> "When we are getting down to the history of our people, the Ottawa River specifically, it was a major trading route for our people. Up and down the Ottawa River." (December 8, 2021)

A large majority of AOPFN families are still involved in the subsistence harvesting economy. Seventy-three percent of AOPFN households that participated in the 2021 AOPFN Diet and Harvest survey (183/250 – Fediuk et al., 2021) identified themselves as active harvesters.

Full practicability of AOPFN Access to Land and Waters is dependent on two key factors. The first is the physical ability to access the areas around the site, which is dependent on the type and extent of barriers required in a future with a given alternative. The second is the willingness of AOPFN members to access the land and water around the site, which can be increased when the land is perceived to be in a natural state or healing and can be decreased when there is fear or stigma associated with the site. In particular, perception of contamination can result in AOPFN members

avoiding areas much larger than the scientifically confirmed contaminated area. One AAC member identified both factors when describing the access and use of the land:

> "We are kind of locked out of that area. So are we gathering food in that area? Well, no… You have got radioactive material there, so no, we are not going to go digest that stuff… What is available there, we cannot touch, or we will not touch." (December 8, 2021)

However, other AAC members stated that they would use the land in the future if it was accessible to them:

> "I would drop my boat there today if I could, so I'm not afraid to go on that land. I wanna make sure that it's safe for my children, my grandchildren, and my great grandchildren and all that come after us." (January 26, 2022)

Members also discussed this access and willingness to use land and waters as an important element of AOPFN stewardship, ceremony, and future generations. In addition, it was noted that there is economic and cultural value associated with harvesting traditional foods and medicines that should not be discounted.

2.3 Algonquin Culture, Spirituality, and Knowledge

Value Statement: AOPFN members have a right to connect culturally and spiritually with lands and waters in Algonquin territory. This includes the ability to conduct ceremony and have a connection to land in the same ways as ancestors. This also includes the ability to share Algonquin knowledge through interactions between generations while on the land.

The condition of the site corresponds to the spiritual health of the land, which corresponds to the spiritual health of the AOPFN members. One AAC member explained that to AOPFN members, everything on earth has a spirit and therefore everything at the NPD site has a spirit. This member talked about how the spirits of the plants and animals at the site have suffered:

> "So, in knowing that everything has a spirit, what is the damage that is being done to the building of this hole, the pouring of concrete, the destruction of

> the mineral world, the plant world, the animal world, and our human world." (December 8, 2021)

The same AAC member also spoke of how the damage at the site has affected their own spirit and the connection between environmental health, mental health, physical health, emotional health and spiritual health. Other AAC members echoed this knowledge:

> "We have to get back to getting connected to the ground and find out what Mother Nature needs to heal itself. And that has everything to do with spirituality… everything is connected to the spirit." (December 8, 2021)

Despite the spiritual damage they see, the AAC members identified that spirit can be brought back to the land if it is allowed to regenerate. The regeneration of the land and the spirit can only occur if Algonquin Knowledge is applied to the site. Past decisions were made from a non-Indigenous perspective, which is why the site is so damaged. By making decisions for the land through the lens of an Indigenous person, the spirit of the land can heal. One AAC member stated that ceremony on the land will help to heal it:

> "No spirit would pop into thin air here. With that saying, how we can restore it, let us get back to the land. Let's be able to have a smudge there, let's see what Mother Nature wants. We can connect with Mother Nature." (December 8, 2021)

Algonquin culture was discussed as a part of Algonquin spirituality and Knowledge. One AAC member talked about the revitalization of culture and how people are learning about the Algonquin ways of understanding the world. This understanding affects the stewardship of the land and water, a value further discussed in section 2.6 below.

2.4 Future Generations

Value Statement: Radioactive risks will not be passed on as a burden to future generations; radioactive materials cannot ever be abandoned and forgotten in Algonquin territory.

Members of the AAC brought up concern for future generations several times and identified that this value plays an important role in their present decisions. One AAC member identified that decisions should be made with the next seven generations in mind. None of the members of the AAC were willing to delay the decision regarding how to decommission the site onto the shoulders of their children or grandchildren.

One AAC member talked about the concern that their future great-great-grandson would be impacted by the plants growing on the site in 50 years. Another stated that they wanted to make sure the land was safe for their children, grandchildren, great-grandchildren and everyone coming after them.

2.5 Sustainable AOPFN Economy

Value Statement: AOPFN has the right to take equitable advantage of economic opportunities associated with the lands and waters of Algonquin territory.

The AAC members discussed the value of the site to the AOPFN economy in two ways. The first way was the potential economic value of the site if it were more accessible and useable over time. For example, one AAC member discussed the potential commercial value of the site in the future to AOPFN as a part of this value.

The second way was the potential economic gains AOPFN could receive from CNL by working alongside of operations. For example, one AAC member discussed opportunities for AOPFN members to be hired for monitoring or establishing an AOPFN Guardian Program in the area.

A third consideration related to economics was focused on more in relation to Value #2 (AOPFN Access to and Use of Lands and Waters) – the traditional economy of harvesting fish, game, food plants, medicines and other resources.

2.6 AOPFN Governance and Stewardship

Value Statement: AOPFN has a right and responsibility to protect and nurture lands, waters, wildlife, vegetation and spirits.

In addition to their rights, AOPFN members have a strong feeling of responsibility towards the lands in their territories. This responsibility has been passed on through

generations and has never been ceded by AOPFN, although the ability to practice governance and stewardship roles has been constrained by the actions of the Crown and settler populations. AAC members have an understanding that the whole of their territory was once utilized by their ancestors and that this site is part of that historic relationship.

When the AAC members spoke of spirituality or health of the land and water, they also talked about AOPFN's role in decision-making. Governance and stewardship cannot be fully separated from spirituality, Algonquin Knowledge, or culture because the information brought to the decision-making process is based on those values.

> "So it's a recovery and restoration of these lands, but also it's the autonomy of the Algonquin people, you know what I mean, to be able to make these decisions in our territory… we need to be making these decisions; we know what is good for us. So, I think that is, you know, a huge value that needs to really be looked at." (December 8, 2021)

This includes the Teachings of the Seven Grandfathers, the ways in which, and values by which Algonquins should live: honesty, humility, respect, courage, wisdom, love, and truth[5]. It is through these teachings that the people of AOPFN would exercise their ways with respect to stewardship and governance of the land:

> "…we are the first peoples, right? — and that respect and those seven grandfather teachings, and looking back to the lands, and we are those natural stewards of the land, and it has to come back to that. And that respect needs to be restored." (February 22, 2022)

For this analysis, AOPFN governance and stewardship was identified as a discrete value because it conveys the ability of AOPFN to have the power to make those decisions. This was stated by an AAC member who recognized that without authority, talk of applying value statements to a decision-making process is fruitless.

[5] The Algonquin Way: Traditional Algonquin Teachings

> "We can all be talking and doing whatever, but if we don't have that governance and we are not stewards of the land, and we are not the stewards of, you know, anything that is going on here, then like I said, I think it kind of falls out of place. We need to have that leadership and we need to have that being able to stand up for us to say, you know what, look at these are our values." (December 8, 2021)

2.7 Worker and Transportation Risk

Value Statement: Physical works and activities on AOFPN lands and waters should be undertaken safely, minimizing risks to workers and to the environment.

AAC members identified that the risks to workers and from material transportation associated with each of the alternative means are worthy of consideration in making decisions about preferred alternatives. AAC members expressed concerns that workers be safe when decommissioning the site, that any spills of radioactive materials in transit within and outside of Algonquin territory could negatively impact on the environment, and that substantial differences in worker and transportation risk could be an important decision-making factor.

2.8 Risk to Other Populations Outside of Algonquin Territory (including non-human)

Value Statement: AOPFN prefers not to pass risks on to other beings (human and non-human) outside of Algonquin territory.

Some AAC members requested a value be placed on not passing risks on to other Indigenous peoples, the general public, and even all living things, outside of Algonquin territory. While the value has some overlap with other values (#1 and #3, for example), it was adopted by the AAC to reflect a value associated with respect for and a desire not to harm living things outside of the traditional Algonquin territory. It is particularly relevant when considering alternative means that require movement and ultimate storage of nuclear waste out of Algonquin territory.

3. AOPFN's Weighting Method

In order to conduct a scoring exercise, the weight put in each of the values used in the AMA needed to be established. At the second meeting, the AAC discussed various weighting options and chose the weights shown in Table 2 below.

In the end, the AAC decided to break values down into two weight categories. The first category was values that were each weighted equally to one another, at 15%. These comprised values 1 through 6 in Table 2 below. The second category were considered less important to AOPFN decision-making and thus each was weighted lower, at 5%. Values 7 and 8 in Table 2 meet this latter category. This weighting was a consensus decision by the 12 members of the AAC involved in the second meeting.

Table 2 AOPFN Weighting by Value

Value	**Weight**
1. Water, Wildlife and Vegetation: Habitat and Quality	15%
2. AOPFN Access to and Use of Land and Waters	15%
3. Algonquin Culture, Spirituality and Knowledge	15%
4. Future Generations	15%
5. Sustainable AOPFN Economy	15%
6. AOPFN Governance and Stewardship	15%
7. Worker and Transportation Risk	5%
8. Risk to Other Populations	5%
Total Percentage	100%

One AAC explained why they thought this was the best way to weight the values:

> "I think these seven and eight [Values of Worker and Transportation Risk, Risk to Other Populations], I mean, they should be on this list but at a very low priority. We're talking about Pikwàkanagàn now and … what we're looking at is our values… so we don't want to get side-lined here on this number seven and number eight. They are concerning but I think [they] definitely got to be a lower value." (January 26, 2022)

In Section 4.10, the subsequent ultimate decision by the AAC not to quantitatively weight Value 8 – Risks to Other Populations – is discussed further.

4. Scoring Each Alternative Means Against AOPFN Values

4.1 AOPFN's General Approach to Scoring Alternative Means

In the second meeting, the AAC chose to evaluate each alternative using a **relative ranking method.** This was a consensus decision by the 12 members of the AAC involved in the second meeting.[6]

In the relative ranking method chosen, a single question was asked for each value – essentially, some variation of "how do the alternatives rank compared to one another when it comes to protecting and promoting this value?" (see Table 3 for the value-specific guiding questions used). In the relative ranking scoring system, the number 1 indicates the alternative means that is the most preferred choice for a given value and the number 3 indicates the alternative means least preferred for a given value. As discussed below in section 4.2, Alternative 1 (Continued Storage with Surveillance) was determined by the AAC to not be part of the evaluation process so there would be no rank of 4. In the relative ranking method, one most preferred alternative is chosen (1) and one least preferred alternative (3) is chosen. The alternative in the middle is given the rank of 2.

While AAC consensus was the goal, it was not required and sometimes not reached in relation to scoring each value. Where consensus was not found in the second meeting on the scoring for a particular value, this was confirmed or revised at the third meeting. The final results are reflected in the findings in Sections 4.3 to 4.10 below and have been verified by the AAC as accurate.

[6] The other scoring option considered was numerically scoring each alternative means independently against guiding questions for each value. The AAC found the relative ranking system to be more intuitive to apply.

Table 3 AOPFN Guiding Questions by Value

Value	**Guiding Question**
Water, Wildlife and Vegetation: Habitat and Quality	Rank the alternatives from the one most protective of water, wildlife and vegetation (=1), to the one least protective (=3).
AOPFN Access to and Use of Land and Waters	Rank the alternatives from the one that does the most to increase AOPFN access to and use of lands and waters (=1), to the one least likely to increase AOPFN access and use (=3).
Algonquin Culture, Spirituality and Knowledge	Rank the alternatives from the one that is most likely to increase Algonquin cultural connection and sharing of Algonquin knowledge at and around the site (=1), to the one least likely to promote culture and knowledge (=3).
Future Generations	Rank the alternatives from the one that does the most to protect future AOPFN generations from risk and responsibility (=1), to the one that puts the most risk and responsibility on future generations (=3).
Sustainable AOPFN Economy	Rank the alternatives from the one that brings the greatest potential for economic benefits that matter to AOPFN (=1), to the one that is least likely to bring these benefits (=3).
AOPFN Governance and Stewardship	Rank the alternatives from the one that most supports AOPFN governance and stewardship priorities (e.g., healing the spirit of the land, adherence to AOPFN principles/values = 1), to the one that is most contrary to AOPFN governance and stewardship (=3).
Worker and Transportation Risk	Rank the alternatives from the one that has the lowest worker and transportation risk (=1), to the one that has the highest worker and transportation risk (=3).

Value	Guiding Question
Risk to Other Populations Outside of Algonquin territory	Rank the alternatives from the one that passes the least risk on to other populations outside of Algonquin territory (=1), to the one that passes the most risk on to other populations outside of Algonquin territory (=3).

4.2 Discussion on Alternative 1

AOPFN Advisory Committee members did not consider Alternative 1 (Continued Storage with Surveillance) a viable alternative means for decommissioning the NPD site. While each of the other alternative means will result in a permanent solution for the NPD site within a defined time frame, Alternative 1 (Continued Storage with Surveillance) will delay this decision and any mitigative action (other than passively allowing the remaining radioactive materials to reduce in potency through natural radioactive decay) to an undetermined time in the future. The decision to exclude Alternative 1 (Continued Storage with Surveillance) was made by the AAC at the second meeting and confirmed at the third meeting.

AOPFN discussion respecting the viability of Alternative 1 (Continued Storage with Surveillance) was focused on two points. First, AAC members did not want future generations to have to manage the waste or the decision. Two AAC members discussed this point – identifying that they had responsibility for fixing the problem before them and they would not place that responsibility on their children or grandchildren. Another AAC member was against any alternative that resulted in a temporary rather than permanent solution at the site. Delaying the decision into the future was not considered a viable solution by AAC members.

Second, AAC members are concerned about levels of contamination from the existing condition of the site and would not like to perpetuate that state.[7] The other three alternatives will result in less middle to long-term risk of contamination

[7] As noted previously, the technical team was at pains to flag that the current and likely future radioactivity risks, as measured by western science, are low to very low.

mobilization from the site than is currently the case in the passive storage and surveillance scenario. An AAC member stated, "something has to be done to ensure this is safe. If we keep waiting, something could happen" (January 26, 2022).

