Statement of Limitations

This report has been prepared by SLR Consulting (Canada) Ltd. (SLR) for AtkinsRéalis and Webequie First Nation (Client) in accordance with the scope of work and all other terms and conditions of the agreement between such parties. SLR acknowledges and agrees that the Client may provide this report to government agencies, interest holders, and/or Indigenous communities as part of project planning or regulatory approval processes. Copying or distribution of this report, in whole or in part, for any other purpose other than as aforementioned is not permitted without the prior written consent of SLR.

Any findings, conclusions, recommendations, or designs provided in this report are based on conditions and criteria that existed at the time work was completed and the assumptions and qualifications set forth herein.

This report may contain data or information provided by third party sources on which SLR is entitled to rely without verification and SLR does not warranty the accuracy of any such data or information.

Nothing in this report constitutes a legal opinion nor does SLR make any representation as to compliance with any laws, rules, regulations, or policies established by federal, provincial or local government bodies, other than as specifically set forth in this report. Revisions to legislative or regulatory standards referred to in this report may be expected over time and, as a result, modifications to the findings, conclusions, or recommendations may be necessary.

Glossary of Terms

Ambient or Background Noise: The ambient noise from all sources other than the sound of interest (i.e. sound other than that being measured).
Attenuation: The reduction of sound intensity by various means (e.g., air, humidity, porous materials, etc.).
Class 3 Area: means a rural area with an acoustical environment that is dominated by natural sounds having little or no road traffic, such as: a small community, agricultural area, a rural recreational area such as a cottage or a resort area; or a wilderness area
dB - Decibel: The logarithmic units associated with sound pressure level, sound power level, or acceleration level. See sound pressure level, for example.
dBA - Decibel, A-Weighted: The logarithmic units associated with a sound pressure level, where the sound pressure signal has been filtered using a frequency weighting that mimics the response of the human ear to quiet sound levels. The resultant sound pressure level is therefore representative of the subjective response of the human ear. A-weighted sound pressure levels are denoted by the suffix 'A' (i.e., dBA), and the term pressure is normally omitted from the description (i.e., sound level or noise level).
dBAI – Decibel, A-Weighted, Impulsive: means the A-weighted sound pressure level of an impulsive sound measured with a sound level meter set to "impulse" response.
dBC – Decibel, C-Weighted: The logarithmic units associated with a sound pressure level, where the sound pressure signal has no filtering of sound between 50 and 5000 Hz. C-weighted sound levels are a better indicator of the presence of low frequency sound than A-weighted sound levels.
dBZ or dBL - Decibel, Linear: The logarithmic units associated with a sound pressure level, where the sound pressure signal is unfiltered, and represents the full spectrum of incoming noise.
Energy Equivalent Sound Level (L_{eq}): An energy-average sound level taken over a specified period of time. It represents the average sound pressure encountered for the period. The time period is often added as a suffix to the label (i.e., L_{eq} (24) for the 24-hour equivalent sound level). L_{eq} is usually A-weighted. An L_{eq} value expressed in dBA is a good, single value descriptor of the annoyance of noise.
Local Study Area (LSA): the area where largely direct, and indirect effects of the Project are likely to occur. The preliminary LSA extends or buffers approximately 1 km each side from the centreline of the supply road alternatives within the preliminary proposed 2 km wide corridor, and 500 metres (m) from the temporary or permanent supportive infrastructure.
Mitigation Noise Level (MNL): a sound pressure level threshold outlined in the Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise. The threshold represents the sound level at which further investigation should occur involving potential mitigation measures.
Peak Particle Velocity (PPV): the peak velocity of a moving particle within the ground.
Percent Highly Annoyed (%HA): Using the dose-response relationship between noise levels and annoyance, as per ISO 1996-1:2003, the percentage of a typical community that would report being "highly annoyed.
Project Footprint (PF): the area of direct disturbance (i.e., the physical area required for Project construction and operation). The PF is defined as the 35-metre wide Webequie Supply Road Right of-Way (ROW) to be selected through the evaluation of routing Alternatives 1, 2 and 3; and temporary or permanent areas needed to support the Project that include laydown yards, storage yards, construction camps, access roads and aggregate extraction sites.

Regional Study Area (RSA): the area where potential, largely indirect and cumulative effects of the Project in the broader, regional context may occur. The preliminary RSA extends 5 km on either side of the LSA to include the geographical extent to which potential effects from the Project may be expected.
Root Mean Square (RMS): the square root of the arithmetic mean of the squares of a set of values, used as a measure of the typical magnitude of a set of numbers, regardless of their sign.
Sound Pressure Level (SPL): The logarithmic ratio of the root-mean square (RMS) sound pressure to the sound pressure at the threshold of hearing. The sound pressure level is defined by equation (1) where P is the RMS pressure due to a sound and P0 is the reference pressure. P0 is usually taken as 2.0×10^{-6} Pascals. SPL (dB) = 20 log(P_{RMS}/P_0)
Sound Power Level (PWL): The logarithmic ratio of the instantaneous sound power (energy) of a noise source to that of an international standard reference power. The sound power level is defined by equation (2) where W is the sound power of the source in watts, and W0 is the reference power of 10^{-12} watts. PWL (dB) = 10 log(W/W_0) Interrelationships between sound pressure level (SPL) and sound power level (PWL) depend on the location and type of source.
Zone of Influence (ZOI): The area of land within or adjacent to a construction site, including any receptors, buildings, or structures, that potentially may be impacted by vibrations emanating from a construction activity where the peak particle velocity measured at the point of reception is equal to or greater than five (5) mm/sec at any frequency or such greater area where specific site conditions are identified by the professional engineer.

1.0 Background and Project Overview

In September 2018, SNC-Lavalin Inc. (SNC-Lavalin) was retained by the Webequie First Nation to conduct an environmental assessment for the Webequie Supply Road Project ("the Project", WSR) under the Ontario *Environmental Assessment Act* (EA Act). SLR Consulting (Canada) Ltd., was retained by SNC-Lavalin (now AtkinsRealis) on behalf of the Webequie First Nation to conduct an environmental noise and vibration assessment for the Project.

The proposed WSR is a new all-season road of approximately 107 km in length from Webequie First Nation to the mineral deposit area near McFaulds Lake (also referred to as the Ring of Fire). A Location Plan for the Project is shown in **Figure N1**. The preliminary proposed corridor for the road consists of a northwest-southeast segment running 51 km from Webequie First Nation to a 56 km segment running east before terminating near McFaulds Lake. A total of 17 km of the corridor is within Webequie First Nation Reserve lands.

Based on the scale and complexity of the Project, and the potential for significant environmental effects, a provincial Individual Environmental Assessment must be completed in accordance with the approved Environmental Assessment Terms of Reference (ToR) prepared by Webequie First Nation (refer to Section 3.2 of the ToR available on the Project website https://www.supplyroad.ca/). Similarly, based on the review of the Detailed Project Description for the WSR, the Impact Assessment Agency of Canada ("the Agency" or IAAC) determined on February 24, 2020 that an impact assessment is required for the Project and issued the Tailored Impact Statement Guidelines (TISG) to provide direction to Webequie First Nation to meet the requirements of the federal *Impact Assessment Act* (IAA). For the Project, the two levels of government have indicated a willingness to follow a coordinated assessment process to the extent possible, and for the proponent to produce one body of documentation, referred to as the Environmental Assessment Report/Impact Statement (EAR/IS). The EAR/IS will address the requirements of both the provincial ToR and the federal TISG for the Project. This Noise and Vibration Technical Report was completed as an integral component of the overall EA/IA which is meant to include both the provincial Environmental Assessment (EA) and the federal Impact Assessment (IA). Webequie First Nation is the proponent of the EA/IA.

Webequie First Nation is an Ojibway community with a total registered on-reserve population of 923 people located in Northwestern Ontario, approximately 525 km north of Thunder Bay (refer to Figure 1 1). It is a fly-in community, currently serviced by the Webequie Airport, with no summer road access and limited winter road access. Since 2015, the community has been involved in the investigation of an all-season road corridor as a means to better service the community, as well as provide for economic development opportunities for its members and businesses that reside in or around the community's reserve and traditional territory.

2.0 Spatial and Temporal Boundaries

2.1 Spatial Boundaries

The following study areas have been selected for the purposes of characterizing existing noise levels for the Project.

Local Study Area (LSA) – the area where largely direct, and indirect effects of the Project are likely to occur.

For noise, the LSA extends 600 m from each side of the centreline of the WSR route Alternatives 1, 2, and 3, and 500 metres (m) from temporary or permanent supportive infrastructure, and 1.5 km from known noise sensitive receptors (i.e., community of Webequie).

For vibration, the LSA extends 200 m from blasting and/or structural pile driving activities associated with construction or operation of the Project.

Regional Study Area (RSA) – There is no RSA proposed for noise as the effects are not anticipated beyond the boundaries of the LSA.

In selecting the preliminary study area boundaries consideration was given to potential effects and effect pathways as a result of the Project. For noise and vibration, the effects of the Project activities are expected to be highly localized and are not predicted to extend beyond the boundaries of the LSA. Therefore, establishing a RSA for noise and vibration is not considered applicable. The spatial boundaries for noise are presented in **Figure N2**.

3.0 Noise and Vibration Basics

3.1 Noise

Sound is, in its simplest form, a dynamic, fluctuating pressure, in a fluid medium such as air. Noise is defined as unwanted sound. The standard practice within the acoustical industry is to use these two terms interchangeably.

Sound levels are usually expressed in terms of A-weighted decibels, also called dBA values, which account for the variation in human frequency response. People do not hear low frequency noise as well as noise in mid or high frequencies. The A-Weighting network was developed to correspond to how humans hear noises such as those typically generated by construction or road traffic.

Unweighted measurements are designated as dBZ values. These measurements are used in investigating impacts from overpressure (blasting) or low frequency noise. Based on the noise sources associated with this project, low frequency noise impacts are not expected.

People experience a wide range of sound levels in their daily activities. Table 1 presents a graphical comparison of “typical” noise levels which might be encountered, and the general human perception of the level. Sound levels from 40 to 65 dBA are considered to be in the faint to moderate range.

Most of the outdoor noise environment, even within the busiest city cores, will lie within this area. Sound levels from 65 to 90 dBA are perceived as loud. This area includes very noisy commercial and industrial spaces. Sound levels greater than 85 dBA are very loud to deafening and may result in hearing damage.

Table 1: Range of Sound Levels

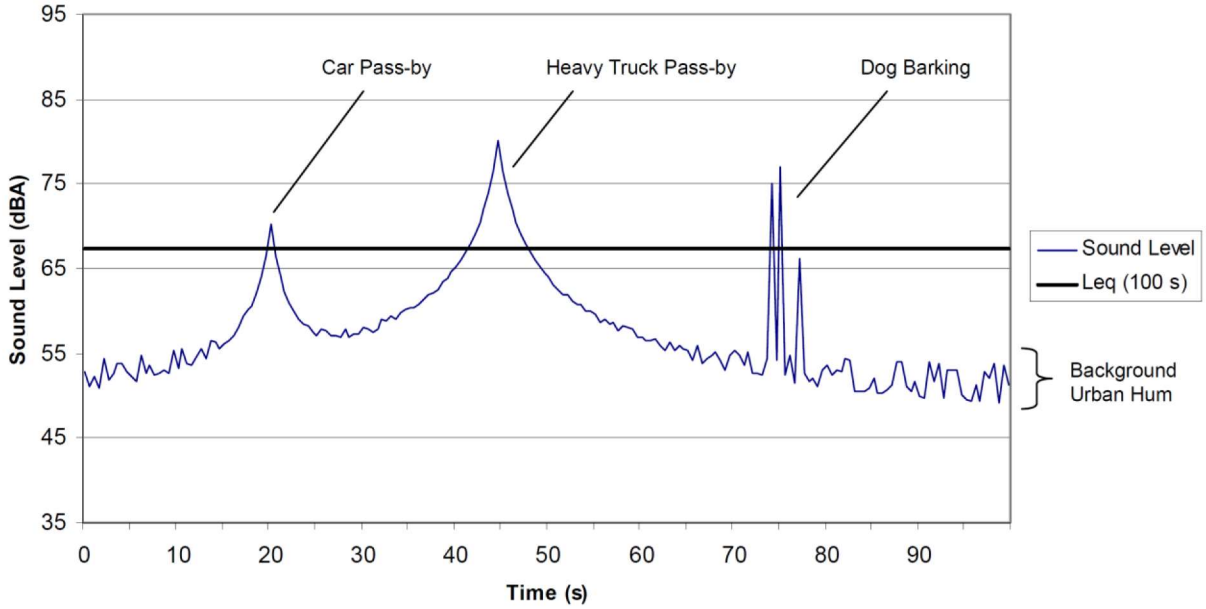

Sound Levels		Sources of Noise
Human Perception	**Sound Level in dBA**	
Deafening	125	Sonic booms
	120	Threshold of Feeling / Pain
	115	Maximum level, hard rock band concert
	110	Accelerating Motorcycle at a few feet away
Very Loud	105	Loud auto horn at 3 metres (m) away
	100	Dance club / maximum human vocal output at 1 m distance
	95	Jack hammer at 15 m distance
	90	Indoors in a noisy factory
Loud	85	Heavy truck pass-by at 15 m distance
	80	School cafeteria / noisy bar; Vacuum cleaner at 1.5 m
	75	Near edge of major highway
	70	Inside automobile at 60 kilometres per hour (km/h)
	65	Normal human speech (unraised voice) at 1 m distance
Moderate	60	Typical background noise levels in a large department store
	55	General objective for outdoor sound levels; typical urban sound level (24h)
	50	Typical suburban / semi-rural sound level (24h)
	45	Typical rural levels (24h); typical noise levels in an office due to HVAC;
Faint	40	Typical background noise levels in a library
	35	
	30	Broadcast Studio
	25	Average whisper
Very Faint	20	Deep woods on a very calm day
	15	
	10	
	5	Human breathing
	0	Quietest sound that can be heard

Source: Engineering Noise Control – Theory and Practice – Fourth Edition – Bies & Hansen

At this time, the best available research indicates that long-term human responses to noise are best evaluated using energy equivalent sound exposure levels (L_{eq} values), in A-Weighted decibels (L_{eq} values in dBA)[1] including adjustments to account for particularly annoying characteristics of the sounds being analysed.

