**Source:** Statistics Canada 1992 , 1998, 2002, 2008, 2012, 2017, and 2020.

**Footnotes:**

1. Data have been subjected to a confidentiality procedure known as random rounding whereby values are rounded either up or down to a multiple of 5, and in some cases, 10. Totals may not add-up due to rounding.
2. In addition to random rounding, area and data suppression has been adopted to further protect the confidentiality of individual respondents' personal information. Area and data suppression results in the deletion of all information for geographic areas with populations below a specified size. For example, areas with a population of less than 40 persons are suppressed. If the community searched has a population of less than 40 persons, only the total population counts will be available. Suppression of data can be due to poor data quality or to other technical reasons.
3. Local Study Area includes La Plonge 192, Wapachewunak 192D, Patuanak, Pinehouse Lake, and Beauval.
4. North Saskatchewan is defined as Census Division No.18.

Footnotes:

1. Data have been subjected to a confidentiality procedure known as random rounding whereby values are rounded either up or down to a multiple of 5, and in some cases, 10. Totals may not add-up due to rounding.
2. In addition to random rounding, area and data suppression has been adopted to further protect the confidentiality of individual respondents' personal information. Area and data suppression results in the deletion of all information for geographic areas with populations below a specified size. For example, areas with a population of less than 40 persons are suppressed. If the community searched has a population of less than 40 persons, only the total population counts will be available. Suppression of data can be due to poor data quality or to other technical reasons.
3. Local Study Area includes La Plonge 192, Wapachewunak 192D, Patuanak, Pinehouse Lake, and Beauval.
4. North Saskatchewan is defined as Census Division No.18.

Footnote:

1. These projections use the same methodology, assumptions and scenarios as in the Population Projections for Canada (2018 to 2068), provinces and territories (2018 to 2043), adapted to Health Regions (a description of the methodology and assumptions of these projections can be found here: <https://www150.statcan.gc.ca/n1/pub/91-620-x/91-620-x2019001-eng.pdf>.) The methods combine the use of historical data and the opinion of experts for each component of growth to develop future trajectories specific to each Health Regions. Generally, the same method has been used for all Health Regions. However, in Health Regions with small populations, where the counts of demographic events recorded annually are usually small, the past trends are often noisy, being very affected by random fluctuations. For this reason, some compromises were made in the less populated Health Regions (including Keewatin Yatthé), such as using the trends in both sex together instead of doing it for each sex separately, or keeping the age structure constant over time (for the projected changes in a given component of growth).

2. Average annual population change and cumulative population change calculated by InterGroup Consultants Ltd.

Footnote:

1. These projections use the same methodology, assumptions and scenarios as in the Population Projections for Canada (2018 to 2068), provinces and territories (2018 to 2043), adapted to Health Regions (a description of the methodology and assumptions of these projections can be found here: <https://www150.statcan.gc.ca/n1/pub/91-620-x/91-620-x2019001-eng.pdf>.) The methods combine the use of historical data and the opinion of experts for each component of growth to develop future trajectories specific to each Health Regions. Generally, the same method has been used for all Health Regions. However, in Health Regions with small populations, where the counts of demographic events recorded annually are usually small, the past trends are often noisy, being very affected by random fluctuations. For this reason, some compromises were made in the less populated Health Regions (including Keewatin Yatthé), such as using the trends in both sex together instead of doing it for each sex separately, or keeping the age structure constant over time (for the projected changes in a given component of growth).

2. Average annual population change and cumulative population change calculated by InterGroup Consultants Ltd.