Of the 12 AAC members that were present at the second meeting, nine explicitly[8] stated that Alternative 1 (Continued Storage with Surveillance) should not be considered as part of this alternative means assessment. Furthermore, no AAC members expressed a desire to rank Alternative 1 (Continued Storage with Surveillance) against the AOPFN values. As a result, no rankings were applied to Alternative 1 (Continued Storage with Surveillance) in the ranking exercise, and Alternatives 2, 3 and 4 were compared to one another, as the only viable alternative means presented by CNL that are currently worthy of consideration by AOPFN.

4.3 Value 1: Water, Wildlife, and Vegetation: Habitat and Quality

The technical team opened the discussion on this value by encouraging the AAC members to think about how the different alternatives would promote biological healing and the return to natural conditions at and around the site, from its current cleared and industrialized state. The members were asked to rank the alternatives from most to least protective of water, wildlife, and vegetation.

Technical information provided by CNL was presented to the AAC. Images and descriptions provided by CNL (see Appendix 1) show that for Alternatives 2 and 4, an area of about 2.5 hectares will remain grassed over with an engineered "hump", fenced in, and no trees allowed to grow, in perpetuity. In contrast, after 12 years, Alternative 3 will be allowed to start to return to an unfenced, natural forested environment, with this being accomplished within about 50 years.[9]

This value incorporates the idea of the revitalization of land as understood by AOPFN members. One AAC member identified that Alternative 3 (Full Removal):

[8] Either vocally, or in the chat on the Zoom videoconference.

[9] Notwithstanding that the "stack" on site will likely be allowed to stay in place for about 50 years in each scenario, as habitat for Chimney Swifts.

> "…is the only alternative that allows for everything to be removed and for the land to be completely restored and revitalized." (January 26, 2022)

Most AAC members agreed with this statement. The majority who chose Alternative 3 (Full Removal) as the best alternative did so because the land at the NPD site will be completely restored and revitalized under this alternative. One member followed up by noting that Alternative 3 (Full Removal) would be the best option for the goal of future use of the area, which shows how connected the value of Water, Wildlife, and Vegetation is to AOPFN Access to and Use of Lands and Waters.

One AAC member identified that they thought Alternative 4 (In-Situ Disposal) should be ranked the lowest. This was due to their fear that allowing any waste to stay on that land would open doors in the future for CNL to add other intermediate and low-level waste to the site. The member stated:

> "…it's a scary road that we walk on you know when we start looking at leaving any of it [nuclear waste] there … I think any alternative other than 3 [Full Removal] is scary because we're going to end up with garbage down the line." (January 26, 2022)

The technical team explained that any waste left at the NPD site would be cemented in place, that there would be no room left to put additional future waste, and that no party has identified any plans to import radioactive waste to the NPD site. This information did not alter the perspective of the AAC member, which remained that any waste left there would feel risky and could lead to further degradation of the site.

One AAC member ranked Alternative 4 (In-Situ Disposal) as the best one against this AOPFN value. This member was concerned that disturbing the waste during partial or full removal (Alternatives 2 or 3) would end up contaminating the surrounding environment during the decommissioning process. This AAC member noted the abundance of wildlife found in the area, the proximity to Algonquin Provincial Park, and the quality of habitat surrounding the site, as elements of the value at risk.

Because most members expressed a desire to remove all waste from the site (Alternative 3 – Full Removal), the majority of AAC members agree that partial removal

of waste (Alternative 2) would be better than no removal of waste (Alternative 4). These results were verified at the February 22 meeting.

*Table 4 AAC Ranking for Value 1: Water, Wildlife and Vegetation: Habitat and Quality. **

Value 1: Water, Wildlife, and Vegetation: Habitat and Quality	**Alternative 2 (Partial Dismantling and Removal)**	**Alternative 3 (Full Dismantling and Removal)**	**Alternative 4 (In-Situ Disposal)**
Ranks identified by AAC members	8 of 9 members scoring chose Rank of 2; one member chose Rank of 3	8 of 9 members scoring chose Rank of 1; one member chose Rank of 3	7 of 9 members chose Rank of 3; one member chose Rank of 1; one member chose Rank of 2
Majority Result	#2 Ranking	#1 Ranking (most preferred)	#3 Ranking (least preferred
*Colours in Table 4 through 10 provide a visual reference for the AAC result. The colour green indicates the most preferred alternative, the colour red indicates the least preferred alternative, and the colour yellow indicates the alternative in between.			

4.4 Value 2: AOPFN Access to and Use of Land and Waters

The technical team presented factual information provided by CNL on how the different alternative means would affect the ability to physically access the site in the future. The technical team explained that Alternatives 2 and 4 would result in a small area remaining fenced off – approximately 2.5 hectares of the overall 385 hectare NPD site (less than 1% of the overall site controlled by Atomic Energy of Canada Limited). Alternatives 2 and 4 would also result in a limitation on the vegetation (no trees) that would be allowed to grow in that fenced area because of the need to maintain the integrity of the engineered cover. The technical team also clarified that even though

there is no surface water on the 2.5 hectares, that the presence of waste there has already been shown in previous AOPFN studies (Fediuk et al., 2021; Malone et al., 2021; Taylor et al., 2021) to be adversely affecting AOPFN members' willingness to travel or fish on the Ottawa River adjacent to the site.

The AAC was asked to rank the alternatives from the one that does the most to increase AOPFN access to and use of lands and waters, to the one least likely to increase AOPFN access and use of lands and waters.

Concerns were raised about Alternatives 2 (Partial Dismantling and Removal) and 4 (In-Situ Disposal), because the physical barriers such as fencing and an unnatural engineered mound would cut AOFPN members off from an area of land. This alienation would include from the area within the fenced area's boundaries – due to the physical constraint - as well as a buffer zone around it wherever the fence and mound are visible from – due to psychosocial concerns associated with the visibly man-made alterations to the area and associations of this with risk, fear and stigma.

Several AAC members were unsure that people would ever want to use the NPD Reactor area again, regardless of the presence of waste. One member stated at the second meeting:

> "I think people are not going to go there at all, because of history or whatever … they would never touch that land again because of what happened on it. The fear always does that, right? That's my concern on that one … a good percentage of people would not going back" (January 26, 2022)

During the third meeting, a member stated that the stigma associated with the site will remain there for many years. This member stated that the presence of the stack would be a source of that stigma. Another member agreed that the site would always be "labelled a previous radioactive site" (February 22, 2022). Several other members expressed the diverging opinion that if the land was healed, people would access it:

> "If we are looking at that option number 3 [Full Removal] again and we're talking about the revitalization of our land and bringing our land back and having the ability to bring the spirit back and bring that culture back to the land, I know for sure that I would be one of those people that would walk

back to that land and have those conversations with the standing tall trees…" (January 26, 2022)

These members highlighted the importance of monitoring programs that include AOPFN Guardians for increasing the trust at the site. One member said that stigma will fade if monitoring shows that the area is safe. Others said they were sure they would go to the site if the waste was removed:

"I would definitely go back to the site and use the site if it was completely removed and monitored for that twelve year… decommissioned timeline". (February 22, 2022)

Ultimately, all AAC members who spoke to this value gave Alternative 3 (Full Removal) the best rank of 1. One member stated that when comparing Alternative 2 (Partial Dismantling and Removal) and Alternative 4 (In-Situ Disposal), they would rank Alternative 4 (In-Situ Disposal) higher because out of the two, it results in a more permanent solution. However, the majority of AAC members ranked Alternative 2 higher than Alternative 4, in large part because AOPFN members prefer for removal of as much waste as possible from the NPD site. These results were verified at the third meeting.

Table 5 AAC Ranking for Value 2: AOPFN Access to and Use of Land and Waters.

Value 2: AOPFN Access to and Use of Land and Waters	**Alternative 2 (Partial Dismantling and Removal)**	**Alternative 3 (Full Dismantling and Removal)**	**Alternative 4 (In-Situ Disposal)**
Ranks identified by AAC members	9 of 10 members scoring chose Rank of 2; one member chose Rank of 3	10 of 10 members scoring chose Rank of 1	9 of 10 members chose Rank of 3; one member chose Rank of 2
Majority Result	#2 Ranking	#1 Ranking (most preferred)	#3 Ranking (least preferred

4.5 Value 3: Algonquin Culture, Spirituality, and Knowledge

The AAC was asked to rank the alternative means from the one that is most likely to increase Algonquin cultural connection and sharing of Algonquin knowledge at and around the NPD site, to the one least likely to promote culture and knowledge at and around the NPD site. No factual information was provided on this topic by the technical team because AOPFN members (e.g., AAC members) are the exclusive knowledge holders on this topic.

All AAC members who spoke to this value ranked Alternative 3 (Full Removal) as the best. One member stated that in order to increase that cultural connection, they must be able to access the land. The technical team then asked if it was correct that Alternative 2 (Partial Dismantling and Removal) was preferred to Alternative 4 (In-Situ Disposal) because under Alternative 2 (Partial Dismantling and Removal), intermediate level radioactive waste would be fully removed from the NPD site, with only low-level radioactive waste remaining. Or, on the contrary, was it possible that the existence of any waste onsite was seen as equally detrimental? One AAC member responded:

> "I think people are not going to go there at all, because of history… they would never touch that land again because of what happened on it." (January 26, 2022)

However, another AAC member stated there was a difference between Alternatives 2 (Partial Dismantling and Removal) and 4 (In-Situ Disposal) because of the level and type of waste that would remain present on the site after decommissioning. Ultimately, the majority of the AAC estimated that Alternative 2 (Partial Dismantling and Removal) was preferrable to Alternative 4 (In-Situ Disposal). These results were verified at the third meeting.

Table 6 AAC Ranking for Value 3: Algonquin Culture, Spirituality, and Knowledge

Value 3: Algonquin Culture, Spirituality, and Knowledge	**Alternative 2 (Partial Dismantling and Removal)**	**Alternative 3 (Full Dismantling and Removal)**	**Alternative 4 (In-Situ Disposal)**
Ranks identified by AAC members	9 of 10 members scoring chose Rank of 2; one member chose Rank of 3	10 of 10 members scoring chose Rank of 1	9 of 10 members chose Rank of 3; one member chose Rank of 2
Majority Result	#2 Ranking	#1 Ranking (most preferred)	#3 Ranking (least preferred

4.6 Value 4: Future Generations

The technical team presented information regarding the risk associated with each alternative posed to future generations. The risk of harmful radioactivity release in each case is low to none. In the case of Alternative 2 (Partial Dismantling and Removal), all intermediate level waste – the worst remaining waste at the site - is removed from the site. In the case of Alternative 3 (Full Removal), all intermediate and low-level radioactive wastes are removed from the site. It was also noted that there would be a small possibility that future interventions could be required at the site if Alternative 2 (Partial Dismantling and Removal) or Alternative 4 (In-Situ Disposal) were chosen, whereas under Alternative 3 (Full Removal) no future interventions could possibly be required at the NPD site, because the radioactive risk would be fully removed.

AAC members were also made aware that Canada has committed to develop a permanent deep geological repository, but that a final location for such a facility has not yet been found. The Nuclear Waste Management Office is currently considering two locations in Ontario, outside of Algonquin territory, for such a site, which would take at least a couple of decades to develop. It was made clear that in the short term (and possibly long term), intermediate level wastes moved out of the NPD would need to be stored at a temporary facility, almost certainly at the Chalk River Laboratories.

The AAC was asked to rank the alternatives from the one that does the most to protect future AOPFN generations from radioactive risks and responsibility for managing that risk, to the one that puts the most risk and responsibility on future AOPFN generations.

One AAC member said they would like all waste to be removed (i.e., Alternative 3 - Full Removal) so the land could be returned to future generations without any radioactive legacy. Several other members agreed with this.

There were three AAC members, however, who chose to rank Alternative 4 (In-Situ Disposal) as the best. This is because any waste removed under Alternatives 2 (Partial Dismantling and Removal) or 3 (Full Removal) "would not be going very far" (AAC member, January 26, 2022). CNL has indicated that some of the waste removed from the NPD site would be temporarily stored at the Chalk River Laboratories site until a permanent storage facility is built offsite, and that low-level radioactive waste from NPD may end up in the proposed Near Surface Disposal Facility at Chalk River permanently. Therefore, future generations would still have to determine where and how some of the waste removed from NPD would be permanently stored, and even if not involved in those decisions, the radioactive liability would still be in Algonquin territory unless and until such time as it is permanently relocated. On top of this, some of the waste (most likely low-level waste, but also possibly intermediate level waste) may well remain in Algonquin territory at Chalk River Laboratories on a permanent basis.

Some AAC members were interested in making sure that fewer, rather than more, permanent radioactive waste disposal facilities are developed in Algonquin territory. One AAC member expressed that by keeping the waste at the NPD site (Alternative 4 – In-Situ Disposal), there would be two permanent nuclear waste disposal facilities within Algonquin territory – one at the NPD site and one at the Chalk River Laboratories site. This member stated:

> "We're really not accomplishing anything by making a second dumping station or a second storage facility. So why would we not just keep the one facility at Chalk River instead of creating a secondary one (at NPD) and leaving it where it is?" (January 26, 2022)

A different member at the third meeting stated something similar:

> "so it's [In-Situ Disposal] kind of like sweeping your floor and creating little piles all over the place and not actually picking up the dirt and putting it into the trash can, right?... but we know Chalk River's not going to be moving right? Any time soon. So, if they're going to have that permanent storage solution, why wouldn't it be the best option to remove that stuff and put it over into the permanent storage right?" (February 22, 2022)

In the end, the majority of AAC members deemed Alternative 3 (Full Removal) as the best alternative for this AOPFN value. As the majority (7 out of 11) of AAC members who engaged in scoring against this value indicated that Alternative 4 (In-Situ Disposal) was the lowest ranked, Alternative 2 (Partial Dismantling and Removal) was determined to be the second preference after Alternative 3 (Full Removal). This result was verified at the third meeting.