Sound levels in the ambient environment vary each instant. In rural environment, the background noise is formed by “the sounds of nature,” composed of noise from wind moving vegetation. As vehicle traffic passes near a noise receptor, the instantaneous sound level may increase as a vehicle approaches, and then decrease as it passes and travels farther away. The energy equivalent sound exposure level L_{eq} is the average sound level over the same period with same acoustical energy as the actual environment (i.e., it is the average of the sound energy measured over a time period T). As a time-average, all L_{eq} values must have a time period associated with them. This is typically placed in brackets beside the L_{eq} tag. For example, a thirty-minute L_{eq} measurement would be reported as an L_{eq} (30 min) value.

Figure 1: The L_{eq} Concept

The L_{eq} concept is illustrated in **Figure 1**, showing noise levels beside a small roadway, over a 100 second time period, with two vehicle pass-bys:

In this example, the background “sounds of nature” are between 47 and 53 dBA. A car passes by at 20 seconds. As it approaches, the noise level increases to a maximum, and then decreases as it speeds away. At 45 seconds, a heavy truck passes by. Near 75 seconds, a dog barks three times. The maximum sound level (L_{max}) over the period is 80 dBA and the minimum is 47 dBA. For almost 50% of the time, the sound level is lower than 55 dBA.

[1] ISO 1996:2003(E), Acoustics – Description, measurement and assessment of environmental noise – Part 1: Basic quantities and assessment procedures.

The L_{eq} (100s) for the example is 67 dBA, which is much higher than the statistical mean sound level of 55 dBA. This illustrates that the L_{eq} value is very sensitive to loud noise events, which contain much more sound energy (as sound is ranked on a logarithmic scale) than the normal background. It is also sensitive to the number of events during the time period, and the duration of those events. If only the truck had passed by during the measurement (no car and no dog barks), the L_{eq} (100s) would be 66 dBA. If only the car and dog barks had occurred, the L_{eq} (100s) would be 61 dBA. This shows that the truck pass-by is the dominant event in our example, due to its level and duration.

The ability of the L_{eq} metric to account for the three factors of level, duration and frequency of events makes it a robust predictor of human response to noise. It is for this reason that the vast majority of noise standards are based on L_{eq} values.

For transportation noise impact analyses, the following durations are typically used:

- L_{eq} (24h) The sound exposure level over then entire 24-hour day;
- L_{eq} Day L_{eq} (16h), from 7 am to 11 pm;
- L_D L_{eq} (15h), from 7 am to 10 pm;
- L_{eq} Night L_{eq} (8h), from 11 pm to 7 am;
- L_N L_{eq} (9h), from 10 pm to 7 am; and
- L_{DN} A special L_{eq} (24h) value with a 10 dB night-time penalty applied to overnight sound levels (10 pm to 7 am).

L_{eq} Day values, covering off the AM-peak and PM-peak travel periods, are generally appropriate for examining the impacts of non-freeway roadways such as the Project. Most of the noise associated with these sources is concentrated in the daytime hours. L_{eq} Day and L_{eq} Night values are used in Ontario transportation noise guidelines.

To account for increased annoyance with noise overnight in a single value, the U.S. Environmental Protection Agency (U.S. EPA) developed the L_{DN} metric (also known as DNL). It is a special form of an overall the L_{eq} (24h) with a +10 dB night-time penalty. L_{DN} values are used in Heath Canada's Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise (HC Guideline).

Other measures which are sometimes used to characterize sound levels include:

- L_{max} values: Maximum sound level measured over an event (pass-by); and
- $L_{N\%}$ values: The noise level exceeded n% of the time. It is a statistical measure of noise level. For highly varying sounds, the L_{90} represents the background noise level, L_{50} represents the median or typical noise level, and L_{10} represents the short-term peak noise levels, such as those due to occasional traffic or a barking dog.
- L_{LM} values: A special measurement of maximum noise level from impulsive noise sources such as hammer hits or metal dropping. These values are designated as "dBAI"

The human ear does not interpret changes in sound level in a linear manner. The general subjective human perception of changes in sound level is shown in Table 2.

Table 2: Subjective Human Perception of Changes in Sound Levels [2]

Change in Broadband Sound Level (dB)	Human Perception of Change
<3	Imperceptible change
3	Just-perceptible change
4 to 5	Clearly noticeable change
6 to 9	Substantial change
>10 and more	Very substantial change (half or twice as loud)
>20 and more	Very substantial change (much quieter or louder)
Notes: Adapted from Bies and Hansen, p53, and MOE Noise Guidelines for Landfill Sites, 1998. Applies to changes in broadband noise sources only (i.e., increases or decreases in the same noise or same type of noise only). Changes in frequency content or the addition of tonal or temporal changes would affect the perception of the change.	

Table 2 is directly applicable to changes in sound level where the noise sources are of the same general character. For example, existing road traffic noise levels can be directly compared to future road traffic noise levels, using the above relationships.

In comparing road traffic noise to rural background noise, the different frequency and temporal nature of the noise means that the road noise may be more noticeable. Adjustments for the nature of the new sound can be applied to better account for temporal and frequency differences.

For transportation noise sources, research conducted by the U.S. Environmental Protection Agency indicates that a 5 dB change in sound levels is required to trigger a change in large-scale community response to noise. This correlates to a clearly noticeable increase in noise levels.

3.2 Vibration

Vibration is the repetitive motion of an object, surface, or fluid. Vibration may travel through the ground, through water, or through the air. Vibration is typically considered to be limited to frequencies below 100 Hertz (Hz); above 100 Hz the effects of vibration would be examined as noise.

Vibration may be measured using a number of different metrics. Relevant descriptors are described below:

- Root-mean-square (RMS) vibration levels, in millimetres per second (mm/s). This is a measure of “average” vibration levels and is often used in determining human response to vibration; and

2 Bies, D.A., and C.H Hansen 1988. Engineering Noise – Theory and Practice, 2nd Ed. E & E & FN Spon, London, p 53.

- Peak-particle velocity (PPV) vibration levels, in mm/s. This is the peak vibration level from an event and is often used in determining the potential for construction damage or impacts on fish and aquatic life.

4.0 Existing Conditions – Environmental Noise

4.1 Measurements of Background Noise Levels

Existing background ambient sound levels at representative Noise Sensitive Areas (NSAs) within the Webequie First Nation community and along the proposed WSR route have been determined through ambient noise level measurements.

Measurements were conducted for the period between October 29 and November 1, 2021. Monitoring was conducted at three locations:

- M1, within the community, at the western terminus of the proposed WSR route;
- M2, at a distance of 4.41 kilometres along the proposed route (away from the community), which has been used as representative of conditions along the route; and
- M3, at a distance of a 10.57 kilometres south-east of the western terminus (away from the community); which has been used as representative of “remote” conditions, away from the community.

Monitoring locations are shown in **Figure N3** and are tabulated in **Table 3**.

Table 3: Ambient Background Noise Monitoring Locations

Monitor Location	Receptor Description	UTM Co-ordinates (Zone 17)	
		Northing	Easting
M1	Western Terminus (Community)	5869527	475454
M2	4.41 km from Western Terminus (Roadway)	5866489	476072
M3	10.57 km from Western Terminus (Remote)	5862350	483213

The community monitor at the western terminus includes noise from community activities (commercial noise, traffic noise, and airport noise). The second and third monitors are sufficiently removed from these sources that they capture ambient background sound levels in the rural area, dominated by the sounds of nature and removed from man-made noises. Monitor M2 received occasional man-made noises due to its proximity to the waste facility to the west. Monitor M3 did not have any human interference throughout the entirety of the measurement period.

The measurements at each location were conducted for a minimum period of 48 hours, in accordance with MECP Publication NPC-233 measurement procedure requirements. The ambient noise measurements were conducted in accordance with the requirements of the following guidelines:

- MECP Publication NPC-102 – *Instrumentation*;
- MECP Publication NPC-103 – *Procedures*;
- MECP Publication NPC-104 – *Sound Level Adjustments*;

- MECP Publication NPC-233 – Information To Be Submitted For Approval Of Stationary Sources Of Sound;
- Health Canada "Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise"; and
- ISO 1996-2:2007, Acoustics — Description, measurement, and assessment of environmental noise – Part 2: Determination of environmental noise levels.

Measurements were conducted with the Larson-Davis NMS044 Outdoor Noise Monitoring System (**Figure 2**), which incorporates LD831 Sound Level Meters equipped with portable power supplies and environmental protection kits. These are Type 1 sound level meters, capable of recording L_{eq} levels and various L_{max}, L_{min}, and L_N values.

Figure 2: Larson Davis NMS044 Outdoor Noise Monitoring System

Courtesy of Larson-Davis

The monitors were located in open areas with limited vegetation, as close to the ground as practical (in keeping with MECP and MTO requirements) and were equipped with appropriate wind screens. The monitors were field calibrated pre- and post-measurement to ensure the accuracy of the results. Photographs of the monitoring locations are included in **Appendix N1**.

Per ISO 1996-2 and MECP Publication NPC-103, the weather conditions during the measurements will be representative of worst-case "noise exposure situation under consideration". For the Project that period is during spring to fall, when "the ground surface is not covered with snow or ice" and is "neither frozen nor soaked by excessive amounts of water". As a result, measurements should be conducted during the spring to fall period, excluding winter months. This is representative of the potential for worst-case impacts, as it is during this period that windows on residences will be open and people will be out on the land.

For this assessment, noise measurements were conducted in October, during the fall period. Given the rural environment, differences in ambient sound levels between the spring, summer and winter periods are not anticipated.

The fall measurements occurred after leaves were down and with insect activity being minimal; thus, the measurements are during naturally quiet periods, and representative of “predictable worst-case conditions” for assessing impacts from the Project.

The parameters that were captured include the following:

- L_{eq} (1-min) values, in dBA, dBC, and dBZ;
- L_{max} and L_{min} values;
- L_1, L_{10}, L_{50}, L_{90}, and L_{99} values;
- Histograms; and
- Simultaneous audio recordings.

A portable meteorological station was used during measurements to characterize local weather conditions, including:

- Wind speeds and direction;
- Temperature;
- Relative humidity; and
- Rainfall.

The raw measurement data was subject to an exclusion analysis, which flagged remove extraneous data from the data set including:

- Periods with adverse, extreme weather conditions (e.g., wind speeds greater than 14 km/h; humidity greater than 90%; temperatures lower than -10 degrees Celsius (°C) or greater than 50ºC, periods of fog and precipitation);
- Periods with extraneous noise sources (e.g., music, car horns, dogs barking, atypical insect and natural noises, etc.); and
- Periods with noise from airport/airstrip activity (aircraft take-offs and landings; audible noise from airport ground activity).

The above weather conditions are representative of “worst-case” conditions favourable to sound propagation, as is required by Health Canada’s noise guidelines, and will result in a conservative (low) estimate of existing background ambient sound levels.

The refined measurement data were then be processed to determine typical sound levels. The following levels will be determined:

- A characterization of the noise sources that contribute significantly to the baseline background ambient sound environment, by type (e.g., traffic, aircraft, trains, industrial);
- A characterization of the background ambient sound environment, using descriptors such as “continuous, intermittent, regular impulsive, highly impulsive, high-energy impulsive, and continuous tonal and intermittent tonal”, per ISO 1996-2 and Health Canada guidance,
- Existing L_{min} and L_{max} sound levels;
- An hourly distribution of baseline sound levels during the day and night (L_{eq} (1hr) values);
- L_{eq} Day, L_D, L_{eq} Night, and L_N sound levels; and

- Overall L_{DN} values.

