The Proposed Project

Ducks Unlimited Canada is proposing to undertake routine maintenance repairs and upgrades to existing constructed wetland infrastructure located at the Shepody National Wildlife Area (segment 12).

The scope of this project includes removal of incompatible vegetation along the extent of the existing lengths of dyke within segment 12. The dyke will be levelled and re-topped with glacial till from a local source. The proposed work will be completed during the winter when frozen ground conditions exist, and disturbance to migratory birds and other wildlife will be minimal. All necessary measures to address potential siltation will be employed, including use of silt fences. All exposed surfaces will be covered with hay mulch at the completion of construction, and will be seeded with native grass species in the spring. The approximate length of dyke to be repaired is 700 metres.