Table 7 AAC Ranking for Value 4: Future Generations

Value 4: Future Generations	**Alternative 2 (Partial Dismantling and Removal)**	**Alternative 3 (Full Dismantling and Removal)**	**Alternative 4 (In-Situ Disposal)**
Ranks identified by AAC members	10 of 11 members scoring chose Rank of 2; one member chose Rank of 3	8 of 11 members scoring chose Rank of 1; three members chose Rank of 3	7 of 11 members chose Rank of 3; three members chose Rank of 1; one member chose Rank of 2
Majority Result	#2 Ranking	#1 Ranking (most preferred)	#3 Ranking (least preferred)

4.7 Value 5: Sustainable AOPFN Economy

The technical team provided some qualitative and quantitative information in relation to this value (see also Appendix 1):

- CNL has identified that Alternative 4 (In-Situ Disposal) is clearly the cheapest of the three alternatives, followed by Alternative 2 (Partial Dismantling and Removal), with Alternative 3 (Full Removal) the most expensive;
- Each of the three alternatives have been deemed economically feasible by CNL;
- None of the three alternatives would likely see extensive jobs for AOPFN members during the decommissioning phase. Much of the work required is highly technical, specialized and likely to be undertaken by larger firms with access to more equipment and capital than what is currently available to AOPFN members and AOPFN firms.
- Alternatives 2 (Partial Dismantling and Removal) and 4 (In-Situ Disposal) would likely have longer-term, but minor in scope, monitoring employment opportunities for AOFPN members.
- Alternative 3 (Full Removal), has the potential to see removal of all restrictions on future land zoning, would see the largest area that is potentially useable in the future for economic purposes by AOPFN members, whether that be for traditional economic purposes (hunting, fishing, trapping, etc.) or for industrial, commercial or residential purposes.

For this value, AAC members were asked to rank the alternatives from the one that brings the greatest potential for economic benefits that matter to AOPFN, to the one that is least likely to bring these benefits.

AAC members chose not to consider compensation for past, present and future harms from the presence of this nuclear facility on Algonquin territory as part of their AMA deliberations. AAC members have indicated, and AOPFN in general agrees, that Canada owes compensation to AOPFN for these undoubted, but never measured, past, present and future harms, regardless of what decommissioning strategy is established at NPD, and that the proposed project and Chalk River Laboratories are on unceded Algonquin land, for which they have never been compensated or accommodated for.

One of the considerations for the value of Sustainable AOPFN Economy was how the different alternatives would result in work for AOPFN members. In the first meeting, AAC members identified that it is possible if waste remained on the site, that AOPFN

members could be hired for monitoring, which will occur over a longer time period with Alternatives 2 (Partial Dismantling and Removal) and 4 (In-Situ Disposal). However, radioactive wastes being removed could support increased traditional economic activities (e.g,. hunting, fishing, trapping, medicine and plant gathering) at and around the site by AOPFN members. The full removal of all wastes may also allow more access to these lands that AOPFN members could potentially use in the future for business opportunities. For example, one AAC member discussed the potential commercial value of the site to AOPFN. This could occur only if all radioactive material is removed, and the fencing taken down.[10]

Ultimately, AAC members tended to believe that the economic opportunities for future use of the site are much higher if all radioactive materials are removed from the site. Eight of 10 AAC members agreed that Alternative 3 (Full Removal) should rank as the best, two said Alternative 4 (In-Situ Disposal) would rank as the best. All members ranked Alternative 2 (Partial Dismantling and Removal) as the "in between", second ranked alternative means. These results were verified at the third meeting.

[10] While the AAC did not describe it in these terms, all lands in AOPFN territory are unceded and AOPFN is pursuing self-governance, and the Algonquin Land Claim with Canada. Therefore, the question of potential AOPFN title to these and surrounding lands, and the ability to control the use of these lands for economic purposes in the future, is a relevant consideration. From an AOPFN perspective, there are greater options for future use of the NPD site if all the radioactive risks – and associated land use restrictions – are removed.

Table 8 AAC Ranking for Value 5: Sustainable AOPFN Economy

Value 5; Sustainable AOPFN Economy	**Alternative 2 (Partial Dismantling and Removal)**	**Alternative 3 (Full Dismantling and Removal)**	**Alternative 4 (In-Situ Disposal)**
Ranks identified by AAC members	10 of 10 members scoring chose Rank of 2	8 of 10 members scoring chose Rank of 1; two members chose Rank of 3	8 of 10 members chose Rank of 3; two members chose Rank of 1
Majority Result	#2 Ranking	#1 Ranking (most preferred)	#3 Ranking (least preferred

4.8 Value 6: AOPFN Governance and Stewardship

The AAC was asked to rank the alternatives from the one that most supports AOPFN governance and stewardship priorities, rights and responsibilities, to the one that is most contrary to AOPFN governance and stewardship priorities, rights and responsibilities. Advisory Committee members were reminded that this value was identified by them to also be tied to healing the spirit of the land and spirituality, which was brought up in discussing the values of Water, Wildlife, and Vegetation, as well as Algonquin Culture, Spirituality, and Knowledge.

No factual information was provided on this topic by the technical team because AAC members are the knowledge holders on this topic.

AOPFN members have a connection with the spirit and the land. This is a connection that CNL and AECL do not have and therefore was not a part of those parties' alternative means assessment. This connection was emphasized by two AAC members as the most important consideration for the discussion of the value of AOPFN governance and stewardship. An AAC member reminded everyone that governance and stewardship is part of their tradition of being caretakers of the land. Another AAC member stated that healing the land will heal the people as well. In addition to this, a member talked about going back to basic principles and focusing on what would have been allowed at the site in the first place if AOPFN governance and stewardship had

been applied, and the relevance those considerations have for decisions on how to manage the land now:

> "If we were just starting this project, what are our traditional values and knowledge, and what are our ways of life? And that's what I keep coming back to. If we were just starting this, what would we allow them to do and what would we not allow? And that's how I keep thinking of this process of everything has a spirit. And yes— you know— if we decide to do the full decommissioning to get that land back, yes, we're kind of uprooting, but in the same sense we're going to be able to start over to be able to redevelop." (February 22, 2022)

An AAC member emphasized that all governance and stewardship decisions for AOPFN start with protection of the land and its spirit:

> "We are the original caretakes of the land, that we— yes, we want to heal the spirit of the land and the spirituality, but the land is so important to us— where ever it is, whether it be at CNL, whether it be in Algonquin Park, whether it be down in Bon Echo, every piece of land is important to us and to our future. So, I really, really want to stress that land is important to us along with the healing." (February 22, 2022)

AAC members also noted that AOPFN members' access to and connection to NPD was completely expropriated in order for the NPD site to be put in place. While the harms attached to this alienation and loss of use and connection will need to be dealt with through relationship building that goes beyond the scope of this AMA, the alternative decommissioning means that is preferrable for AOPFN is one that allows for reestablishment of AOPFN access to and healthy connection with the whole site, and reestablishment of AOPFN controls over how the site is managed into the future, without land use restrictions. AOPFN thus prefers for alternatives that allow the land to heal the quickest from harms, that do not pass decisions down to future generations, and that align with AOPFN values associated with the health of the lands and waters.

As a result of the above-noted factors, eight out of nine AAC members ranked Alternative 3 (Full Removal) the best and one member ranked Alternative 4 (In-Situ

Disposal) the best. Again, Alternative 2 was considered the second best alternative by AAC members. These results were verified at the third meeting.

Table 9 AAC Ranking for Value 6: AOPFN Governance and Stewardship

Value 6: AOPFN Governance and Stewardship	**Alternative 2 (Partial Dismantling and Removal)**	**Alternative 3 (Full Dismantling and Removal)**	**Alternative 4 (In-Situ Disposal)**
Ranks identified by AAC members	9 of 9 members scoring chose Rank of 2	8 of 9 members scoring chose Rank of 1; one member chose Rank of 3	8 of 9 members chose Rank of 3; one member chose Rank of 1
Majority Result	#2 Ranking	#1 Ranking (most preferred)	#3 Ranking (least preferred

4.9 Value 7: Worker and Transportation Risk

AAC members acknowledged that any differential worker and transportation risks associated with the active decommissioning phase are worthy of consideration in making decisions about preferred alternatives. The AAC was asked to rank the alternatives from the one that has the lowest worker and transportation risks, to the one that has the highest worker and transportation risks.

The technical team reviewed information regarding worker and transportation risk associated with each alternative. It was noted that only Alternative 4 (In-Situ Disposal) is likely to minimize the transportation, handling and repackaging of radioactive waste. Alternative 3 (Full Removal) – especially – and Alternative 2 (Partial Dismantling and Removal) would require increased interaction between workers and radioactive waste as well as the transport of materials, increasing transportation risk. It was noted that CNL recognizes that all of the alternatives can be undertaken safely, but that there are incremental differences in the likelihood of worker and transportation incidents between the alternatives (information provided by CNL in its public filings):

- Alternative 4 (In-Situ Disposal) – least risk of transportation accidents and estimated +/- 0.19 lost time injuries during decommissioning

- Alternative 2 (Partial Dismantling and Removal) – second least risk of transportation accidents and estimated +/- 0.6 lost time injuries during decommissioning
- Alternative 3 (Full Removal) – highest incremental risk of transportation accidents and estimated +/- 1.2 lost time injuries during decommissioning

In discussion on this value, an AAC member identified that workers could get hurt during the dismantling of the infrastructure (especially under Alternatives 2 (Partial Dismantling and Removal) and 3 (Full Removal)). Another identified that the vehicles transporting the materials could have an accident:

> "You are disturbing the soil, disturbing the air. Although we talk about the environmental impact, I am also concerned about the possible injury of anybody going in there and getting hurt while they try to do this." (December 8, 2021)

Those transportation risks are highest under Alternatives 2 (Partial Dismantling and Removal) and 3 (Full Removal). While CNL provided information showing that Alternative 3 may require up to 1525 truckloads of total waste, it was left to the technical team to estimate how much radioactive waste truckloads were required for all three alternatives considered in this AMA.[11] The following estimates were presented to the AAC to help inform their decision-making:

- Alternative 2 (Partial Dismantling and Removal) – approximately 40 truckloads of intermediate level waste (ILW);
- Alternative 3 (Full Dismantling and Removal – approximately 40 truckloads of ILW, approximately 240 truckloads of low-level waste (LLW); and
- Alternative 4 (In-Situ Disposal) – no truckloads of ILW or LLW.

[11] CNL did not provide estimates of how many truckloads of waste would leave the site under Alternative 4 (which requires landfill and recycling truckloads to remove surface facility structures), and only provided estimates of radioactive waste truck loads for Alternative 2.The technical team derived the numbers above from the tables provided by CNL.

Almost all of the AAC members said they would rank Alternative 4 (In-Situ Disposal) the best for this value and Alternative 3 (Full Removal) as the worst. Two members said they would rank Alternative 3 (Full Dismantling and Removal) as the best.[12] Alternative 2 (Partial Dismantling and Removal) again received the middle ground rank of 2. These results were verified at the third meeting.

Table 10 AAC Ranking for Value 7: Worker and Transportation Risk

Value 7: Worker and Transportation Risk	**Alternative 2 (Partial Dismantling and Removal)**	**Alternative 3 (Full Dismantling and Removal)**	**Alternative 4 (In-Situ Disposal)**
Ranks identified by AAC members	9 of 9 members scoring chose Rank of 2	9 of 11 members scoring chose Rank of 3; two members chose Rank of 1[13]	9 of 9 members scoring chose rank of 1
Majority Result	#2 Ranking	#3 Ranking (least preferred)	#1 Ranking (most preferred

[12] The rationale presented by members who chose Alternative 3 (Full Removal) as preferred against this value is that they were basing their opinion on an overall high concern about Alternative 4 (In-Situ Disposal), rather than focusing on the merits of this one value. One of the members who preferred for Alternative 3 (Full Removal) against this value framed it this way: "I think it's a scary road that we walk on you know when we start looking at leaving any of it there it should go off to containment units that are going to be designed for that whether that's deep disposal or an intermediate disposal... So like I said I'm really in support of three when it we look at every one of these criteria right from 1 to 7 to 8 right so just my personal thoughts" (February 22, 2022).

[13] The two members who chose Alternative #3 as the highest ranked Alternative Means for Worker and Transportation Risk, did not rank the other two alternative means against this AOPFN Value.

4.10 Value 8: Risk to Other Populations Outside of Algonquin territory (including non-human)

The AAC was asked to rank the alternatives from the one that passes the least risk on to other populations in other territories (including non-human), to the one that passes the most risk on to other populations outside of Algonquin territory.

The technical team reviewed the factual information regarding each of the alternatives, including that all alternatives would likely result in storage of some radioactive waste in Algonquin territory. However, Alternative 3 (Full Removal) could result only in a shorter-term storage of intermediate-level radioactive wastes from NPD on Algonquin territory, some of which would likely be subject to removal to outside Algonquin territory if and when Canada identifies and develops an appropriate permanent storage facility for radioactive wastes in the form of the proposed deep geological repository.

AAC members expressed mixed feelings on this value, not wanting to take on the burden of radioactivity left behind by Canada themselves in Algonquin territory, while also expressing concern for other people and living beings outside Algonquin territory as well.

In relation to some of the alternatives that would likely see later movement of the waste out of Algonquin territory (Alternatives 2 (Partial Dismantling and Removal) and, especially, 3 (Full Removal)), some AAC members expressed concern that they would be shifting risk onto other Nations' territories or even areas used by non-Indigenous people. One of the members was concerned about the perception of the Algonquin people choosing to transport hazardous materials through and off of their territory and into the territories of others.

> "There was risks with moving the waste off of the site that could possibly you know, spill over into other territories. Now if I – like we weren't consulted we are getting the option to be consulted. And we have the choice to move it out of our territory, but then we are going to go push it on someone else's territory, right?" (December 8, 2021)

However, another member stated that the risk of transporting hazardous material should be completely held by Canada, not thrust upon AOPFN. These materials (or the technology to generate them) did not originate in Algonquin territory; they were brought in by Canada, and Canada is responsible to take them out.