The monitoring data will be further supplemented with a review of typical background ambient sound level data for rural areas based on population density, contained in Health Canada's noise guidelines and in Alberta Energy Regulator (AER) Directive 038.

4.2 Identification of Noise Sensitive Areas

SLR worked with socio-economic specialists with the Atkins Realis Project Team and Webequie to identify noise sensitive areas ("NSAs") applicable to the Project, which are points of reception where noise impacts will be predicted.

In order to meet the provincial/federal EA/IA requirements, the NSAs considered have included the following:

- Permanent residences, including homes within the Webequie community;
- Schools, hospitals, community centres, retirement complexes, or assisted care homes;
- Seasonal residences, such as trapper cabins or hunting and fishing campsites, which are used by members of the Webequie First Nation, other Indigenous communities, and stakeholders;
- Spiritual or sacred spaces which members of the Webequie First Nation, other Indigenous communities, and stakeholders may identify as requiring quiet or being sensitive to disruptions from noise;
- Other locations which members of the Webequie First Nation, other Indigenous communities, and stakeholders and/or the Wildlife and other Project disciplines may identify as requiring quiet or being sensitive to disruptions from noise, for instance locations important for country foods; and,
- The mine exploration camp at the McFaulds Lake area operated by Wyloo Metals (formally Noront Resources).

Working with the socio-economic specialists for the Project, all NSAs within the LSA have been identified and mapped. See **Figures N6 to N16** and **Appendix N2.**

4.2.1 Location of Representative Receptors

Specific NSAs which are representative of potential impacts at a group or cluster of receptors have been identified and are used in the assessment. The representative NSAs used in the assessment are shown in **Figures N6 to N16**. If the applicable guidelines are met at these worst-case locations, they will be met everywhere.

Representative NSA locations are also summarized in **Table 4**.

Notes:

RP##	Permanent residence, retirement complexes, assisted care homes
RPF##	Future permanent residence, per Webequie First Nation On-Reserve Land Use Plan May 31, 2019.
RS##	Hotels, seasonal residence, trapper's cabin, hunting and fishing campsites (and which are allowed to be disclosed)
CHL##	Cultural Heritage Landscapes identified in Cultural Heritage Report–Webequie Supply Road March, 2022. Coordinates for CHL locations are not presented in this table due to potential sensitivity of the data.
I##	Noise-sensitive institutional receptor such as schools, hospitals, clinics, etc.
O##	Other noise sensitive locations which Webequie First Nation, or other Stakeholders have identified as requiring quiet or being sensitive to disruptions from noise, for example spiritual or sacred spaces or hunting grounds (and which are allowed to be disclosed)
C##	Construction Camps (long-term)
n/a	Not Available

An aerial review of the existing receptors was completed by SLR personnel. Locations for the noise sensitive areas have been provided in **Table 4** above and are considered representative of the most sensitive NSAs in the vicinity of the aggregate extraction sites. If the guideline limits are met at these locations, they will be met everywhere. All points of reception are shown in

Figures N6 to N16. The future residential dwellings are not considered noise sensitive areas for assessing construction noise as the roadway is expected to be built prior to the residences.

4.2.2 Noise Monitoring Results

4.2.2.1 Results at Monitor Location M1

The sound environment at monitoring location M1 is dominated during the daytime by the sounds of people, including occasional traffic noise, dogs barking, and airport activity.

Man-made sounds are generally intermittent. During breaks in activity and during the majority of the night-time period, the sound environment is dominated by the continuous “sounds of nature”, including the noise of leaves rustling vegetation, etc. There is intermittent traffic noise, and airport activity throughout the night-time period.

No tonal noise sources were identified. Similarly, no regular impulsive, highly impulsive, high-energy impulsive noise sources, as described in ISO 1996-2 and Health Canada guidelines, were identified.

The raw and processed measurement data for Monitor M1 is included in **Appendix N3** and

Appendix N4, respectively. The results of the monitoring and presented graphically and in tabulated form below:

Figure 3: Noise Monitoring Results at Monitor M1

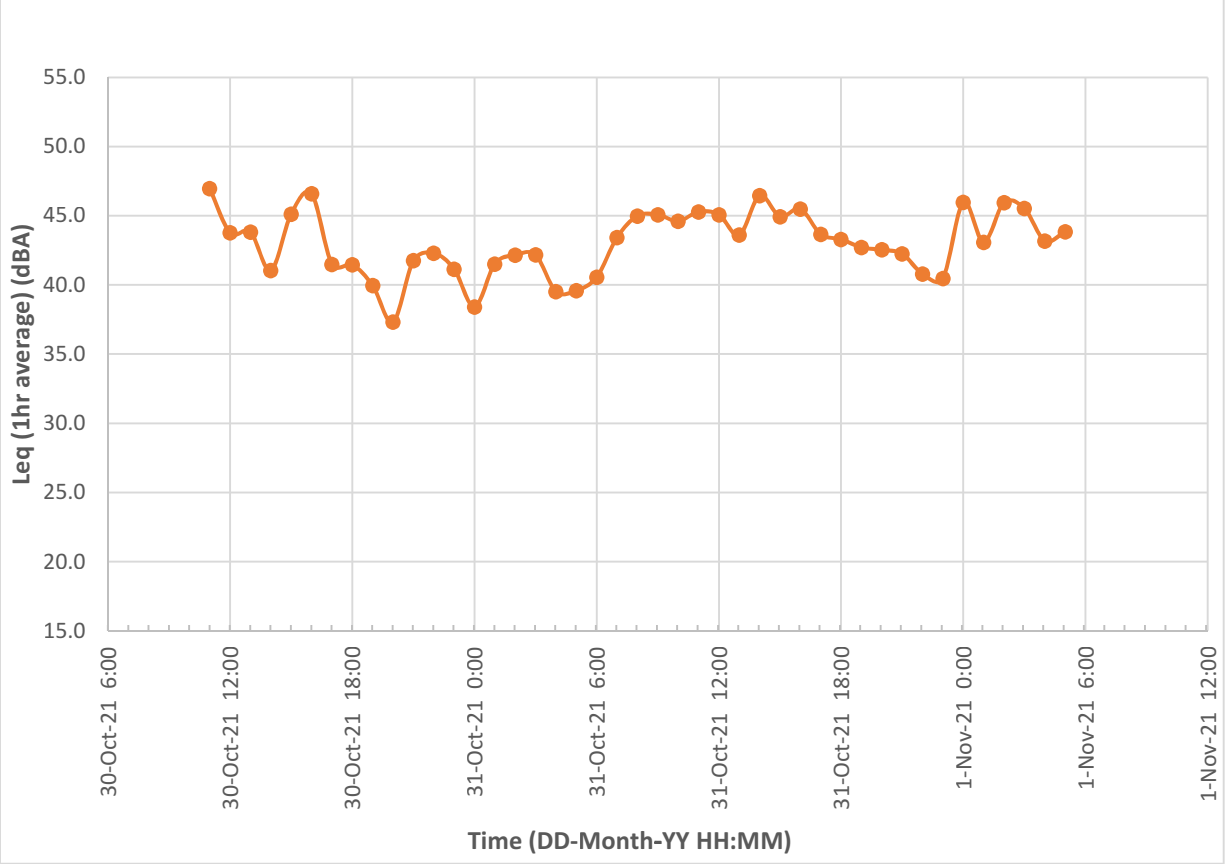

Table 5: Measured Ambient Background Sound Levels at Monitor M1

Noise Metric	Measured Value (dBA)
L_{eq} Day (7am to 11pm)	43.9
L_D (7 am to 10 pm)	44.0
L_{eq} Night (11 pm to 7 am)	42.8
L_N (10 pm to 7 am)	42.7
L_{DN} (24 hours)	49.5
Ranges of Measured Hourly L_{eq} (1 hr) Sound Levels	
Daytime (7 am to 7 pm)	41.0 to 47.0
Evening (7 pm to 11 pm)	37.3 to 42.7
Night-time (11 pm to 7 am)	38.4 to 46.0
Ranges of Measured Hourly L_{max} Sound Levels	
Daytime (7 am to 7 pm)	59.1 to 67.0
Evening (7 pm to 11 pm)	49.5 to 67.0
Night-time (11 pm to 7 am)	47.6 to 64.1

4.2.2.2 Results at Monitor Location M2

The sound environment at monitoring location M2 is dominated at all times by the continuous “sounds of nature”, including the noise of leaves rustling vegetation, etc. There was chainsaw activity near the monitor during periods of the daytime, but sound levels were omitted from the summarized results. Vehicle activity along the road was intermittent and mostly during the daytime period between 7AM and 11PM.

No tonal noise sources were identified. Similarly, no regular impulsive, highly impulsive, high-energy impulsive noise sources, as described in ISO 1996-2 and Health Canada guidelines, were identified.

The raw and processed measurement data for Monitor M2 is included in **Appendix N3** and

Appendix N4, respectively. The results of the monitoring and presented graphically and in tabulated form below:

Figure 4: Noise Monitoring Results at Monitor M2 – October 30 – October 31

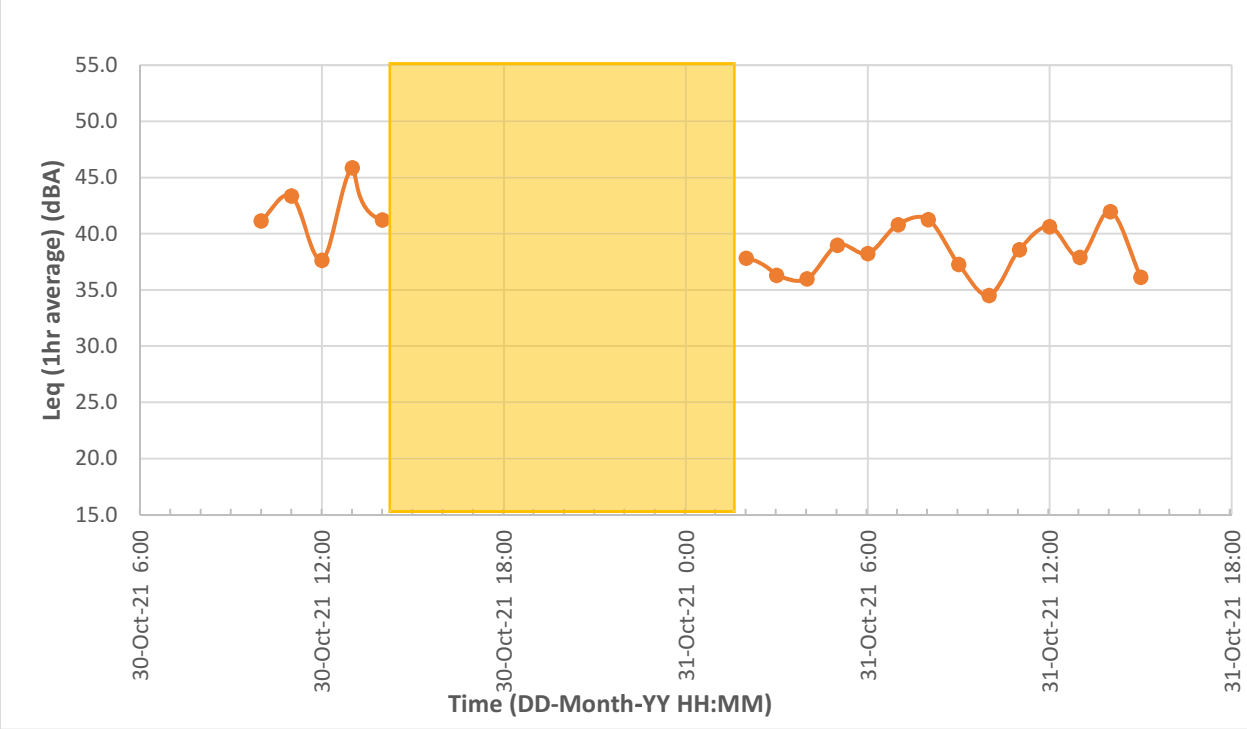

Figure 5: Noise Monitoring Results at Monitor M2 – November 1 – November 2

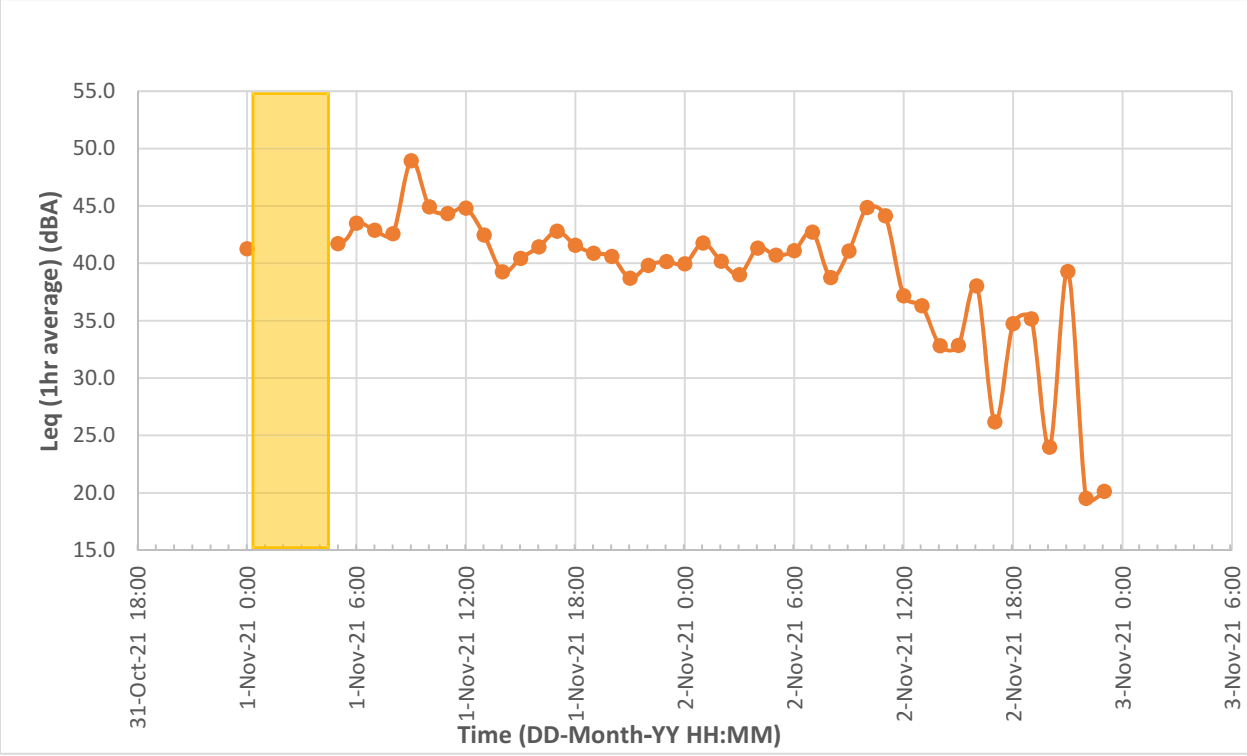

Figure 6: Noise Monitoring Results at Monitor M2 – November 3 to November 4

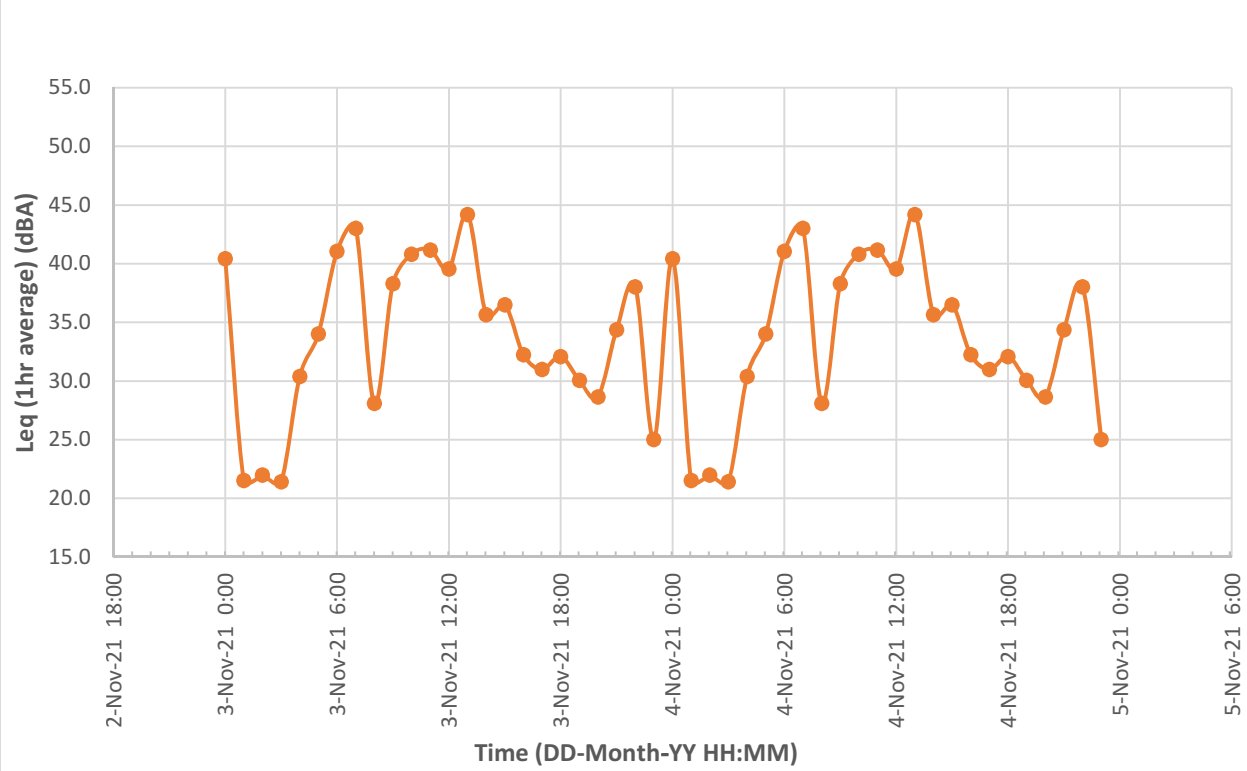

Figure 7: Noise Monitoring Results at Monitor M2 – November 5 to November 6

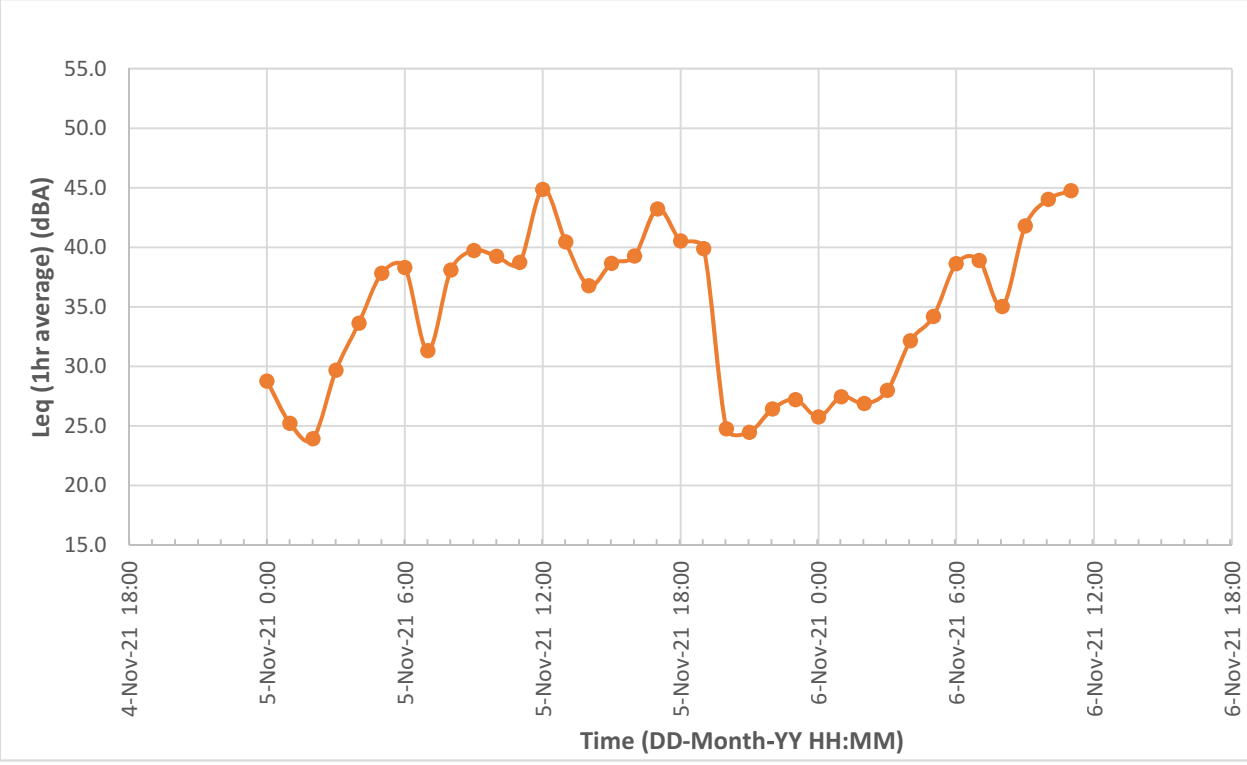

Table 6: Measured Ambient Background Sound Levels at Monitor M2

Noise Metric	Measured Value (dBA)
L_{eq} Day (7am to 11pm)	40.6
L_D (7 am to 10 pm)	40.7
L_{eq} Night (11 pm to 7 am)	38.1
L_N (10 pm to 7 am)	38.1
L_{DN} (24 hours)	44.6
Ranges of Measured Hourly L_{eq} (1 hr) Sound Levels	
Daytime (7 am to 7 pm)	19.5 to 48.9
Evening (7 pm to 11 pm)	19.5 to 40.9
Night-time (11 pm to 7 am)	20.1 to 41.8
Ranges of Measured Hourly L_{max} Sound Levels	
Daytime (7 am to 7 pm)	27.4 to 66.8
Evening (7 pm to 11 pm)	27.4 to 66.7
Night-time (11 pm to 7 am)	27.6 to 65.7

4.2.2.3 Results at Monitor Location M3

The sound environment at monitoring location M3 is dominated at all times by the continuous “sounds of nature”, including the noise of leaves rustling vegetation, bird calls, water movement etc. There are intermittent periods of airport activity including helicopter noise, but sound levels are not as high as at M1.

No tonal noise sources were identified. Similarly, no regular impulsive, highly impulsive, high-energy impulsive noise sources, as described in ISO 1996-2 and Health Canada guidelines, were identified.

The raw and processed measurement data for Monitor M3 is included in **Appendix N3** and **Appendix N4**, respectively. The results of the monitoring and presented graphically and in tabulated form below:

Figure 8: Noise Monitoring Results at Monitor M3

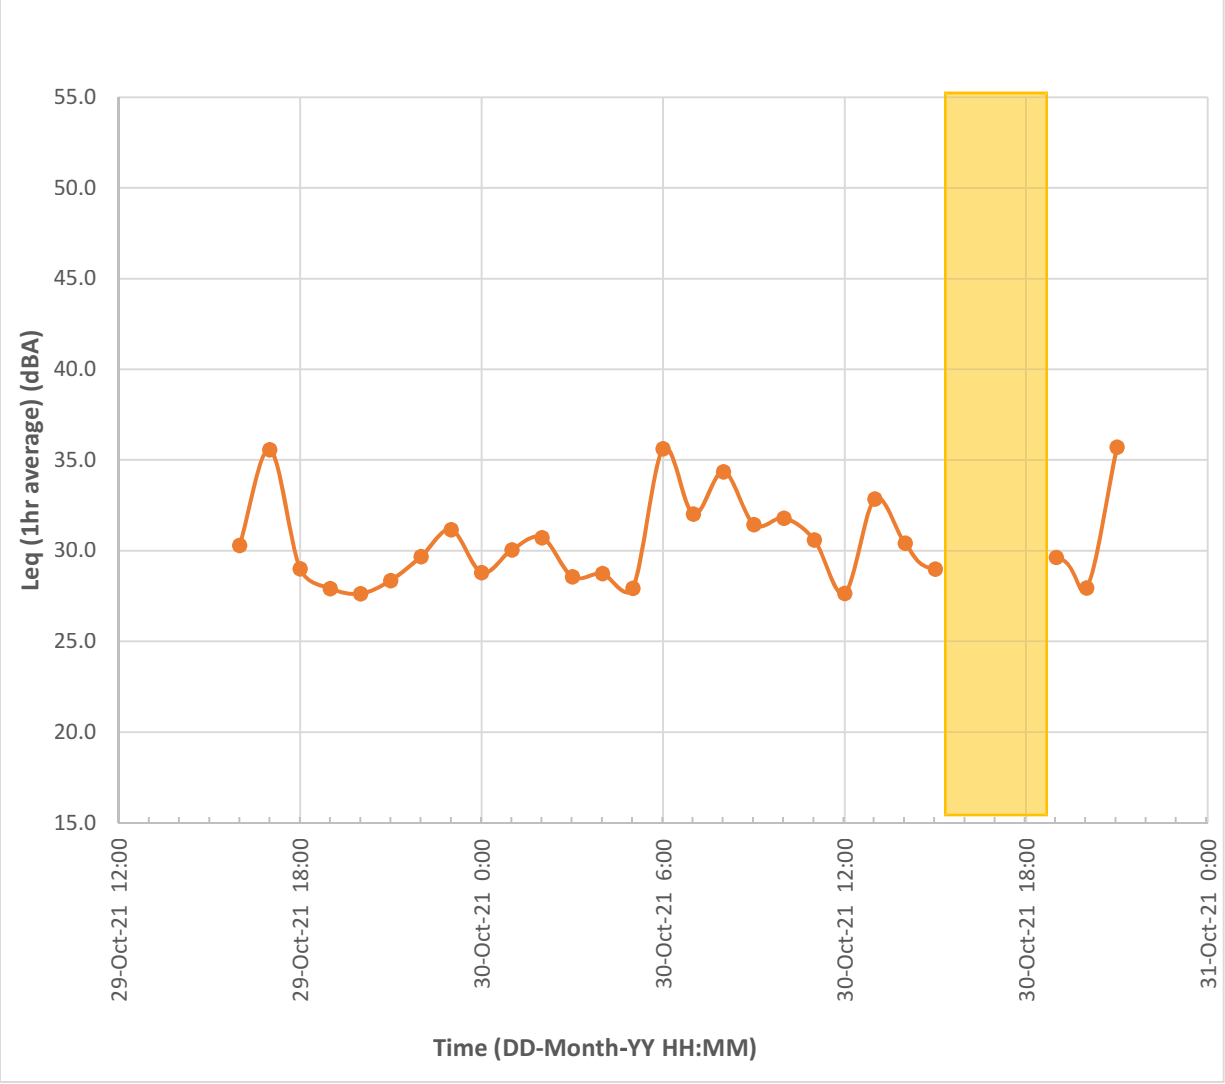

Table 7: Measured Ambient Background Sound Levels at Monitor M3

Noise Metric	Measured Value (dBA)
L_{eq} Day (7am to 11pm)	31.6
L_D (7 am to 10 pm)	31.7
L_{eq} Night (11 pm to 7 am)	31.0
L_N (10 pm to 7 am)	30.8
L_{DN} (24 hours)	37.3
Ranges of Measured Hourly L_{eq} (1 hr) Sound Levels	
Daytime (7 am to 7 pm)	29.0 to 35.6
Evening (7 pm to 11 pm)	27.6 to 35.7
Night-time (11 pm to 7 am)	27.9 to 35.6
Ranges of Measured Hourly L_{max} Sound Levels	
Daytime (7 am to 7 pm)	31.8 to 66.4
Evening (7 pm to 11 pm)	32.8 to 50.9
Night-time (11 pm to 7 am)	33.0 to 56.8

4.2.3 Review of Health Canada's Noise Guidelines and Alberta Energy Regulator Directive 038.

Table 6.1 of the Health Canada Guideline provides estimations of baseline noise levels using qualitative descriptions and population densities of average types of communities. This is adapted from research conducted in Alberta by the Alberta Energy Regulator (AER) and codified in AER Directive 038. The table is reproduced as **Table 8** for reference below.

Table 8: Estimation of Baseline Noise Levels Using Qualitative Descriptions and Population Densities of Average Types of Communities (from Health Canada Guidelines)

Community Type and Qualitative Description	Average Census Tract Population Density, Number of People Per Square km	Estimated Baseline Sound Level, L_{DN} (dBA) [1]
Quiet Rural Dwelling units more than 500 m from heavily travelled roads and/or rail lines and not subject to frequent aircraft flyovers	28	< 45 [2]
Quiet Suburban Residential Remote from large cities, industrial activity and trucking	249	48 to 52
Normal Suburban Residential Not located near industrial activity	791	53 to 57
Urban Residential Not immediately adjacent to heavily travelled roads and industrial areas	2,493	58 to 62
Noisy Urban Residential Near relatively busy roads or industrial areas	7,913	63 to 67
Very Noisy Urban Residential	24,925	68 to 72

Notes:

[1] Note that a range of values is provided and that selection of the appropriate estimated value would typically be based on the precautionary principle in the absence of adequate justification for a higher baseline. All day-night sound level (L_{DN}) values, except those of the quiet rural area community type, are based on the US EPA levels document (US EPA 1974).

[2] The quiet rural area (L_N = 35 dBA) estimated baseline noise level and population density were obtained from AER Directive 038 (revised Feb 16, 2007). The difference between L_D and L_N was obtained from AER and US EPA, and was approximated as 10 dBA. As such, quiet rural areas are considered to be less than or equal to 45 dBA L_{DN}.

The intent of the table is for it to be used in situations where baseline measurement data are not available. The community type over the entire LSA would be qualitative described as “Quiet Rural”. The corresponding conservative estimates of background sound levels are:

- L_D – 45 dBA
- L_N – 35 dBA
- L_{DN} – 45 dBA

At Monitor M1, background L_D sound levels fall within the range of a “Quiet Rural” area, however L_N sound levels exceed 35 dBA on average therefore driving the area into a “Quiet Suburban Residential” category. L_{DN} sound levels exceed the 45 dBA Quiet Rural criteria, this is due to the greater sound levels during the night-time between 10 pm and 7 am.

Monitors M2 and M3 have background sound levels within the range of a “Quiet Rural” area, which makes sense given their locations are far from frequent human activity and heavily travelled roadways.

4.2.4 Summary of Baseline Sound Levels Adopted for the Assessment

Table 9 summarizes the baseline sound levels to be used in the assessment.

Table 9: Summary of Baseline Sound Levels For Use in the Assessment

NSA Location	Source	MTO *Environmental Guide for Noise* (dBA)		Health Canada Guidelines (dBA)			MECP Publication NPC-300 Stationary Noise (L_{eq} (1hr) (dBA)		
		L_{eq} Day	L_{eq} Night	L_{DN}	L_D	L_N	Daytime	Evening	Night-time
CHL01 to CHL04	M1	44	43	50	44	43	45	40	40
CHL05	M2	41	38	45	41	38	45	40	40
CHL06 to 33	M3	32	31	37	32	31	45	40	40
I01 to I06	M1	44	43	50	44	43	45	40	40

C01 to C22	M1	44	43	50	44	43	45	40	40

Notes:

All values are in dBA, except Percent Highly Annoyed (%HA)

M# - background limits established from noise monitoring location

RP## Permanent residence, retirement complexes, assisted care homes

RPF## Future permanent residence, per Webequie First Nation On-Reserve Land Use Plan May 31, 2019.

RS## Hotels, seasonal residence, trapper’s cabin, hunting and fishing campsites (and which are allowed to be disclosed)

CHL## Cultural Heritage Landscapes identified in Cultural Heritage Report–Webequie Supply Road March, 2022

I## Noise-sensitive institutional receptor such as schools, hospitals, clinics, etc.

O## Other noise sensitive locations which Webequie First Nation, or other Stakeholders have identified as requiring quiet or being sensitive to disruptions from noise, for example spiritual or sacred spaces or hunting grounds (and which are allowed to be disclosed)

C## Construction Camps (long-term)

5.0 Construction Noise Impact Assessment – Aggregate Extraction Sites

Construction of the WSR will require aggregates, which will be obtained from two aggregate extraction sites, located along the WSR route (referred to as aggregate resource areas ARA-2 and ARA-4). Locations of ARA-2 and ARA-4 are shown in **Figure N4** and **Figure N5**. ARA-2 will

be fully used for construction of the Project over a five to six year period, and the site will be progressively rehabilitated (restored to its previous condition) during the construction phase. ARA-4 will be developed to provide material for construction of the road and will also serve as a source of aggregate to maintain and operate the road on an annual basis for the assumed 75-year operation and maintenance life cycle period for the Project.

5.1 Applicable Guidelines - MECP Publication NPC-300 Stationary Source Noise Guidelines

Noise from the aggregate extraction sites were modelled as a “stationary” sources of sound, in accordance with the requirements of MECP Publication NPC-300. The guideline sets out noise limits for two main types of noise sources:

- Non-impulsive, “continuous” noise sources such as ventilation fans, mechanical equipment, and vehicles while moving within the property boundary of an industry. Continuous noise is measured using 1-hour average sound exposures (L_{eq} (1-hr) values), in dBA; and
- Impulsive noise, which is a “banging” type noise characterized by rapid rise time and decay. Impulsive noise is measured using a logarithmic mean (average) level (L_{LM}) of the impulses in a one-hour period, in dBAI.

Furthermore, the guideline requires an assessment at, and provides separate guideline limits for:

- Outdoor points of reception (e.g., back yards, communal outdoor amenity areas); and
- Façade points of reception such as the plane of windows on the outdoor façade which connect onto noise sensitive spaces, such as living rooms, dens, eat-in kitchens, dining rooms and bedrooms.

The applicable noise limits at a point of reception are the higher of:

- The existing background ambient sound levels, or
- The exclusion limits set out in the guideline.

Table 10 outlines the exclusion limits set out in the guideline. The guidelines define four area classifications dependent on the proximity to roads/rail-lines, nature of land uses and activities in the area. The four classifications are as follows:

> **Class 1** means an area with an acoustical environment typical of a major population centre, where the background sound level is dominated by the activities of people, usually road traffic, often referred to as “urban hum.”
>
> **Class 2** means an area with an acoustical environment that has qualities representative of both Class 1 and Class 3 areas:
>
> - sound levels characteristic of Class 1 during daytime (07:00 to 19:00 or to 23:00 hours); and;
> - low evening and night background sound level defined by natural environment and infrequent human activity starting as early as 19:00 hours (19:00 or 23:00 to 07:00 hours).

Class 4 means an area or specific site that would otherwise be defined as Class 1 or 2 and which:

- is an area intended for development with new noise sensitive land use(s) that are not yet built;
- is in proximity to existing, lawfully established stationary source(s); and
- has formal confirmation from the land use planning authority with the Class 4 area classification which is determined during the land use planning process.

Additionally, areas with existing noise sensitive land use(s) cannot be classified as Class 4 areas.

The study area is defined as:

Class 3, as per the MECP NPC-300 which can be described as “a rural area with an acoustical environment that is dominated by natural sounds having little or no road traffic.”

Table 10: MECP Publication NPC-300 Exclusion Limits for Class 3 Rural Areas

Time of Day	Non-Impulsive Noise (L_{eq} (1hr) Values, dBA)		Impulsive Noise (L_{LM} Values, bai)		
	Plane of Windows of Noise Sensitive Spaces	Outdoor Points of Reception	No. of Impulses in a 1-hour Period	Plane of Windows of Noise Sensitive Spaces	Outdoor Points of Reception
7 am to 7 pm	45	45	9 or more	45	45
			7 to 8	50	50
			5 to 6	55	55
			4	60	60
			3	65	65
			2	70	70
			1	75	75
7 pm to 11 pm	40	40	9 or more	45	45
			7 to 8	50	50
			5 to 6	55	55
			4	60	60
			3	65	65
			2	70	70
			1	75	75
11 pm to 7 am	40	n/a	9 or more	40	n/a
			7 to 8	45	n/a
			5 to 6	50	n/a
			4	55	n/a

Time of Day	Non-Impulsive Noise (L_{eq} (1hr) Values, dBA)		Impulsive Noise (L_{LM} Values, bai)		
	Plane of Windows of Noise Sensitive Spaces	Outdoor Points of Reception	No. of Impulses in a 1-hour Period	Plane of Windows of Noise Sensitive Spaces	Outdoor Points of Reception
			3	60	n/a
			2	65	n/a
			1	70	n/a
Notes: Class 1 – urban, Class 2 – suburban, Class 3 – rural, Class 4 – infill					

Noise levels were modelled at the closest NSAs to ARA-2 and ARA-4. Where there were no noise sensitive receptors within 1.5 km of the boundary of the aggregate resource areas, the point of reception used in the assessment was a 1.5 km radius from ARA-2 or ARA-4 as per AER Directive 038/Health Canada Guidelines[3].

5.2 Assumed Noise Sources

The detailed design of the aggregate extraction sites has not progressed to the point where actual equipment selections have been made. Based on the information provided in the Planning & Construction Input for Road & Supportive Infrastructure report completed by Sigfusson Northern Ltd. (2023), assumptions have been made for equipment used at each site.

The following noise sources are assumed:

- One (1) primary crusher with associated screener;
- Six (6) stackers;
- Three (3) front-end loaders;
- Movement of material through conveyors; and
- Movement of heavy trucks throughout the aggregate extraction sites carrying material.

The sound levels for all sources listed above were assumed based on SLR's in-house database for similar types of equipment.

The assumed modelled locations of the significant noise sources are shown in **Figure N4** for ARA-2 and **Figure N5** for ARA-4. Sound level data used in the assessment were obtained from SLR's in-house database for similar types of equipment. The data used in the analysis are provided in **Appendix N5**. Based on the noise sources associated with this project, low frequency noise impacts are not expected.

[3] From Alberta Energy Regulator (AER) Directive 038: Noise Control, which is referenced in the Health Canada Guidelines.

5.3 Impact Assessment

5.3.1 Operating Conditions/Scenarios

Based on assumptions made, the aggregate extraction sites are expected to be in operation during the daytime between 7 am and 7 pm. To represent a worst-case simulation of the noise emissions, the crusher/screener, stackers, and front-end loaders were assumed to be in operation continuously throughout the daytime. A total of ten (10) heavy shipping trucks were assumed to enter and exit the aggregate extraction sites during each hour.