Given the uncertainty around where any waste would ultimately be disposed of at this time, the AAC voiced the difficulty they faced in ranking alternatives under this value. For example, one member stated:

> "if we don't know where it's going, then the only risk right now in the transportation is to AOPFN members and our own territory at this time. So, for us to rank some other population or a risk to other areas— we can't really do that. We can't have input on a situation or other territories if we don't have the idea of where it could potentially go in ten years from now." (February 22, 2022)

Ultimately, following this discussion it was determined by the AAC there was not enough information to rank the alternatives on this value, but it would continue to be included as part of the individual assessments (see Section 5.2), as it is deemed of importance to the AAC and AOPFN.

5. Calculation of AOPFN Overall Rankings

5.1 Rankings Using Value-Specific Scoring and Weighting

Prior to the third and final meeting, the technical team converted the rankings into numerical "points" in order to complete the weighted scoring exercise. Any alternative given a rank of 1 (best rank) was given a corresponding score of 3 (highest). Any alternative given a rank of 2 (second rank) was given a score of 2, and any alternative given a rank of 3 (worst rank) was awarded 1 point (lowest).

The total score was calculated by adding up the weighted points for each alternative means. The results are shown in Table 11 below, which shows the points for each alternative means scored for each value in the grey row, and each score with the weights applied in the blue row.

Table 11 AOPFN Weighted Scores for Alternative Means to Undertake the NPD Site Decommissioning

		Alternative 2 (Partial Dismantling & Removal)	Alternative 3 (Full Removal)	Alternative 4 (In-Situ Disposal)
1. Water, Wildlife and Vegetation: Habitat and Quality	Points	2	3	1
	Weighted Points: 15%	0.3	0.45	0.15
2. AOPFN Access to and Use of Land and Waters	Points	2	3	1
	Weighted Points: 15%	0.3	0.45	0.15
3. Algonquin Culture, Spirituality and Knowledge	Points	2	3	1
	Weighted Points: 15%	0.3	0.45	0.15
4. Future Generations	Points	2	3	1
	Weighted Points: 15%	0.3	0.45	0.15
5. Sustainable AOPFN Economy	Points	2	3	1
	Weighted Points: 15%	0.3	0.45	0.15
6. AOPFN Governance and Stewardship	Points	2	3	1
	Weighted Points: 15%	0.3	0.45	0.15
7. Worker and Transportation Risk	Points	2	1	3
	Weighted Points: 5%	0.1	0.05	0.15
	Points	N/A	N/A	N/A

		Alternative 2 (Partial Dismantling & Removal)	Alternative 3 (Full Removal)	Alternative 4 (In-Situ Disposal)
8. Risk to Other Populations	Weighted Points: 5%	N/A	N/A	N/A
Total		**1.9**	**2.75**	**1.05**

The Technical Team presented the above-noted scoring table to the AAC at the third meeting and explained that it was built from the determination of majority scores. The table did not account for opinions that differed from the majority of the group. The Technical Team offered to create a scoring scheme that accounted for any instances of differing opinions. The AAC decided to score alternatives based on the majority opinion. The AAC verified the findings of the scoring table at the third meeting.

Alternative 3 (Full Removal) is clearly the AOPFN preferred alternative means against AOPFN-identified, weighted, and scored values. Alternative 3 (Full Removal) is well over twice as preferred as either Alternative 4 (In-Situ Disposal) and also clearly better than Alternative 2 (Partial Dismantling and Removal).

5.2 Individual AAC Member Rankings

While ranking each alternative against specific values and tabulating those scores is an important tool, AOPFN members tend to think holistically, about the pros and cons of each alternative on balance rather than as a compilation of discrete value scores. As a result, in the third meeting, each AAC member was asked to provide their own individual overall ranking, from 1 (best) to 3 (worst) for the three alternative means given full consideration in the AOPFN AMA. The results are shown in Table 12.

Table 12 Individual Rankings of Alternative Means by AAC Members

	Rank #1 (Best)	**Rank #2 (Middle)**	**Rank #3 (Worst)**
Member 1	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)

	Rank #1 (Best)	**Rank #2 (Middle)**	**Rank #3 (Worst)**
Member 2	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)
Member 3	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)
Member 4	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)
Member 5	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)
Member 6	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)
Member 7	Abstained from overall ranking		
Member 8	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal*
Member 9	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)
Member 10	Alternative 3 (Full Removal)	Alternative 4 (In-Situ Disposal) or Alternative 3 (Full Removal)	
Member 11	Alternative 3 (Full Removal)	Alternative 2 (Partial Dismantling/Removal)	Alternative 4 (In-Situ Disposal)

*Member 8 wanted to make it clear that they are very opposed to Alternative 4 (In-Situ Disposal) and would prefer not to see it on a ranking list at all.

Overall, ten members of the AAC prefer Alternative 3 (Full Dismantling and Removal) as the approach to decommission the NPD site. No members preferred any other alternative means. The least favoured alternative mean is Alternative 4 (In-Situ Disposal). One AAC member opted to abstain from providing an individual, overall ranking, on the basis that they saw ranking by values to be the preferred method of determining the preferred alternative.

6. Discussion and Conclusions

After conducting three meetings with the AOPFN's Advisory Committee, and triangulating qualitative and quantitative data, Alternative #3 (full removal) was determined to be AOPFN's preferred, viable alternative for the NPD decommissioning project. In addition to this primary finding, there are several important conclusions that will be discussed in this section, that AOPFN, CNL, AECL and CNSC must take special note of from this Alternative Means Assessment in making subsequent decisions:

1. AOPFN Preferences for NPD Reactor Decommissioning;
2. AOPFN and Algonquin Knowledge's Role in Decision-Making;
3. The Role of Financial Cost in AOPFN Decision-Making; and
4. Inclusion of AOPFN in Monitoring Programs.

Following discussion of these main points, the conclusions summarize AOPFN recommendations developed during this study.

6.1 AOPFN Preferences for NPD Reactor Decommissioning

AOPFN prefer for the adoption of an alternative decommissioning strategy for NPD that:

- Contributes to the minimization of the number of permanent hazardous waste disposal facilities in Algonquin territory;
- Supports the healing of the land back to a natural condition as quickly as possible, and thus supports healing of spirit as well;
- Will allow for the greatest chance for meaningful reconnection of AOPFN members to the NPD site in the future, for cultural and traditional use purposes;
- Reduces fear, stigma and perceived risk for AOPFN members in relation to the use of their territory;
- Provides the maximum real and perceived protection for the Kichi-Sìbì (Ottawa River);
- Does not pass risks in Algonquin territory on to future generations to handle;

- Allows for the maximum flexibility of future land uses for economic purposes by AOPFN and its members;
- Is a permanent rather than temporary site solution at NPD;
- Has acceptable and well understood and well managed worker and transportation risks, and can be completed safely; and
- Is endorsed by AOPFN through a Free, Prior and Informed Consent decision.

While each of the above preferences are important, there were three very strong preferences shared by AAC members multiple times across several values. These points help to explain AOPFN perspectives drawn on for this AMA, in determining an AOPFN preferred alternative means to decommission the NPD site.

The first preference was a **desire to heal the land, its spirit, and how the land is tied to the people**. This was discussed under the first six values in the AMA (Water, Wildlife, and Vegetation; AOPFN Access to and Use of Land and Waters; Algonquin Culture, Spirituality, and Knowledge; Future Generations; Sustainable AOPFN Economy, AOPFN Governance and Stewardship). For example, one member stated:

> "To me it has to be more powerful that we are the original caretakers of the land, that we— yes, we want to heal the spirit of the land and the spirituality, but the land is so important to us— where ever it is, whether it be at CNL, whether it be in Algonquin Park, whether it be down in Bon Echo, every piece of land is important to us and to our future. So, I really, really want to stress that land is important to us along with the healing." (February 22, 2022)

The second preference was for **maximization of safe and trusted access and use of the NPD site and its surroundings for present and future generations**. This was discussed under Values 2 (AOPFN Access to and Use of Land and Water) and 4 (Future Generations). This access is critical for AOPFN to practice governance and stewardship activities as caretakers of the land. Not only do AAC members want their future great-grandchildren to have the option to practice their culture safely throughout their territory, they also do not want those same great-grandchildren to be burdened with decisions regarding NPD waste management.

The third strong preference **was a desire to limit the number of permanent waste storage sites within Algonquin territory**. This was stated by multiple AAC members who were also worried that allowing the NPD to become a permanent waste site would set a precedent for future permanent hazardous waste sites throughout the Algonquin territory.

6.2 AOPFN and Algonquin Knowledge's Role in Decision-Making

The AOPFN AMA was seen as an exercise in self-determination. As one AAC member stated:

> "Algonquin people need to be able to make decisions on their own territory. First Nations should always be consulted. We need to reinforce that we were not consulted and they can see that if they had been consulted, there would be a different outcome." (February 22, 2022)

This quote highlights the importance of requiring the Algonquin perspective into all decision-making processes within Algonquin territory. While scientific information may lead to one conclusion, Algonquin Knowledge brings in an entirely different context. This is best summarized by an AAC member in the final meeting:

> "[…] yes, science is very important and we respect science and how science is important. But we also understand natural law, and how important natural law is and how that can balance out between science and natural law, and how working together can have a significant impact. So, you know, just balancing those two— and that's what we're all about is balance […] articulating that in the report is so important in how we have to work together to achieve that balance." (February 22, 2022)

According to a member of the AAC, all AOPFN decisions go back to the Seven Grandfather Teachings. The Seven Grandfathers, who led the Algonquin people when time began each offered a teaching by which all people should live before they passed into the spirit world. These are honesty, humility, respect, courage, wisdom, love, and

truth. These teachings are what the AOPFN value system are built on and are integrated into AOPFN ways of being.[14]

The incorporation of Indigenous (Algonquin) Knowledge, values, and culture in an Alternative Means Assessment **can** influence decision-making and **needs to be included prior to and as part of** decision-making on a preferred alternative future for the NPD site and all nuclear sites within unceded Algonquin territory. Because AOPFN has the right to be consulted when activities will affect their territory, they should be brought into discussions on project scopes and alternatives during the design stages.

Therefore, Canada (both AECL and CNSC) and the site operator, CNL, need to revisit their preferred alternative, along with AOPFN. The different findings of the two AMAs mean that there are still important discussions about acceptable and preferred futures to be had, that have not occurred in a meaningful way as yet. AOPFN's findings here are not findings to be filed away; they are material to decisions by all parties – the Proponent, Canada (both the holder of the nuclear legacy – AECL - and the regulator - CNSC), and AOPFN.

6.3 The Role of Financial Cost in AOPFN Decision-Making

AOPFN teachings may, at times, be in conflict with decisions that are made from solely – or even partially - a financial perspective. The AAC members understood that all alternatives were technically and financially feasible but noted that Alternative 4 (In-Situ Disposal), CNL's preferred alternative, was also by far the least expensive. Several of the AAC members stated that their perspective was not grounded in financial accounting

> "we come from a different place than a business place. Our connection to the land is much more— deeper. It's not a business deal. It's very, very hard for us to make a decision on what's going on with our land based on a business sense." (February 22, 2022)

[14] https://www.thealgonquinway.ca/lessons/plan-lesson-4-e.pdf

Therefore, it was observed that social and environmental values outweighed the financial impact of alternative preferences, where, to AOPFN, aspects of sustainability, revitalization, and wellbeing take precedence over monetary costs.

6.4 Inclusion of AOPFN in Monitoring Programs

The AAC has determined that the best course of action, the alternative that best aligns with their values, is the one that removes all of the radioactive waste from the NPD site and prevents it from becoming a permanent hazardous waste disposal facility. Regardless of the outcome of this decision-making process, any action at the NPD site must be paired with AOPFN involvement in monitoring programs. The AAC members have stressed the importance of this throughout the three meetings that were part of this AMA process. This will increase trust between AOPFN and CNL and would increase the likelihood that AOPFN members will utilize the area in and around the site in the future

> "I would also use the site, but I would also want AOPFN to have all the information on the monitoring regularly. So, we know from our own standpoint that I'm trusting my people, my monitors, my department that they have said it is safe to go. So, AOPFN has to have this monitoring and be involved in the monitoring and collect the database of monitoring on our own." (February 22, 2022)

Therefore, AOPFN needs to be involved in any onsite and near-site monitoring programs, no matter what decommissioning strategy is eventually implemented. This arises out of the fact that regardless of CNL's extensive technical monitoring programs (existing now and planned in the Project Case), trust has not been and likely will not be built until AOPFN members are empowered to collect and interpret data themselves.

6.5 AOPFN Recommendations

1. **Alternative 3 (Full Removal) is the preferred alternative of NPD decommissioning from an AOPFN perspective. This preference for fully removing all radioactive waste from the NPD site needs to be considered in decision-making for this project, and AOPFN requests that CNL, AECL**

and CNSC all engage with/consult with AOPFN about the implications of this finding.

2. **AOPFN requests early and comprehensive consultation and engagement on future alternative means assessments in or impacting on Algonquin territory, to incorporate AOPFN values and determine weighting and criteria early in the process.**
3. **Regardless of which decommissioning strategy is adopted, AOPFN requests adequate funding from CNL to perform fulsome Algonquin knowledge-based monitoring of the NPD site and its surroundings through the AOPFN Guardians monitoring program, for the life of the Project, including the Institutional Control period.**
4. **Regardless of which decommissioning strategy is adopted, AOPFN requests a limiting of the number of radioactive waste storage sites in Algonquin territory.**
5. **Regardless of which decommissioning strategy is adopted, AOPFN requests that the movement of radioactive wastes into, across and out of AOPFN territory be subject to written AOPFN permissions.**
6. **Regardless of what decommissioning strategy is eventually adopted, AECL and CNL should be actively and immediately engaging with/consulting with AOPFN about compensatory/accommodation measures for over 60 years of lost use and occupancy by AOPFN members of the area at and around the NPD site. Recognizing, calculating and compensating for these losses, which will likely occur on into the future, is a critical step in reconciliation between Canada and AOPFN.**

6.6 Closing

As evidenced by this exercise, the consideration of AOPFN values and Algonquin Knowledge in performing an Alternative Means Assessment led to a different conclusion than that of CNL's. These conclusions demonstrate the need for early and meaningful engagement with AOPFN on future AMA's and, by extension, any proposed project in the Algonquin territory. Additionally, it is equally as important the AOPFN be involved in ongoing monitoring of the project site. At the time of writing this report,

AOPFN's Guardian program is in development, and will act as stewards, the eyes and ears of AOPFN values. By having AOPFN monitoring involvement, it will help to ensure these values, among others, identified in this AMA, relative to the proposed project, are constantly considered, and will allow for the spirit of the land to heal.