5.3.2 Noise Impact Modelling

Operations at the aggregate extraction sites were modelled using Cadna/A, a computerized version of the internationally recognized ISO 9613-2 noise propagation algorithms. This is the preferred noise modelling methodology of the MECP. The ISO 9613 equations account for:

- Source to receiver geometry
- Distance attenuation
- Atmospheric absorption
- Reflections off the ground and ground absorption
- Reflections off vertical walls
- Screening effects of buildings, terrain, and purpose-built noise barriers (noise walls, berms, etc.).

The following additional parameters were used in the modelling, which are consistent with providing a conservative (worst-case assessment of noise levels):

- Temperature: 10°C
- Relative Humidity: 70%
- Ground Absorption G: G=1.0 (absorptive) as default global parameter,
- Reflection: An order of reflection of 1 was used (accounts for noise reflecting from walls)
- Wall Absorption Coefficients: Set to 0.21 (21 % of energy is absorbed, 79% reflected)
- Terrain: Assumed to be flat

5.3.3 Predicted Stationary Sound Levels – Aggregate Extraction Site Operations

The predicted sound levels at each receptor are summarized in Table 11 for continuous noise from the aggregate extraction sites ARA-2 and ARA-4. Predicted sound level contours are shown in **Figure N17** and **Figure N18** for continuous noise for daytime operations at 1.5 m. A sample modelling output file for C06 is included in **Appendix N6**.

Table 11: Predicted Stationary Sound Levels - Aggregate Extraction Site Operations

NSA Location	Aggregate Extraction Site	Description	Predicted Sound Levels L_{eq} (1-hr) (dBA)	Performance Limits L_{eq} (1-hr) (dBA)	Investigation of Noise Mitigation Required? (Yes/No)
			Daytime	Daytime	
CHL-24	ARA-4	Culturally Sensitive Area - Gooseberries	31	45	No
CHL-25		Culturally Sensitive Area - Fishing	30	45	No
CHL-28		Culturally Sensitive Area - Gooseberries	24	45	No
C06	ARA-2	Construction Camp 2A-Receptor 6	45	45	No
C07		Construction Camp 2A-Receptor 7	46	45	Yes
C08		Construction Camp 2A-Receptor 8	47	45	Yes
C09		Construction Camp 2A-Receptor 9	48	45	Yes
C10		Construction Camp 2A-Receptor 10	48	45	Yes
C11		Construction Camp 2A-Receptor 11	49	45	Yes
C12		Construction Camp 2A-Receptor 12	49	45	Yes

Predicted sound levels are expected to exceed NPC-300 guideline limits at Construction Camp 2A located near ARA-2, by a maximum of 4 dB. Given workers will be in the field during the daytime, the exceedances are minor and considered negligible. The overall sound levels are not excessive, and would meet the NPC-300 guideline limits in a suburban or semi-rural area (50 dBA). Noise mitigation is not warranted.

6.0 Construction Noise Impacts – Blasting

Blasting of rock is expected to be limited to ARA-2 for extraction and processing rock and aggregate and one small rock outcrop along the preferred route for the WSR.

Applicable Guidelines Peak overpressure sound levels from blasting should be controlled by the blasting contractor to ensure the following criteria are met.

Blasting noise guidelines and criteria considered in the assessment are outlined in **Table 12** and **Table 13**.

Table 12: Construction Phase Blasting Noise Guidelines

Project Component	Applicable Guideline	Metrics Considered
All	MECP Publication NPC-119 – Blasting	Peak Overpressure

Table 13: Construction Phase Vibration Limits

Criteria	Medium	Limit
MECP Publication NPC-119 – Blasting	Air	• Peak sound pressure limit of 120 dBL, in the absence of noise monitoring • Peak sound pressure limit of 128 dBL, with noise monitoring

Peak overpressure sound levels from blasting should be controlled by the blasting contractor to ensure the criteria are met.

7.0 Construction Noise Impacts – General Construction Activities

As construction of the roadway proceeds along the route, there will be a number of different activities taking place, including:

- Clearing of vegetation and removal of overburden;
- Compaction of subgrades;
- Addition and compaction of base course and final courses of aggregate; and
- In some locations, construction of bridges and water crossings.

7.1 Applicable Guidelines

Table 14 outlines noise guidelines that have been considered in the assessment of construction noise impacts.

Table 14: Construction Phase Noise Guidelines

Project Component	Applicable Guideline	Metrics Considered
All	Health Canada Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise	L_D, L_N, L_{DN}
	MECP Publication NPC-115 – Construction Equipment	L_{max} at 15 m
	MECP Publication NPC-118 – Motorized Conveyances	L_{max} at 15 m

7.1.1 Health Canada Noise Guidelines

Health Canada considers two separate scenarios for evaluating construction noise, based on predicted L_D and L_N sound levels.

7.1.1.1 Short-Term Construction Noise (Less than 1 Year)

Health Canada suggests that for construction activities lasting less than a year, the construction noise assessment should follow approaches recommended by the U.S. EPA document *Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety* (1974). This technique is based on estimating a Mitigation Noise Level (MNL) based on community type and baseline noise level. Correction factors are then applied based on the type of construction, duration, etc.

For rural environments, Health Canada recommends using a base MNL of 47 dBA. **Table 15** describes correction factors considered for short-term construction noise.

Table 15: Construction MNL Corrections

Description	Correction to MNL
Construction duration less than two months	+ 10 dB
Winter (or windows always closed)	+ 5 dB
Negligible tonal or impulsive noise	+ 5 dB

7.1.1.2 Long-Term Construction Noise (More than 1 Year)

Health Canada suggests that for construction activities longer than 1 year, mitigation be implemented when noise levels during long-term construction result in a greater than 6.5% increase in %HA. Community consultation is recommended if sound levels continue to exceed a 6.5% increase in %HA even with mitigation installed.

7.1.2 MECP Publication NPC-115 and NPC-118 Construction Equipment Noise Emission Limits

MECP stipulates limits on noise emissions from individual items of equipment, rather than for overall construction noise. In the presence of persistent noise complaints, sound emission standards for the various types of construction equipment used on the project should be checked to ensure that they meet the specified limits contained in MECP Publication NPC-115 – Construction Equipment, and MECP Publication NPC-118 – Motorized Conveyances.

Table 16 summarizes maximum noise emission levels for typical construction equipment as specified in MECP Publication NPC-115 and NPC-118.

Table 16: MECP Publication NPC-115 and NPC-118 Maximum Noise Emission Levels for Typical Construction Equipment

Type of Unit	Maximum Sound Level [1] (dBA)	Distance (m)	Power Rating (kW)
Excavation Equipment [2]	83	15	< 75
	85	15	> 75
Pneumatic Equipment [3]	85	7	-
Portable Compressors	76	7	-
Diesel Powered Trucks	95	15	-

Type of Unit	Maximum Sound Level [1] (dBA)	Distance (m)	Power Rating (kW)
Notes: [1] Maximum permissible sound levels presented here are for equipment manufactured after Jan. 1981. [2] Excavation equipment includes bulldozers, backhoes, front end loaders, graders, excavators, steam rollers and other equipment capable of being used for similar applications. [3] Pneumatic equipment includes pavement breakers.			

7.2 Impact Assessment

Based on the information provided in the Planning & Construction Input for Road & Supportive Infrastructure report completed by Sigfusson Northern Ltd. (2023), assumptions have been made for equipment used for the construction of the WSR and associated waterbody crossings.

7.2.1 Noise Impact Modelling

Construction operations were modelled using Cadna/A, a computerized version of the internationally recognized ISO 9613-2 noise propagation algorithms. This is the preferred noise modelling methodology of the MECP. The ISO 9613 equations account for:

- Source to receiver geometry
- Distance attenuation
- Atmospheric absorption
- Reflections off the ground and ground absorption
- Reflections off vertical walls
- Screening effects of buildings, terrain, and purpose-built noise barriers (noise walls, berms, etc.).

The following additional parameters were used in the modelling, which are consistent with providing a conservative (worst-case assessment of noise levels):

- Temperature: 10°C
- Relative Humidity: 70%
- Ground Absorption G: G=1.0 (absorptive) as default global parameter,
- Reflection: An order of reflection of 1 was used (accounts for noise reflecting from walls)
- Wall Absorption Coefficients: Set to 0.21 (21 % of energy is absorbed, 79% reflected)
- Terrain: Assumed to be flat

7.2.2 Assumed Noise Sources

Road construction equipment and activities are expected to consist of the following:

7.2.2.1 Roadway Construction

Removal of Overburden

- Excavator: one unit on a single day, assumed to operate 40% of the daytime;
- Haul Trucks: up to 3 units on a single day, assumed to operate 100% of the daytime;
- Dozer: one unit on a single day, assumed to operate 40% of the daytime; and
- Scraper: one unit on a single day, assumed to operate 40% of the daytime.

Compaction of Subgrade

- Compactor: up to 2 units on a single day, assumed to operate 20% of the daytime.

Base Course

- Front-end loaders: up to 2 units on a single day, assumed to operate 40% of the daytime;
- Dozer: one unit on a single day, assumed to operate 40% of the daytime; and
- Haul trucks: up to 4 units on a single day, assumed to operate 100% of the daytime.

Compaction of Base Course

- Compactor: one unit on a single day, assumed to operate 20% of the daytime; and
- Grader: one unit on a single day, assumed to operate 40% of the daytime.

Surface Course

- Backhoe: up to 2 units on a single day, assumed to operate 40% of the daytime;
- Haul Trucks: up to 3 units on a single day, assumed to operate 100% of the daytime; and
- Roller: one unit on a single day, assumed to operate 20% of the daytime.

7.2.2.2 Bridge Construction

Construction of Embankments

- Backhoe: one unit on a single day, assumed to operate 40% of the daytime;
- Haul Trucks: up to 3 units on a single day, assumed to operate 100% of the daytime;
- Excavator: one unit on a single day, assumed to operate 40% of the daytime;
- Dozer: one unit on a single day, assumed to operate 40% of the daytime;
- Scraper: one unit on a single day, assumed to operate 40% of the daytime; and
- Compactor: one unit on a single day, assumed to operate 20% of the daytime.

Bridge Construction

- Backhoe: one unit on a single day, assumed to operate 40% of the daytime;

- Man Lift: one unit on a single day, assumed to operate 20% of the daytime;
- Haul Trucks: up to 3 units on a single day, assumed to operate 100% of the daytime;
- Impact Pile Driver: one unit on a single day, assumed to operate 20% of the daytime; and
- Crane: one unit on a single day, assumed to operate 16% of the daytime.

7.2.3 Predicted Stationary Sound Levels – Roadway Construction

Based on the assumptions presented above, **Table 17** below presents the predicted sound levels at the surrounding NSAs from the construction of the WSR. The assessment of short-term community annoyance is based on the MNL. An investigation into noise mitigation is warranted if the L_{DN} predicted is above 47 dBA. The 47 dBA zone of influence is shown in **Figure N19** and **Figure N20**.

Table 17: Predicted Sound Levels at Surrounding NSAs - Construction Noise (Roadway Construction)

NSA Location	Existing (Baseline) Sound Levels (dBA)			Predicted Construction Sound Levels [1] (dBA)			Investigation of Noise Mitigation Required?
	L_{DN}	L_D	L_N	L_{DN}	L_D	L_N	
CHL01	50	44	43	31	31	0	No
CHL02	50	44	43	40	40	0	No
CHL03	50	44	43	33	33	0	No
CHL04	50	44	43	33	33	0	No
CHL05	45	41	38	49	49	0	Yes
CHL06	37	32	31	38	38	0	No
CHL07	37	32	31	43	43	0	No
CHL08	37	32	31	43	43	0	No
CHL09	37	32	31	35	35	0	No
CHL10	37	32	31	34	34	0	No
CHL11	37	32	31	35	35	0	No
CHL12	37	32	31	30	30	0	No
CHL13	37	32	31	41	41	0	No
CHL14	37	32	31	46	46	0	No
CHL15	37	32	31	42	42	0	No

7.2.4 Predicted Stationary Sound Levels – Bridge Construction

Based on the assumptions presented above, **Table 18** below presents the predicted sound levels at the surrounding NSAs for construction related noise from bridge construction activities at water crossings: WB-1 at Winisk Lake (Six Span Composite Steel Bridge), WC-3 at Winiskisis Channel (Twin-Span Steel Bridge), and WC-13 at a tributary of the Ekwan River (Single Span Composite Steel Bridge) of the WSR. These two bridge locations were selected as the locations within 1.5km of an NSA. The assessment of short-term community annoyance is based on MNL. An investigation into noise mitigation is warranted if the L_{DN} predicted is above 47 dBA. Setbacks to the 47 dBA threshold are shown in **Figure N21** and **Figure N22**.

7.2.5 Discussion on Results – Roadway and Bridge Construction

The highest predicted noise levels at the culturally sensitive areas CHLs 5, 7, 17, and 25 are between 49 and 57 dBA, exceeding the MNL threshold of 47 dBA (L_{DN}). The most affected noise-sensitive areas are found within 150 m of the roadway, or 300 m of a waterbody crossing (involving pile driving/bridge construction). There are no exceedances predicted for the existing permanent residences within the Webequie community.

Noise impacts from roadway construction are only expected to affect noise-sensitive receptors for approximately one week based on an approximate 100 m/day rate of construction. As such, mitigation is not warranted.

Noise impacts from the bridge construction are expected to exceed the 47 dBA threshold at CHL-7 and C05 (Construction Camp 1A). The sound levels are moderate (53 dBA and 48 dBA respectively). No permanent residences are affected. As such, mitigation is not warranted.

8.0 Construction Vibration Impacts – Blasting

Blasting may take place in some locations. At this time blasting is expected to be limited to ARA-2 for extraction and processing rock and aggregate and one small rock outcrop along the preferred route for the WSR. Vibration levels from blasting should be controlled by the blasting contractor to ensure the following criteria are met.

8.1 Applicable Guidelines

Guidelines and criteria considered in examining vibration impacts during construction are outlined in **Table 19** and **Table 20**.

Table 19: Construction Phase Vibration Guidelines

Project Component	Applicable Guideline	Metrics Considered
All	MECP Publication NPC-119, Blasting	PPV
	MTO Provincial Standard OPPS.PROV 120, General Specification of the Use of Explosives	PPV
	DFO Guidelines For The Use Of Explosives In Canadian Fisheries Waters	PPV, Peak Overpressure

Table 20: Construction Phase Vibration Limits

Criteria	Medium	Limit		
DFO Guidelines For The Use Of Explosives In Canadian Fisheries Waters	Water	• Instantaneous pressure < 100 kPa, 10 m from the point of detonation; • Maximum PPV Velocity of 13 mm/s in spawning beds during incubation.		
MECP Publication NPC-119 – Blasting	Ground	• Maximum PPV Velocity of 10 mm/s for unmonitored blasts; • Maximum PPV Velocity of 12.5 mm/s for blasts where routine monitoring of peak pressure levels occurs.		
MTO Provincial Standard OPPS.PROV 120	Ground	Structures and Pipelines	Maximum PPV Velocity of 20 mm/s ≤ 40 Hz	Maximum PPV Velocity of 50 mm/s >40 Hz
		Concrete and Grout < 72 hours from placement	Maximum PPV Velocity of 10 mm/s	
	Water	100 kPA, (mandatory monitoring required)		

The guidelines outlined in **Table 19** and **Table 20** are not based on background ambient vibration levels – rather they are from the activity itself, which will dominate over background levels. Vibration levels are controlled through blast design and confirmed through monitoring.

9.0 Construction Vibration Impacts – General Construction Activities

As construction proceeds along the WSR route, vibration from construction activity will occur. An assessment has been completed to examine the extent of vibration away from the construction area.

9.1 Construction Vibration Guidelines - City of Toronto By-Law 514-2008

While not directly applicable, the City of Toronto By-Law 514-2008 provides useful criteria and assessment methods for examining the potential for vibration impacts from construction activity. The by-law specifies “Do-Not-Exceed” threshold limits as listed in **Table 21** to address structural concerns for nearby/adjacent structures.

Table 21: City of Toronto By-Law Vibration Guidelines

Frequency of Vibration (Hz)	Peak Particle Velocity (mm/s)
Less than 4	8[1]
Between 4 and 10	15
Greater than 10	25
Notes: [1] While the threshold limit is 8 mm/s for frequencies below 4 Hz, 62.5% of the threshold limit, i.e., 5 mm/s, is given as an appropriate cautionary threshold for most structures and typically serves as the industry best practice for defining the Zone of Influence.	

9.2 Zone of Influence of Construction Vibration

The City of Toronto By-Law requires determination of a “zone of influence” or ZOI associated with construction activities. Chapter 363 of The City of Toronto Municipal Code defines this as follows:

> “The area of land within or adjacent to a construction site, including any buildings or structures, that potentially may be impacted by vibrations emanating from a construction activity where the peak particle velocity measured at the point of reception is equal to or greater than five (5) mm/sec at any frequency or such greater area where specific site conditions are identified by the professional engineer in a preliminary vibration study.”

For this assessment, the model recommended by the Federal Transit Administration (FTA) in the United States has been applied for prediction of vibration impacts during construction and to establish the extent of the ZOI. The source vibration levels associated with the equipment planned for shoring/excavation were specified based on data in the FTA document, as well as SLR’s own measurement data collected on construction projects.

The ZOI was determined based on the following numerical model:

$$\mathrm{PPV}_{equip} = \mathrm{PPV}_{ref} \times (25/D)^{\gamma}$$

Where:

- PPV_{equip} is the estimated peak particle (ground) velocity at distance D from the equipment;

- PPV_{ref} is the peak particle (ground) velocity due to operation of the source equipment at an offset distance of 25 ft (7.6 m); and,
- γ is the ground vibration decay factor (γ = 1.4, for rocky soil).

Estimation of the ZOI requires solving equation (1) for D when PPV_{ref} = 5 mm/s for general adjacencies or 3 mm/s for designated/listed heritage property, respectively. This calculation is completed for each anticipated equipment type to establish the maximum (worst-case) offset of the ZOI from the extent of the construction activity.

The source level for the equipment used in this assessment (PPV_{ref}), and associated ZOI offset distances for each equipment type are summarized in **Table 22**.

Table 22: Summary of ZOI Offset Associated with Construction Activities

Equipment/Activity	Peak Particle Velocity – PPV@1m Setback (mm/s)	ZOI Setback Distance (m)
Vibratory Roller	107	11
Compactor	166	15
Large Bulldozer	48	4
Loaded Trucks	41	6
Excavator	9	3
Impact Pile Driver	344	24
Sonic Pile Driver	91	10

9.3 Predicted Construction Vibration Levels

The predicted peak particle velocity vibration levels for the receptors during the roadway and bridge construction activities, considering the 3 mm/s PPV target level criteria are presented in **Table 23** for roadway construction and **Table 24** for bridge construction**.** Vibration impacts from general construction activity are not anticipated.

Table 23: Predicted Construction Vibration Levels at Sensitive Receptors – Roadway Construction

10.0 Construction Noise and Vibration Code of Practice

To minimize the potential for construction noise and vibration impacts, as the project design and construction plan proceeds, it is recommended that provisions be written into the contract documentation for the Contractor, as outlined below:

- Construction should be limited to the daytime period, where possible, especially near residences.
- All equipment should be properly maintained to limit noise emissions. As such, all construction equipment should be operated with effective muffling devices that are in good working order.
- In the presence of persistent noise complaints, all construction equipment should be verified to comply with MOE NPC-115 guidelines.
- In the presence of persistent complaints and subject to the results of a field investigation, alternative noise control measures may be required, where reasonably available. In selecting appropriate noise control and mitigation measures, consideration should be given to the technical, administrative, and economic feasibility of the various alternatives.

11.0 Operational Noise Impact Assessment

For transportation projects, operational noise is of primary importance. This section of the report provides an analysis of operational noise impacts from road traffic noise related to the Project.

11.1 Noise Sources of Interest for the Assessment

In establishing the potential operational and construction noise impacts of a project such as the WSR, comparisons are made of:

- noise from operation and construction the roadway, versus various applicable guidelines; and
- the change from existing conditions, which results from the operation and construction of the project.

The existing background ambient noise environment along the majority of the Project is dominated by the sounds of nature (wind, leaves rustling, etc.), with little to no man-made sounds.

Near the Webequie community, the existing ambient background sound environment includes:

- Natural background ambient noise, similar to more remote areas;
- Man-made sounds from community activities, such as vehicles and equipment; and
- Noise from the operation of the local airport.

The Webequie airport is located approximately 1.9 km to the southwest of the community, and operates in uncontrolled airspace. Current and future flight data were requested from NAV Canada, but specific statistical data was not available. Anecdotally, there are currently a maximum of 1 to 2 flights per day using the facility. This number is not expected to increase due to the construction and operation of the WSR.

As a result, a specific assessment of the Project's effects on airport noise is not required. Noise levels from the Webequie airport were not modelled. Existing (and effectively future) airport activities were captured in the background noise measurements at Monitor M1, discussed above, which was used in assessing impacts at the community. Airport noise is not discussed further in this report.

11.2 Applicable Noise Guidelines

There are a number of applicable noise guidelines addressing the potential for environmental noise and vibration impacts from the Project. The guidelines which have been considered for operational noise in this assessment are outlined in **Table 25** and described in the following subsections.

Table 25: Operations Phase Noise Guidelines

Project Component	Applicable Guideline	Metrics Considered
Road	MTO Environmental Guide for Noise	L_{eq} Day
	Health Canada Guidance for Evaluating Human Health Impacts in Environmental Assessment: Noise (the Health Canada Guideline)	L_{DN}, L_D, L_N, L_{max}, Change in Percent Highly Annoyed (%HA)
Permanent Aggregate/Bedrock Extraction Site	MECP Publication NPC-300, Environmental Noise Guideline - Stationary and Transportation Sources - Approval and Planning (Publication NPC-300)	L_{eq} (1hr), during operating period

11.2.1 MTO Environmental Guide for Noise

Ontario's most relevant and recent guideline/document related to assessing road traffic noise impacts is the MTO Environmental Guide for Noise.

The MTO Environmental Guide for Noise is used for provincially owned and operated facilities and is the most extensive and up-to-date. Under these guidelines, the importance of changes from a noise impact perspective is based on the objective level and change from existing conditions. Cumulative sound levels are assessed. The MTO Environmental Guide for Noise is based on:

- The change from existing "no-build" background sound levels, and the "future build" sound levels with the project in place (background sound levels + project [4]); as well the Provincial Objective for outdoor sound levels of 55 dBA. Changes greater than 5 dBA require an investigation of noise mitigation.
- The maximum "future build" sound levels. Sound levels in excess of 65 dBA require an investigation of noise mitigation.

Table 26 summarizes the requirements for investigation of mitigation measures.

[4] Project noise will include noise from roadway operations and noise from the Aggregate/Bedrock Extraction Site.

Table 26: MTO Environmental Guide for Noise

Proposed Improvements/Project Future Build Noise Levels	Mitigation Effort Required
< 5 dB change & < 65 dBA	• None
≥ 5 dB change OR ≥ 65 dBA	• Investigate noise control measures within right-of-way • Noise control measures where used must provide a minimum of 5 dBA of attenuation, averaged over the first row of receivers • Mitigated to as close to ambient as possible, where technically, economically and administratively feasible
Notes: Values are L_{eq} Day levels for municipal roads and provincial highways, and L_{eq} (24h) for freeways	

11.2.2 Health Canada Noise Guidelines

Health Canada's noise guidelines for operational noise are based on three main parameters:

- The change in "Percent Highly Annoyed" (%HA) due to project operations. This is calculated based on the change from existing "no-build" background sound levels, and the "future build" sound levels with the project in place (background sound levels + project).
- Indoor night-time average sound levels should not exceed 30 dBA (10 pm to 7 am); and
- Maximum indoor sound levels from individual events should not exceed 45 dBA and the number of events occurring during the over-night period should not exceed 10 to 15 events (10 pm to 7 am).

Health Canada assesses annoyance based on the concept of Percent Highly Annoyed (%HA), which is an aggregate measure of community annoyance, based on noise levels received, the types of noise, and other aggregating factors. The calculated %HA provides information on how an average community responds to a noise level. It is important to emphasize that these annoyance responses are not applicable to a particular individual or group but represent an average community.

The Health Canada guidelines use the dose-response relationship between noise levels and annoyance, as per ISO 1996-1:2003, based on measured and/or predicted L_{DN} values, in dBA.

The %HA value for the existing background ambient sound levels (i.e., the "no-build" situation) is calculated, as is the %HA for cumulative sound level with the Project in operation (the "build" scenario). Health Canada identifies a change in %HA of greater than 6.5% as being indicative of a noise impact. Noise mitigation measures should be investigated in this situation.

Health Canada required that mitigation be investigated for "build scenario" L_{DN} sound levels in excess of 75 dBA, regardless of the change in %HA.

The relationship between noise and %HA is non-linear in nature. At higher sound levels, there can be a substantial increase in the %HA, with relatively small changes in the noise environment; correspondingly, at lower sound levels far greater changes in sound levels may be required to substantially change the estimated %HA. At moderate sound levels, a 6.5% change

in %HA corresponds to a 5 dB change, equivalent to the mitigation thresholds in the MTO Environmental Guide for Noise. In situations where greater expectation for, and value placed on, “peace and quiet”, such as in rural areas, Health Canada recommends that a +10 dB adjustment be placed in project noise levels to avoid underpredicting impacts.

In evaluating indoor night-time sound levels, a conservative adjustment of -15 dBA will be applied as appropriate to account for attenuation through open windows in accordance with the Health Canada guidelines.