AOPFN appreciated this opportunity to complete an Alternative Means Assessment from their own perspective and looks forward to involvement in the discussions and decisions that arise out of its conclusions.

Glossary of Terms

Term	Definition
AECL	Atomic Energy of Canada Limited
AKLUS	Algonquin Knowledge and Land Use Study
ALARA	"As Low As Reasonably Achievable" -A principle of radiation protection that holds that exposures to radiation are kept as low as reasonably achievable, social and economic factors taken into account.
Alternative Means Assessment (AMA)	Identification of all the technically and economically feasible alternative ways CNL could use to complete its decommissioning goals and an evaluation of each alternative, which explains which alternative is preferred and why.
AOPFN Values	Valued components (see, below) that are defined by AOPFN Advisory Committee members as part of this AMA.
Background Radiation	The dose or dose rate (or an observed measure related to the dose or dose rate) attributable to all sources other than the one specified.
Best Available Technology and Techniques Economically Achievable (BATEA)	Minimum pollution prevention performance standards for which effluent and/or emission concentrations have been demonstrated to be achievable within an industrial sector and are therefore economically achievable across that industrial sector. BATEA takes into account both treatment technologies and techniques used to achieve the desired effluent and/or emission concentrations. The way in which the installation is designed, built, maintained,

	operated and decommissioned is also considered as part of these technologies and techniques.
Bounding Scenario	An accident or disruptive event with consequences larger (i.e., greater releases to the environment) than others considered.
Chronic	Involving stimulus that is lingering or continues for a long time; often signifies periods from several weeks to years, depending on the reproductive life cycle of the species. Can be used to define either the exposure or the response to an exposure (effect). Chronic exposure typically induces a biological response of relatively slow progress and long continuance.
CNL	Canadian Nuclear Laboratories
CNSC	Canadian Nuclear Safety Commission
COPC	Contaminant of Potential Concern
Decommissioning	Administrative and technical actions taken to allow the removal of some or all of the regulatory controls from a facility. This does not apply to a repository or to certain nuclear facilities used for mining and milling of radioactive materials, for which closure is used.
Deep Geological Repository	A facility for disposal of radioactive waste located underground (usually several hundred metres or more below the surface) in a geological formation to provide long term isolation of radionuclides from the biosphere.
Dose Limit	A maximum allowable radiation dose (effective dose or equivalent dose) which is in place to minimize the risk of adverse health effects due to radiation exposure.

Duty to Consult	In Canada, the duty to consult and accommodate with Indigenous peoples arises when the Crown contemplates actions or decisions that may affect an Indigenous person's Aboriginal or Treaty rights.
EIS	Environmental Impact Statement
Environmental Assessment	An assessment of the environmental effects of a project.
Environmental Impact Statement	A detailed technical document prepared by the proponent of a designated project to be assessed pursuant to the Canadian Environmental Assessment Act, 2012. The environmental impact statement identifies the potential adverse environmental effects of a designated project including cumulative effects, measures to mitigate those effects, and an evaluation of whether the designated project is likely to cause any significant adverse environmental effects.
Grouted	Radioactive waste materials that have been treated and conditioned into forms that are suitable for their subsequent management, including transportation, storage and final disposal. Grout is typically a cementitious mortar or paste that can fill gaps and crevices.
Guiding Questions	Questions that help determine the importance placed on AOPFN values with respect to the Project, and the AMA.
Hazardous Waste	Waste that is potentially hazardous to human health and/or the environment due to its nature and quantity and that require special handling and storage techniques.
In-Situ	A method of carrying out decommissioning “in place”, the end-

Decommissioning	state of which is a disposal facility, thus the project now uses the term "in-situ disposal" (see below)
In-Situ Disposal	A method of carrying out disposal "in place".
In-Situ Treatment	A method of managing or treating contaminated soils, sludges and waters "in place" in a manner that does not require the contaminated material to be physically removed or excavated from where it originates.
Institutional Controls Phase	A phase of the NPD Closure Project, assumed to extend at least 100 years following the Decommissioning Execution phase. This involves the control of residual risks at a site after it has been decommissioned, as defined in REGDOC 2.11.1 Vol III (CNSC 2018a). The Institutional Controls phase may include active measures (such as surveillance and monitoring) and passive measures (such as access controls).
Intermediate Level Waste	Radioactive solid waste that typically exhibits levels of penetrating radiation sufficient to require shielding during handling and interim storage.
Low Level Waste	Radioactive solid waste that contains material with radionuclide content above established clearance levels and exemption quantities, but that generally has limited amounts of long-lived activity.
LSA	Local Study Area
Mitigation	Measures aimed at eliminating, reducing or controlling the adverse effects of a licensed activity, substance, equipment or facility. Mitigation may include restitution for any damage caused by such

	effects, such as through replacement, restoration or compensation.
NPD	Nuclear Power Demonstration
NPDWF	Nuclear Power Demonstration Waste Facility
Post-Institutional Controls phase	The Post-Institutional Controls phase is the period of time following the Institutional Control period, continuing indefinitely.
Qualitative	Relating to, measuring, or measured by the quality of something rather than its quantity.
Quantitative	Relating to, measuring, or measured by the quantity of something rather than its quality.
Radiation	The emission by a nuclear substance, the production using a nuclear substance, or the production at a nuclear facility of, an atomic or subatomic particle or electromagnetic wave with sufficient energy for ionization.
Radioactive Decay	The spontaneous transformation of one radioisotope into one or more different isotopes (known as decay products or daughter products), accompanied by a decrease in radioactivity (compared to the parent material). This transformation takes place over a defined period of time (known as a half-life), as a result of electron capture; fission; or the emission of alpha particles, beta particles, or photons (gamma radiation or X-rays) from the nucleus of an unstable atom. Each isotope in the sequence (known as a decay chain) decays to the next until it forms a stable, less energetic end product. In addition, radioactive decay may refer to gamma-ray and conversion electron emission, which only reduces the excitation energy of the nucleus.

Radioactive Waste	For the purposes of waste management, any material (liquid, gaseous, or solid) that contains a radioactive nuclear substance, as defined in section 2 of the Nuclear Safety and Control Act, and which the owner has declared to be waste. In addition to containing nuclear substances, radioactive waste may also contain non-radioactive hazardous substances, as defined in section 1 of the General Nuclear Safety and Control Regulations.
Temporal Boundary	Timeframe during which project activities are actively occurring, including the duration of predicted residual effects.
Valued Component	Environmental, social, economic, cultural or health related features that may be affected by a project and that have been identified to be of concern by the proponent, government agencies, Indigenous peoples, the scientific community or the public.
Value Statements	Descriptive statements of agency related to AOPFN Values, generated in the AMA methodology design process. They convey how values are of importance to AOPFN.
VC	Valued Component (used instead of VEC)

Appendices[15]

Appendix 1: Information Provided by CNL on the Four Alternative Means

1A) Conceptual Depictions by CNL

Each of the four alternative means are described in more detail below, along with a pictographic representation of the approach. All of this information was provided by CNL to the AOPFN technical team.

1. Continued Storage with Surveillance (SwS)

For this analysis it has been assumed that this approach involves continuing to defer decommissioning by maintaining the NPDWF in the SwS phase, thereby allowing for further radioactive decay. This will involve continued maintenance, monitoring and yearly reporting in the form of annual compliance reports. Specific activities may change over time as the state of the facility changes.

Continued SwS serves as a baseline case against which the other alternative means are compared.

[15] Note: for the purposes of readability, tables and figure numbers have been adjusted to match ordering in this report (as opposed to numbering in their original documents).

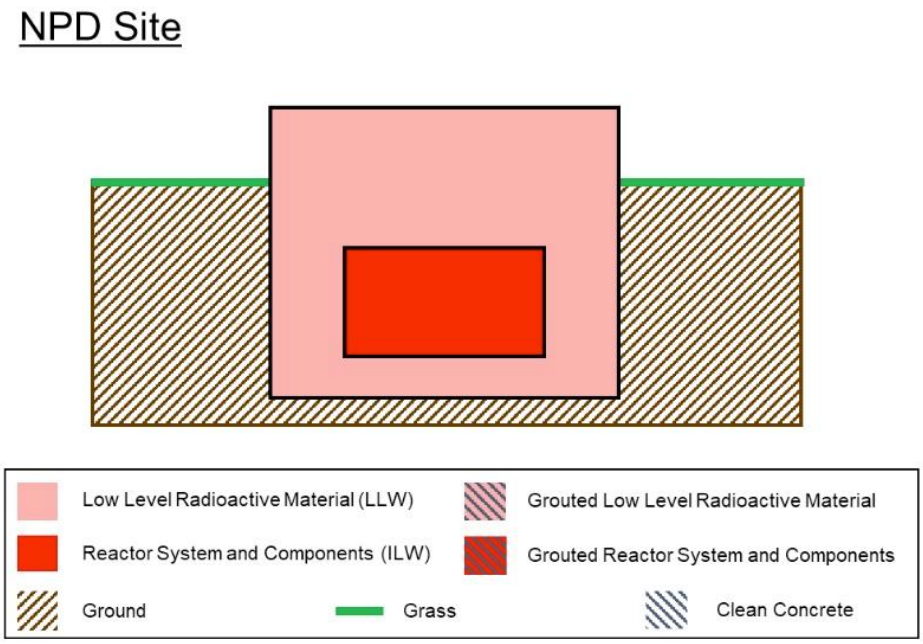

Figure 2 Conceptual design of Alternative #1 (continued storage and surveillance (SwS)) for the NPD decommissioning project

2. Partial Dismantling and Removal

This alternative means is a combination of the in-situ disposal and full removal alternatives, and involves removal of the reactor system and components. The feeders, pressure tubes, calandria tubes, calandria and associated bioshielding will be removed, and the fuel handling room will be decommissioned. This waste would be packaged in containers for transport and storage. Additionally, a few drums of waste from the spent fuel bay cleanup would likely also be removed. This waste would be temporarily stored at the CRL site, prior to final disposal. It is assumed that a disposal facility for ILW will become available at CRL at some point during the Institutional Controls phase. Activities associated with the construction of such a facility are not considered in this assessment; only disposal-related activities (e.g., transportation, handling, emplacement) are considered. The remaining facility systems, structures, and components will remain in- situ, and will be decommissioned in the same manner as for "4. In-Situ Disposal". The above ground structures will be demolished and the rubble emplaced in the below grade structures prior to grouting. A concrete cap and

engineered barriers would cover the facility and the surrounding area would be remediated. The stack would remain intact to continue serving as a habitat for chimney swifts. During the Institutional Controls phase, surveillance, inspection, maintenance, and monitoring activities will be undertaken at the NPD site. These activities will include inspection of the integrity of the disposal facility, i.e., concrete cap and engineered barrier, and maintenance such as re-grading and removing trees and deep-rooted plants. The specific monitoring activities would be developed in compliance with applicable CSA N288 series documents for groundwater, effluent, and environmental monitoring.

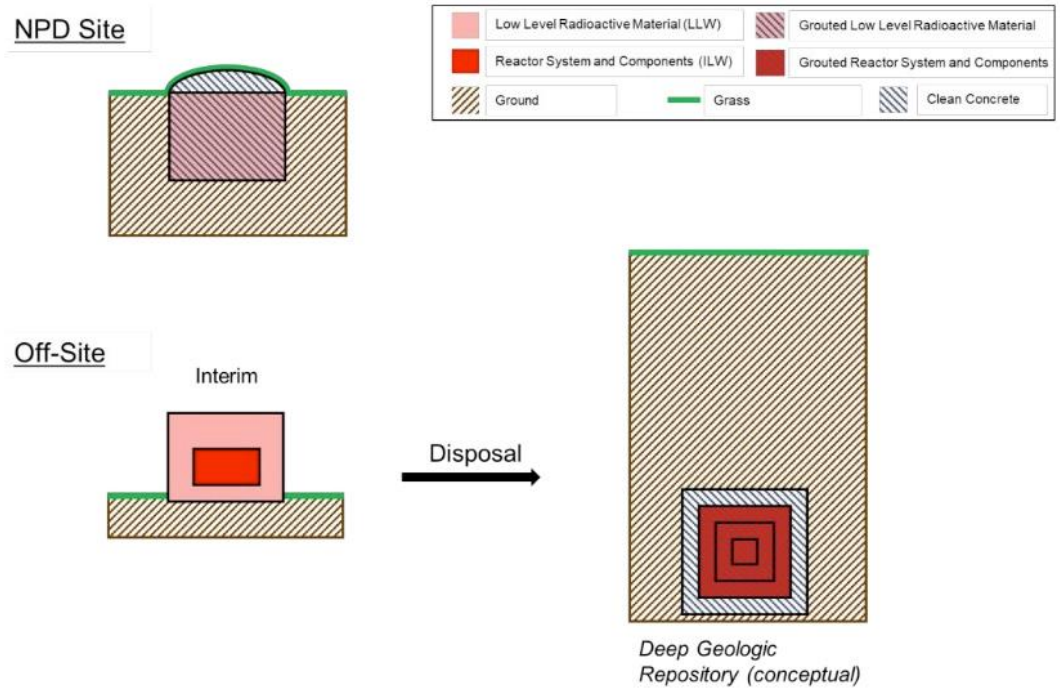

Figure 3 Conceptual design of Alternative #2 (partial dismantling and removal) for the NPD decommissioning project

3. Full Dismantling and Removal

For this analysis it has been assumed that this alternative means involves removing all radioactive material from the site and storing it temporarily at CRL, until a final disposal location is available. It is assumed that disposal facilities for both low-level waste (LLW) and intermediate-level waste (ILW) will become available at CRL during the Institutional

Controls phase. The activities associated with the construction of these facilities is not in the scope of this assessment; only the disposal-related activities (e.g., transportation, handling, emplacement) are considered.

All structures on-site would be demolished and removed from the site, along with any nuclear or hazardous waste. This would include the removal of the reactor and the associated systems. It would also include removal of the stack and construction of a replacement roosting structure. The site would be remediated following the removal of all structures. It has also been assumed that the waste will be stored in containers within a building at the CRL site due to the lack of a disposal facility at the time of waste removal.

During the Institutional Controls phase, it is assumed that minimal surveillance, inspection, and maintenance activities will be undertaken at the NPD site. It is expected that monitoring activities will continue to demonstrate the enhancement of the site following removal of the facility. Similarly, monitoring of the chimney swift population and use of the roosting structure will be required. General maintenance of the property will also be required (e.g., surface condition of roads and landfills).

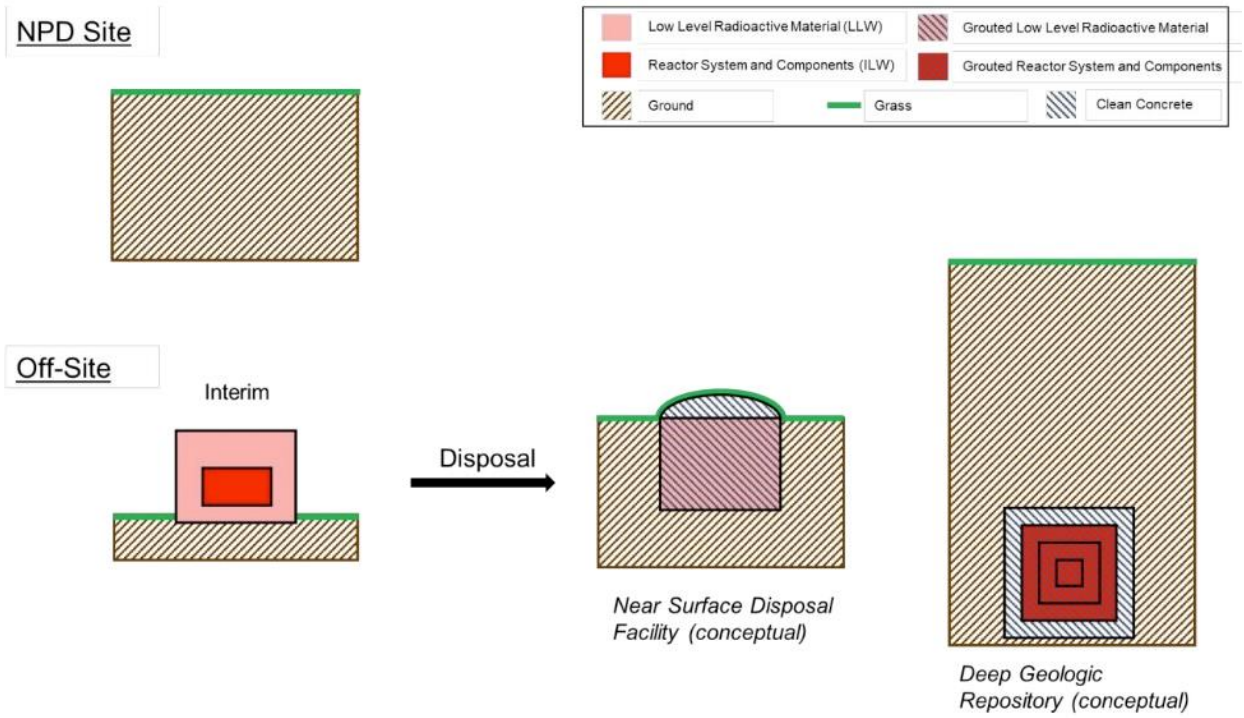

Figure 4 Conceptual design of Alternative #3 (full removal) for the NPD decommissioning project

4. In-Situ Disposal

For this analysis it has been assumed that this alternative means involves grouting the reactor and associated systems in place within the building as a means of decommissioning. The above ground structures will be demolished, and the rubble will also be grouted within the below grade structures. The stack would not be demolished, as it will be left as a habitat for chimney swifts. Finally, a concrete cap and engineered barrier system would be placed over the facility to close it and the site will be remediated.

During the Institutional Controls phase, surveillance, inspection, maintenance, and monitoring activities will be undertaken at the NPD site. These activities will include inspection of the integrity of the disposal facility, i.e., concrete cap and engineered barrier, and maintenance such as re-grading and removing trees and deep-rooted plants. A draft follow-up program has been developed in compliance with applicable CSA N288 series documents for groundwater, effluent, and environmental monitoring

to be undertaken during both the Decommissioning Execution and Institutional Controls phases.

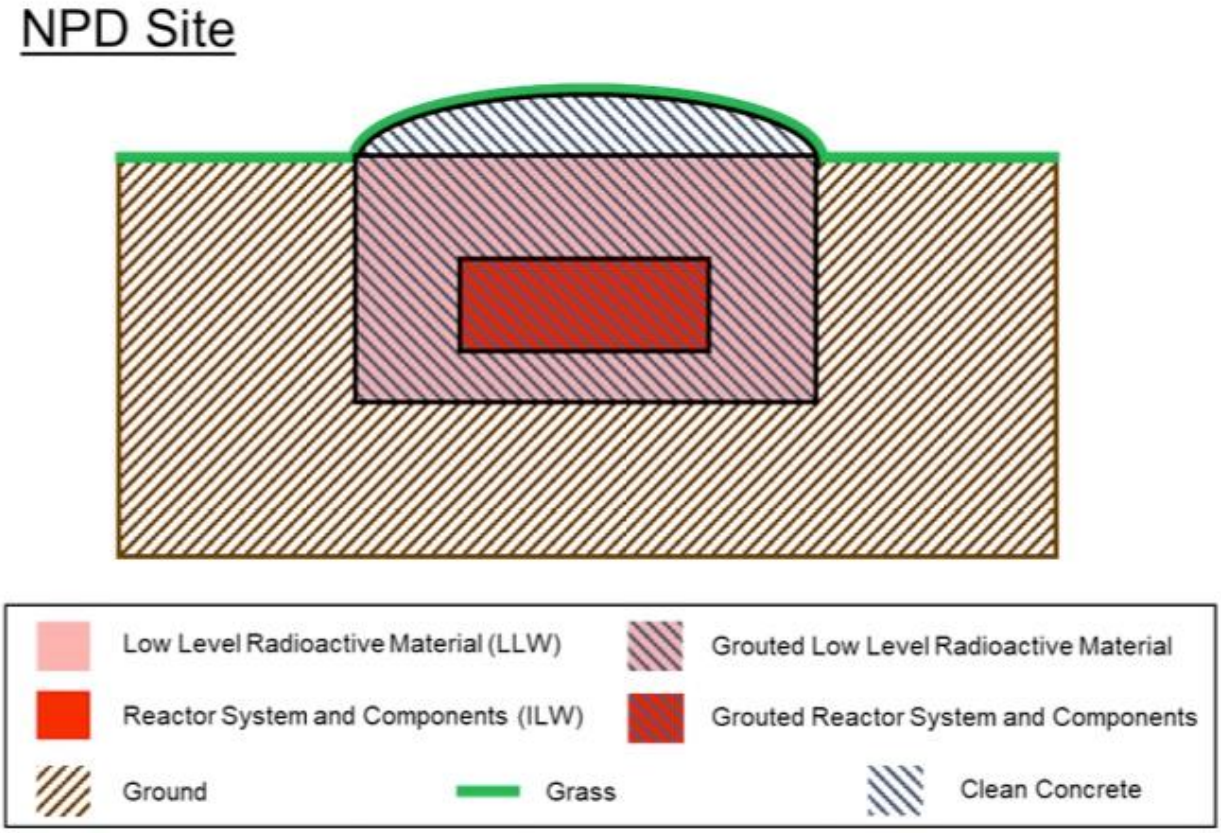

Figure 5 Conceptual design of Alternative #4 (in-situ disposal) for the NPD decommissioning project

1B) Visual and Written Descriptions of What the NPD Reactor Site Would Look Like after 50 and 100 Years after Decommissioning: Comparing the Four Alternatives

This information was provided by CNL to AOPFN, to support the AAC's understanding of how the future would look under the four alternatives.

Option 1: Continued Storage with Surveillance (SWS)

For this option the facility will be maintained in its current state. The facility will be maintained/repaired indefinitely. It is expected that the facility and site will not look any different from its current state in the next 50 years, e.g. as shown in Figure 1. The stack would remain intact to continue serving as a habitat for chimney swifts for at least the next 50 years. At this time a case for removing the stack could be made. Thus 100 years from now the facility and site is expected to look similar to the current state minus the stack, as shown in Figure 2.

Figure 6 Site at 50 years – Continued SWS

Figure 7 Site at 100 years – Continued SWS

Option 2: Partial Dismantling and Removal

For this option, parts of the below grade facility are removed and the above ground structures are demolished with the rubble emplaced in the below grade structures prior to grouting. A concrete cap and engineered barriers cover the facility. The stack remains intact to continue serving as a habitat for chimney swifts for at least the next 50 years, see Figure 3. At this time a case for removing the stack could be made. It is expected that the institutional control period will extend beyond 100 years in which case fences and access roads will be maintained. Thus the appearance of the site at 100 years is similar to the 50 year mark with the exception that the stack is removed, see Figure 4.

Figure 8 Site at 50 years – Partial Dismantling and Removal

Figure 9 Site at 100 years - Partial Dismantling and Removal

Option 3 : Full Dismantling and Removal

All structures on-site would be demolished and removed from the site, along with any nuclear or hazardous waste. This would include the removal of the reactor and the associated systems. The site would be remediated following the removal of all structures, including fences and roads. Soil compacted areas will be broken up with a

track machine where necessary, and these areas will be top-dressed as required and replanted with native vegetation or allowed to revegetate naturally. Subsoil will be tilled and cultivated as necessary during clean up to remove compacted material. **After 50 years the site should have filled in with trees and vegetation and the only manmade structure would be the ventilation stack and an access road for inspection/maintenance and ultimate removal of stack. At 100 years the ventilation stack will no longer present and the site should have returned to a natural state similar to the current forest that surrounds the disturbed areas of the site.**

[*no images made available by CNL; note the bolded text above which describes what the area would likely look like at 50 and 100 years].*

Option 4 : In-Situ Disposal

The reactor and associated systems will be grouted in place within the building as a means of decommissioning. The above ground structures will be demolished, and the rubble will also be grouted within the below grade structures. Finally, a concrete cap and engineered barrier system would be placed over the facility to close it. The stack would not be demolished, as it will be left as a habitat for chimney swifts for the next 50 years, see Figure 5. It is expected that the institutional control period will extend beyond 100 years in which case fences and access roads will be maintained. Thus the appearance of the site at 100 years is similar to the 50 year mark with the exception that the stack is removed, see Figure 6. Note: The appearance of the site under this option is the same as for the Partial Dismantling and Removal option.

Figure 10 Site at 50 years – In-Situ Disposal

Figure 11 Site at 100 years - In-Situ Disposal

1C) Comparison of Select Attributes of the Four Potential Alternatives

The summary information below is taken from CNL's alternative means assessment information in its Environmental Impact Statement, and information understood by AOPFN's Technical Team through review of this information and engagement with CNL.

Table 13 Comparison of select attributes of the four potential alternatives with respect to the 8 values determined as part of the AOPFN AMA process

AOPFN Value	**Factor**	**Alternative 1: Storage and Surveillance**	**Alternative 2: Partial Dismantle and Removal**	**Alternative 3: Full Dismantle and Removal**	**Alternative 4: In-Situ (On Site) Disposal**
1. Water, Wildlife and Vegetation: Habitat and Quality	Would the Alternative have any scientifically measurable impact on water quality?	Very Unlikely	Very Unlikely	Very Unlikely	Very Unlikely
	Would the Alternative have any scientifically measurable impact on wildlife numbers or health?	Very Unlikely	Very Unlikely	Very Unlikely	Very Unlikely
	In a future with the Alternative, will the site be allowed to return to normal forested conditions?	uncertain; not a permanent solution	No, a small area will have a cleared area	Yes, within 50 to 100 years	No, a small area will have a cleared area

AOPFN Value	Factor	Alternative 1: Storage and Surveillance	Alternative 2: Partial Dismantle and Removal	Alternative 3: Full Dismantle and Removal	Alternative 4: In-Situ (On Site) Disposal
			where only grass will be allowed to grow		where only grass will be allowed to grow
2. AOPFN Land and Water Access and Use	In a future with the Alternative, will there be any access restrictions to the site?	uncertain; not a permanent solution	Yes, a small area will remain fenced off	No	Yes, a small area will remain fenced off
	In a future with the Alternative, how will the site look?	uncertain; not a permanent solution	Partially natural and partially unnatural	Natural, once the stack is removed	Partially natural and partially unnatural
4. Future Generations	In a future with the Alternative, what is the risk of catastrophic radioactivity release to the environment at the site?	Very low to none	Very low to none	None	Very low to none

AOPFN Value	Factor	Alternative 1: Storage and Surveillance	Alternative 2: Partial Dismantle and Removal	Alternative 3: Full Dismantle and Removal	Alternative 4: In-Situ (On Site) Disposal
	In a future with the Alternative, will there be radioactive materials left at the site?	uncertain; not a permanent solution	Yes, a very small amount of low-level and intermediate-level radioactive waste	No	Yes, a small amount of low-level and intermediate-level radioactive waste
	In a future with the Alternative, will the site be considered a permanent hazardous waste disposal facility?	uncertain; not a permanent solution	Yes	No	Yes
	In a future with the Alternative, is there a chance that interventions would be required at the site if an accident or failure occurs?	uncertain; not a permanent solution	Yes	No	Yes
	How much would the Alternative cost?	$4.5 M/yr.	$70-90 M	$125-150 M	$60-80 M, including

AOPFN Value	Factor	Alternative 1: Storage and Surveillance	Alternative 2: Partial Dismantle and Removal	Alternative 3: Full Dismantle and Removal	Alternative 4: In-Situ (On Site) Disposal
5. Sustainable AOPFN Economy		+ periodic infrastructure improvement	+ storage costs + eventual final disposal costs	+ storage costs + eventual final disposal costs	institutional control activities
	How many jobs for AOPFN are likely with the Alternative?	Very few	Very few, potential for minimal longer-term monitoring	Very few, no longer-term monitoring	Very few, potential for minimal longer-term monitoring
7. Worker and Transportation Risk	Does the Alternative minimize the transportation, handling and repackaging of radioactive waste?	No	No	No	Yes
	How much worker and transportation risk is involved with implementing the Alternative?	uncertain; not a permanent solution	Low to Very Low (+/- 0.6 lost time injuries)	Low (+/- 1.2 lost time injuries)	Very Low (+/- 0.19 lost time injuries)