11.3 Identification of Noise Sensitive Areas

SLR worked with socio-economic specialists with the AtkinsRealis Project Team and Webequie to identify noise sensitive areas (“NSAs”) applicable to the Project, which are points of reception where noise impacts will be predicted.

Working with the socio-economic specialists for the Project, all NSAs within the LSA have been identified and mapped. The NSAs used for the assessment are detailed in **Section 4.2** and shown in **Figures N6 to N12** and tabulated **Appendix N2** and **Table 4.**

11.3.1 Review of Health Canada’s Noise Guidelines and Alberta Energy Regulator Directive 038.

Table 6.1 of the Health Canada Guideline provides estimations of baseline noise levels using qualitative descriptions and population densities of average types of communities. This is adapted from research conducted in Alberta by the Alberta Energy Regulator (AER) and codified in AER Directive 038. The table is reproduced as **Table 27** for reference below.

Table 27: Estimation of Baseline Noise Levels Using Qualitative Descriptions and Population Densities of Average Types of Communities (from Health Canada Guidelines)

Community Type and Qualitative Description	Average Census Tract Population Density, Number of People Per Square km	Estimated Baseline Sound Level, L_{DN} (dBA) [1]
Quiet Rural Dwelling units more than 500 m from heavily travelled roads and/or rail lines and not subject to frequent aircraft flyovers	28	< 45 [2]
Quiet Suburban Residential Remote from large cities, industrial activity and trucking	249	48 to 52
Normal Suburban Residential Not located near industrial activity	791	53 to 57
Urban Residential Not immediately adjacent to heavily travelled roads and industrial areas	2,493	58 to 62
Noisy Urban Residential Near relatively busy roads or industrial areas	7,913	63 to 67
Very Noisy Urban Residential	24,925	68 to 72

Notes:

[1] Note that a range of values is provided and that selection of the appropriate estimated value would typically be based on the precautionary principle in the absence of adequate justification for a higher baseline. All day-night sound level (L_{DN}) values, except those of the quiet rural area community type, are based on the US EPA levels document (US EPA 1974).

[2] The quiet rural area (L_N = 35 dBA) estimated baseline noise level and population density were obtained from AER Directive 038 (revised Feb 16, 2007). The difference between L_D and L_N was obtained from AER and US EPA, and was approximated as 10 dBA. As such, quiet rural areas are considered to be less than or equal to 45 dBA L_{DN}.

The intent of the table is for it to be used in situations where baseline measurement data are not available. The community type over the entire LSA would be qualitative described as “Quiet Rural”. The corresponding conservative estimates of background sound levels are:

- L_D – 45 dBA
- L_N – 35 dBA
- L_{DN} – 45 dBA

At Monitor M1, background L_D sound levels fall within the range of a “Quiet Rural” area, however L_N sound levels exceed 35 dBA on average therefore driving the area into a “Quiet Suburban Residential” category. L_{DN} sound levels exceed the 45 dBA Quiet Rural criteria, this is due to the greater sound levels during the night-time between 10 pm and 7 am.

Monitors M2 and M3 have background sound levels within the range of a “Quiet Rural” area, which makes sense given their locations are far from frequent human activity and heavily travelled roadways.

11.3.2 Summary of Baseline Sound Levels Adopted for the Assessment

Table 28 summarizes the baseline sound levels to be used in the assessment.

Table 28: Summary of Baseline Sound Levels For Use in the Assessment

NSA Location	Source	MTO *Environmental Guide for Noise* (dBA)		Health Canada Guidelines (dBA)			MECP Publication NPC-300 Stationary Noise (L_{eq} (1hr) (dBA)

11.4 Road Traffic Data

The evaluation of noise impacts is determined by the change in cumulative sound levels from the 2041 "no-build" scenario to the future "build" scenario. Assessments are based on a mature state of development or at the start of construction. Accordingly, a design year of 2041 applies to this Project.

Traffic information for the 2041 "no-build" and "build" scenario for multiple roadways was provided by AtkinsRéalis. The data were further summarized in **Table 29**. Traffic data were

provided as Average Annual Daily Traffic (AADT), with the percentage of commercial vehicles, day/night traffic split and posted speeds.

Table 29: 2041 "Build" Traffic Information at Anticipated Date of Construction

Roadway	Average Annual Daily Traffic (AADT)	Day/Night Split (% / %) [1]	%Heavy Trucks	Speed (km/h)
Webequie Supply Road	500	90	25%	80
Notes: [1] Daytime/Night-time traffic volume split of 90% daytime (7 am to 11 pm) and 10% night-time was assumed based on traditional day/night breakdown for low-volume Ontario roadways.				

11.5 Noise Modelling Methods

11.5.1 Roadway Noise Model

Sound levels from the proposed roadway will be predicted using Cadna/A, a noise computer modelling package produced by Datakustik GmbH. Cadna/A includes a computerized implementation of the internationally recognized ISO 9613 noise propagation algorithms, and accounts for:

- Source and receiver geometries and distances;
- Source directivity;
- Screening from terrain and purpose-built noise barriers;
- Attenuation from woods and heavily forested areas;
- Ground attenuation due to soft terrain;
- Atmospheric absorption; and
- Worst-case meteorological conditions.

The WSR traffic near the identified NSAs was modelled as a “moving point source” of sound.[5] “Future Build” sound levels (i.e., with the WSR in operation) will be predicted at the NSAs. The following levels will be determined:

- Overall sound levels during the daytime (7 am to 11 pm) and night-time (11 pm to 7 am) periods; and,
- Overall “day-night” sound levels over the entire day (L_{DN} values).

These will be compared to the “no-build” background ambient sound levels previously determined (see **Table 28**), as well as against the corresponding applicable and/or relevant noise guidelines.

[5] Roadway noise models require a minimum traffic volume of 40 vehicles per hour for the roadway to be considered a “line source” of noise, equating to a minimum traffic volume of 960 vehicles per day. That threshold is not met here, making the use of a “moving point source model” the most appropriate method for predicting noise from the new road.

The model uses the following vehicle classifications:

Automobiles -	Two axles and four wheels designed primarily for the transportation of nine or fewer passengers, or transportation of cargo (light trucks). This classification includes motorcycles. Generally, the gross vehicle weight is less than 4,500 kilograms.
Heavy trucks -	Three or more axles and designed for the transportation of cargo. Generally, the gross vehicle weight is greater than 12,000 kilograms.

As inputs into the noise model, the noise emission levels of automobiles and heavy trucks travelling over a gravel road were measured to develop a series of maximum pass-by sound levels at a number of different vehicle speeds. As a conservative assumption, the maximum posted speed of 80 km/h was assumed for all locations on the road. The maximum pass-by sound levels measured from the gravel road exceeded those predicted for a standard roadway consisting of stone mastic asphalt or similar pavement types typically used.

11.6 Operational Noise Modelling Results

Noise modelling was completed for the preliminary recommended preferred route (Alternative 3). Table 30 presents a comparison of predicted “no-build” versus future “build” sound levels at noise-sensitive receptors in the study area, during the 16-hour daytime period, per the MTO Environmental Guide for Noise.

Table 31 presents a comparison of the “baseline” sound levels and the predicted “total operational” sound levels to Health Canada’s Guidelines.

RP## Permanent residence, retirement complexes, assisted care homes

RPF## Future permanent residence, per Webequie First Nation On-Reserve Land Use Plan May 31, 2019.

RS## Hotels, seasonal residence, trapper's cabin, hunting and fishing campsites (and which are allowed to be disclosed)

CHL## Cultural Heritage Landscapes identified in Cultural Heritage Report–Webequie Supply Road March, 2022

I## Noise-sensitive institutional receptor such as schools, hospitals, clinics, etc.

O## Other noise sensitive locations which Webequie First Nation, or other Stakeholders have identified as requiring quiet or being sensitive to disruptions from noise, for example spiritual or sacred spaces or hunting grounds (and which are allowed to be disclosed)

C## Construction Camps (long-term)

11.6.1 Discussion of Results - MTO Environmental Guide for Noise

Based on the predicted operational sound levels presented in **Table 30** above, the maximum predicted sound level (L_{eq} – Daytime) is 44 dBA which is equal to the measured baseline ambient sound level within the community/settlement of Webequie.

Based on the predicted operational sound levels presented in Table 30, the changes in sound levels predicted at some of the culturally sensitive areas are expected to exceed the 5 dB threshold outlined in the MTO Environmental Guide for Noise. Overall "Build" sound levels are predicted to be less than or equal to 45 dBA which is considered appropriate for a quiet rural environment. Overall "Build" sound levels are less than the 55 dBA criteria outlined in the MTO Environmental Guide for Noise.

NSAs including CHL-7, CHL-8, CHL-13, CHL-14, CHL-15 CHL-17, and CHL-25 are predicted to exceed the 5 dB change outlined in the MTO Environmental Guide for Noise.

11.6.2 Discussion of Results - Health Canada Guidelines - Long-term Community Annoyance (%HA)

Based on the predicted operational sound levels presented in

Table 31 above, the maximum predicted sound level (L_{DN}) is 54 dBA with a maximum predicted change in %HA of 4.5%.

For the future residential area, sound levels will be a maximum of 47 dBA with a maximum change in %HA of 2.3%, which is dependent on the final location of the residences. Locations at this time have been estimated based on information provided by AtkinsRéalis.

Based on the predicted sound levels presented in

Table 31 above, the maximum change in %HA (percent highly annoyed) is 4.5% at CHL-25 (Fishing Area) which is below the 6.5% threshold. The results indicate that the operational noise impacts are not expected to cause long-term community annoyance based on Health Canada's Guidelines.

12.0 Operational Vibration Impact Assessment

There are no significant sources of underwater noise or vibration associated with the operations phase of the Project (i.e., the roadway in use). Vibration impacts from the operations phase of the Project are highly unlikely, and therefore an assessment of vibrations from operations is not required under the Provincial Terms of Reference or the Federal Tailored Impact Statement Guidelines.

13.0 Conclusions and Recommendations

The potential environmental noise and vibration impacts of the proposed WSR have been assessed. Both operational and construction noise and vibration impacts have been considered. The conclusions and recommendations are as follows:

13.1 Construction Noise – Aggregate Extraction Site Operations

- Predicted sound levels are expected to minorly exceed NPC-300 guideline limits at Construction Camp 2A located near ARA-2.
- Given workers will be in the field during the daytime, the exceedances are minor and considered negligible. The predicted sound levels are moderate (< 50 dBA). Noise mitigation is not required.
- Based on the noise sources associated with this project, low frequency noise impacts are not expected.

13.2 Construction Noise - General Construction Activities

- The highest predicted noise levels at the culturally sensitive areas CHLs 5, 7, 17, and 25 are between 49 dBA and 57 dBA, exceeding the MNL threshold of 47 dBA (L_{DN}).
- The most affected noise-sensitive areas are found within 150 m of the roadway, or 300 m of a water crossing (involving pile driving/bridge construction).
- There are no exceedances predicted for the existing permanent residences within the Webequie community.
- Noise impacts from roadway construction are expected to affect noise-sensitive receptors for approximately one week based on an approximate 100m/day rate of construction.
- Noise impacts from the bridge construction are expected to exceed the 47 dBA threshold at CHL-7 and C05 (Construction Camp 1A). However, based on the overall level and nature of the receptors, noise mitigation is not recommended.

13.3 Construction Vibration

- Vibration impacts from general construction activities are not anticipated.

Any blasting should be designed by the contractor to meet the requirements listed in **Table 20** .

13.4 Operational Noise – MTO Guidelines

- The results show that changes in sound levels resulting from the proposed Project are expected to be negligible for the existing residences within the Webequie community and less than requirements outlined MTO Noise Guide. Overall “Build” sound levels are predicted to be less than or equal to 45 dBA which is considered appropriate for a quiet rural environment.
- For the culturally sensitive areas, the maximum sound level is predicted to be 46 dBA. The maximum change is predicted to be 14 dB which is above the MTO Noise Guide threshold. Overall “Build” sound levels are highly dependent on the exact location of the noise-sensitive receptor. Sound levels are predicted to be less than 46 dBA which is considered appropriate for a quiet rural area. Noise mitigation is not recommended.

13.5 Operational Noise – Health Canada Guidelines

- The results show that changes in sound levels resulting from the proposed Project are expected to be negligible for the existing residences within the Webequie community and less than the 6.5% threshold per Health Canada Guidelines.
- In the future residential areas, the predicted change in %HA is expected to be a maximum of 2.3% which is below the threshold of 6.5% to warrant mitigation. Results are highly dependent on the location of the future residences.
- For the culturally sensitive areas, the maximum predicted change in %HA is 4.5% which is below the threshold of 6.5% to warrant mitigation.

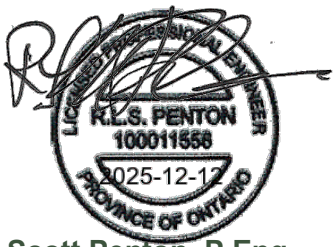

14.0 Closure

Should you have any questions on the above, please do not hesitate to contact us.