AOPFN Value	Factor	Alternative 1: Storage and Surveillance	Alternative 2: Partial Dismantle and Removal	Alternative 3: Full Dismantle and Removal	Alternative 4: In-Situ (On Site) Disposal
	Is it likely that the Alternative can be completed safely?	Yes	Yes	Yes	Yes
8. Risk to Others	Would the Alternative likely see radioactive waste currently at NPD stored in Algonquin territory?	Yes, at minimum over the short term	Yes, at minimum over the short term, at NPD and Chalk River	Yes, at minimum over the short term, at Chalk River	Yes, permanently at NPD
	Would the Alternative likely see radioactive waste moved from Algonquin territory to other territories?	uncertain; not a permanent solution	Possibly, if Deep Geological Repository (DGR) developed	Possibly, if Deep Geological Repository (DGR) developed	No
	What is the level of risk to the public of the materials that would be moved under this Alternative?	uncertain; not a permanent solution	Very Low	Very Low	n/a; no radioactive materials moved

AOPFN Value	Factor	Alternative 1: Storage and Surveillance	Alternative 2: Partial Dismantle and Removal	Alternative 3: Full Dismantle and Removal	Alternative 4: In-Situ (On Site) Disposal
	Under this Alternative, where is the likely final disposal location for NPD's current radioactive wastes?	uncertain; not a permanent solution	Some at NPD; some at CRL; some at DGR	Some at CRL; some at DGR	All at NPD

1D) Information Request Responses from CNL to AOPFN to Support AMA

NOTE: YELLOW HIGHLIGHTED MATERIALS BELOW ARE FROM THE ORIGINAL DOCUMENT SENT TO THE AAC, TO DENOTE THAT THIS IS A SEPARATE TECHNICAL TEAM COMMENT TO THE AAC, AND NOT MATERIAL FROM CNL.

AOPFN ALTERNATIVE MEANS ASSESSMENT FOR THE NUCLEAR POWER DECOMMISSIONING PROJECT: ADDITIONAL INFORMATION PROVIDED BY CNL ON AOPFN ADVISORY COMMITTEE QUESTIONS

February 22, 2022

AOPFN Technical Team to AOPFN Advisory Committee

1. *AOPFN REQUEST: Can CNL provide a plain language information package on how ISD has been implemented at other sites in the past and what effects have been encountered during subsequent monitoring?*

   A number of worldwide facilities have been decommissioned using ISD. Basic details about these facilities, their inventory, ISD activities and monitoring plans and results are included in Appendix 1 below.

2. *AOPFN REQUEST: CNL is requested to provide exact information about how large the overall NPD site is (the whole AECL owned area, in hectares), and how large in hectares is the area shown in the images provided previously (the impacted area that will be subject to the Decommissioning).*

   The overall AECL owned area at the NPD site is 385 hectares. The area shown in the images impacted by decommissioning and enclosed by the fence is ~2.5 hectares.

3. *AOPFN REQUEST: CNL is requested to provide an estimation, for each of Alternatives 2, 3 and 4, of how long fencing will likely be kept around the decommissioned facility, and, if the fenced in area (in hectares) will differ between any of these alternatives, please provide that information as well.*

For Alternatives 2 and 4 the fenced area is the same at 2.5 hectares. For Alternative 3, the fence is not required so the fenced area would be 0 hectares.

Alternative 2: Partial Dismantling and Removal. In this case the fenced area will be 2.5 hectares. As the reactor systems and components would be removed there would be no intermediate level waste remaining in the facility. The fence is expected to remain in place for 100 years at which point the majority of the radioactivity will have decayed to unconditional clearance levels. At this point a licence to abandon from the CNSC would be applied for. As the site also contains non-radiological contaminants and hazardous constituents its use is limited through compliance with the land disposal requirements of Ontario Regulation 347. It is expected that the 2.5 hectare fenced area will be required in perpetuity.

Alternative 3: Full Dismantling and Removal. In this case once the decommissioning activities have been completed all components of the facility will have been removed offsite, the fence will no longer required. Therefore if this option were pursued the fencing would be removed after approximately 12 years (the time to complete the decommissioning activities).

Alternative 4: In-Situ Disposal. The fence is expected to remain in place for at least 100 years as a condition of the Licence to Decommission, although it is anticipated that a decommissioning licence would be in place for 300 years. At this point a licence to abandon from the CNSC could be applied for. As the site also contains non-radiological contaminants and hazardous constituents its use is limited through compliance with the land disposal requirements of Ontario Regulation 347. It is expected that the 2.5 hectare fenced area will be required in perpetuity.

4. *AOPFN REQUEST: CNL is requested to provide an estimation, for each of Alternatives 2, 3 and 4, of how long monitoring of the site will continue into the future. If there are differences in the type and intensity of monitoring required, this*

should be identified as well.

Alternative 2: Partial Dismantling and Removal. The monitoring is expected to remain in place for 100 years at which point the majority of the radioactivity will have decayed to unconditional clearance levels. At this point a licence to abandon from the CNSC would be applied for. As the site also contains non-radiological contaminants and hazardous constituents it then will fall under Ontario Regulation 232/98. O. Reg. 232/98 requires that an annual post-closure care report be prepared following closure of the site that contains the results of monitoring. This requirement is given in Section 32 of the Regulation. It is expected that this will consist of groundwater monitoring using the existing wells and will be required in perpetuity.

Alternative 3: Full Dismantling and Removal. In this case once the decommissioning activities have been completed the site will be considered remediated no monitoring would be required.

Alternative 4: In-Situ Disposal. Monitoring is expected to remain in place for at least 100 years as a condition of the Licence to Decommission, although it is anticipated that a decommissioning licence would be in place for 300 years for the entirety of which monitoring would be required. The frequency of monitoring and contaminants monitored may change during this time based on previous monitoring results. At this point a licence to abandon from the CNSC could be applied for. As the site also contains non-radiological contaminants and hazardous constituents it then will fall under Ontario Regulation 232/98. O. Reg. 232/98 requires that an annual post-closure care report be prepared following closure of the site that contains the results of monitoring. This requirement is given in Section 32 of the Regulation. It is expected that this will consist of groundwater monitoring using the existing wells and will be required in perpetuity.

5. *AOPFN REQUEST: CNL is requested to provide an estimation, for each of Alternatives 2, 3 and 4, how long in months or years the active decommissioning stage would take (i.e., how long it would take to complete everything up to the end state (minus removal of the stack, which is a longer-term*

activity).

Alternative 2: Partial Dismantling and Removal. Active decommissioning is estimated to take 93 months (seven years and nine months) and is based on the work activities determined as part of Alternatives 3 and 4.

Alternative 3: Full Dismantling and Removal. Active decommissioning is estimated to take 144 months (12 years).

Alternative 4: In-Situ Disposal. Active decommissioning is estimated to take 32 months (two years and eight months).

6. *AOPFN REQUEST: CNL is requested to provide an estimation of how many a. truckloads and b. mass of radioactive materials are still in the NPD site, and how much of that (broken down if possible to low level vs. intermediate level waste) will be removed in Alternative 2 (the only active Alternative that neither takes all the materials out or leaves all the materials in situ).*

   Waste volume estimates are given in **Error! Reference source not found.** below f or the Alternative 3: Full Dismantling and Removal strategy. This was used to estimate the volumes associated with full or partial removal of waste from NPD and provides a reasonable estimate for planning purposes. Masses are based on typical densities of materials and wastes applied to the estimated volume. A breakdown by potential disposal routes is also given. The total volume of waste is estimated to be 16,309 m^3. A truckload of waste is typically quoted as 14 cubic yards or about 10.7 m^3. Therefore the volume of waste for full dismantling would result in 1,525 truckloads.

   For Alternative 2 the majority of the waste volume would remain at the site, and this would consist entirely of low level waste. The reactor, systems and components is about 123 m^3 and the primary heat transport system is about 265 m^3 of unprocessed volume of intermediate level waste that would be packaged and shipped to Chalk River Laboratories for storage and future disposal. Therefore the unprocessed volume is approximately 390 m^3 or about 40 truckloads.

Table 14 Waste Volume Estimates

Material/ Component	Mass (kg)	Total Volume (m^3)	Disposal (m^3)			
			Recycle	Landfill	LLW	ILW

AOPFN TECHNICAL TEAM COMMENT: CNL IS INDICATING FOR ALTERNATIVE 2 (PARTIAL DISMANTLING AND REMOVAL) THAT ONLY 40 TRUCKLOADS OF WASTE, ALL INTERMEDIATE LEVEL RADIOACTIVE WASTE, WILL NEED TO BE REMOVED FROM THE

SITE, AND THAT UNDER ALTERNATIVE 3, SOME 1525 TRUCKLOADS WOULD BE REQUIRED. TWO THINGS ARE KEY TO NOTE HERE: ACCORDING TO THE TABLE ABOVE, ONLY ABOUT 280 OF THE TRUCKLOADS UNDER ALTERNATIVE 3 WOULD HOST RADIOACTIVE WASTE (40 TRUCKLOADS OF ILW AND 240 TRUCKLOADS OF LLW); AND 2. CNL HAS NOT INDICATED HOW MUCH OF THE RECYCLING AND LANDFILL TRUCKLOADS ARE REQUIRED UNDER ALTERNATIVES 2 AND 4. WE KNOW THEY ARE REQUIRED BECAUSE EACH OF ALTERNATIVES 2, 3 AND 4 REQUIRE REMOVAL OF ALL ABOVE GROUND STRUCTURES. THE AOPFN TECHNICAL TEAM HAS ESTIMATED THE AMOUNT OF WASTE IMPORTANT TO AOPFN (RADIOACTIVE WASTE), THAT NEEDS TO BE REMOVED IN EACH OF THE ALTERNATIVES, ACCORDING TO THE DATA TABLE ABOVE. THESE ESTIMATES SHOULD BE TREATED AS ROUGH, AS CNL HAS NOT PROVIDED DATA TO CONFIRM THEM.

Table 15 Estimate of truckloads of nuclear waste based on waste volume estimates (see: table 14)

ALTERNATIVE	INTERMEDIATE LEVEL WASTE TRUCKLOADS	LOW LEVEL WASTE TRUCKLOADS
2 – PARTIAL DISMANTLING AND REMOVAL	40	0
3 -FULL DISMANTLING AND REMOVAL	40	240
4 – IN SITU DISPOSAL	0	0

1E) Examples of In-Situ Disposal from other locations

All materials provided by CNL

Hallam Nuclear Power Reactor, Nebraska USA

Part of a combined fossil fueled power plant, decommissioned 1969. The reactor core, most of the radioactive materials and bulk sodium were removed from the site. All other potential contaminants were entombed by creating three isolation rooms within the structure and remain below ground with no other fill materials. The entombment structure contains the reactor vessel, the guard vessel surrounding it and most of the internal parts of the vessel, stainless steel thimbles which contain process tubes, control rods tubes, dummy elements and a spent neutron source. Twelve storage cells within the structure contain the damaged moderator elements. All above ground components of the reactor were removed and decontaminated or disposed. The site is covered by an engineered barrier. Contaminants remaining below ground are in three areas. Each area is steel lined and surrounded by several feet of concrete and other structural materials, which provided shielding during operation. Approximately 1.11E+16 Bq of activation products (Cs-137, Co-60, Fe-55, Mn-54, Ni-63, Sm-151, Sr-90 and tritium) are contained.

Long term monitoring of the site (to 2090) is the responsibility of the US DOE and includes 17 monitoring wells, 7.62 m to 22.86 m deep surrounding the site. The water table is 45 meters below surface, and is an important aquifer for farming. The wells are used to sample perched water tables, water tables that are above normal due to the presence of imp

In 2006, the US Department of Energy Office of Legacy Management recommended discontinuing groundwater monitoring because analytical results since 1970 demonstrated there had been no impact to shallow, perched groundwater and no current or anticipated unacceptable risk to human health and the environment. In 2008 the State of Nebraska instead agreed to a reduction in sampling and analysis

from once a year to once every 2 years. Water quality data continues to demonstrate that there have been no negative impacts to the shallow, perched groundwater from radioactive materials entombed. Thus in 2018 the sampling frequency has been reduced to once every 5 years from 2021 to 2041 and once every 10 years from 2041 to 2071.

Piqua Nuclear Power Reactor, Ohio, USA

This was a 45.5 MW reactor, organically cooled and moderated (with terphenyl), and decommissioned in 1969. The reactor site is located on the east bank of the Great Miami River, about 30 miles north of Dayton. Decommissioning consisted of crediting the concrete biological shield (2.4 m thick) surrounding the reactor vessel as the primary entombment structure and capping the vessel and biological shield with a water proof barrier and concrete slab. Fuel, coolant and most of the radioactive materials were removed from the site including contaminated piping and most of the equipment inside the reactor building. More than 99% of the radioactive material entombed at the site is below ground and consists of activation products. The inventory is estimated to be 2.0E+15 Bq with 97% consisting of Fe-55. The rest of the building was decontaminated. The city of Piqua uses the adjoining buildings for office and storage space and maintains the protection system against corrosion of the steel dome. The US DOE continues to monitor and evaluate. The water table is at about the same level as the bottom of the reactor vessel. No ground water contamination has been reported.

BONUS Reactor, Punta Higuera, Puerto Rico

This was a prototype Boiling Water Reactor decommissioned in 1970, and is located less than 100 m from the Atlantic Ocean. All special nuclear materials such as fuel and highly activated components e.g. control rods and shims, were removed to the US mainland (Oak Ridge Tennessee) for disposal. The reactor vessel, biological shield and non-removable parts were left in place below grade and entombed/encased in concrete along with contaminated materials. Total

radiological inventory in the entombed structure at the time of decommissioning was estimated to be 2.0E+15 Bq, consisting mainly of Co-58, Co-60, Ni-63, Mn-54 and Fe-55. All piping systems were flushed. The reactor vessel and associated internal components within the biological shield were entombed in concrete and grout. Contaminated and activated materials were placed in the main circulation pump room beneath the pressure vessel and entombed with concrete. Systems external to the entombment were decontaminated or disposed. The BONUS reactor dome over the reactor vessel was left in place. The site has museum status and is open to the public. No radionuclides or other contaminated releases have been reported.

SM-1A Fort Greely, Alaska USA

This reactor was decommissioned in 1973. After closure the fuel core and control rods were removed and shipped to Savannah River and Idaho National Laboratory for reprocessing and disposal. The reactor vessel and reactor room were filled with grout and concrete. A radioactive waste storage building was left in place with concrete added to the floor to cover remaining contamination. The above ground building remains.

Thirty wells surround the facility to monitor ground water. Leaks and contamination have been released to the nearby Jarvis Creek from the waste pipeline, recharge well and dilution well. Large quantities of soil were removed to remediate. The Army is planning future removal of these items.

Heavy Water Component Test Reactor, Savannah River Site (SRS), South Carolina USA

The reactor was decommissioned in 2009. The Savannah River borders the site on the southwest side. Land bordering the SRS is chiefly forest and agricultural. The closest towns to the site are New Ellenton and Jackson, both in South Carolina. The closest residences stand about 200 feet from the site perimeter on the west, north and southeast sides. The area near the HWCTR facility is mostly wooded, with an

elevation of approximately 280 feet above sea level. The water table at the site is some 30 feet below the lowest point in the reactor containment building. The reactor vessel, steam generators, steel containment dome and all the above grade components of the facility were removed and disposed. The vessel was placed in an on-site disposal trench and grouted in place. The vessel cavity was used to emplace other equipment i.e. the Transfer Coffin Refueling Machine. Approximately 3,940 m^3 of flowable grout was used to fill the spaces below grade. Final site footprint was covered with a high strength concrete cap. Plans for a barrier mound were dropped as the mound could interfere with future plans in the immediate area. Prior to decommissioning an estimated 7.8E+13 Bq of radioactivity remained in the facility with 99% of the total being activated materials in the reactor vessel. The decision to remove the vessel was based on plans to occupy the site in the future.

C,K,L,P and R Production Reactors, Savannah River Site, South Carolina USA

These were isotope production reactors designed to produce tritium and Pu-239 for the US weapons program. Nearby water bodies are the Steel Creek, Mill Creek, tributaries of PAR Pond, L-Lake, Indian Grave Branch, Fourmile Branch and Castor Creek. The last reactor was decommissioned in 2012. The design and operation of each of the five SRS production reactor facilities were similar. The construction history/design/materials and operating conditions for each reactor are comparable resulting in similar types of contaminated materials (concrete, metal, etc.). Therefore, the same remedial approach was identified for all these reactor facilities. After deactivation and removal of fuel, the ISD steps were, radiological characterization and condition inspections, removal of water, oils and other hazardous liquids, sealing all penetrations coming into and out of the structures, removing power and installing temporary power. The below grade portion of the structure is stabilized by filling with structural grout/ concrete, sealing structural openings, installing roof slabs to prevent in-leakage and establishing long term monitoring and surveillance of the remaining above ground structures. Reactor

vessels and equipment grouted in place Approximately 145,265 m^3 of grout was used in the disassembly basins and lower levels. The combined P and R grouted facilities required 191,140 m^3 and 2,989 m^3 of concrete. The estimated radiological inventory is 8.33E+15 Bq and 2.22E+15 Bq for P and R respectively.

As of 2020 water contaminants released at Savannah River were all below applicable standards.

221-U Process Canyon, Hanford, Washington USA

One of three nearly identical chemical separations plants constructed from 1944-1945. The U Canyon is constructed of heavily reinforced concrete, 247 m x 20 m x 23.5 m with 15.5 m above grade. Equipment placed in the upper gallery was removed for disposal or placed below in process cells (125 major pieces placed in 39 of the 40 available cells). To meet criteria for ISD, tank D-10 which contained 1,900 l of Transuranic Radioactive Waste mixed waste was removed for disposal. A 2013 safety analysis review estimated 1.85E+5 Bq of radiological inventory consisting of equal parts of Cs-137 and Sr-90. About 19,000 m^3 of grout was pumped into the galleries, cell drain header, process cells and tanks containing residual materials to the maximum extent possible. Future wok includes demolition of the above ground structure, to be used as fill rubble for an engineered barrier. Surface water at the Hanford Site includes the Columbia River (northern and eastern sections), Columbia Riverbank springs, springs on Rattlesnake Mountain, ponds on the Hanford 18 Site, and water systems directly east and across the Columbia River from the Hanford Site. In addition, the Yakima River flows along a short section of the southern boundary of the Hanford Site. The 200 West Area is about 8 km from the Columbia River. Groundwater beneath the Hanford Site is found in both an upper unconfined aquifer system and in deeper basalt-confined aquifers. The Columbia River is the primary discharge area for both the unconfined and confined aquifers.

Ground water monitoring and visible monitoring for degradation will continue.

Experimental Breeder Reactor, Idaho National Laboratories, USA

This reactor was decommissioned in multiple phases from 1994 to 2015. Phase 1 included defueling from 1994 to 1996 and removal of subassemblies, neutron source, inner blanket, reflector, outer blanket and control assemblies. Phase 2 removed all bulk liquid sodium and was completed in 2001. Phase 3 was treatment of the primary and secondary systems for residual sodium with CO_2 and water vapour to convert the sodium to sodium carbonate. Treatment terminated in 2005 leaving an estimated 850 gallons of un-carbonated sodium remaining on surfaces and in ancillary equipment. Approximately 2,600 m^3 of grout was used to fill the building and reactor by 2015. Total radioactive inventory is 5.55E+14 Bq contained within the primary coolant tank, mostly activated materials in the core/blanket region. Removal of the concrete dome and capping of the site with a high strength cap is planned for later years. Surface waters on the site include the Big Lost River and Birch Creek. The Snake River Plain Aquifer, lies between 220 ft (at the north end of the Site) to 610 ft (at the south end of the Site) below the surface of the Site.

Monitoring of the site is part of the surveillance of the overall Material and Fuels Complex.

Production Reactor EL-2, Seversk Russia

Production Uranium-Graphite Reactor was decommissioned in 2015. The process system equipment including the cooling pool were dismantled. All fuel removed as well as sludge deposits from the ShT-2 water filled storage vaults where parts of the graphite sleeves were stored. Metal structures, water, power, communications and air suction lines used for filling, on top of the reactor were dismantled as were the fuel discharge devices and cooling systems. Water resistant structural concrete was placed in the areas below the reactor up to the biological shield. The primary purpose was to reinforce and support the structural stability of the reactor vault contents, namely the graphite stack, metal structures and clay

barriers. The balance of the facility was filled with a specially developed Siberian (Bentonite-type) clay mixture. The site was finished with a mound cover of alternating layers clay, sand, crushed stone and topsoil. Modelling of the radionuclides indicated a period of 300 years before general occupation of the site. The predominant radionuclide is C-14 in the graphite at 10E+6 Bq/g. The graphite stack had a volume of 804 m^3 and weighs 1,422.6 tonnes. Three more dual purpose reactors were started up in 1961 (ADE-3), 1965 (ADE-4) and 1967 (ADE-5) at Seversk. Five more at Mayak in Ozersk and three at Zheleznogosk in Kraasnoyarsk. All have ceased operations and are scheduled for decommissioning using the same approach as the EI-2 reactor. All these areas have waste disposal sites available but the decision to entomb was driven by the lack of a technical solution to disposing the graphite. The closest large water source is the Tom River.

RB-1, RB-2 Montecuccolino, Bologna Italy

The RB-1 and RB-2 reactors were decommissioned 1989. The RB-1 reactor is a graphite-moderated and -reflected reactor with enriched UO_2 as fuel, and is located a few km from Bologna, there are no major water sources nearby. Fuel was removed for re-cycle off site. The reactor vessels were a cylinder, 286 cm diameter by 300 cm in height contained in another slightly larger vessel, sitting on a steel base plate. Based on a threshold of 1.0 Bq/g for free release, residual activation showed Co-60 at 3.5 Bq/g. and Fe-55 calculated as 8.0 Bq/g. The strategy was to decommission in situ as RB-1 was part of a multi-unit research reactor complex. Components were placed into the reactor vessel and grouted in place. Concrete was used to fill the remaining space to a level floor, now used for another purpose. Decay will reduce contaminants below release levels in about ten years. A similar strategy was used for RB-2. In this case the vessel was removed and residual contaminants concreted in place. The lab is now a mechanical test lab.

Lucens Research Reactor, Lucens, Vaud, Switzerland

Reactor was decommissioned in 1992. Partly due to its underground construction a strategy to entomb in place was chosen. All fuels and liquids were removed. Some 252 tonnes of metallic scrap contaminated above release levels were packed in to drums and containers then cemented in place in several of the cavities of the facility such as the fuel pool, condenser pits and D_2O reservoir. The facility was then filled with a flowing grout mixture. The total radioactive inventory is estimated at 3.7E-09 Bq. The piping of non-contaminated auxiliary systems was also entombed.

The former machine hall cavern and access tunnel were transformed into a storage area for cultural and historic exhibits, open to the public.

Boiling Water Reactor Experiment-1 Landfill, Idaho National Nuclear Laboratory, USA

The BORAX-1 reactor was a small experimental reactor used for testing boiling water reactor technology. In 1954 one final test was conducted that resulted in the intentional destruction of the reactor. The destruction of the reactor contaminated approximately 7 800 m^2 of the surrounding area. Immediately following the final test most of the radioactive debris, including some fuel residue, was collected and buried onsite in the reactor shield tank. At BORAX-1, the contaminated area was covered with approximately 0.15 m of gravel to reduce radiation levels at the ground surface. Buried materials at the site consist of uncovered uranium fuel residue, irradiated metal scrap, and contaminated soil and debris. The burial ground is contained within the foundation of the BORAX-1 installation. The dimensions of the foundation are 5.5 × 9.8 × 3.4 m. A mounded gravel and dirt cover approximately 1.5 m high and 9 m in diameter is centered over the buried shield tank. In1997, an engineered long-term barrier was installed over the BORAX-1 landfill. The barrier was designed to provide radioactive shielding and prevent inadvertent human intrusion. Percolation of water into these landfills does not pose an unacceptable risk to the environment, so these surface barriers were not designed to prevent water getting into the site.

The design life for the BORAX-1 barrier is 320 years. The barriers were designed to endure the erosive effects of wind and water, allowing them to maintain an acceptable depth of barrier over the course of the design life. The BORAX-1 barrier was constructed with an under-layer consisting of 15 cm of topsoil and 15cm of gravel emplaced for shielding of the surrounding contaminated 7800 m^2 area. This soil was consolidated to a roughly 37 × 37 m area and compacted on top of where the reactor is buried. A riprap layer was placed over the consolidated soil to form the top layer of the barrier to minimize erosion. The surface barriers were designed to experience minimal erosion over the design life based on the soil types and the addition of the riprap layer. Areas adjacent to both barriers were graded to encourage drainage around and away from the capped landfill sites to reduce erosion of the barrier materials and not to avoid water infiltration.

Although the surface barrier is operating as expected some rabbit activity has been noted during the annual landfill inspections. Likely, the rabbits were using the boulder field as shelter.

Entombment of Super Kukla Facility, Nevada Test Site, USA

The Super Kukla Facility consisted of four structures, Building 5400, Building 5400A, Building 5410, and a Wooden Building. In 1979, operation and testing of the reactor ceased and the reactor core and components were disassembled and removed. The reactor fuel was sent for storage at the Y12 Plant in Oak Ridge, Tennessee. Radiological contaminants of concern included Co-60, C-14, Cl-36, Cs-137, Eu-152, Eu-154, Eu-155, Fe-55, Am-241, tritium, Ni-63, plutonium, Sr-90, and uranium. The primary chemical contaminants included PCBs, metals, and Freon.

Aboveground structures were demolished and disposed. Radiologically impacted equipment primarily activated metals from Buildings 5400A, 5410, the Wooden Shed, and remaining in B-5400 were entombed in B-5400. The entombment of B-5400 renders the structure inaccessible, and there are no credible transport mechanisms for migration of contaminants. Before placement of grout,

radiologically impacted material and debris from Building 5400A, Building 5410 and the Wooden Shed were placed into Building 5400 for entombment. Additionally, the lead shielding wall located in the Reactor Room was left in place. The Closure Plan provides an analysis of the risks associated with the lead wall. The conclusion of this discussion is that the lead wall would be left in place because risk to workers removing it was determined greater than the risk associated to leave it in place. Additionally, due to the robustness of the existing concrete structure (i.e., floors, walls and ceiling), and the grouting of void spaces, the lead wall would be sufficiently encapsulated to prevent migration of hazardous material to groundwater. Grouting activities took place in 2007.

Decommissioning of Industrial Uranium-Fuelled Graphite Moderated Reactor at Krasnoyarsk

Until 2009, the decommissioning option for this reactor was long term safe enclosure within the reactor vaults for at least 100 years. The shift from safe enclosure to in-situ entombment was as a result of no realistically viable approaches to disposal of the main reactor components. Solutions were available for the entombment option. In 2010, an industry-wide concept of uranium-graphite reactor decommissioning was adopted, with in-situ entombment as its main option.

The key argument in favour of entombment is that the reactors are constructed inside excavations mined through solid rock. The rock provides a natural safety barrier, which, in combination with already existing barriers will ensure radiation safety requirements are met. In addition, the rock is a key structural component of the entire underground structure capable of withstanding significant internal and external loads and impacts. In-situ entombment also provides a physical barrier to unauthorized access to the radioactive waste.

Safety assurance of in-situ entombment is achieved through implementation of a multibarrier defence-in-depth principle. This approach uses a combination of existing barriers (shroud, steel structures, concrete vault, rock surrounding the mine)

and new barriers (clay backfill, concrete filling of subreactor space, sealing structure over the reactor vault).

Environmental Impact Statement - NPD Closure Project
